U.S. Department of Commerce National Bureau of Standards he National Bureau of Standards¹ was established by an act of Congress on March 3, 1901. The Bureau's overall goal is to strengthen and advance the nation's science and technology and facilitate their effective application for public benefit. To this end, the Bureau conducts research and provides: (1) a basis for the nation's physical measurement system, (2) scientific and technological services for industry and government, (3) a technical basis for equity in trade, and (4) technical services to promote public safety. The Bureau's technical work is performed by the National Measurement Laboratory, the National Engineering Laboratory, the Institute for Computer Sciences and Technology, and the Center for Materials Science.

The National Measurement Laboratory

Provides the national system of physical and chemical measurement; coordinates the system with measurement systems of other nations and furnishes essential services leading to accurate and uniform physical and chemical measurement throughout the nation's scientific community, industry, and commerce; provides advisory and research services to other Government agencies; conducts physical and chemical research; develops, produces, and distributes Standard Reference Materials; and provides calibration services. The Laboratory consists of the following centers:

- Basic Standards² Z
- Radiation Research
- Chemical Physics
- Analytical Chemistry

The National Engineering Laboratory

Provides technology and technical services to the public and private sectors to address national needs and to solve national problems; conducts research in engineering and applied science in support of these efforts; builds and maintains competence in the necessary disciplines required to carry out this research and technical service; develops engineering data and measurement capabilities; provides engineering measurement traceability services; develops test methods and proposes engineering standards and code changes; develops and proposes new engineering practices; and develops and improves mechanisms to transfer results of its research to the ultimate user. The Laboratory consists of the following centers:

- Applied Mathematics
- Electronics and Electrical Engineering²
- Manufacturing Engineering
- Building Technology
- Fire Research
- Chemical Engineering²

The Institute for Comptuer Sciences and Technology

Conducts research and provides scientific and technical services to aid Federal agencies in the selection, acquisition, application, and use of computer technology to improve effectiveness and economy in Government operations in accordance with Public Law 89-306 (40 U.S.C. 759), relevant Executive Orders, and other directives; carries out this mission by managing the Federal Information Processing Standards Program, developing Federal ADP standards guidelines, and managing Federal participation in ADP voluntary standardization activities; provides scientific and technological advisory services and assistance to Federal agencies; and provides the technical foundation for computer-related policies of the Federal Government. The Institute consists of the following centers:

- Programming Science and Technology
- Computer Systems
 Engineering

The Center for Materials Science

Conducts research and provides measurements, data, standards, reference materials, quantitative understanding and other technical information fundamental to the processing, structure, properties and performance of materials; addresses the scientific basis for new advanced materials technologies; plans research around cross-country scientific themes such as nondestructive evaluation and phase diagram development; oversees Bureau-wide technical programs in nuclear reactor radiation research and nondestructive evaluation; and broadly disseminates generic technical information resulting from its programs. The Center consists of the following Divisions:

- Inorganic Materials
- Fracture and Deformation³
- Polymers
- Metallurgy
- Reactor Radiation

¹Headquarters and Laboratories at Gaithersburg, MD, unless otherwise noted; mailing address Gaithersburg, MD 20899.

²Some divisions within the center are located at Boulder, CO 80303.

³Located at Boulder, CO, with some elements at Gaithersburg, MD.

CATALOG STRUCTURE AND USE

Full bibliographic citations including keywords and abstracts for National Bureau of Standards papers published and entered into the National Technical Information Service (NTIS) collection are cited in the "NBS Publications Announcements" section of this catalog. (Also included are NBS papers published prior to 1985 but not reported in previous supplements of this annual catalog.) Entries are arranged by the COSATI (Committee on Scientific and Technical Information) classification system which consists of 22 broad subject categories (see back cover) and 178 subcategories. Within a subcategory, entries are listed alphanumerically by NTIS order number.

Four additional abbreviated indexes are included to allow the user to identify NBS papers by personal author, keywords, title, and NTIS order/report number. Each entry lists the appropriate title, the NTIS order number, and the abstract number.

NBS papers may also be identified by searching the NTIS database either online via the commercially available DIALOG system or in the issues of NTIS's Government Reports Announcements and Index and its Government Reports Annual Index.

AVAILABILITY AND ORDERING INFORMATION

The highest quality and least expensive copies of NBS publications published as Government documents are available from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402. Publications cited with stock numbers (SN) and purchase orders should be cited by these numbers. GPO will accept payment by check, money order, VISA, Mastercharge, or deposit account. For availability and price, write to the GPO or telephone (202) 783-3258. Should an NBS publication be out of print at the GPO, its continued availability is assured at NTIS which sells publications in microfiche or paper copy reproduced from microfiche.

If an entry has a price code, such as PC A04/MF A01, the publication may be ordered from NTIS in paper copy (PC) or microfiche (MF) or both if both codes are given. Order from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22161. A copy of the latest price code schedule is available from NTIS. NTIS will accept payment by check, money order, VISA, American Express, Mastercharge, or deposit account, NTIS is the sole source of Federal Information Processing Standards (FIPS), NBS Interagency Reports (NBSIRs), and Grant/Contract Reports (GCRs).

Sometimes, papers noted "Not Available NTIS" may be obtained directly from the author or from the external

publisher cited. Such papers are not for sale by either the GPO or NTIS.

Two other sources for NBS publications are depository libraries (libraries designated to receive Government publications) and Department of Commerce District Offices. The depository libraries listed in Appendix A receive selected NBS publications (see inside back cover for a description of the various NBS publication series). While not every Government publication is sent to all depository libraries, certain depositories designated as Regional Depositories receive and retain one copy of all Government publications made available. Contact the depository library in your area to obtain information on what is available and where.

Department of Commerce District Offices listed in Appendix B provide ready access at the local level to publications, statistical data and summaries, and surveys. Each District Office serves as an official sales agency of the Superintendent of Documents, U.S. Government Printing Office. A wide range of Government publications can be purchased from these offices. In addition, the reference library of each District Office contains review copies of many Government publications.

Abstract

AERONAUTICS

Keywords: *Aircraft cabins, *Aircraft fires, Computerized simulation, Flow measurement, Mathematical models, Smoke, Vents, Ceilings(Architecture), Floors, Fire safety, UNDSAFE II computer code.

Several projects have studied the effects of fires on the interior environment of an aircraft. Fires both internal and external to the aircraft were considered. The thrust of the work was to obtain the interior flow field. The flow was calculated using two- and three-dimensional field models with experimental verification in a wind tunnel.

Thermal Response of Aircraft Cabin Celling Materials during a Post-Crash, External Fuel-Spill, Fire Scenario.

Final rept.,
L. Y. Cooper. 1985, 11p
See also PB85-145647. Sponsored by Federal Aviation Administration, Washington, DC.
Pub. in Proceedings of AIAA (American Institute of Aeronautics and Astronautics) Aerospace Sciences

Meeting (23rd), Reno, NV., January 14-17, 1985, AIAA-85-0395, 11p 1985.

Keywords: *Aircraft cabins, *Aircraft fires, *Fire resistant materials, Thermal resistance, Flammability, Tests, Temperature, Fire safety, Algorithms, *Ceilings.

An algorithm is developed to predict the thermal response of aircraft ceiling materials during a post-crash fire scenario. The scenario involves an aircraft's emergency exit doorway which opens directly onto the flames of an external, fuel-spill fire which engulf a large portion of the fuselage. Data of near-ceiling temperatures acquired during a series of eight, full-scale, widebody aircraft cabin, post-crash test simulations provide indirect validation of the algorithm. These tests involved cabins outfitted with only single, mockup seats. Two other full-scale cabin tests involving fire spread through twenty-one seat arrays with different types of seat construction provide the input data required to exercise the algorithm in evaluations of fully outfitted cabins. Relative to the post-crash scenario, a measure of cabin fire safety is proposed, viz., the post-crash time-to-ceiling-ignition. The measure would be used as a surrogate for the post-crash time available for passengers to safely evacuate the cabin.

ASTRONOMY ASTROPHYSICS

Sponsored by National Aeronautics and Space Administration, Washington, DC Pub. in Astrophysical Jnl. 296, p169-174, 1 Sep 85.

Keywords: Distance, Reprints, *Cepheid variables.

The absolute visual magnitudes of main-sequence

Cepheid companions was determined from their effective temperatures. These are obtained by comparing the measured relative energy distributions with model atmosphere energy distributions. Assuming an average Galactic extinction law, it was found that the distance moduli for the Cepheids should be smaller by delta(m(v) - M(v)) = -0.5 as compared to the Sandage-Tammann relation.

Pub. in Proceedings of Future of Ultraviolet Astronomy Based on Six Years of IUE Research, Goddard Space Flight Center, April 3-5, 1984, NASA (National Aero-nautics and Space Administration) Conf. Publ. 2349, p472-475.

Keywords: *Stars, Extraterrestrial radio waves, Ultraviolet spectra, X rays, Stellar winds, IUE.

In order to understand the nature of the circumsteller regions in the so-called hybrid (-chromosphere) stars, the authors have analyzed existing long wavelength IUE data of these stars, obtained new 6 cm radio observations with the VLA, and compiled all available Xray observations. The authors conclude that the lowvelocity absorption components seen in the Mg II h and k lines of hybrids are almost certainly interstellar and that only the high-velocity components are indica-tive of the stellar wind speeds.

Two Periods of TT Arietis.

Final rept.,

J. R. Thorstensen, J. Smak, and F. V. Hessman. 1985, 9p

Grants NSF-AST81-08691, NSF-AST83-16496 Sponsored by National Science Foundation, Washington, DC.

Pub. in Publications of the Astronomical Society of the Pacific 97, p437-445 May 85.

Keywords: *Binary stars, *Variable stars, Spectroscopy, Photometry, Reprints, *TT Arietis Star.

The authors obtained velocities of the cataclysmic variable TT Ari in its high and intermediate photometric states, with the aim of clarifying the spectroscopic period and demonstrating that the spectroscopic and photometric periods are indeed distinct. It was found that no single period fits all the available data well; however, the original Cowley et al. period fits all the high-state data quite well. The authors conclude that the velocities change phase between the high and the intermediate states.

Progress Report on the Analysis of Long Exposure SWP High Resolution Spectra of Cooi Stars. Final rept.,

J. L. Linsky, T. R. Ayres, A. Brown, K. Carpenter, and C. Jordan. 1984, 5p Grant NGL-06-003-057

Pub. in Proceedings of Future of Ultraviolet Astronomy Based on Six Years of IUE Research, Greenbelt, MD., April 3-5, 1984, NASA Conference Publication 2349, p445-449 1984.

Keywords: Ultraviolet spectra, Dwarf stars, Giant stars, *Stellar chromospheres, Barium stars, Supergiant stars, IUE.

During the last few years the authors have obtained very long exposure, high-dispersion SWP spectra of many stars located throughout the cool half of the HR diagram. These 12-21 hour exposures were obtained by combining NASA and Vilspa shifts so as to obtain the longest possible exposures at times of low back-ground. Included are dwarf stars of spectral type GO V-M2 V, G9.5 III-M5 II giants, G2 lb-M2 lab super-giants, a number of RS CVn-type systems, and Barium stars. Given the importance of this data set and the many questions that it can answer with appropriate data reduction and extensive modeling efforts the authors summarize briefly what has and is being done with these data.

Atmospheric Properties of RU Lupi Derived from

Atmospheric Properties of HU Lupi Derived from High- and Low-Resolution iUE Spectra,
A. Brown, M. V. Penston, R. Johnstone, C. Jordan, and N. P. M. Kuin. 1984, 4p
Pub. in Proceedings of the Future of Ultraviolet Astronomy Based on Six Years of IUE Research, Goddard Space Flight Center, April 3-5, 1984, NASA Conf. Publ. 2249, 2249, 2249. 2349, p338-341.

Keywords: *Stellar atmospheres, Ultraviolet spectra, Line width, *RU Lupi Star, Stellar winds, IUE.

High- and low-dispersion spectra of the pre-main sequence star, RU Lupi, have been obtained using both the SWP and LWR cameras. Strong p Cygni line pro-files are seen in Mg II and Fe II emission lines, indicat-ing that the lines are formed in the stellar wind of RU Ing that the lines are formed in the stellar wind of HU Lupi. An increase in transition region line widths is seen with increasing temperature, which cannot be due solely to opacity broadening, thus indicating that kinematic broadening mechanisms (e.g. flows and turbulence) are dominant. The transition region density is about 3 x 10 to the 10th power/cc derived from the Si III lambda 1892/C III lambda 1909 line ratio. The status of the authors atmospheric modeling of RU Lupi is discussed.

Predicted Long-Slit, High-Resolution Emission-Line Profiles from interstellar Bow Shocks. Final rept.,

A. C. Raga, and K. H. Boehm. Jun 85, 24p Grant NSF-AST83-14551 Pub. in Astrophysical Jnl., Supplement Series 58, p201-224 Jun 85.

Keywords: *Spectral lines, *Emission spectra, Inter-stellar matter, Shock waves, Stars, Reprints, Bow waves

The authors have computed the position-dependent The authors have computed the position-dependent emission-line profiles (called 'position-velocity diagrams' by Choe, Bohm, and Solf) for the lines H(beta), (N II) lambda 6583, (S II) lambda 6731, (O I) lambda 6300, and (O III) lambda 5007 which are formed in a (somewhat simplified) model of a radiating interstellar bow shock of high Mach number. Such models have been suggested as an explanation of the emission-line process of Harbita Hara epicate in connection with the spectra of Herbig-Haro objects in connection with the 'interstellar bullet model.' Some of the restrictive as-sumptions used in related earlier work have been eliminated. By comparing the authors results to the recent high-resolution long-slit coude spectra of Herbig-Haro objects (obtained by Bohm and Solf), important similarities are found.

Not available NTIS National Bureau of Standards (NML), Boulder, CO. Quantum Physics Div.

Sobolev Approximation for Line Formation with Continuous Opacity.

Final rept., D. G. Hummer, and G. B. Rybicki. 1 Jun 85, 10p Grant NSF-AST82-18375

Pub. in Astrophysical Jnl. 293, p258-267, 1 Jun 85.

Keywords: *Spectral lines, Reprints, Radiative transfer, Sobolev approximation.

The Sobolev approximation for line-formation problems in atmospheres with high-speed flows is generalized to include the effects of continuum absorption and emission in the region of the line. The result is very simple, being expressed entirely in terms of known functions with the exception of one quantity of order unity, which is tabulated. Comparison with accurate numerical solutions for simple problems in plane-parallel geometry shows the approximation to be quite accurate in those regions of the atmosphere where the conditions for the validity of the approximation are satisfied. A three-dimensional version of the theory is given that applies to general geometries.

Optical and Radio Study of the Taurus Molecular

Cloud Toward HD 29647.

Final rept., R. M. Crutcher. Jan 85, 15p

Sponsored by National Science Foundation, Washing-

Pub. in Astrophysical Jnl. 288, p604-617, 15 Jan 85.

Keywords: *Interstellar matter, Radio astronomy, Reprints, *Molecular clouds, Taurus Constellation.

The advantages of combined optical and radio wavelength observations are discussed, and the first such comprehensive study of a dark molecular cloud is described. The line of sight to HD 29647, an eighth magnitude B6-7 IV Ng-Mn star which is behind the outer envelope of Taurus Molecular Cloud 1, has been stud-

PB86-101938 Not available NTIS National Bureau of Standards (NML), Boulder, CO. Quantum Physics Div.

Unexpected Ultraviolet Variability of Herbig-Haro Object 1.

Final rept., E. W. Brugel, K. H. Boehm, J. M. Shull, and E. Boehm-Vitense. 1985, 4p Grant NAG5-193

Pub. in Astrophysical Jnl. 292, pL75-L78, 15 May 85.

Keywords: *Interstellar matter, *Nebulae, Ultraviolet spectra, Variability, Reprints, IUE.

Between 1979 and 1983 the line fluxes of the C IV 1550 and C III 1909 emission lines in HH 1 have decreased monotonically by factors of at least 4-6, while no indications of drastic changes in the optical range (and specifically in the (O III)5007 line) have been found. Our result is based on four IUE spectra obtained by three different groups of observers. These relatively by three different groups of observers. These relatively rapid changes can be used to estimate the thickness of the shocked layers and preshock density (eta sub of the shocked tayers and preshock density (eta sub 0). These results suggest a clumpy medium, with (eta sub 0) approx. = 1000/cc, leading to 'truncated' shock waves whose column densities are insufficient to develop complete recombination zones.

500,015 PB86-102464 Not available NTIS National Bureau of Standards (NML), Boulder, CO. Quantum Physics Div.
Photospheres of Hot Stars. 1. Wind Blanketed

Model Atmospheres.

Final rept., D. C. Abbott, and D. G. Hummer. Jul 85, 17p.

Grant NSF-AST82-18375 Pub. in Astrophysical Jnl. 294, p286-302, 1 Jul 85. Keywords: *Stellar atmospheres, Photosphere, Reprints, Stellar winds.

Preliminary to an extensive and detailed comparison of improved non-LTE photospheric models with observa-tions of hot stars made with high photometric accura-cy, the authors construct non-LTE stellar atmospheres which account for the radiation reflected back onto the photosphere by line and electron scattering from the wind. The effects of this 'wind blanketing' on the spectrum and internal structure of the atmosphere are given for an example with Teff=42,000 K, and a wide range of wind density, gravity, and model assumptions. Particular attention is given to the problem of determining Teff.

Combined Effect of Potential and Nonpotential

Magnetic Fields on Equilibrium in Stellar Atmospheres.

Final rept.,

Aug 84.

E. B. Gliner. 1 Aug 84, 10p Pub. in Astrophysical Jnl. 283, n1 p363-372, 1 Aug 84.

Keywords: *Stellar atmospheres, Stellar magnetic fields, Solar corona, Reprints.

An equilibrium in a plasma atmosphere around a gravitating body is considered with regard to both a magnetic field of electrical currents in the atmosphere and a magnetic field originating inside the star. The relation between the combined non-force-free magnetic field and the thermodynamic parameters of atmospheric plasma is treated analytically on the basis of an approach which is discussed in detail. Though restricted by the axisymmetrical situation, the approach allows for multipole structure of a stellar magnetic field and arbitrary radial variation of a toroidal atmospheric magnetic field. Among phenomena caused by the com-bined magnetic field are inverted altitude run of density in the atmosphere, depletions and excesses in plasma density, 'north-south' atmospheric asymmetry, and in-homogeneous temperature distribution. Subsequent applications are discussed, in particular for the explanation of solar corona asymmetry.

Frequent Ultraviolet Brightenings Observed in a Solar Active Region with Solar Maximum Mission. Final rept.

J. G. Porter, J. Tommre, and K. B. Gebbie. 1984, 8p Grant NsG-5318

Sponsored by Air Force Geophysics Lab., Hanscom AFB, MA., and National Aeronautics and Space Administration, Washington, DC. Pub. in Astrophysical Jnl. 283, n2 pt1 p879-886, 15

Keywords: *Solar activity, Solar ultraviolet radiation, Ultraviolet spectra, Solar spectrum, Reprints.

Observations in the ultraviolet of sites of enhanced intensity within an active region on the Sun reveal frequent and rapid brightenings in Si IV and O IV line emission. These transition region lines were observed with 0.08 s sampling in time using the Ultraviolet Spectrometer and Polarimeter (UVSP) instrument on the Solar Maximum Mission (SMM) satellite. The observations suggest that intermittent heating events of modest amplitude are occurring at many sites within an active region. By selecting the brightest site at any given time within an active region and then sampling its behavior in detail within a 120 s interval, the authors found that about two-thirds of the samples showed variations of the Si IV line intensity. The brightenings typically lasted about 40 s to 60 s, though some were as brief as 20 s. Intensity increases of about 20% to 100% were commonly observed.

Observations of Interstellar Hydrogen and Deuterlum Toward Alpha Centauri A. Final rept..

W. B. Landsman, R. C. Henry, H. W. Moos, and J. L.

Linsky. 1984, 7p Grant NSG-5393 Sponsored by National Aeronautics and Space Admin-

istration, Washington, DC.
Pub. in Astrophysical Jnl. 285, n2 p801-807, 15 Oct 84.

Keywords: *Interstellar matter, Ultraviolet spectra, Reprints, IUE.

The authors present a composite profile of the Ly(alpha) emission line of alpha Cen A, obtained from 10 individual spectra with the high-resolution spectro-graph aboard the International Ultraviolet Explorer (IUE) satellite. There is excellent overall agreement with two previous Copernicus observations. Interstellar deuterium is detected, and a lower limit is set on the deuterium to hydrogen ratio. In addition, the deuterium bulk velocity appears blueshifted by 8 \pm or - 2km/s with respect to interstellar hydrogen, suggesting a nonuniform medium along the line of sight.

500,020

PB86-132677 Not available NTIS National Bureau of Standards (NML), Boulder, CO. Quantum Physics Div. Blue Companions of Cephelds.

Final rept., E. Boehm-Vitense, and C. Proffitt. 1985, 10p Grant NSG-5398

Sponsored by National Aeronautics and Space Administration, Washington, DC Pub. in Astrophysical Jnl. 296, p175-184, 1 Sep 85.

Keywords: Binary stars, Ultraviolet spectra, Reprints, Cepheid variables, IUE.

Twenty-one Cepheids, known or suspected to have blue companions, were studied with the International Ultraviolet Explorer satellite. For 13 of them, companions were indeed seen, though they were generally fainteer in the UV than expected. For four Population I Cepheids, the suspected companions were not seen. For none of the Population II Cepheids could a com-painion be detected. The authors discuss the effective temperatures and luminosities of the companions which could be observed and compare the positions of Cepheids and companions in the T(eff) luminosity diagrams with positions expected from stellar evolution calculations.

Polarization Properties and Time Variations of the SiO Maser Emission of R Leo.

F. O. Clark, T. H. Troland, G. H. Pepper, and D. R. Johnson. 1984, 11p

Pub. in Astrophysical Jnl. 276, n2 pt 1 p572-582, 15

Keywords: *Masers, Variable stars, Reprints, *R Leo Star, *Silicon oxide masers, Stellar envelopes, Polarization.

The authors have measured the polarization properties of the v=1, J=2-I SiO circumstellar maser emission from R Leo over a period of three and one half years. As in previous reports, they present data con-cerning Stokes parameter I, and linear polarization.

SIO Flux Measurements of Variable Stars.

F. O. Clark, T. H. Troland, G. H. Pepper, and D. R. Johnson. 1984, 5p

Pub. in Astrophysical Jnl. 283, n1 pt 1 p174-178, 1 Aug

Keywords: *Variable stars, *Masers, Reprints, *Silicon oxide masers, Infrared astronomy, Stellar envelopes.

The authors report measurements of total flux for six circumstellar SiO maser sources. Both polarizations were measured simultaneously for these highly polarized sources. They compare SiO flux curves with infrared minima and maxima. The SiO flux correlates with the infrared flux, although a characteristic phase lag is present. The comparisons of SiO and infrared flux at light minimum are the most straightforward. Interpreted in terms of observed physical motions associated with these stars, the SiO-infrared phase lag of 63 to 129 days can be used to infer a scale size on the order of 10-13 cm. The corresponding light travel time is of the order of 10-17 cm, which is well outside of the SiO line formation region. The observed phase lag is interpreted as strong evidence against direct stellar infrared radiation as an exciting mechanism for the majority of the SiO flux.

VLA Observations of A and B Stars with Kilogauss Magnetic Fields.

Final rept.,

S. A. Drake, D. C. Abbott, J. H. Bieging, E. Churchwell, and J. L. Linsky. 1985, 6p Grant NGL-06-003-057

Sponsored by National Aeronautics and Space Administration, Washington, DC.
Pub. in Proceedings of Radio Stars Workshop, Boul-

der, CO., June 1984, p247-252 1985.

Keywords: *Radio sources(Astronomy), Stellar coronas, Stellar magnetic fields, Early stars

The serendipitous discovery that the star sigma Ori E (B2 Vp (He Strong)) is a 3.5 mJy radio continuum source at 6 cm has stimulated a radio survey of other early-type stars with strong magnetic fields. No Ap stars have been detected of 8 observed, with typical 3 sigma upper limits of 0.5 mJy at 2 cm. Of 6 Bp stars examined, only HR 1890, also a helium-strong star, was detected. The authors discuss possible emission mechanisms for the observed radio emission, and conclude that nonthermal emission seems the most plausible, on the basis of the present data.

VLA Radio Continuum Survey of Active Late-Type Giants in Binary Systems: Preliminary Results. Final rept.,

S. A. Drake, T. Simon, and J. L. Linsky. 1985, 6p

Grant NGL-06-003-057
Sponsored by National Aeronautics and Space Administration, Washington, DC.
Pub. in Proceedings of Radio Stars Workshop, Boulder, CO., June 1984, p253-258 1985.

Keywords: *Radio sources(Astronomy), *Binary stars, Giant stars, Stellar chromospheres, Late stars, Mass loss.

The authors have made sensitive survey at 6 cm of active G and K giants in binary systems, including the so-called Long-Period RS CVn stars. The systems observed have orbital periods in the range of about 10 to more than 100 days, and are judged to be active on the basis of their pronounced chromospheric and transition region emission lines and (where available) strong X-ray emission compared to single giants of similar spectral type. Results to date show that strong radio continuum emission at centimeter wavelengths is a common but not universal property of this class of stars. The authors discuss possible correlations be-tween radio luminosity and other properties, such as Xray luminosity, rotational period, and type of compan-

Mass Loss from Red Giants: Results from Ultraviolet Spectroscopy.

Final rept.,
J. L. Linsky. 1985, 24p
Grant NGL-06-003-057
Sponsored by National Aeronautics and Space Administration, Washington, DC.

Pub. in Proceedings of Mass Loss from Red Giants, Los Angeles, California, June 1984, p31-54 1985.

Keywords: *Giant stars, Ultraviolet spectra, *Red giant stars, *Mass loss, Late stars, Stellar winds, X ray sources, Radiative transfer.

New instrumentation in space, primarily the IUE space-craft, has enabled the application of ultraviolet spectroscopic techniques to the determination of physical properties and reliable mass loss rates for red giant winds. One important result is the determination of where in the H-R diagram are found stars with hot outer atmospheres and with cool winds. So far it appears that single cool stars, except perhaps for the socalled hybrid stars, have either hot outer atmospheres or cool winds but not both.

500,026 PB86-139888 National Bureau of Standards (NML), Boulder, CO. Quantum Physics Div. Beyond Lyman Alpha: The New Frontier in Ultra-

violet Spectroscopy. Final rept.,

L. Linsky. 1985, 9p Pub. in Comments on Astrophysics 10, n6 p247-255

Keywords: *Ultraviolet spectroscopy, Far ultraviolet radiation, Interstellar matter, Galaxies, Reprints, Stellar chromospheres, Stellar winds.

Major advances in our understanding of planets, stars, the interstellar medium, and galaxies will come from spectroscopy in the ultraviolet at wavelengths below 1200 A. While existing spacecraft like IUE and Space Telescope, now under construction, are sensitive only at longer wavelengths, the proposed FUSE/Columbus mission will obtain high resolution spectra in the below 1200 A region even of faint sources. This comment summarizes the scientific program of such a mission.

North American Workshop on Cataclysmic Variables and Related Systems (8th), R. F. Webbink. 1985, 10p

Pub. in Comments Astrophys. 10, n5 p189-198 1985.

Keywords: *Binary stars, Reprints, *Cataclysmic variables, White dwarf stars, X ray sources.

When the term 'cataclysmic variable' (CV) was coined by R. P. Kraft, he applied it strictly to eruptive variable stars -- the class included supernova, novae, and dwarf novae. From the beginning, it was clear that supernova were fundamentally different phenomena from novae and dwarf novae. The latter two types of objects had been found to have the same underlying physical nature: a low-mass dwarf star, fillings its Roche lobe, and transferring matter through an accretion disk onto a white dwarf star. Supernovae were quickly dropped as members of this class, but in the years since the term cataclysmic variable has been broadened to include other types of objects which, while they may not display well-developed eruptions, and may not all contain accretion disks, nevertheless share the same interacting red dwarf - white dwarf nature.

National Bureau of Standards (NML), Boulder, CO. Quantum Physics Div. AY Ceti: A Flaring, Spotted Star with a Hot Com-

panion. Final rept

T. Simon, F. C. Fekel, and D. M. Gibson. 1985, 9p Sponsored by National Aeronautics and Space Admin-istration, Washington, DC.

Pub. in the Astrophysical Jnl. 295, p153-161, 1 Aug 85.

Keywords: *Binary stars, Radio sources(Astronomy), Ultraviolet spectra, Reprints, *AY Ceti stars, Late stars, X ray sources, White dwarf stars, IUE.

AY Ceti is a late-type single-line spectroscopic binary, a bright X ray source, and a spotted star, as evidenced by its prominent photometric wave. In this paper, the authors report on observations made with the IUE satellite and the VLA radio interferometer. They conclude that the bright lines and soft X ray emission of AY Cet arise from the cool primary star, rather than from mass transfer and accretion onto the secondary as has recently been proposed for the similar system 56 Peg.

Dynamics of Orbiting Dust under Radiation Pressure.

Final rept.,
A. Deprit. 1984, 30p
Pub. in the Big Bang and Georges Lemaitre, p151-180

Keywords: *Dust, *Orbits, Radiation pressure, Hamiltonian functions, Dynamics, Reprints, Initial value problems, Three dimensional.

For a three-dimensional Keplerian system in the presence of a homogeneous field possibly in uniform rotation, action and angle variables are introduced by ca-nonical transformation in the averaged Hamiltonian truncated at the first order. After substitution, the first order averaged system proves to be integrable. More precisely, it is shown how the orbit space decomposes into a pair of spheres in a three-dimensional space, on which the representative curves are the small circles induced by a finite rotation about a fixed axis. From this intuitive geometric picture follow simple formulas for solving the initial value problem.

PB85-202612 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Anomalous Atmospheric Spectral Features be-tween 300 and 310 NM Interpreted in Light of New Ozone Absorption Coefficient Measurements. Final rept.

R. D. McPeters, and A. M. Bass. 1982, 4p Sponsored by National Aeronautics and Space Admin-

istration, Washington, DC. Pub. in Geophysical Research Letters 9, n3 p227-230

Keywords: *Albedo, *Ozone, Near ultraviolet radiation, Stratosphere, Atmospheric radiation, Reprints, Absorption coefficients, Nimbus 7 satellite.

Continuous scan data from the solar backscattered ultraviolet instrument on Nimbus 7 reveals real structure in the atmospheric albedo between 300 and 310 nm, a region in which spectral anomalies have been reported in ground based observations. The authors find that these spectral anomalies are largely explained as structure at the one to five percent level in the ozone absorption coefficient as measured by Bass and Paur. Previous ozone absorption coefficient measurements were insufficiently accurate to resolve this structure.

Evaluated Kinetic and Photochemical Data for At-

Evaluated Kinetic and Photochemical Data for Atmospheric Chemistry: Supplement 2, D. L. Baulch, R. A. Cox, R. F. Hampson, J. A. Kerr, and J. Troe. c1984, 120p Included in Jnl. of Physical and Chemical Reference Data, v13 n4 p1259-1380 1984. Available from American Chemical Society, 1155 Sixteenth St., N.W., Washington, DC 20036.

Keywords: *Reaction kinetics, *Photochemical reactions, *Vapor phases, *Air pollution, Gases, Dissociation reactions, Temperature, Tables(Data), Halogen compounds, Enthalpy, Nitrogen inorganic compounds, Physical properties, Chemical properties, Pressure, Spectroscopic analysis, Oxygen inorganic compounds, Absorption cross sections, Index terms, *Atmospheric chemistry. mospheric chemistry.

The paper updates and extends previous critical evaluations of the kinetics and photochemistry of gas phase chemical reactions of neutral species involved in atmosphere chemistry. The work has been carried out by the authors under the auspices of the CODATA Task Group on Gas Phase Chemical Kinetics. Data sheets have been prepared for 256 thermal and photo-chemical reactions, containing summaries of the available experimental data with notes giving details of the experimental procedures. For each reaction, a pre-ferred value of the rate coefficient at 298 K is given together with a temperature dependence where possible. The selection of the preferred value is discussed; and estimates of the accuracies of the rate coefficients and temperature coefficients have been made for each reaction. The data sheets are intended to provide the basic physical chemical data needed as input for calculations which model atmospheric chemistry. A table summarizing the preferred rate data is provided, together with an appendix listing the available data on enthalpies of formation of the reactant and product species.

Advances in natural radiocarbon measurement techniques have made it feasible, for the first time, to assess the contribution of biogenic (contemporary) carbonaceous sources to individual chemical fractions in milligram quantities of atmospheric particles. Isotopic measurements for source reconciliation are doubly important when dealing with pure species, such as methane, carbon monoxide or elemental carbon, because they represent the only compositional information obtainable. Elemental carbon is of special interest in this regard because of changing energy patterns associated with both contemporary (wood-burning) and fossil (diesel fuel and unleaded gasoline) carbon. Following a review of the assumptions underlying the use of radiocarbon as a biogenic tracer and the status of minicounter and accelerator techniques for the assay of milligram and microgram samples, a survey will be presented of recent observations on urban and rural carbonaceous particles. Results for these particles, which have been fractionated according to size or volatility, have exhibited the full range from fossil to biogenic source dominance.

Solar Cycle Effect on Atmospheric Carbon Dioxide

Levels. Final rept.,

Pub. in Weather Clim. Responses. Sol. Var., p129-136

Keywords: *Atmospheric composition, *Carbon dioxide, *Solar cycle, Solar activity, Sunspots, Ocean temperature, Reprints, Sea surface temperature.

The authors present a causal time-series model for the Mauna Loa atmospheric CO2 record which super-sedes a mathematical model (Rust et al., 1978, 1979) consisting of four effects represented by exponential and sine functions. One effect is a 142-month oscillation which trails the sunspot numbers by exactly a quarter-cycle. This suggests that solar activity affects the rate of change in the atmospheric CO2 abundance. The new model replaces the mathematical functions with four measured time series representing proposed physical causes and reduces the number of adjustable parameters from 13 to 5 with no significant deterioration in the fit. The authors present evidence that solar activity affects the CO2 abundance through variations in ocean temperature or circulation.

Pub. in Sigsoft Software Eng. Not. 7, n5 p35-38 Dec

Keywords: *Management information systems, *Production management, Prototypes, Systems engineering, Reprints, *Interactive systems, *Software tools, *Computer systems design, User needs.

Rapid prototyping is especially effective when implementing interactive information management systems. With the right tools, the development process for these systems involves the generation of successive prototypes where each successor is closer to the user re-quirement. The final prototype becomes either the pro-duction system or a production subsystem which is integrated into the total system. The tools used to generate successive prototypes are called application generators and program generators. There are several software engineering issues addressed by these tools.

National Materials Policy: Critical Materials and Opportunities.

Final rept., J. B. Wachtman. 1982, 7p Pub. in American Ceramics Society Bulletin 61, n2 p214-220 1982.

Keywords: Government policies, Reprints, *Critical materials, Advanced materials.

Materials technology is vital and central to high productivity in manufacturing, to efficient energy conversion, to maintaining a high level of health and safety, and to striking a good balance between our standard of living and environmental protection. Recent concern with the possibility of a 'resource war' waged in terms of price escalation or outright cutoff has brought the question of secure supply to the fore. Our advanced technological society requires many very special, high-performance materials. Some of these are almost unique in their ability to perform the required functions. The authors call these critical materials when the function that they perform is very important and when substitution of other materials significantly lowers performance or increases cost or does both.

This study was commissioned by the Office of Product Standards Policy, National Bureau of Standards, as an independent appraisal of the implementation of OMB Circular A-119 (hereinafter referred to as 'A-119' or the 'Circular'). A-119 establishes Federal standards policy for agency participation in the development and use of voluntary standards. This current report is a compendium of numerous interviews and discussions with standards practitioners from both the public and private sectors. It is their collected expertise regarding implementation of A-119 which form the bases for many of the opinions and conclusions summarized herein.

Budget Estimates for Replacement of Plant and Facility Equipment at the National Bureau of Standards.

Final rept., P. T. Chen, and R. E. Chapman. 1981, 17p Pub. in ASHRAE (American Society of Heating, Refrig-eration and Air-Conditioning Engineers) Transactions 87, n1 p1243-1259 1981.

Keywords: *Budget estimates, *Maintenance, *Equipment replacement, Buildings, Cost analysis, Obsolete equipment, Renovating, Reprints, *National Bureau of Standards.

The study develops a framework, based on service life distributions fitted to data from a published survey, for dealing with the 'replacement problem.' Service life distributions are used to develop replacement schedules for approximately 50 major plant and facility equipment items at the National Bureau of Standards (NBS). The costs associated with these replacement schedules are estimated on an annual basis over a ten-year planning horizon using a probabilistic cost model. Estimates from this model are intended for use in budgeting for replacements over the planning horizon. The results of this study indicate that approximately \$11 million (all estimates are in first quarter 1980 dollars) will be needed to meet expected replacements during fiscal years 1982 through 1991 at the NBS Gaithersburg site.

er Productivity, W. M. Osborne, and L. Rosenthal. 9 Jul 85, 13p Included in Jnl. of Research of the National Bureau of Standards, v90 n4 p305-317 Jul-Aug 85.

Keywords: *Office buildings, *Automatic control equipment, *Management information systems, Productivity, Performance evaluation, *Microcomputers, *Informatic equipment in the control of mation processing

While it is generally assumed that the use of micro-computers helps to improve productivity in an office environment, quantitative measures in this area are lacking. This paper addresses the measurement of the effect on productivity in an end user, office environment as a result of the introduction of micrcomputer-based technology. It is concerned with defining how productivity can be measured in such an environment and with current efforts to measure changes in productivity. It identifies and assesses the various techniques and measures used to describe the magnitude of productivity improvements that result from the use of microcomputers in the workplace, and makes recommendations for ways in which changes in productivity, may be measured.

Keywords: *Data processing, *Management information systems, *Backup systems, Contingency, Management, Strategy, Alternatives, Computer software.

The publication addresses the issue of selecting ADP backup processing support in advance of events that cause the loss of data processing capability. The document emphasizes the need for managers at all levels of the organization to support the planning, funding, and testing of an alternate processing strategy. It pro vides a general description of the alternatives, and rec-ommends criteria for selecting the most suitable alternate processing method.

National Archives and Records Service (NARS)

Twenty Year Preservation Plan,
A. Calmes, R. Schofer, and K. R. Eberhardt. 10 Jan
85, 70p NBSIR-85/2999
Sponsored by National Archives and Records Service,
Washington, DC.

Keywords: *Maintainability, *Archives, *Documents, *Conservation, Preserving, Evaluation, Inventory control, *National Archives and Records Service, *Preservation plan.

The purpose of this preservation plan is to identify types, extent of programs and resource requirements

to bring the preservation needs of the National Archives and Records Service (NARS) to a current status at the end of twenty-two years. Data for devel-oping the plan was derived from a scientific survey of holdings, data obtained from interviews with NARS' archivists, earlier studies and observation of operations. The recommended plan is divided into nine action categories: (1) environmental control; (2) holdings maintenance of current holdings; (3) holdings maintenance as a part of the accessioning process; (4) interception, assessment and protection at time of use; (5) systematic duplication of impermanent documents; (6) reproduction of frequently used documents; (7) laboratory treatment of intrinsically valuable documents; (8) laboratory conservation of treasures; and (9) preservation of nontextual records. The 22 year cost of the Preservation Plan in 1984 dollars is estimated at \$209.1 mil-

J. C. Tucker, and E. Cerutti. 1982, 33p Pub. in Sciences and Technologies Libraries, n2-4, p79-111 1982.

Keywords: *Information retrieval, Libraries, Bibliographies, Guidelines, Verifying, Sources, Reprints, *Interlibrary Ioan, *Technical reports, *Foreign documents.

As a result of improved bibliographic reference systems, reduction of library budgets and rising prices of publications, greater demands are made on interlibrary loan staffs to locate material outside the library to satisfy information needs. Traditionally, publications produced outside the United States; particularly by foreign publishers and organizations, have been the most diffi-cult to identify and obtain. The paper investigates different mechanisms for verifying citations to foreign publications and locating sources, including national libraries, online, and commercial sources.

In this paper the authors discuss the role of the Office of Standard Reference Data in the critical step of data evaluation in addition to the coordination and stimulation of data activities in the scientific disciplines and technical areas. The authors examine the alterations in these areas of data evaluation and data dissemination which have occurred in the last decade due to advances in computing. The computerization of standard reference data has occurred at all stages of the process, from the automation of the data centers right through the output mechanisms. The advantages of computerized data are discussed, along with a description of the problems encountered. Finally, an overview is given of present products of the Standard Reference Data System, and plans and pricing policies for the future are outlined.

Impact of Energy Pricing and Discount Rate Policies on Energy Conservation in Federal Buildings. Final rept.,

S. K. Fuller, and R. T. Ruegg. Nov 85, 61p NBSIR-

Sponsored by Department of Energy, Washington, DC.

Keywords: Buildings, Fuels, Pricing, *Life-cycle cost, *Energy conservation, Government buildings, Federal Energy Management Program.

The study investigates how energy conservation projects for federal buildings would be affected by a change in energy pricing and discount rate policies. It focuses on the choice between marginal-cost prices versus average market prices and a 10 percent discount rate versus a 7 percent discount rate. Graphical and numerical comparisons of hypothetical cases in selected geographical areas illustrate the expected impact on selection, design and sizing, and priority of energy-saving projects.

Topological Approach to the Matching of Single

Fingerprints: Development of Algorithms for Use on Rolled Impressions.

Final rept.,

M. K. Sparrow, and P. J. Sparrow. May 85, 80p NBS/SP-500/124 Also available from Supt. of Docs as SN003-003-02656-5. Library of Congress catalog card no. 85-

Keywords: *Matching, Comparison, Automation, Digital techniques, Topology, Coding, Algorithms, *Fingerprints, *Automated fingerprint processing, Rolled impressions

The motivation for seeking topological descriptions of single fingerprints is provided by the elasticity of the human skin; successive rolled impressions from the same finger will invariably have suffered a degree of relative distortion (translation, rotation and stretching). Topology based systems should be free from the detrimental effects of plastic distortion. Systems are described for the extraction of simple topological codes from rolled impressions of the pattern types 'loops', 'whorls' and 'arches'. The generated codes take the form of vectors or simple digital arrays. The nature and frequency of changes that may occur in such codes is investigated and fingerprint comparison algorithms, based on these topological codes, are developed. The objective of such algorithms is to draw a score derived from the degree of 'nearness' of the topological codes in such a manner that it intelligently reflects similarity or dissimilarity in the two prints under comparison.

Topological Approach to the Matching of Single
Fingerprints: Development of Algorithms for Use

on Latent Fingermarks.

Final rept.,

M. K. Sparrow, and P. J. Sparrow. Oct 85, 73p NBS/ SP-500/126

Also available from Supt. of Docs as SN003-003-02680-8. Library of Congress catalog card no. 85-600592

Keywords: *Matching, Comparison, Automation, Digital techniques, Topology, Coding, Algorithms, *Fingerprints, *Automated fingerprint processing, Latent fingermarks.

The paper naturally follows a previous N.B.S. Special Publication (No. 500-124), in which topological coding schemes were devised for automated comparison of rolled impressions. The contents of that paper are a prerequisite for a proper understanding of this one The development of topological coding schemes is here extended to cover the automated searching of fragmentary latent marks, such as would be found at the scene of a crime. The benefits to be derived from topological descriptions of fingerprints are a direct result of their immunity to change under ordinary plas-tic distortion. In the case of latent marks such spatial distortions tend to be exaggerated; hence the importance of applying topology-based systems to them. This paper describes a method of coding fingerprint patterns by a variety of 'topological coordinate schemes', with fingerprint comparison being performed on the basis of localized topological information which is extracted from the recorded coordinate sets. Such comparison is shown to offer a substantial improvement in performance over existing (spatial) techniques. Furthermore, a methods for pictorial reconstruction of a complete fingerprint, from its coordinate representation, is demonstrated.

Reference Speech Recognition Algorithm for Benchmarking and Speech Data Base Analysis.

Final rept., J. L. Hieronymus, and W. J. Majurski. 1985, 5p

Pub. in Proceedings of the Institute of Electrical and Electronic Engineers International Conference on Acoustics, Speech, and Signal Processing, ICASSP 85, Tampa, Florida, March 26-29, 1985, p1573-1576. Keywords: *Speech recognition, Statistics, Performance, Words(Language), Reprints, Data bases, Data analysis, Benchmarking.

A complete connected word reference algorithm has been developed at NBS. It provides score statistics and confusibility measures as well as word decisions on speech data base on which it is run. The basic algorithm is like the Bridle, Brown, and Chamberlain (1) algorithm with Euclidean distances on mel scale cepstral coefficients. There are options as to the particular spectral features, the type of spectral comparison measures and the training scheme. Score statistics are collected and a measure of confusibility is computed for each word in the vocabulary. The algorithm has been tested on the Texas Instruments Isolated Word Data Base (2). The most confusible words in the data base are no and go. In addition the performance of the reference system has been compared with several generic types of recognizers.

Final rept.,

C. H. Spiegelman. 1979, 4p Pub. in American Statistical Association 1979 Pro-ceedings of the Social Statistics Section, p370-373

Keywords: *Educational sociology, Tools, Intelligence tests, Statistical analysis, Regression analysis, Errors, Reprints, *Education programs, *Program evaluation, Analysis, G.R.E. scores.

It is well known that nonrandomized education programs are difficult to evaluate (Campbell and Stanley (1968)). Some help in the evaluation may be obtained by using available instrumental variables, such as G.R.E. scores, or I.Q. tests. However, they should be used with great care as errors in these variables can mislead naively performed analysis. The work shown here gives a new procedure for evaluating pretestposttest social programs. This paper summarizes the most important results and procedures found in Spiegelman (1976, 1977). Examples indicating how and when the new procedure may be useful are found at the end of this paper.

Human Behavlor in Fire: What We Know Now. Final rept.,

B. M. Levin. 1984, 10p Pub. in SFPE (Society of Fire Protection Engineers) Technology Report 84-3, 10p 1984.

Keywords: *Human behavior, *Fires, Decision making, Education, Fire protection, Fire alarm systems, Fire safety, Evacuation egress.

While the decisions and actions of people in fire emergencies sometimes may be unpredictable or erratic, it is more common for their decisions and actions to follow consistant behavioral patterns. Fire safety can be upgrading if we design fire safety systems and training programs based on common behavioral patterns. Some common behavioral patterns in fire emergencies are: 1. people will evacuate through a familiar route rather than through the best route; 2. women will tend to warn and assist others while men are more likely to fight the fire; 3. panic is very rare but heroic and altruis-tic actions are common; 4. many severely disabled people can evacuate themselves in a timely fashion in many buildings if there are no unnecessary barriers; and 5. many people will not respond to mild ambiguous fire cues.

M. Dizdaroglu, and M. G. Simic. 1983, 9p Pub. In International Jnl. of Radiation Biology and Re-lated Studies in Physics, Chemistry and Medicine 44, n3 p231-239 1983.

Keywords: *Peptides, *Separation, *Radiation effects, Gas chromatography, Mass spectroscopy, Reprints, *Hydroxyl radicals, Dimers, High performance liquid chromatography, Succinic acid/diamino-dimethyl.

Alpha-Peptide radicals of L-Ala-L-Ala and tetra-L-Ala, which are formed from OH radical reactions, were shown to give peptide dimers. These peptide dimers were separated and isolated by HPLC. On acid hydrolysis, all of the studied peptide dimers yielded alanine and alpha-diamino dimethyls succinic acid (Ala-Ala dimer), which was characterized by gas chromatogra-phy-mass spectrometry as a TMS derivative. The described procedure is suggested as a suitable method for isolation and characterization of amino acid dimers.

Studies of Porous Metal Coated Surgical Implants,
A. C. Fraker, A. W. Ruff, A. C. Van Orden, H. Hahn,
and A. J. Bailey. Jun 85, 57p NBSIR-85/3166

Contract FDA-224-79-5023 Prepared in cooperation with ARTECH Corp., Falls

Keywords: *Surgical implants, *Medical equipment, Metals, Biocompatibility, Corrosion, Fatigue, Coatings, *Biomaterials, Cobalt chromium molybdenum alloy,

Metal porous coating, Titanium 6 aluminum 4 vanadium alloy.

The material in the report deals with the subject of metal porous coated surgical implants which are used primarily for orthopedic applications. The report is presented in three parts. The first part gives a brief history of the development of various types of metal porous coated implants and discusses the need for improved fixation of orthopedic devices which led to the investi-gation of porous coatings for bony ingrowth attach-ment. The second part of the report contains experimental data on the corrosion behavior of sintered spheres of Co-Cr-Mo and analysis of surface films after exposure to saline solution. The third part reports on a corrosion-fatigue study of arc plasma sprayed porous Ti and Ti-6A1-4V coatings. The porous coatings on the materials studied did not adversely affect the corrosion or mechanical properties of the material. Changes in processing, contamination, etc. could have detrimental effects on the chemical and mechanical behavior of the materials.

PB85-183556 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Initiator-Accelerator Systems for Dental Resins. Final rept.,

G. M. Brauer, and H. Argentar. 1983, 13p Grant PHS-DE-40015 Pub. in ACS (American Chemical Society) Symposium Series 212, p359-371 1983.

Keywords: *Dental materials, *Acrylic resins, Curing, Plastics, Polymerization, Free radicals, Stability, Sealants, Polymeric films, Reprints, Toluidine/bis(hydroxyethyl), Phenylacetic acid/(dimethylamino), Benzoyl peroxide, Polymerization initiators.

Acrylic resins, because of their excellent esthetic properties, ease of processing and satisfactory biocompati-bility, are materials of choice for dental fillings, pros-thetic devices and sealants. In practically all applica-

tions, a fluid monomer formulation (sometimes with solid fillers) is hardened by a free-radical-initiated polymerization that is effected by an initiator and/or heat, light or an initiator-accelerator system. Dentures are cured by a heating cycle during which the initiator, usually benzoyl peroxide (BP) is decomposed and releases sufficient radicals to yield a hard denture. Azo compounds such as 2,2-azo-bis-isobutyronitrile may also be used. To provide the cure at ambient or mouth temperature, redox initiator accelerators systems, and also be used. To provide the cure at ambient or mouth temperature, redox initiator-accelerator systems, generally BP-tertiary aromatic amines, are employed. Many commercial chemical activated restorative resins employ the BP-bis (2-hydroxyethyl)-p-toluidine (DHEPT) system. More reactive amines which yield color stable products, are p-(dimethylamino) phenylacetic acid and its esters. Redox systems such as BP-sulfinic acids, peroxide-thiourea, hydroperoxide-ascorbic acid or trialkylborane-oxygen also cause rapid polymerization of acrylic resins. Their instability on prolonged storage or suspect biocompatibility limits their chemical applications. Cure systems activated by UV or visible light exposure use respectively an aliphatic ether of benzoin or an alpha-diketone such as camether of benzoin or an alpha-diketone such as cam-phoroquinone with a substituted morpholine reducing agent. Light-cure offers a great advantage since this allows the dentist as much working time as he reauires.

Keywords: *Image intensifiers, *Radiology, *Calcium tungstates, *Luminous intensity, X rays, Reprints.

For calcium tungstate intensifying screens employed in film-screen imaging systems, Coltman found that approximately 1000 light photons of average energy 2.7 eV were produced for each 50 keV x-ray absorbed. Of this number, he found that only about 55% are emitted from the output side of a 109 mg/sq cm screen. The authors have developed a method based on counting single photons to determine this number for various thickness of calcium tungstate screens. For calcium tungstate screens with thicknesses of 30, 50, 86, and 123 mg/sq cm, the average numbers of light photons emitted per absorbed x-ray are measured for 8 x-ray energies between 17- and 69-keV. The values for 50 keV are less than the values found by Coltman. Studies of the causes of this discrepancy are in

Enamel Fluoride Profile Construction from Blopsy

Final rept., L. C. Chow, G. M. Beaudreau, and W. E. Brown. 1985, 10p

Sponsored by American Dental Association Health Foundation, Chicago, IL.

Pub. in Caries Research 19, p103-112 1985.

Keywords: *Enamels, *Fluoride, Biopsy, Reprints.

In fitting enamel biopsy data to a curve that describes the F profile in a subset of individuals subjected to a given treatment regimen, an implicit approximation is made that all individuals of a subset have the same F profile. In the present work the authors assume that the F profiles for the individuals can be best described by a single polynomial functional form, and that the co-efficients of the polynomial can be calculated for each individual from multilayered biopsy data. The F content at a normalized depth can then be calculated for each individual and be used to compute the mean F content of the subset.

The report presents the results of work involved with the development of basic generic science and engi-neering which is expected to be useful in the development or control of dental materials used for restorative or treatment purposes. Some of the developments involve investigations into new dental resin formulations (Part I) which might improve the performance of dental composites. Cements and adhesion to filler particles or tooth structure are also addressed in this part. Part II deals with examination of the basic parameters affecting the wear and durability of materials with particular emphasis on dental composites. The resultant information is used to help guide developments in Part I. Part III is concerned with dental casting alloys, and the strength of veneered dental systems, in particular, porcelain fused-to-metal.

Energy Dependence of Radiochromic Dosimeter Response to X-rays and Gamma Rays.

Final rept..

W. L. McLaughlin, A. Miller, R. M. Uribe, S Kronenberg, and C. R. Siebentritt. 1985, 29p Sponsored by International Atomic Energy Agency,

Vienna (Austria), and Federal Emergency Management Agency, Washington, DC.
Pub. in Proceedings of the International Symposium on High-Dose Dosimetry, Vienna, Austria, October 8-12, 1984, p397-424 1985.

Keywords: *Dosimetry, X rays, Gamma rays, Tissues(Biology), Films, Energy, *Radiochromic dosimeters.

Liquid, solid and liquid-core 'fibre-optics' radiochromic dosimeters were studied for their spectral sensitivity to ionizing photons in the energy range 10 keV to 100 MeV. By comparison of ratios of mass energy-absorption coefficients and mass collision stopping powers of water and biological tissues (fat, muscle and bone), approximate errors due to energy dependence for typical 60Co gamma-ray scattered spectra and to rough simulation of tissues by means of certain additives to radiochromic dosimeters could be estimated. Design of approximate tissue-simulating dosimeters is accomplished by comparing experimental and computational results for various radiochromic films, liquid solutions and liquid-core waveguides. Several experimental tests of energy dependence were made using X- and gamma-rays. For water-, fat-, muscle- or bone-simulation over the photon energy range, chlorides, bro-mides, triethyl phosphate or dimethyl sulphoxide or a combination of these are added in appropriate concentrations.

Sponsored by American Dental Association Health Foundation, Chicago, IL.
Pub. in Proceedings of the Symposium on Tooth

Enamel (4th), Odawara, Japan, May 24-28, 1984, p8-

Keywords: *Dental materials, *Calcium phosphates, *Enamels, In vitro analysis, In vivo analysis, Acids, *Chemical reaction mechanisms, Apatite/hydroxy.

It is slightly over a quarter of a century since octacalcium phosphate (OCP), Ca8H2(PO4)6.5H2O, was firmly established to be a member of the family of crystalline calcium phosphates and its relationship to hy-droxyapatite (OHAp), Ca5(PO4)3OH, was correctly perceived. Yet, despite its involvement in many aspects of calcium phosphate chemistry in vitro, its role in enamel chemistry is frequently ignored. In this paper the authors briefly summarize the reported evidence for the involvement of OCP in enamel formation. They then describe the results of some in vivo experiments which provide close to incontrovertible proof that an acidic precursor is involved in the formation of enamel mineral. The authors then discuss the evidence showing that OCP rather than brushite, CaHPO4.2H2O, or monetite, CaHPO4, is the most probable acidic calcium phosphate to be involved in this way.

Radiation Dosimetry in Food Irradiation Technology. Final rept.

W. L. McLaughlin, R. M. Uribe, and A. Miller. 1982,

Pub. in Trans. American Nuclear Society 41, p23-25 1982.

Keywords: *Food irradiation, *Dosimetry, Quality assurance, Quality control, Gamma rays, Bremsstrahlung, Electron beams, Reprints, Food preservation.

Routine dosimetry is a valuable means of quality control in the preservation of food by ionizing radiation. The radiations include mainly gamma-ray photons (e.g. (60) Co and (137) Cs gamma rays), bremsstrahlung, and electron beams up to 10 MeV. The dose ranges are about 1 kilorad to several megarad. Because of this relatively wide dose range in food processing and the fairly high dose rates and possible extremes of environmental conditions in a process irradiator, dosimetry can require traceability to standards, i.e. by accurate calibration. Suitable care is also required in the selection of the proper dosimetry system for the purpose at hand. The aim of the present summary is to suggest appropriate methods of dosimetry and routine measurement procedures for achieving quality assurance in radiation processing.

High-Dose Dosimetry, Vienna, Austria, October 8-12, 1984, p357-371 1985.

Keywords: *Dosimetry, *Heat measurement, Electron beams, Food irradiation, Gamma radiation, Standards.

Intense electron beams and gamma radiation fields are used for sterilizing medical devices, treating municipal wastes, processing industrial goods, controlling parasites and pathogens, and extending the shelf-life of foods. Quality control of such radiation processes depends largely on maintaining measurement quality assurance through sound dosimetry procedures in the research leading to each process, in the commissioning of that process, and in the routine dose monitoring practices. This affords documentation as to whether satisfactory dose uniformity is maintained throughout the product and throughout the process. Therefore, dosimetry at high doses and dose rates must in many radiation processes be standardized carefully, so that 'dosimetry release' of a product is verified. The standardization is initiated through preliminary dosimetry intercomparison studies such as those sponsored re-cently by the IAEA. This is followed by establishing periodic exercises in traceability to national or international standards of absorbed dose and dose rate.

Fit of Multiple Unit Fixed Partial Denture Castings. Final rept.

R. W. Hinman, J. A. Tesk, E. E. Parry, and G. T.

Eden. 1981, 1p Sponsored by National Inst. of Dental Research, Be-

Pub. in Jnl. of Dental Research 60, 376p 1981.

Keywords: *Dental materials, Dental prostheses, Casting, Reprints, Prosthodontics.

There exists a general consensus within dentistry that the technique which produces the best fit of fixed partial dentures involves the casting of single units which are subsequently joined by soldering. Base metal alloys unfortunately do not, as a class, lend themselves to soldering as readily as do gold based alloys. The difficulties with soldering these alloys predicate the need for techniques which will maximize the accuracy of one piece multiunit castings. A hardened steel die system has been devised to approximate a maxillary three unit FPD. Pressure formed, annealed wax patterns of nearly invariant dimensions are produced and measured and subsequently compared to the resultant castings.

Internal Setting Expansion of a Dental Casting Investment Measured with Strain Gauges. Final rept.,

E. T. Meiser, W. G. de Rijk, J. A. Tesk, R. W. Hinman, and R. A. Hesby. Jun 85, 4p Pub. in Jnl. Prosthetic Dentistry 53, n6 p870-873 Jun

Keywords: *Dental materials, *Castings, Cements, Investments, Strain gages, Reprints, Prosthodontics.

Dental casting procedures rely in part on the setting expansion of the casting investment to compensate for the shrinkage of the casting alloy during the solidification and cool down process. The feasibility of monitoring the setting expansion of casting investments by means of strain gauges was investigated, with thestrain gauges located near the center of the investment. Two types of configurations were employed: I - strain gauges on a polymeric substrate embedded directly in the investment, il - an augmented retentive form (with plates perpendicular to the substrate) also embedded directly in the investment. Results show that the setting expansion as indicated by the strain gauges is significantly less than the values found by the traditional methods of external measurements and even less than those of the internal measurements previously developed by some of the authors. The addition of a retentive frame (wings) to the gauges reduced the variation in the data obtained and produced expansion values higher than those seen with strain gauges on a flat substrate only. Considering all methods, a very real question arises as to which (if any) of the techniques is

(Scanning Electron Microscopy) Studies of Co-Cr-Mo Surgical Implant Alloy Corrosion Behavlor.

Final rept., A. C. Van Orden, J. L. Chidester, A. C. Fraker, and P. Sung. 1982, 2p

Pub. in Proceedings of Annual Meeting Electron Microscopy Society of America (40th), Washington, DC., August 9-13, 1982, p520-521.

Keywords: *Surgical implants, Anodic polarization, Corrosion, Cobalt, Chromium, Molybdenum, *Scanning electron microscopy.

The influence of small variations in the composition of Co-Cr-Mo alloys was studied using SEM, energy dispersive x-ray analysis, and electrochemical measure-ments. SEM and EDX data were correlated with data from in vitro corrosion measurements involving anodic polarization and repassivation measurements. The effects of small variations in alloy composition are evident through SEM and EDX studies of the surface film. The alloy with the highest amount of Fe was shown to have the thickest film. The film was shown to be enriched in Fe, Mo and Si, and depleted in Co and Cr. It

can be concluded from this study, that small variations in alloy composition affect the composition and stability of the passive film formed on the surface of the

Mechanical Durability of Candidate Elastomers for Blood Pump Applications.

Final rept., G. B. McKenna, and R. W. Penn. 1982, 6p Pub. in Proceedings of World Biomaterials Congress (1st), Baden, Austria, April 12, 1980, Advances in Biomaterials 3, p629-634 1982.

Keywords: Fatigue, Cyclic loads, Failure, Durability, *Blood pumps, *Biomaterials, Circulatory assist de-

The mechanical durability of an elastomer is a critical factor in its suitability for blood pump applications. In such applications an elastomeric bladder is expected to undergo cyclic stress or strain histories at a frequen-cy of approximately 2 Hz for periods of several years. Test methodologies for characterizing the mechanical durability of such materials do not exist. Based on previous work using an additivity of (or cumulative) damage rule as a framework to describe time dependent failure of both glassy and semicrystalline polymers (1,2), the authors have developed a useful methodology for describing the mechanical durability of elas-tomers which are candidate materials for blood pump applications. Within this framework, the authors are in the process of characterizing the mechanical durability of a polyolefin rubber, a urethane-silicone copolymer elastomer and a segmented polyurethane elastomer all of which are candidate materials for blood pump applications. The authors have also prepared a standard butyl rubber in out laboratory for use as an interlaboratory control for comparisons with other labs testing the same materials.

Ballistic Resistance of Police Body Armor.

Final rept. Mar 85, 17p

Sponsored by National Inst. of Justice, Washington,

DC. Pub. Pub. in NIJ (National Inst. of Justice) Standard-0101.02, 17p Mar 85.

Keywords: *Protective clothing, *Armor, *Ballistic deformation, Penetration, Reprints, Kevlar.

The standard establishes minimum performance requirements and methods of test for the ballistic resistance of police body armor. This standard is a revision of NILECJ-STD-0101.01, dated December 1978. This revision adds performance requirements for level III-A, a requirement to test fabric armor for shots impacting the armor at an incident angle of 30 degrees, and a test method that simulates a multishot assault. In addition, the test round velocity for level IV armor has been changed from 838 plus or minus 15 m (2750 plus or minus 50 ft) per second to 868 plus or minus 15 m (2850 plus or minus 50 ft) per second and the allowable time to test the wet conditioned armor has been increased. The scope of the standard is limited to ballistic resistance only and does not address threats from knives or sharply pointed instruments, a different type of threat.

PB85-207314 Not available NTIS National Bureau of Standards (NEL), Gaithersburg, MD. Law Enforcement Standards Lab.

RIot Helmets and Face Shields.

Final rept. Oct 84, 21p

Sponsored by National Inst. of Justice, Washington,

Pub. in NIJ (National Inst. of Justice) Standard-0104.02, 21p Oct 84.

Keywords: *Protective clothing, *Face shield, *Headgear, Helmet, Reprints.

The standard establishes requirements and methods of test for helmets and face shields to be worn by law enforcement officers during civil disturbances, riots, or other situations that pose a threat of injury from blows to the head. This standard is a revision of and super-sedes NIJ Standard-0104.01 dated August 1980. This revision of the standard changes the impact attenuation requirement, deletes the requirement for wet testing of helmets, modifies the requirement and test method for peripheral vision limits, and clarifies test methods and test equipment requirements. The scope

of the standard is limited to riot helmets and face shields. It should be noted that they are not designed to offer protection against gunfire.

This Government-owned invention available for U.S. licensing and, possibly, for foreign licensng. Copy of patent available Commissioner of Patent, Washington, DC 20231 \$1.00.

Keywords: *Dosimeters, *Patents, *Dyes, *Optical waveguides, Real time operations, *Leuko dye dosimetry, *Radiochromic waveguide dosimeters, Radiochromic dyes, PAT-CL-250-474.

A radiochromic leuko dye dosimeter includes a plastic tube containing a solution of a radiochromic dye which is sensitive to ionizing radiation, one end of the tube being closed by a reflective surface, the opposite end of the tube being closed by a transparent plug to form a one-way optical waveguide. Light enters the tube through the transparent end thereof and is reflected back and exits through the transparent end. The intensity of the exiting light is measured to determine radi-ation induced absorption of the leuko dye.

Combustion Conditions and Exposure Conditions for Combustion Product Toxicity Testing.

Final rept., C. Huggett. Oct 84, 20p Pub. in Jnl. of Fire Sciences 2, n5 p328-347 Sep/Oct

Keywords: *Toxicity, *Materials tests, *Fire tests, *Combustion products, Air pollution control, Exposure, Laboratory animals, Dosage, Smoke, Comparison, Hazards, Reprints, *Air pollution effects(Animals), *Indoor air pollution, Air pollution effects(Humans).

A number of procedures have been described in the ilterature for investigation of the inhalation toxicity of combustion products. There is need for agreement on test methods and test conditions to facilitate communication, allow the exchange of data, and provide a basis for control of hazards due to combustion products in fires. Combustion systems and animal exposure systems which have been employed are classified according to their basic attributes. Simple considerations of limiting stoichiometry in the combustion module can guide the selection of conditions which simulate real fire environments. The dynamics of the exposure system will determine the procedural dose received by the test animal and can be related to real fire exposure. Many past investigations have failed to take adequate account of these fundamental principles.

Some limitations and potential limitations of the NBS toxicity screening test method had been identified in earlier work. These limitations have now been explored in greater detail. Also investigated was an alternative combustion system, consisting of a radiant cone heater, identical to the one in the recently developed Cone Calorimeter, an enclosed combustion chamber, and a slightly revised variant of the animal chamber. The new animal chamber was so constructed that, prior to the insertion of the animals, it could be evacuated and then back-filled with a desired sampling of the combustion products. The radiant combustion system showed a different mix of capabilities and limitations compared to the cup furnace combustor in the existing test method. In the present project, the more detailed assessment of the cup furnace operation leads to the recommendation that there is no single, universally preferable combustion environment, but that the cup furnace is adequate for the intended purpose of providing toxicity screening.

Pub. in Proceedings of American Chemical Society Meeting (184th), Kansas City, MO., September 12-17, 1982, Organic Coatings and Applied Polymer Science 74, p408-413.

Keywords: *Adhesives, *Composites, Fracture, Epoxy, Stress analysis, Viscoelasticity.

The desire to use adhesives and composites in structural applications has led to a need for a failure prediction capability for the polymers used in such systems. Unfortunately, this task is greatly complicated by the failure load being dependent not only upon the specimen geometry but also on the previous history of loading, temperature, environment, etc. For the tough, rubber-modified polymers that are of most interest for structural applications the effects of previous history can be dramatic. As a result, predictions based on measurements at a single set of conditions can lead to dangerous over or under estimates of the fracture behavior. In an effort to understand this problem the present work has studied the fracture behavior of various polymer formulations using bulk and adhesive joint specimens tested over a wide variety of different thermal and loading histories.

Technical note,

J. Hord. Jul 85, 107p NBS/TN-1087 Also available from Supt. of Docs as SN003-003-

Keywords: *Information systems, *Chemical industry, *Measurement, *Surveys, Drug industry, Electronic industry, Measuring instruments, Calibrating, Food in-Temperature measurement, Flow measure-Plastics industry, Petroleum industry, ment, Plastics industry, Petroleum industry, Concentration(Composition), Marketing, Tables(Data).

A survey of measurement needs in the chemical and related process industries has been completed, a data base established and reported herein. Sixty-five people responded to the survey, representing the chemical, oil and gas, pharmaceutical, electronic chemicals, energy, instrument manufacturer, food, plastics, and other segments of American industry. The respondents identified: 133 measurement problems of which 106 are defined in detail; 27 measurement needs where no current measurement capability exists (or is known); and three generic measurement areas (flow, composition/concentration, and tempera-ture) in need of improvement. The survey revealed strong demands for improved in-line and in-reactor measurements, in a processing plant environment, to improve process/product quality and to reduce costs. The data base includes instrument (sensor) technical specifications, service conditions, calibration and maintenance requirements, and marketing information.

Final rept.,

N. C. Scrivner, and B. R. Staples. 1983, 14p Sponsored by American Inst. of Chemical Engineers, New York.

Pub. in Proceedings of World Congress of Chemical Engineering (2nd), Montreal, Canada, October 4-9, 1981, p349-362 1983.

Keywords: *Industrial plants, *Chemical equilibrium, *Solutions, Thermodynamics, Mathematical models, Gypsum, Solubility, Activity coefficient, pH, Calcium sulfate, Chromium hydroxide, Sodium chloride, Pitzer equations.

The paper discusses industrial applications of thermodynamic theories and empirical developments. The predicted solubility of gypsum as a function of ionic strength (added salts) and as a function of tempera-ture is compared by calculations using 2 models, one using a speciation approach (a commercial computer code) and the other a nonspeciation model (the Pitzer equations). The solubility data of Marshall and Slusher for added NaCl has selected and recommended as a test data set for model calculations of gypsum solubility. The effects of common ion, neutral ion, and H(+1) on the solubility of gypsum is illustrated. The effect of pH and ionic strength on the solubility of chromium hydroxide complexes is discussed for another industrial application.

Development of a Performance Test Procedure and Measurement Technique in a Batch Mixing **System,** D. M. Ginley. Jul 85, 145p NBSIR-85/3030

Keywords: *Mixing, Batching, Tests, Measurement.

A performance test procedure and measurement technique for a batch mixing system is described using conductivity probes. The design of the automated experimental apparatus is described, and experimental procedures are given. Data collected from the experiments are explained, and a mixtime analysis of the data is performed. Conductivity probe response curves provide a good representation of the system dynamics. Mixtime analysis allows for probe response comparisons to evaluate system geometry and probe location.

Alkall Vapor Transport in Coal Conversion and

Combustion Systems. Final rept.,

J. W. Hastie, E. R. Plante, and D. W. Bonnell. 1982, 58p

See also PB81-221319. Sponsored by Department of Energy, Morgantown, WV. Morgantown Energy Tech-

nology Center.
Pub. in ACS (American Chemical Society) Symposium Series 179, p543-600 1982.

Keywords: *Alkali resistant tests, *Corrosion tests, *Coal, *Combustion chambers, Fuel additives, Transport properties, Mass spectroscopy, Reprints, *Synthetic fuels.

Alkali metal containing vapor species are ubiquitous in combustion systems. These species originate from coal mineral and atmospheric impurities (organic and inorganic), ceramic construction materials, or as additives, such as with potassium seeding for MHD or with bulk glass as a particle absorbing medium. Alkali vapor transport over representative slag, glass, and simple halide, hydroxide and sulfate systems is discussed in relation to materials and process limitations in coal-supported energy systems. Measurement problems associated with vapor transport measurements are also considered.

Selection of Supports for Immobilized Liquid Membranes.

Final rept

J. D. Way, R. D. Noble, and B. R. Batemen. 1985,

Pub. in American Chemical Society Symposium Series n269, St. Louis, Missouri, April 8-13, 1984, Chapter 6, Materials Science of Synthetic Membranes, p119-138 1985.

Keywords: *Membranes, *Supports, Separation, Chemical properties, Molecular structure, Diffusion, Surface chemistry.

Criteria for immobilized liquid membrane (ILM) support selection can be divided into two categories: structural properties and chemical properties. Structural properties include geometry, support thickness, porosity, pore size distribution and tortuosity. Chemical criteria consist of support surface properties and reactivity of the polymer support toward fluids in contact with it. The support thickness and tortuosity determine the diffusional path length, which should be minimized. Porosity determines the volume of the liquid membrane and therefore the quantity of carrier required. The mean pore size determines the maximum pressure dif-ference the liquid membrane can support. The support must be chemically inert toward all components in the feed phase, membrane phase, and sweep or receiving

Influence of Substrate Parameters on Column Se-

lectivity with Alkyl Bonded-Phase Sorbents.

Final rept., L. C. Sander, and S. A. Wise. 1984, 19p Pub. in Jnl. of Chromatography 316, p163-181 1984.

Keywords: *Silicon dioxide, *Synthesis(Chemistry), *Polymers, *Sorbents, Substrates, Physical properties, Surface chemistry, Phase rule, Reprints, Chemical reaction mechanisms.

Differences in bonded-phase properties were studied for monomeric and polymeric C18 phases prepared on a variety of silica substrate materials. A total of 22 silicas with pore diameters ranging from 50-1000 A were used in synthesis. Phase loadings for the resulting bonded phases ranged from 1.3-5.4 micromol/sq m. Physical properties of the substrates including surface area, pore volume, packing density, and background carbon were measured prior to bonding. Large differences were observed in the properties of the silica substrates and in the chromatographic behavior of the resulting phases. Differences in selectivity as well as absolute retention were observed as a function of pore size, with the greatest changes in selectivity occurring for the polymeric phases. The effect of silica pretreat-ment on phase synthesis and column selectivity was also examined for wide- and narrow-pore substrates. Phases prepared from silica pretreated with acid had greater polymeric character than those prepared from base-pretreated silica. Variation in phase loading and column selectivity is thought to be a function of both the reactivity of the silica surface and pore size. A model for polymeric phase synthesis is proposed where the extent of reaction is limited by a size-exclusion mechanism.

Intaglio Ink Considerations,
B. Dickens. Sep 85, 31p NBSIR/85-3216
Sponsored by Bureau of Engraving and Printing,
Washington, DC.

Keywords: *Printing inks, *Alkyd resins, *Setting time, *Polymerization, Molecular weight, Solubility, Oxygen, Curing, Thixotropy, Silicon dioxide, Fillers, Performance evaluation.

Alkyds are recommended as the most practical resin system to polymerize in air. The alkyd should have a well-chosen molecular weight distribution and be dispersible in a water-containing solvent system. The sol-

ubility of oxygen in the ink formulations and solvent mixtures should be determined and the compositions mixtures should be determined and the compositions adjusted to provide a level of oxygen which gives optimum cure. UV irradiation of the newly printed currency paper can probably be used to skin the ink rapidly and prevent blocking. This may allow printing of both sides of the currency paper in one pass. Replacement of the various pigments and fillers currently in use by dysentiated to the book base of an arganic polymer, either attached to the backbone of an organic polymer, either in water-soluble form or in the form of a glass should be investigated. The silica filler may be acting as a des-sicant as well as a thickening agent. If this dessicant action is not important, thixotropy of the ink should be adjusted by using sodium carboxy methyl cellulose instead. Other recommendations are given and the formulation of intaglio printing inks is reviewed with special reference to BEP requirements.

PATENT-4 558 218 Not available NTIS Department of Commerce, Washington, DC. Heat Pipe Oven Molecular Beam Source.

R. E. Drullinger. Filed 1 Aug 84, patented 10 Dec 85, 7p PB86-137239, PAT-APPL-6-636 769 Supersedes PB85-108132.

This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of patent available Commissioner of Patents, Washington, DC 20231 \$1.00.

Keywords: *Molecular beams, *Patents, Sources, Atomic beam sources, Heat pipes, PAT-CL-250-251.

A heat pipe oven molecular beam source wherein a hollow porous metal, metalloid or ceramic body with at least one opening is nearly saturated with the working material and heated to just above the melting point of material and heated to just above the melting point of the working material, generating a thin liquid layer of the working material on the internal surface of the body. Material passing the length of the bore of the body without striking a wall will escape and form the beam. Material striking the liquid layer covering the inside of the body will condense and be conveyed by capillary action back to the closed end of the body.

Intermolecular Potential Calculations for Polycycllc Aromatic Hydrocarbons.

J. H. Miller, W. G. Mallard, and K. C. Smyth. 11 Oct

84, 8p Pub. in Jnl. of Physical Chemistry 88, n21 p4963-4970, 11 Oct 84.

Keywords: *Aromatic polycyclic hydrocarbons, *Intermolecular forces, *Potential energy, Soot, Air pollution, Reprints, Benzene, Molecular configuration, Numerical solution, Dimers, Coronene, Circumcoronene.

Methods of calculating the dispersive part of the intermolecular potential for polycyclic aromatic hydrocar-bons of D(sub 6h) symmetry are examined. A new, semi-empirical method is utilized to generate the approximate angle dependent dispersive potentials. These dispersive potentials are added to the electrostatic potentials which arise from the permanent quadrupole moments, and the resulting total potential is used to predict the angle between the planes of the molecules in the most stable dimer configuration for the homologous series benzene, coronene, and circumcoronene. These angles are 90, 42, and 36 degrees, respectively, and the well depths at these angles are 2.41, 7.87, and 23.0 kcal/mol.

Principles of Quality Assurance of Chemical Meas-J. K. Taylor. Feb 85, 81p NBSIR-85/3105

Keywords: *Quality assurance, *Chemical analysis, *Chemical properties, *Measurement, Calibrating, Methodology, Sampling, Inspection, Experimental design, Standards, Standard reference materials.

The general principles of quality assurance of chemical measurements are discussed. They may be classified as quality control -- what is done to control the quality of the measurement process, and quality assessment -- what is done to evaluate the quality of the data output. Quality assurance practices are considered as a hierarchy with levels progressing from the analyst, the laboratory, the project, to the program. The activities of each level are different and depend upon the ones beneath it. Recommendations are presented for developing credible quality assurance practices at each level. An appendix contains outlines that may be used to develop the various documents associated with a quality assurance program.

Interactions of Composition and Stress in Crystal-

F. C. Larche, and J. W. Cahn. 30 Aug 84, 34p Prepared in cooperation with Montpellier-2 Univ.

Included in Jnl. of Research of the National Bureau of Standards, v89 n6 p467-500 Nov-Dec 84.

Keywords: *Crystals, *Stress analysis, *Solids, Phase transformation, Thermodynamics.

The thermodynamics of stressed crystals that can change phase and composition is examined with particular attention to hypotheses used and approximations made. Bulk and surface conditions are obtained and for each of them practical expressions are given in terms of experimentally measurable quantities. The concept of open-system elastic constants leads to the reformulation of internal elastochemical equilibrium problems into purely elastic problems, whose solutions are then used to compute the composition distribution. The atmosphere around a dislocation in a cubic crystal is one of several examples that are completely worked out. The effects of vacancies and their equilibrium within a solid and near surfaces are critically examined, and previous formulas are found to be first order approximations. Consequences of the boundary equations that govern phase changes are studied with several examples. Finally, problems connected with diffusional kinetics and diffusional creep are discussed.

Keywords: *Particle size, *Standards, *Polystyrene, Light scattering, Optical measurement, Spheres, Surfaces, Error analysis, Mic scattering, *Standard reference materials, Transmission electron microscopy.

The average diameter of the first micrometer particle size standard (Standard Reference Material 1690), an aqueous suspension of monosized polystyrene spheres with a nominal 1 micrometer diameter, was accurately determined by three independent techniques. In one technique the intensity of light scattered by a diluted suspension of polystyrene spheres was measured as a function of scattering angle, using a He-Ne laser polarized in the vertical direction. The second technique consisted of measuring as a function of angle the intensity of light scattered from individual polystyrene spheres suspended in air, using a He-Cd laser with light polarized parallel and perpendicular to the scattering plane. The measurement of row length by optical microscopy for polystyrene spheres arranged in close-packed, two-dimensional hexagonal arrays was the basis of the third technique. The measurement errors for each technique were quantitively assessed. For the light scattering experiments, this required simulation with numerical experiments. The average diameter determined by each technique agreed within 0.5% with the most accurate value being 0.895

500,146

+ or - 0.007 micrometers based on light scattering by an aqueous suspension. Transmission electron microscopy, flow through electrical sensing zone counter measurements, and optical microscopy were also used to obtain more detailed information on the size distribution including the standard deviation (0.0095 micrometers), fraction of agglomerated doublets (1.5%).

M. Dishon, G. H. Weiss, and J. T. Bendler, 27 Nov. 84, 13p

Prepared in cooperation with National Institutes of Health, Bethesda, MD., and General Electric Corporate Research and Development, Schenectady, NY. Included in Jnl. of Research of the National Bureau of Standards, v90 n1 p27-39 Jan-Feb 85.

Keywords: *Density(Mass/volume), *Molecular relaxation, *Mathematical models, *Linearity, Polymers, Semiconductors, Tables(Data), Stability, Numerical solution.

Stable law distributions occur in the description of the linear dielectric behavior of polymers, the motion of carriers in semi-conductors, the statistical behavior of neurons, and many other phenomena. No accurate tables of these distributions or algorithms for estimating the parameters in these relaxation models exist. In this paper the authors present tables of the functions together with related functional properties of zQ(sub alpha) (z). These are useful in the estimation of the parameters in relaxation models for polymers and related materials. Values of the integral Q(sub alpha) (z) are given for alpha=0.01, 0.02(0.02)0.1(0.1)1.0(0.2)2.0 and those of V(sub alpha) (z) are given for alpha=0.0(0.1)0.1(0.1)2.0. A variety of methods was used to obtain six place accuracy. The tables can be used to sequentially estimate the three parameters appearing in the Williams-Watts model of relaxation. An illustration of this method applied to data in the literature is given.

Meeting on Atomic and Molecular Physics Close to Ionization Thresholds in High Fields, Aussois, France, June 7-11, 1982.

Keywords: *Magnetic fields, *Diamagnetism, Experimental design, Excitation, Zeemen effect, Ionization, Forecasting, Reprints, *Hydrogen atoms, *Rydberg series, Numerical solution.

The spectrum of high Rydberg states of atomic hydrogen in a magnetic field has received much attention in the last few years. Although no experimental work has been done, theoretical activity has elucidated major features of the spectrum ranging in energy up to a few cyclotron frequency units below the ionization threshold. In the weak field limit an unexpected richness of structure has been uncovered by perturbative treatments based on the 0(4) symmetry of hydrogen.

Group 7D—Physical Chemistry

Though this symmetry is absent in the more complex atoms for which experimental data are available, the authors believe that a comprehensive theory of Ryd-berg diamagnetism will ultimately be phrased in hydrogenic language. The authors review here the basic physics which motivates this hypothesis, the experimental and numerical results which substantiate it, and the opportunities it suggests for future investigations.

Keywords: *Aluminum, *Silicon, *Auger electrons, *Ion beams, *Ion irradiation, Sputtering, Monte Carlo method, Solids, Reprints, *Atom atom interactions, * *Auger spectroscopy.

Atom collisions of several keV may result in inner-shell excitations. The energy spectra of Auger electrons from excitations induced by ion bombardment of solid materials are different from those stimulated by x-rays or electrons. Auger electron spectra produced by ion bombardment of solids contain features similar to spectra obtained from atoms undergoing Auger transitions in the gas phase, i.e., atomic-like spectra. An in-terpretation of the atomic-like spectra from ion-bom-barded solids is that a significant portion of the atoms undergoing Auger de-excitation have previously been sputtered from the solid. Auger decay in the gas phase can occur if the inner-shell lifetime is sufficiently long for the excited atom to escape. Results from our Monte Carlo calculations of the origin, movement, and decay of ion-bombardment induced 2p inner-shell ex-citations of Al and Si will be presented. These calculations indicate that a significant portion of the Auger emission originates from sputtered atoms; the kinetic energy of atoms sputtered while experiencing inner-shell excitation far exceeds the average kinetic energy of sputtered atoms, and so, Auger electron emission may constitute a probe of the high energy collision cascade near the surface. Calculated dependence of the Auger electron intensity on the incident angle of the ion beam will be compared with measurements, and the effect of inner-shell lifetime on the calculated Auger electron intensity will be discussed.

Summary of Group Theoretical Results for Microwave and Infrared Studies of H2O2.

Final rept.,

J. T. Hougen. Jun 84, 11p Pub. in Canadian Jnl. of Physics 62, n12 p1392-1402

Keywords: *Hydrogen peroxide, *Molecular rotation, *Microwave spectroscopy, *Infrared spectroscopy, Microwave spectroscopy, Reprints.

Group theoretical treatments found in the literature for other molecules, based on double-groups of appropriate permutation--inversion groups, are modified slightly and applied to H2O2. This permits a more unified view of many theoretical results derived in various earlier studies of the molecule. Briefly, if no effects due to internal rotation tunneling were observed in the H2O2 spectrum, the molecule could be treated using the C2 point group of its equilibrium geometry. If effects due to internal rotation tunneling through only the trans barrier are observed (as is presently the case), the molecule should be treated using the C2h point group of its trans planar conformation at the top of the tunneling barrier. An empirically discovered successful fitting procedure for the ground state rotational levels, reported in a treatment of microwave and millimetre wave measurements on H2O2, can be rationalized on the basis of the present theoretical results.

National Bureau of Standards (NEL), Gaithersburg, MD. Thermophysics Div. Thermal Expansion Coefficient of FCC Metals.

Final rept., R. A. MacDonald. 1984, 9p

Pub. in Thermal Expansion 8, p11-19 1984.

Keywords: *Thermodynamic properties, *Thermal expansion, Forecasting, Reprints.

The work to be reported here improves upon and extends that presented at the 7th European Thermophysical Properties Conference in 1980. There it was shown that the calculated thermal expansion values, epsilon, were very sensitive to the curvature of the potential, phi (r), assumed for the nearest neighbor interaction. The authors give a brief summary of the theory pertinent to their calculation of the thermodynamic properties of the fcc metals. Next they present the results that were obtained for the thermal expansion of copper and then they examine the problem of obtaining alpha by derivation from thermal expansion data. They find that there can be quite a large variation in the values of alpha derived from thermal expansion data and they urge that the 'direct' method of measurement of alpha be used in the future.

Planar Ca-PO4 Sheet-Type Structures: Calcium Bromide Dihydrogenphosphate Tetrahydrate, CaBr(H2PO4)-4H2O, and Calcium iodide Dihydrogenphosphate Tetrahydrate, Cal(H2PO4)-4H2O. Final rept.,

M. Mathew, S. Takagi, and W. E. Brown. 1984, 4p Sponsored by American Dental Association Health Foundation, Chicago, IL. Pub. in Acta Crystallographica C40, p1662-1665 1984.

Keywords: *Calcium phosphates, *Crystal structure, Sheets, Reprints.

Both compounds have planar sheet-type structures consisting of Ca-H2PO4 chains. The halide ions, X, and the water molecules are linked via O-H...X hydrogen bonds to form X(H2O)6 octahedra. These octahedral units are linked together to form a polymeric layer (X(H2O)4)n between the Ca-H2PO4 sheets.

inelastic Mean Free Paths and Attenuation Lengths of Low-Energy Electrons in Solids. Final rept.,

C. J. Powell. 1984, 16p

Pub. in Scanning Electron Microscopy IV, p1649-1664

Keywords: *Surface chemistry, *Solids, *Electron energy, Dielectric properties, Free electron theory, Re-

Calculations of inelastic mean free paths and measurements of attenuation lengths of low-energy electrons in solids have been studied. The emphasis of the study was on the systematics of the dependences of these quantities on material and electron energy. Calculations of inelastic mean free paths from experimental dielectric data indicate that different dependences on electron energy occur in different materials and that deviations from simple theoretical or empirical expressions are to be expected.

GAMPHi - A Database of Activity and Osmotic Coefficients for Aqueous Electrolyte Solutions. Technical note,

R. N. Goldberg, J. L. Manley, and R. L. Nuttall. Mar 85, 28p NBS/TN-1206

Also available from Supt. of Docs as SN003-003-02640-9. Sponsored by Department of Energy, Pittsburgh, PA.

Keywords: *Information systems, *Activity coefficients, *Osmosis, *Electrolytes, Fortran, Thermodynamics, Solutions, Computer programming, Gibbs free

A database of activity and osmotic coefficients for 350 binary aqueous electrolyte solutions at 298.15 K has been assembled together with a collection of subroutines for utilizing the database. The computer codes, which are written in FORTRAN 77, can be used either interactively or from user-written programs to calculate values of the activity and osmotic coefficients at selected molalities.

Validation of the Sulfur Concentration of Selected
iron-Base NBS (National Bureau of Standards)
Standard Reference Materials by Isotope Dilution
Spark Source Mass Spectrometer. Spark Source Mass Spectrometry.

Final rept., R. W. Burke, P. J. Paulsen, E. J. Maienthal, and G. M. Lambert. 1982, **5**p Pub. in Talanta 29, n10 p809-813 1982.

Keywords: *Chemical analysis, *Sulfur, *Iron containing alloys, Concentration(Composition), Equilibrium, Reprints, *Standard reference materials, *Isotopic dilution spark source mass spectroscopy.

An isotopic dilution spark source mass spectrometric procedure has been developed for the accurate determination of sulfur in iron-base alloys. A sealed tube dissolution technique is used to prevent volatilization losses and to effect isotopic equilibration. Application of this technique to the reanalysis of existing NBS Standard Reference Materials yields results that are generally in good agreement with the certified values.

Detection of the 2pi* Orbital of CO and NO Chemisorbed on Ni(111) by Surface Penning Ionization Electron Spectroscopy (SPIES).

Final rept., F. Bozso, J. Anas, J. T. Yates, R. M. Martin, and H. Metiu. 1983, 4p

Pub. in Chemical Physics Letters 94, n3 p243-246

Keywords: *Carbon monoxide, *Nitrogen oxides(NO), *Chemisorption, Nickel, Surface chemistry, Ionization, Reprints, *Surface Penning Ionization Electron Spec-

The authors use surface Penning ionization spectroscopy (SPIES) to study the electronic properties of CO and NO adsorbed on Ni(111). In this experiment an atomic beam containing ground state and 2 singlet S He atoms collides with the adsorbate covered Ni(111) surface. This causes the transfer of approximately 20.6 eV energy into the electronic degrees of freedom of the adsorbate molecules, forcing them to emit electrons. The SPIE spectrum is obtained by analyzing the energy of these electrons. The high surface sensitivity of this method allows us to measure the binding energy of the partly filled 2 pi* orbitals of CO and NO.

500,163 PB85-184521 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Analyses of the Aqueous Phase During Early C3S

Final rept., P. W. Brown, E. Franz, G. Frohnsdorff, and H. F. W. Taylor. 1984, 6p Pub. in Cement and Concrete Research 14, n2 p257-

262 1984.

Keywords: *Liquid phases, *Hydration, Surfaces, Reprints, *Carbon sulfide, Phase equilibrium.

The concentrations of calcium and silica in solution during the first 4 hours of C3S hydration were measured. The results of these analyses indicate that a solid hydrate forms within 30 seconds of hydration and that an equilibrium between the solution and the solid hy-dration product is rapidly established. A strong dependence of the degree of early hydration on the water to C3S ratio was observed, while the dependence on the surface area of the C3S was minimal.

500.164 PB85-184547 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Effects of Coherency Constraints on Phase Equi-Final rept.

J. W. Cahn, and F. C. Larche. 1983, 2p Sponsored by Materials Research Society, University Park, PA., and American Society for Metals, Metals Park, OH.

Pub. in Proceedings of Symposium on Alloy Phase Diagrams, Boston, MA., November 1982, Materials Research Society Symposia Proceedings, v19 p311-312 1983.

Keywords: *Thermodynamics, Alloys, Phase diagrams, Congruencies, Consolidation, Strain energy methods, *Phase equilibrium, Solid state chemistry.

The thermodynamics of coherent phase equilibria is reviewed. It is recommended that boundaries between fields in which different combinations of phases coexist coherently be depicted on phase diagrams. However, the compositions of coexisting phases cannot be read from such a diagram because tie-lines will not usually end on these boundaries. Apparent discrepancies between different experimental phase diagram determination for solid state equilibria may have a sound physical basis.

E. A. Di Marzio, and C. M. Guttman. 1982, 10p Pub. in JnI of Applied Physics 53, n10 p6581-6590 Oct

Keywords: *Crystallization, *Polymers, Crystal growth, Nucleation, Reprints, Monomers.

Point has suggested that during the polymer crystallization process individual stems form by zippering of monomer segments onto the substrate and that at any time during the zippering process the stem can fold over, thus initiating a new stem. The authors augment the treatment of Point analytically by allowing each of the subsequent stems to fold any stage in the zippering process rather than only during the forming of the first stem. The problem is isomorphic to the mathematical problem of the growth of a Cayley Tree with infinite branching. Although there is net growth, the rules of growth (crystallization) are such that branches of the tree can be resorbed. By use of a simple renormalization technique, formulae are obtained both for the steady state growth rate and for the lamellar thickness which for special cases reduce to the Point results. Classical nucleation theory remains valid at low to moderate supercoolings.

500.166 PB85-184604 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Cross Polarization-Magic Angle Sample Spinning NMR Study of Several Crystal Forms of Lactose. Final rept.,

W. L. Earl, and F. W. Parrish. 1983, 10p Pub. in Carbohydrate Research 115, n1 p23-32 1983.

Keywords: *Isotopic labeling, *Lactose, *Nuclear magnetic resonance, *Molecular structure, Carbon 13, Reprints, *Chemical shifts(Nuclear magnetic resonance).

Five different crystalline forms of lactose were investigated using cross polarization-magic angle sample spinning (13)C (CP-MAS) NMR. Both the anhydrous beta-lactose and the alpha-lactose monohydrate structures are known from x-ray diffraction studies and the CP-MAS NMR data agree with those structures. The structure of the stable anhydrous alpha-lactose has not been reported. The CP-MAS NMR results indicate that the crystal must have two or more lactose molecules per unit cell. The chemical shifts measured for two mixed crystals with alpha:beta ratios of 5:3 and 4:1 are a direct result of the fact that both materials are real mixed crystals rather than physical mixtures of crystals of pure alpha- and beta-lactose. The chemical shifts also indicate that the lactose molecules in both mixed crystals are in environments similar to the crystalline environment of the stable anhydrous alpha-lactose.

500,167 PB85-184612 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Thermochemistry of interface and Surface Segregation and Chemisorption for Core Level Binding Energy Shifts.

Enskog Theory for Multicomponent Mixtures: 1.

Linear Transport Theory. Final rept

M. L. de Haro, E. G. D. Cohen, and J. M. Kincaid. 1983, 14p

Pub. in Jnl. of Chemical Physics 78, n5 p2746-2759, 1

Keywords: *Transport theory, *Fluids, Mixtures, Viscosity, Thermal conductivity, Diffusion coefficients, Reprints, *Enskog-Thome theory.

The Enskog theory for dense multicomponent fluid mixtures is developed. Two versions are considered: the standard theory and the revised theory. Explicit ex-pressions for all the transport coefficients (shear and bulk viscosity, thermal conductivity, mutual and thermal diffusion coefficients) in terms of the sizes, masses, and concentrations of the constituents of the mixture are given in third Enskog approximation. Applications will be discussed in subsequent papers.

PB85-184695 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Multi-Vacancy Effects in Argon K-Spectra. Final rept.,

R. D. Deslattes, P. L. Cowan, R. E. LaVilla, and K.

Dyall. 1982, 5p Sponsored by National Science Foundation, Washington, DC.

Pub. in Proceedings of International Conference on X-Ray and Atomic Inner-Shell Physics, 'X-82', Eugene, OR., August 23-27 1982, AIP Conference Proceedings n94, p100-104.

Keywords: *Argon, *Atomic energy levels, *X-ray analysis, Emission spectroscopy, Excitation.

The authors have carried out coordinated measurements of K series emission and absorption spectra in atomic argon. Specifically, emission spectra (especially in the region of K(beta(sub 1,3) were recorded with photon excitation energies ranging from below the single-vacancy threshold to energies above most important double-vacancy thresholds. Satellite emission spectra were modelled using both Dirac-Fock and Configuration Interaction (CI) calculations. Comparisons with experiment show reasonable agreement of the CI calculations for the first high energy satellite complex, beta(sup V), but not for the second, beta.

Application of Hueckel-Moebius Concept to Torsional Vibration and Internal Rotation of Mole-

Y. N. Chiu. 1984, 18p Pub. in Theochem 17, n3-4 p211-228 Apr 84.

Keywords: *Molecular rotation, *Molecular vibration, Angular momentum, Ethane, Reprints, *Huckel molecular orbitals, *Huckel approximation, *Linear combination of vibrational wavefunctions.

Linear combination of vibrational wavefunctions (LCVW) centered at the periodic potential minima is used to represent the approximate torsional wavefunction of the hindered internal rotation of a coaxial-(XY(sub n))2-type molecule. These linear combina-tions are shown to have the correct pseudo-angular momentum upon rotation of one or both parts of the rotor. And they are uniquely correlated with the wavefunctions of free internal rotation having the same angular momentum.

Final rept.,
L. P. Cook. 1982, 18p
Sponsored by Metallurgical Society of AIME, Warrendale, PA., and American Ceramic Society, Columbus, OH. Basic Science Div.
Pub. in Proceedings of Symposium on Metal and Ceramic Powders, Louisville, KY., October 12-14, 1981, Processing of Metal and Ceramic Powders, p165-182, 1982

Keywords: *Densification, *Sintering, *Kinetics, Diffusion, Powders, *Anorthite, *Scanning electron microscopes, *Transferred electron microscopes, Calcium aluminate silicate.

By comparison with other tectosilicates, powdered crystalline anorthite (CaAl2Si2O8) shows a strong tendency for densification during sintering. Experi-

ments have been conducted to determine the conditions under which this behavior is reproducible and to determine the mechanism or mechanisms responsible. Results indicate that while minor changes in grain size distribution have a large effect upon the kinetics of sintering and densification, relatively coarse powders ultimately yield as dense a product as powders with a much higher percentage of fines. A two-stage hypoth-esis for densification at 1400C is proposed: (1) an early rapid densification associated with grain boundary diffusion driven by minimization of highly anisotropic surface energy; (2) volume diffusion, primarily along closely spaced parallel twin planes.

PB85-187268 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Number and Novelty in Approaches to the Calculation of Strainless Group Increments. Final rept..

D. Van Vechten, and J. F. Liebman. 1981, 6p Pub. in Israel Jnl. of Chemistry 21, n2-3 p105-110 1981.

Keywords: *Strain energy methods, *Molecular structure, *Thermochemistry, Differences, Reprints, *Alicyclic hydrocarbons.

In this paper, the authors show that the large number of approaches using apparently unrelated strainless increments for unsubstituted alicyclic hydrocarbons in the literature are neither mathematically nor conceptually unique. They additionally demonstrate that if the strain energy assigned to a compound by any three sets of increments are known, the strain energy any other approach would assign can automatically be determined without considering any further details of the structure of the compound. Equivalently, there are but three mathematically distinct, i.e. linearly independent, strainless incremental approaches for these com-pounds. Thus the choice of which method to employ in one's own reasoning relative to a chemical problem must be based on personal, rather than strictly chemi-cal or mathematical criteria. They proceed by present-ing our criteria and their molecular realization, the concepts of diagonal reference states. Diagonal reference states are defined from hydrocarbons composed solely of the group of interest. The virtues and debits of this method are presented in support of their conclusion that this approach is preferable because it is diag-

PB85-187276 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Inferences About Molecular Motion from Proton Decoupled 13C NMR Spectra of Solid Polymers.

D. L. Vanderhart, G. G. A. Bohm, and V. D. Mochel.

1981, 1p Pub. in Abstracts of Papers American Chemical Society 182, 112p Aug 81.

Keywords: *Nuclear magnetic resonance, *Solids, *Polyethylene, *Polyethylene terephthalate, *Molecular rotation, Carbon 13, Mechanical properties, Magnetic fields, Sites, Comparison, Reprints, *Chemical shifts(Nuclear magnetic resonance).

Proton decoupled (13)C spectra are used to describe molecular motion in polyethylene (PE) and polyethyleneterephthalate (PET). Use of static oriented samples suitably aligned in the magnetic field allow one to obtain information about the frequency and geometry of motion from the (13)C lineshape. In systems with or motion from the (13)C lineshape. In systems with appropriate symmetries, molecular motion can effect an exchange between magnetically inequivalent sites. In particular, 180 degrees flip-flop motions in the crystalline regions of PE and aromatic ring flip-flops in PET represent two-site exchange processes with equal populations at each site. The dipolar interaction between isolated pairs of (13)C nuclei was used to study flip-flop motions in PE whereas the anisotropic chemical shift of the protonated aromatic carbons in PET. cal shift of the protonated aromatic carbons in PET was used to study aromatic ring motion. For the flip-flop motion in crystalline PE comparison will be made with some dynamic mechanical measurements. It is felt that information about crystalline motions is generalizable to unoriented, melt crystallized samples since some of the oriented samples were annealed so as to minimize any crystalline defects introduced by mechanical deformation.

Interfacial Tension of Fluids Near Critical Points and Two-Scale-Factor Universality. Final rept..

M. R. Moldover. Feb 85, 12p NASA Order-H-27954-B Pub. in Physical Review A 31, n2 p1022-1033 Feb 85.

Keywords: *Interfacial tension, *Fluids, *Critical point, *Liquid phases, Thermodynamic properties, Binary mixtures(Materials), Temperature, Tables(Data), Re-

Data for the surface tension of pure fluids near critical points and for the interfacial tension between coexisting liquid phases of binary mixtures near consolute points are reviewed using recent theoretical values for the critical exponents and the concept of two-scalefactor universality. The observation implies that the scale factors for the critical anomaly in the free energy of these liquid-vapor systems can be estimated from measurements of the densities of the coexisting phases at all temperatures and a measurement of the capillary rise near the triple point.

500,182 **PB**85-187391 Not available NTIS National Bureau of Standards (NEL), Boulder, CO. Chemical Engineering Science Div. Thermal Conductivity of Parahydrogen.

Final rept.,

H. M. Roder. Oct 84, 5p Pub. in Jnl. of Chemical and Engineering Data 29, n4 p382-386 Oct 84.

Keywords: *Thermal conductivity, *Hydrogen, Experimental design, Isotherms, Temperature, Density(Mass/volume), Comparison, Reprints

The paper presents new experimental measurements of the thermal conductivity of parahydrogen for eight isotherms at temperatures from 100 to 275 K with intervals of 25 K, pressures to 12 MPa, and densities from 0 to 12 mol/L. Three additional isotherms at 150, 250, and 275 K cover para-rich compositions with para percentages varying from 86% to 73%. For these three isotherms the pressures reach 70 MPa and the density a maximum of 30 mol/L. The data for all compositions are represented by a single thermal conductivity surface in which the differences in thermal conductivity for different ortho-para compositions are accounted for in the dilute-gas term. The new measurements are compared with previous data on parahydrogen through the new correlation. It is estimated that the overall uncertainty of both experimental and correlated thermal conductivity is 1.5 percent at the 3 sigma level.

Non-Linear Behavior of Polyisobutylene Solutions as a Function of Concentration.

Final rept., L. J. Zapas, and J. C. Phillips. 1981, 16p Pub. in Jnl. of Rheology 25, n4 p405-420 1981.

Keywords: *Polyisobutylene, *Nonlinear systems, Solutions, Concentration(Composition), Stress relaxation, Strain analysis, Rheological properties, Reprints, BKZ theory.

The nonlinear behavior in simple shear of polyisobutylene (Vistanex L-100) solutions in cetane was studied for three concentrations in various shear histories. The concentrations of the solutions were 10, 15.1, and 19.3 percent by weight. It is shown that a simple superposition principle can be applied at concentrations region where the intermolecular forces are predominant for the systems and for which the potential function in the Bernstein, Kearsley and Zapas elastic fluid theory can be expressed as a product of a function of time and a function of strain. An excellent agreement was obtained with the experimental data, even for transient experiments where the shearing and normal stresses depend on time.

Convective and Interfacial Instabilities during Solidification of Succinonitrile Containing Ethanol. Final rept.,

R. J. Schaefer, and S. R. Coriell. 1982, 11p Sponsored by Materials Research Society, University Park, PA. and Universities Space Research Association, Columbia, MD.

Pub. in Proceedings of Symposium on Materials Processing in the Reduced Gravity Environment of Space, Boston, Mass., November 16-18, 1981, v9 p479-489

Keywords: *Solidification, *Crystallization, *Convection, *Interfaces, Additives, Ethyl alcohol, Stability, Succinonitrile.

Although slow convective flow is difficult to detect in solidifying metals, it can readily be observed in transparent materials by observing the motion of small neutrally buoyant particles. An excellent material for such studies is succinonitrile, which solidifies with an unfaceted solid/liquid interface and which has well characterized physical properties. For studies of solute-in-duced convection, ethanol is a useful addition to succinonitrile because it has a lower density and a somewhat similar molecular structure. Samples of high purity and ethanol-doped succinonitrile are solidified unidirectionally in a vertical temperature gradient. Latex microspheres, 2 micrometers in diameter, are suspended in the liquid to delineate convective flow. Convective and morphological stability are observed as a function of solute concentration and growth velocity. These measurements are compared to theoretical calculations which predict the transition from stability to instability as a function of solidification conditions. The predicted transitions occur at low concentrations and solidification velocities, so that extreme care is required to eliminate the effects of impurities or thermally-induced convection.

Raman and X-Ray Investigations of Ice 7 to 36.0 GPa.

Final rept

G. E. Walrafen, M. Abebe, F. A. Mauer, S. Block, and G. J. Piermarini. 1982, 9p See also AD-A116 900.

Pub. in Jnl. of Chemical Physics 77, n4 p2166-2174

Keywords: *X ray analysis, *Raman spectroscopy, *X ray diffraction, *Ice, Hydrogen bonds, Chemical bonds, Pressure, Water, Reprints, Hydroxyl radicals.

Raman spectra for ice VII to 30 GPA and x-ray lattice parameters to 36 GPa, both at room temperature, are presented and discussed. Both the Raman OHstretching peak frequency (delta nu) and the edge distance of the body-centered cubic unit cell (a) decrease at a decreasing rate with pressure rise. This minimum suggests that a symmetric hydrogen bond, O-H-O, and thus a new structure, may result at pressures of 75 GPa, or above. An analysis of both the present and previously published data verified this relation with A=2943/cm (sq A).

500,187 PB85-187789 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Thermodynamic Surface for isobutane.

M. Waxman, and J. Gallagher. 1982, 9p Sponsored by American Society of Mechanical Engineers, New York.

Pub. in Proceedings of Thermophysical Properties (8th), Gaithersburg, MD, June 15-18, 1981, p88-96 1982.

Keywords: *Butanes, *Thermodynamics, *Surface chemistry, Temperature, Cryogenics, Vapor phases, Liquid phases, Ideal gases, Density(Mass/volume), Pressure, *Isobutane.

A thermodynamic surface is presented for the thermodynamic properties of isobutane for the ranges of temperature from 250 to 600 K and of pressures from 0 to 400 bar, exclusive of the critical region. The surface, expressed analytically, is in the form of the Helmholtz free energy as a function of temperature and density. The Helmholtz free energy is based upon the sum of three contributions: that of the ideal gas, of a physically based function incorporating the effects of molecular repulsion and attraction, and of a sum of residual terms that companies of the abusiness. that compensate for inadequacies of the physically based function. The latter two contributions are evaluated from only pressure density-temperature data. The significant deviations are in regions where exclusive of vapor pressure data, the liquid and vapor phases are not defined adequately by experimental data. The au-thors discuss the development of the correlation and also its possible extension to cryogenic temperatures.

500.188 PB85-187797 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Speciation of Arsenic in Fossii Fuels and Their Conversion Process Fluids. Final rept..

C. S. Weiss, E. J. Parks, and F. E. Brinckman. 1983, 18p

Pub. in Chapter in Arsenic: Ind., Biomed., Environ. Perspect., Proc. Arsenic Symposium, p309-326 1983.

Keywords: *Arsenic, *Fossil fuels, *Chemical analysis, *Environmental surveys, *Arsenic inorganic compounds, *Arsenic organic compounds, Coal gasification, Petroleum industry, Oil shale, Industrial wastes, Combustion products, Trace elements, Metals, Retorting, Water pollution, Air pollution, Reprints, *Gel permeation chromatography, Solid wastes, Coal liquefaction

The increased use of coal and oil shale, both directly and following conversion processes, as alternatives to petroleum dictates the need to understand the chemistry and environmental fate of many toxic elements which are found at higher concentrations in these alternative fossil fuels and their processing products. These elements include As, Be, Cd, Cr, Ge, Hg and Se. The ultimate environmental availability of such elements include the control of t ments found in these matrices will depend not only upon the molecular form originally present, but also on the chemical transformations occurring during the type

of process used to convert these materials to conventional fuels, and during their final use. The concentra-tion and nature of one principal bioactive element, As, in the source materials (petroleum, coal, and oil shale) will be reviewed, as will the distribution of As species among products, process waters, and residues during a variety of coal conversion and oil shale retorting processes. The methods developed at NBS to speciate As in both the products and process waters generated during synthetic fuel processes rely on the chromatographic separation of the product or process water with As-selective detection. The discrete molecular speciation of As is possible in some cases. However, complexes, colloids, or macromolecular As-containing and process and process and process are contained by the containing and process waters generated during the containing and process waters generated during the containing and process water with the chromatographic separation of the product or process water with As-selective detection. The discrete molecular special process are contained by the chromatographic separation of the product or process water with As-selective detection. taining species, evident in size-exclusion chromatograms of various shale oils, must be evaluated in terms of the extent and nature of the complexing capacity of the matrix for As as well as the stability of these Ascontaining compounds.

Resolution in C-13 NMR of Organic-Solids Using
High-Power Proton Decoupling and Magic-Angle Sample Spinning.

Final rept D. L. Vanderhart, W. L. Earl, and A. N. Garroway. 1981, 41p

Pub. in Jnl. of Magnetic Resonance 44, n2 p361-401 1981.

Keywords: *Nuclear magnetic resonance, *Solids, *Line width, *Organic compounds, Experimental design, Carbon 13, Reprints, *Chemical shifts(Nuclear magnetic resonance).

It is found experimentally that (13)C linewidths in solids are 10-100 times broader than those in liquids even though the combined techniques of high-power proton decoupling and magic angle sample spinning are employed. The combination of the latter techniques should produce spectra determined by isotropic chemical shifts just as in a liquid. Various linebroadening mechanisms are described and evaluated for semirigid, disordered (glassy) solids and ordered crystalline solids. The greater strength of secular local magnetic fields and the more restricted molecular mobility in solids versus liquids are the principal reasons for greater linewidths in solids. In particular, the importance of anisotropic bulk susceptibility is pointed out for the first time. An important perspective is that resolution will improve only marginally if at all for higher values of the static field.

Final rept.,
R. B. Christensen, and D. W. Norcross. Jan 85, 10p
Contract DOE-EA-77-A-01-6010
Pub. in Physical Review A 31, n1 p142-151 Jan 85.

Keywords: *Lithium, *Molecular energy levels, *Mathematical models, Excitation, Ionization, Resonance,

Wave functions, Reprints, *Electron electron interactions.

Results are presented of five-state close-coupling and distorted-wave calculations for electron impact excitation of Li II from the ground state to the four n=2states for energies below the ionization threshold. Sensitivity of the results to scattering approximation, target wave functions, and resonance effects is examined. The spin-allowed transitions are found to be much more sensitive to scattering approximation and to the choice of target wave functions than are the spin-forbidden transitions, but rather more strongly to the latter.

Quality Assurance and Protocols in Sampling and Sample Preparation of Biological Samples.

Final rept.,

R. Zeisler, and S. A. Wise. 1985, 23p

Pub. in Chapter 15 in Biological Reference Materials: Availability, Uses, and Need for Validation of Nutrient Measurement, p257-279 1985.

Keywords: *Samples, *Trace elements, *Quality assurance, *Environmental surveys, *Chemical analysis, Sampling, Concentration(Composition), Liver, Storage, Laboratories, Reprints, *Biological processes.

The apparent concentrations of trace constituents in biological samples, as opposed to the true concentra-tions, can be critically influenced by sampling steps prior to analysis. A multilevel approach is required to preserve a valid subsample for subsequent analysis, which is representative of the original bulk materials. In the NBS/EPA pilot program for environmental specimen banking, sampling protocols, sample preservation techniques and subsampling procedures have been developed and evaluated. A sampling protocol for human livers based on the above considerations is presented as the core of the pre-analysis quality assurance plan. This protocol includes step-by-step instructions for sampling the liver specimens and it can easily be modified to the use in sampling other tissues. Features of the protocol include: Use of special implements and/or techniques to minimize contamination during sample excision; shipment and storage of the samples under clean conditions at cryogenic temperatures; sample preparation in clean laboratories; and homogenization by a cryogenic homogenization technique that uses Teflon mills. The above steps provide a controlled basis for the analytical measurements which results in more accurate and intercomparable

Synthesis and Characterization of C18 Stationary

Phases for the Liquid Chromatographic Separation of Polycyclic Aromatic Hydrocarbons.

Final rept., L. C. Sander, and S. A. Wise. 1983, 12p Pub. in Proceedings of Polynuclear Aromatic Hydrocarbons: Int. Symposium on Mechanisms, Methods, and Metabolism (8th), p1133-1144 1983.

Keywords: *Aromatic polycyclic hydrocarbons, *Synthesis(Chemistry), Separation, Substrates, Comparison, Polymers, Mixtures, *Reverse phase liquid chromatography, Monomers.

A number of monomeric and polymeric C18 bonded phases were synthesized on a variety of silica substrates to evaluate selectivity differences for the liquid chromatographic (LC) separation of polycyclic aromatic hydrocarbons (PAH). The results of this study indicate which parameters (i.e., phase type, surface coverage, and silica pore diameter) are responsible for pro-viding optimum selectivity for the separation of PAH. Comparisons of phase types indicated that polymeric C18 phases on wide pore silica substrates (300 A) were most effective in separation of a sixteen-component PAH mixture. A simple empirical LC test was devised to gauge the extent of the monomeric or polymeric nature of a phase.

Keywords: *Detonation, *Mathematical models, *Exothermic reactions, Dissociation reactions, Chemical reactions, Shock waves, Reprints, *Molecular crystals.

molecular dynamical study of the detonation process in a dense system is presented. The model is a filament of a molecular crystal capable of undergoing exothermic dissociation. When the model is heated at one end, dissociation reactions start at the heated end and propagate along the filament. The accompanying expansion of the heated region drives a shock wave into the filament, causing further reactions due to shock heating. The results thus obtained provide a molecular description of the initiation of detonation.

Compact Effective Potentials and Efficient
Shared-Exponent Basis Sets for the First- and
Second-Row Atoms Second-Row Atoms.

Final rept., W. J. Stevens, H. Basch, and M. Krauss. 15 Dec 84,

8p Pub. in Jnl. of Chemical Physics 81, n12, pt. 2, p6026-6033, 15 Dec 84.

Keywords: *Atoms, *Potential theory, Atomic energy levels, Normal density functions, Reprints, *Effective-range theory, *Pseudopotential theory, Pseudospectral methods, Numerical solution, Gaussian measures.

Compact effective potentials, which replace the atomic core electrons in molecular calculations, are presented for atoms in the first and second rows of the periodic table. The angular-dependent components of these potentials are represented by compact one- and two-term gaussian expansions obtained directly from the appropriate eigenvalue equation. Energy-optimized gaussian basis set expansions of the atomic

pseudo-orbitals are also presented. The basis sets consist of four gaussian functions which have a common set of exponents (shared-exponents) for the s and p orbitals. The potentials and basis sets have been used to calculate the equilibrium structures and spectroscopic properties of several molecules. The results compare extremely favorably with corresponding all-electron calculations.

face Chemical Analysis, M. P. Seah, and C. J. Powell. Mar 85, 41p NBSIR-85/3120

Keywords: *Surface chemistry, *Standards, *Chemical analysis, Coatings, Films, *Standard reference materials. Versailles project.

This report is based on a proposal to the Steering Committee of the Versailles Project on Advanced Materials and Standards (VAMAS) for the coordinated development amongst the VAMAS member states of standards for surface chemical analysis. VAMAS was established following a meeting of the Heads of State or government at Versailles, France in 1982 that agreed on a number of projects relating to technology, growth, and employment. Specifically, VAMAS was organized to promote international coordination, in the ganized to promote international coordination in the development of standards in a wide range of advanced material sectors. Surface chemical analysis was approved as a VAMAS Technical Working Area in June, 1984. The report describes the growth and diversity of surface analysis in the development of advanced materials in modern technologies and additionally, the use of surface analysis for improved films and coatings. The principal techniques of surface analysis in common use are identified and the technical limitations to accurate surface analyses identified. Specific needs are identified for the common methods of surface analysis, Auger-electron spectroscopy, x-ray photoelectron spectroscopy, and secondary-ion mass spectroscopy together with the needs for ion sputtering which is used to obtain composition versus depth information in films and coatings. Existing standards activities in the member countries of VAMAS are reviewed and suggestions are made for additional standards for surface chemical analysis.

Final rept.

M. J. Pilling, J. R. McNesby, and W. Braun. 1981, 15p

Sponsored by Maryland Univ., College Park.
Pub. in Jnl. of Photochemistry 17, n3-4 p281-295 1981.

Keywords: *Decomposition reactions, *Mathematical models, Infrared lasers, Reprints, *Laser induced reactions, *Ketone/diethyl, *Butane, Laser applications.

The focused, IR Laser-induced decomposition of diethyl ketone has been studied and compared with the SiF4-sensitized decomposition of diethyl ketone and n-butane. A model has been constructed for the direct decomposition of diethyl ketone involving total decomposition of diethyl ketone into ethyl radicals and CO near the focus. Reaction between ethyl radicals form a short-lived n-butane which decomposes statistically into two ethyls or two methyls and ethylene. The system is allowed to react with due account being taken of unimolecular fall-off behavior for all species. The temperature which best explains the experimental product distribution is 1400 K. SiF4-sensitized decomposition of diethyl ketone and n-butane appear to be characterized by purely thermal processes.

Group 7D—Physical Chemistry

Keywords: *Polymers, *Equations of state, *Phase diagrams, Blends, Mixtures, Stability, Critical temperature, Thermodynamics, Entropy.

Phase diagrams of liquid polymer/polymer mixtures (blends) are very unusual when compared to similar low molecular weight mixtures. Neither the familiar adage 'likes dissolve likes' nor the familiar observation that solubility increases with temperature are in general applicable to polymer blends. In this paper, the authors examine the thermodynamic and molecular reasons responsible for this unusual phase behavior. A general thermodynamic analysis of phase stability is presented which suggests that thermally induced phase separation near a low critical solution temperature is an entropy driven process. The entropic driving force is related to the compressible nature of a fluid mixture and the propensity of fluids to contract upon mixing (negative volume changes) at sufficiently high temperatures, or equivalently, sufficiently low fluid densities. By using molecular equation of state theories, they are able to show that volume contraction is always expected at low fluid densities if attractive interactions exist between dissimilar molecular species. All of the unusual aspects of polymer blend phase behavior can be given a rational basis.

Pub. in Cement and Concrete Research 13, n6 p843-848 Nov 83.

Keywords: *Calcium silicates, *Hydration, *Crystals, *Surface chemistry, Calcium hydroxide, Cements, Concrete products, Construction materials, Reprints.

A reaction product believed to be an initial hydrate layer was observed to have formed on large pure C3S single crystals after 5 minutes of hydration. This layer was then increased in thickness and became covered with micrometer-sized spheres of poorly crystallized Ca(OH)2, within 30 minutes. Subsequently, the formation of a new hydration of acicular morphology was observed to occur on the surface of the first-formed hydrate. This transformation was accompanied by the disappearance of the first hydrate layer and the calcium hydroxide spheres.

Reaction Products from a Microwave Discharge In N2 and H2S. 1. The Microwave Spectrum of NS. Final rept.,

F. J. Lovas, and R. D. Suenram. 1982, 7p Pub. in Jnl. of Molecular Spectroscopy 93, n2 p416-422 Jun 82.

Keywords: *Microwave spectra, Molecular energy levels, Interstellar matter, Radio astronomy, Molecular rotation, Reprints, *Nitrogen sulfide.

The microwave spectrum of NS has been reinvestigated in order to provide more accurate molecular constants, and measured and predicted transition fre-quencies for radio astronomers. The analysis follows earlier studies but provides an improvement in the accuracy of the molecular constants which is essential for predicting higher frequency transitions for radio astronomy. The calculated transitions range up to the N=6-5 levels with an accuracy on the order of 1 MHz.

The redox and complexation reactions of S(IV) with transition metal ions was reviewed, with emphasis on the mechanism of the oxidation of S(IV). Primary emphasis was on the reactions of Fe(III), Cu(II), Mn(III), and Co(III), but others, such as Hg(II), Cu(III), and Ir(IV) were also discussed. The results were analyzed and the proposed mechanisms discussed. Suggestions were given for the experimental work needed to establish the mechanism of the oxidation of S(IV) by transition metal ions.

Dielectric Friction and ionic Mobility in Polar Liquids and Liquid Crystals.

Final rept.. J. B. Hubbard, R. F. Kayser, and P. J. Stiles. 1983,

Pub. in Chemical Physics Letters 95, n4-5 p399-401 1983.

Keywords: *Dielectric properties, *Liquid crystals, *Ionic mobility, *Mathematical models, Friction, Molecular relaxation, Comparison, Diffusion, Transport properties, Reprints, *Polar liquids.

The authors introduce a continuum model of dielectric friction on an ion in a polar liquid. This model couples hydrodynamic motions of the polarized solvent to dielectric relaxation by both rotational diffusion and translational diffusion of solvent molecules. They show that in solvents with sufficiently long dielectric relax-ation times, translational diffusion is the dominant relaxation mechanism. They compare their predictions with experimental data on ion mobilities in nematic liquid crystals.

PB85-197515 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Preparation and Certification of Standard Reference Materials to Be Used in the Determination of Retained Austenite in Steels.

Final rept.,

G. E. Hicho, and E. E. Eaton. 1983, 4p Pub. in Advances in X-Ray Analysis 26, p137-140 1983.

Keywords: *Chemical analysis, *X ray fluorescence, *Austenite, *Steel constituents, *Stainless steel, Standards, X ray analysis, X ray diffraction, Calibrating, Reprints, *Standard reference materials.

X-ray Standard Reference Materials have been pre-pared to aid diffractionists in their determination of retained austenite in hardened steels. Using powder metallurgical techniques, two groups of powder compacts, containing nominally 5, and 30% austenite in a matrix of ferrite, were prepared from 310 austenitic stainless steel and 430 ferritic stainless steel powders. The compacts, approximately 21 mm diameter, 3 mm thick, were subsequently ground, polished, and characterized. The significant difference in nickel contents acterized. The significant difference in nickel contents of each component, 20 weight percent in the 310 as compared to .09 in the 430, allowed the use of X-ray fluorescence to determine the weight percent nickel on each compact's surface. Compacts were then ranked from lowest to highest nickel content and a predetermined number of samples were selected from each population in order to establish calibration curves. Each calibration curve related the weight percent nickel, as determined by X-ray fluorescence to cent nickel, as determined by X-ray fluorescence, to the area percent austenite as determined by quantita-tive metallographic examination of a compact's stained surface. Using the calibration curve, the area percent austenite (i.e., volume percent) was subsequently assigned to each corresponding weight percent nickel. A number of specimens were selected from each group and the volume percent austenite was determined by X-ray diffraction. Results show good agreement with the value obtained from the calibration curve for these compacts.

Pub. in Proceedings of Symposium on Thermophysical
Properties (8th), Gaithersburg, MD., June 15-18, 1981,
Volume 1: Thermophysical Properties of Fluids, p368376 1982 376 1982.

Keywords: *Thermodynamic properties, *Surface chemistry, *Ethylene, *Critical point, Equations of state, Scaling, Fluids, Speed of sound, Vapor pressure, Comparison, Experimental design, PVT properties.

The anomalous thermodynamic behavior of fluids near the critical point is described by a thermodynamic potential the authors introduced before. It has the following features: dependent and independent variables are intensive; the thermodynamic properties are analytic throughout the one-phase region except at the critical point; the asymptotic critical behavior is described by Ising-model critical exponents; liquid-vapor asymmetry is incorporated by means of 'mixing of variables'; one correction term to asymptotic scaling is used. A complete formulation of thermodynamic properties is presented here. For ethylene, the thirteen adjustable parameters in the potential were determined by a fit to PVT, vapor pressure and speed-of-sound data. Comparison with experimental data and with other recent formulations are presented.

New Representation for Thermodynamic Properties of a Fluid.

Final rept.,

F. Kohler, and L. Haar. 1981, 7p Pub. in Jnl. of Chemical Physics 75, n1 p388-394, 1 Jul

Keywords: *Fluids, *Thermodynamic properties, Equations of state, Thermodynamic properties, Density(Mass/volume), Helmholtz free energy, Reprints, Virial coefficients.

It is proposed to consider the contribution of the nonisolated molecular pairs to the configurational Helmholtz' energy, i.e., the quantity f*/RT B(rho), where the product of second virial coefficient beta times molar density rho covers the contribution of the isolated pairs. The difference function can be correlated empirically in a simple way and can be used for estimating thermodynamic properties at intermediate and low densities from high density results.

500,220 PB85-197689 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Electrodynamics of an Ion Near the Surface of a **Conducting Dielectric.** Final rept.,

R. F. Kayser, and J. B. Hubbard. 1982, 10p Pub. in Jnl. of Chemical Physics 77, n9 p4704-4713, 1 Nov 82.

Keywords: *Electrodynamics, *Surfaces, *Ions, *Solids, *Dielectric properties, Conductivity, Reprints.

The authors investigate the electrodynamic phenomena associated with an ion moving near the flat surface of a conducting dielectric solid, where the

medium containing the ion has an arbitrary dielectric constant, and the solid has a surface conductivity which is independent of its bulk conductivity. For a fixed ratio of surface to bulk conductance, they show that the frictional drag on the ion is dominated by surface dissipation if the ion is sufficiently close to the surface, while bulk (i.e., ohmic) dissipation is the dominant drag mechanism at large distances. The energy dissi-pation turns out to be independent of the dielectric constants of the two media, given that dielectric dis-persion effects are neglected.

Pub. in Jnl. of Dental Research 64, n1 p2-5 Jan 85.

Keywords: *Hydrolysis, *Calcium phosphates, pH, Temperature, Dential materials, Reaction kinetics, Thermodynamics, Chemical reactions, Reprints, *Apa-

Effects of temperature (25 and 37C), pH (4.9-10.5) and CaF2 on CaHPO4:2H2O (DCPD) hydrolysis were studied in a pH-stat. Octa-calcium phosphate (OCP) was the product at pH 6.2-6.8 and 25-37C; thermodynamically stable apatitic compounds were formed at higher pH and/or higher temperature. In the presence of CaF2, apatite was the product, its crystallinity improved, and the fluoride content increased as pH of the reaction decreased. The results demonstrate the remarkable ability of fluoride to promote the hydrolysis of an acidic calcium phosphate, DCPD, to apatite.

Final rept., W. R. Schell, J. R. Swanson, and L. A. Currier. 1983, Pub. in Radiocarbon 25, n2 p621-628 1983.

Keywords: *Anthropology, *Sediments, *Water pollution, *Radiocarbon dating, Lakes, Air pollution, Concentration(Composition), Fuel consumption, Industrial wastes, Fallout, Reprints, *Lake Washington, Seattle(Washington).

An example of how man's contaminants are intro-duced, deposited and retained in sediments giving a chronological record of events has been developed for Lake Washington, Seattle. Introduction of significant amounts of both inorganic and organic compounds into the environment have been identified as originating from fossil fuel sources-such as power plants and motor vehicles. However, many organic compounds are introduced also from contemporary biogenic materials. Through the application of the combined carbon isotope analysis technique (CCIA), the authors can disisotope analysis technique (CCIA), the authors can distinguish between fossil and contemporary carbon source classes (using 14C), and they can identify certain sources within each of these classes (using 13C). In order to establish the chronology of the organic carbon pollutant input to the lake sediment, the ages of the layers have been determined using 210 Pb dating techniques. The pattern observed in the sediment thus reflects the change in the local energy consumption pattern from a predominately coal to an oil sumption pattern from a predominately coal to an oil based economy. From the plutonium profile they infer that mixing occurs for three or four years before the sediment layers are compacted.

Laser Production of a Very Slow, Monoenergetic Atomic Beam.

J. V. Prodan, W. D. Phillips, and H. Metcalf. 1982, 5p Sponsored by Office of Naval Research, Arlington, V Pub. in Physical Review Letters 49, n16 p1149-1153, 18 Oct 82.

Keywords: *Atomic beams, *Sodium, Laser beams, Velocity, Spectroscopy, Reprints, Laser cooling, Laser trapping, High resolution.

Using a resonant, counterpropagating laser beam, the authors have reduced the velocity of atoms in a neutral, thermal sodium beam to 40 m/s, or 4% of their initial velocity. These atoms have a kinetic energy comparable to the well depth of proposed optical traps. The 'temperature' characterizing the atoms' relative-motion was reduced to 70mK.

500,237 **PB85-20202**6 Not available NTIS National Bureau of Standards, Gaithersburg, MD Dispirations, Disclinations, Dislocations, and Chain Twist In Polyethylene Crystals.

D. H. Reneker, and J. Mazur. 1983, 14p Pub. in Polymer 24, n11 p1387-1400 1983.

Keywords: *Polyethylene, Molecular structure, Reprints, *Polymeric chains, *Molecular conformation.

It is proposed that the twist in polyethylene chains that can result from crystallization and subsequent defor-mation aggregates at boundaries and becomes a template for further reorganization that results in the long period observed in polyethylene fibers. The observed lower density at the boundaries requires the transport of free volume to the twist boundaries. Dispirations, disclinations, and dislocations are crystallographic defects that provide the necessary transport mechanism. Twist and bend, derived from the Eulerian angles-which are computed from the sets of chain internal coordinates, relate the orientation of different segments of a chain. Twist and bend are useful for the characterization of both crystallographic defects and arbitrary conformations of polymer chains. Defects, along with folds, chain ends, and ordinary edge and screw dislocations provide a basis for interpretation of structure-property relationships in solid polyethylene.

PB85-202042 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Cell Model Theory of Polymer-Solutions.

Final rept., I. C. Sanchez, and D. J. Lohse. 1981, 7p Pub. in Macromolecules 14, n1 p131-137 1981.

Keywords: *Polymers, *Solutions, Thermodynamics, Scaling, Reprints, *Cell model, Virial coefficients, Chemical potentials, Numerical solution, Flory Huggins theory.

An incompressible, statistical thermodynamic theory of a polymer solution is formulated, which takes into account concentration in homogeneities. A generalized cell model is used as the basis for the new polymer solution theory. Closed-form, parametric equations are obtained for solvent and polymer chemical potentials which only reduce to classical (Flory-Huggins) potentials when concentration homogeneity is assumed. In a

good solvent, the calculated second virial coefficient decreases with molecular weight M(sup -1/5) dependence) in good agreement with available experimental data. In dilute solutions, chain dimensions can be analytically determined; the well-known Flory excluded volume equation is obtained. The most important parameter in the cell model is the average number of chains/cell, lambda. For semi-dilute solutions (lambda << 1), it is shown that several important scaling results are recovered from a simple scaling hypothesis for lambda.

Not available NTIS PB85-202620 National Bureau of Standards, Gaithersburg, MD. Adsorption of Water on Aluminum(111).

F. P. Netzer, and T. E. Madey. 1983, 8p Pub. in Surface Science 127, n1 pL102-L109 1983.

Keywords: *Water, *Adsorption, Aluminum, Surface chemistry, Reprints, Electron stimulated desorption ion angular distributions, Low energy electron diffraction, Auger electro spectroscopy.

The adsorption of H2O on Al(111) has been studied by ESDIAD (electron stimulated desorption ion angular distributions), LEED (low energy electron diffraction), AES (Auger electron spectroscopy) and thermal desorption in the temperature range 80-700 K. The general behavior of H2O adsorption on clean and oxygenprecovered Al(111) (theta (sub 0) < or about mono-layer) is rather similar at low temperature, but a much higher reactivity for dissociative adsorption of H2O is noted on the oxygen-dosed surface around room temperature.

ometrles. Final rept.,

D. E. Newbury, and R. L. Myklebust. 1984, 11p
Pub. in Proceedings of Pfefferkorn Conference on
Electron Beam Interactions with Solids for Microscopy, Microanalysis and Microlithography (1st), Monterey, CA., April 18-23, 1982, p153-163 1984.

Keywords: *Electron scattering, *Electron probes, Monte Carlo method, Elastic scattering, Backscattering, X ray analysis, Spatial distributions, *Electron electron interactions, *Microprobe analysis, *Monte Carlo simulation, Numerical solution, Scanning electron microscopy.

Implementing a Monte Carlo simulation for application to electron sample interactions requires use of accurate treatments of elastic and testing must be carried out to ensure that the calculation yields sensible and useful results. A suitable testing procedure includes calculation of (1) electron backscatter coefficients as a function of atomic number, including any necessary adjustment of scattering parameters (2) backscatter coefficients as a function of speciment tilt; (3) backscatter and transmission coefficients for thin foils; (4) backscattered electron energy distributions; (5) electron spatial distributions; and (6) x-rays, including x-ray depth distributions and relative and absolute yields. Adapting a Monte Carlo simulation to a particular problem involving special sample geometry requires careful consideration of the interaction of the electron with the target. When the electron trajectory crosses a boundary, the segments of the trajectory in each phase must be calculated in a logical, stepwise fashion, allowing for modification of the step lengths due to variable scattering power in phases of different composition. The particular example of a planar boundary between phases of different composition is considered.

National Bureau of Standards, Gaithersburg, MD. Crystal Growth Kinetics and the Lateral Habits of Polyethylene Crystals.

Final rept., E. Passaglia, and F. Khoury. 1984, 14p Pub. in Polymer 25, n5 p631-644 1984.

Keywords: *Polyethylene, *Crystal growth, *Reaction kinetics, Polymers, Lateral stability, Surface energy, Reprints.

For polyethylene crystals the aspect ratio r of the crystal dimensions in the a and b crystallographic direc-

tions depends on temperature, undercooling, solvent, concentration, and molecular weight. At steady state growth, r can be expressed in terms of the ratio of growth rates normal to the (110) and (100) faces. Writing the growth rates in terms of the kinetic theory of crystal growth yields an expression which is used to analyze experimental results for crystallization from

Hydrocarbon Type Separation of Lubricating Base
Oil In Multigram Quantity by Preparative HPLC.

Final rept., P. Pei, J. Britton, and S. M. Hsu. 1983, 19p Pub. in Jnl. of Liquid Chromatography 6, n4 p627-645

Keywords: *Lubricating oils, *Chemical analysis, *Hydrocarbons, Aromatic compounds, Reprints, High performance liquid chromatography.

A preparative HPLC method has been developed to separate lubricating base oil into its three major hydro-carbon fractions: saturates, aromatics and polars. The results are directly comparable to ASTM Method D2007, 'Hydrocarbon Type Analysis by Gradient Elution Liquid Chromatography.' The new method employs a prep HPLC unit with equal dual, radically compressed columns consisting of clay and alumina/silica gel columns. Depending on the solvent elution schemes, minor components (1 to 2% by wt.) of a base oil can be isolated in multigram quantities for fur-

Solld-State Structures of Keto-Disaccharides as
Probed by Carbon-13 Cross-Polarization, 'Magic-Angle' Spinning NMR Spectroscopy. Final rept.

P. E. Pfeffer, K. B. Hicks, and W. L. Earl. 1983, 13p Pub. in Carbohydrate Research 111, n2 p181-193

Keywords: *Isotopic labeling, *Nuclear magnetic resonance, *Saccharides, Solid state physics, Carbon 13, Crystal structure, Reprints, *Cross polarization magic angle spinning, Lactulose, Maltulose.

The 15 MHz(13)C cross-polarization magic angle spinning (CP-MAS) spectra of maltulose H2O and anhydrous lactulose were examined at different B(sub 0) and B(sub 1) field strengths. While the lactulose spectrum was insensitive to changes in these parameters, the maltulose spectrum showed significant responses. From selective relaxation experiments, a mixture of three 'forms' (based on the ratio of the C-2' carbon resonances) of both lactulose and maltulose were shown to exist in the solid state. the (1/sup H)360 MHz DMSO-OH solution spectra of the unmutarotated disaccharides were used to establish the isomeric and anomeric composition of these crystalline solids. The the composition of lactulose, as determined by the (1 sup)H DMSO-OH spectrum, correlated well with the CP-MAS data, however, the spectrum of unmutarotated maltulose showed the presence of only a single beta-pyranose form anomer. Based on the ratio of the lactulose, tautomore determined from the (1 sup)H lactulose tautomers determined from the (1 sup)H

500,244 27

Group 7D—Physical Chemistry

DMSO-OH spectrum (referenced to fructose), the C-2' carbon resonances representing each anomeric form of lactulose were assigned in the CP-MAS spectrum. A 'crossover' in chemical shift positions of the anomeric resonances was observed in going from solution to solid state. Furthermore, a pronounced increase in the proportion of the furancial anomers was noted for lactulose in the crystalline state relative to solution.

Stress Relaxation of Polyvinylidene Fluoride in Final rept...

J. C. Phillips, A. Peterline, and P. F. Waters. 1983, 7p Pub. in Polym. Mater. Sci. Eng. 49, p555-561 1983.

Keywords: *Stress relaxation, Diffusion, Sorption, Vapor pressure, Reprints, *Vinylidene fluoride polymers, Acetic acid/(ethyl-ester).

In general, the presence of a vapor or gas in a polymer matrix enhances the stress relaxation of the polymer. The diffusion process at a given strain level may also be affected by the relaxation process. By studying diffusion and relaxation simultaneously, one obtains useful information of the concurrent processes. Polyvinylidene Fluoride in Ethyl Acetate vapor was studied at 30C for different vapor pressures at a given strain level. The results indicate that the time-dependent changes due to the sorption are reflected in the stress relaxation. These effects are also enhanced by polymer anisotropy and with the equilibrium concentration of the sorbate which is roughly proportional to the vapor pressure.

Rotational Collisional Narrowing in the NO Fundamental Q Branch, Studied with cw Stimulated Raman Spectroscopy.

Final rept.,

W. Lempert, G. J. Rosasco, and W. S. Hurst. 15 Nov 84, 5p Pub. in Jnl. of Chemistry Physics 81, n10 p4241-4245,

15 Nov 84.

Keywords: *Raman spectroscopy, *Nitrogen oxide(NO), *Molecular rotation, Spectral lines, Line width, Inelastic scattering, Reprints.

Self-broadened NO Q-branch spectra were obtained in the pressure region about 20-100 kPa. The authors determined J-and omega-dependent pressure broadening coefficients. The observed collisional narrowing was fitted by means of a relaxation matrix theory, incorporating recent experimental and theoretical values of NO state-to-state rates. A 'fitting law' representation of the state-to-state rates yielded good agreement with both the measured broadening coefficients and the observed spectrum.

Kinetic Isotope Effect in the Thermal Dehydration of Cellobiose.

Final rept., M. D. Scheer. 1985, 6p Pub. in Fundamentals of Thermochemical Biomass Conversion, p89-94 1985.

Keywords: *Dehydration, *Reaction kinetics, *Isotope effect, *Cellobiose, Water, Deuterium compounds, Hydrogen, Reprints.

The rates of dehydration of cellobiose, with 50% deuteration of its hydroxyl hydrogens, were measured in the 190-250 C temperature range. These rates were found to be smaller and the liquefaction temperature about two degrees higher than was the case for ordinary cellobiose. This is shown to be quantitatively consistent with the previously proposed view that the process of 'melting with decomposition' is an aqueous dissolution of the sugar and its decomposition products in the eliminated water. It is also shown that the rates of elimination of D2O relative to H2O and HDO cannot be accounted for by consideration of the difference in zero point energies. It is concluded that there is a significant quantum mechanical tunnelling contribution to the rates of saccharide dehydration at the relatively low temperatures of these experiments. 500,248 PB85-202836 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Fluorescence Measurements of Diffusion in Polymer Systems.

Final rept.,
F. W. Wang, R. E. Lowry, and E. S. Wu. 1984, 18p
Pub. in Proceedings of Transport Phenomena: Migration of Gases, Liquids, and Solids in Elastomers,
Denver, CO., October 24, 1984, 18p.

*Fluorescence, *Diffusion coefficient, *Phenylene diamine/N-N-diphenyl, compounds, *Phenylene diar *Thiophene/di(butyl-benzoxazolyl).

The diffusion coefficients for two antioxidants N, N'-diphenyl-p-phenylene-diamine (DPPD) and 2,5-di(5-tert-butyl-2-benzoxazolyl)thiophene (Uvitex OB) have been measured by extraction from a low density poly-ethylene film into 1-propanol at 22C. Extraction was done in a special cuvet-equipped vessel which ex-cludes oxygen during extraction and permits direct fluorescence monitoring of the extraction solvent.

Oxygen exclusion eliminates errors due to fluorescence quenching and antioxidant oxidation and allows precise measurement of the diffusion coefficient. The self-diffusion coefficient of a polystyrene polymer in diethyl phthalate was measured as a function of polymer concentration. The concentration dependence of the self-diffusion coefficient was found to agree with the predictions of the scaling concepts.

Uniformly Valid Asymptotic Solutions of Chemical Rate Equations for Irradiation-Produced Point Defects.

Final rept.,

R. E. Mickens. 1983, 9p Pub. in Acta Physica Polonica A 64, n1 p59-67 Jul 83.

Keywords: *Reaction kinetics, *Mathematical models, *Asymptotic series, *Point defects, Irradiation, Reprints, Numerical solution.

The authors present a perturbation technique for obtaining solutions to a pair of nonlinear coupled differential equations which model the behavior of the kinetics of irradiation-produced interstitials and vacancies. The procedure eliminates secular terms at each stage of the calculation; consequently, the solutions are uniformly valid for 0 < or = t < infinity.

PB85-202877 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Comparative Rate Single Pulse Shock Tube Studies on the Thermal Stability of Polyatomic Molecules.

Final rept.,

W. Tsang. 1981, 71p Pub. in Shock Tubes and Chemistry, p59-129 1981.

Keywords: *Thermal stability, *Polyatomic molecules, *Shock tubes, *Chemical bonds, *Bonding strength, Heats of formation, Decomposition, Polymers, Re-

The comparative rate single pulse shock tube technique is shown to offer unique advantages for the de-

termination of unimolecular rate parameters for the transformations of polyatomic organic molecules. The results derived from this method on bond fissions, complex fissions and isomerizations are summarized. Particularly noteworthy are the regularities and interrelationships in the rate parameters. Results on the bond fission reactions have led to rates that are much lower than originally expected. This is brought about by smaller A-factor (for the alkanes) and higher carboncarbon bond energies. The former is suggestive of a transition state that grows 'tighter' with temperature, while the latter calls into question heats of formation of organic radicals determined by metathesis reactions. It is demonstrated that the new bond energies provide a much sounder basis for the biradical mechanism for cis-trans isomerization and small ring decyclization. Directions for future work are indicated.

Dynamic Behaviour of the Pople and Karasz Model.

Final rept.

P. H. E. Meijer, and M. Keskin. 1984, 8p Contract N00014-78-C-0518, Grant NATO-1928 Pub. in Jnl. of Physics and Chemistry of Solids 45, n8-9 p955-962 1984.

Keywords: *Crystallization, *Plastics, *Dynamics, *Mathematical models, Reprints, *Pople karasz model, *Most probable path method.

Using the Pople and Karasz model for the solidification of plastic crystals, the authors construct two different sets of dynamic equations for the translational and ro-tational order parameters. The first is straight general-ization of the Pople and Karasz model, whereby one coupling parameter is a function of the other, and vice versa. The second generalization is based on the most probable path method of Kikuchi. In order to accomplish this they start with an appropriate transformation of the parameters. It is then shown that it is necessary to incorporate the special-angular correlation in order to apply this method. Computations for both systems of equations are given to demonstrate the behavior of the long range order parameter if it is initially far from equilibrium.

Transduction Phenomena in Ferroelectric Polymers and Their Role in Pressure Transducers. Final rept.,

A. S. DeReggi. 1983, 6p

Sponsored by Army Research Office, Arlington, VA. and Office of Naval Research, Arlington, VA. Pub. in Ferroelectrics 50, p21-26 1983.

Keywords: *Transducers, *Piezoelectricity, *Pyroelectricity, *Ferroelectric materials, *Polymers, Adiabatic conditions, Heat transfer, Reprints, *Vinylidene fluoride polymers.

The facts (1) that the piezo and pyroelectricity of polyvinylidene fluoride (PVF2) is largely secondary and (2) that polymers in general have large thermal expansion coefficients, are responsible for tranduction properties where piezo and pyroelectric effects may have to be considered together. In particular, in a PVF2 transducer subjected to compression, the adiabatic compressional heating of the polymer is calculated to give a pyroelectric response amounting to approximately -10 percent of the isothermal piezoelectric response to the same compression. The thermal time constant governing the heat exchange between the polymer and its surrounding thus is an important design parameter. This time constant sets a crossover frequency between adiabatic and non-adiabatic response.

PB85-205292 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Poly-

Transduction Phenomena in Ferroelectric Polymers and Their Role in Biomedical Applications. Final rept.

A. S. DeReggi. 1984, 23p Sponsored by Army Research Office, Arlington, VA. and Office of Naval Research, Arlington, VA. Pub. in Ferroelectrics 60, p83-105 1984.

*Ferroelectric materials, *Polymers, Keywords: *Transducers, *Piezoelectricity, *Pyroelectricity, Heat transfer, Adiabatic conditions, Polyvinyl fluoride, Reprints, *Vinylidene fluoride polymers, Biomedicine.

Ferroelectric polymers such as polyvinylidene fluoride, polyvinyl fluoride, and several copolymers and blends when poled have pressure and temperature transduction properties which are related mainly to volume changes. Because of compressional heating effects, the pressure response includes both piezoelectric and pyroelectric terms, the latter representing nominally a - 10 percent effect under adiabatic conditions. At low frequencies, where there is enough time in a cycle period for significant heat to be exchanged between the polymer and the surroundings becomes relevant as well as the compressional heating of the surround-ings. For sensors in good thermal contact with thermally conducting surroundings, the time constant for internal thermal equilibration of the polymer becomes relevant also along with the polarization distribution function, unless the latter is uniform. The piezoelectric response of thin tubes, balloons and caps is discussed within the dipole density model for which the response is determined by thickness changes.

Two-Photon Induced Fluorescence of the Tumor
Localizing Photosensitizer Hematoporphyrin Derivative via 1064 NM Photons from a 20 NS QSwitched Nd-YAG Laser.

Final rept..

R. Bodaness, and D. King. 16 Jan 85, 6p Pub. in Biochemical and Biophysical Research Com-munications 126, n1 p346-351, 16 Jan 85.

Keywords: *Fluorescence, *Hematology, *Porphyrins, *Photochemical reactions, *Chemotherapy, Biochemistry, Excitation, Photons, Reprints, *Cancer, Laser applications.

The authors demonstrate the direct 1064 micrometers two-photon excitation of hematoporphyrin derivative (HPD), a complex mixture of photosensitizing porphyrins which is selectively retained in tumor tissue and used in cancer photochemotherapy. Although 1064 micrometers is outside of the one-photon HPD absorption spectrum, two-photon induced fluorescence from HPD was observed following excitation by the 20 ns output of an amplified, Q-switched Nd-YAG laser at peak power levels of 0.1 to 3 GW/sq cm. Evidence for the successful two-photon excitation to vibrational levels of the S1 state consists of the observation of the known HPD fluorescence spectrum exhibiting peaks at approximately 615 and 675 micrometers, with the observed two-photon induced fluorescence intensity exhibiting a quadratic dependence on the excitation laser intensity as required for a direct two-

Group 7D—Physical Chemistry

photon process. More generally, these results suggest the possibility for the achievement of photosensitized oxidations utilizing photons of lower energy than that required for single photon excitation, offering the potential for both greater selectivity and a reduction in competing photochemical processes.

SANS (Small-Angle Neutron Scattering) and SAXS (Small-Angle X-ray Scattering) Studies on Molecular Conformation of a Block Polymer in Microdomain Space.

H. Hasegawa, T. Hashimoto, H. Kawai, T. P. Lodge, and E. J. Amis. 1985, 12p
Pub. in Macromolecules 18, n1 p67-78 1985.

Keywords: *Neutron scattering, *X ray analysis, *Polymers, Polystyrene, Polyisopyrene, Reprints, *Molecular conformation, *Small angle scattering.

The molecular conformation of a block polymer chain in a microphase-separated domain space (a confined space) was studied by small-angle neutron scattering (SANS) with a deuterium labeling technique. The sam ples studied were polystyrene-polyisoprene diblock polymers, and they have a morphology of highly orient-ed alternating lamellar microdomains composed of polystyrene (PS) and polyisoprene (PI) in bulk when cast from dilute solutions in toluene. Conclusion (iii) does not mean at all that the chains in domain space are unperturbed but rather that they are strongly perturbed. The lateral contraction was proposed to be the consequence of the repulsive potential between the centers of block chains which are located in narrow interfacial regions (i.e., essentially in the two-dimensional space). A residual 'memory' of the repulsion in the bulk block polymer could be a consequence of the two-dimensionality of the space available to chemical junctions of the block polymers and/or an effect of re-pulsive potential (which existed in the polymer solution with a good solvent) being 'locked-in' at high polymer concentrations.

Ionization Energies and Entropies of Cycloalkanes: Kinetics of Free Energy Controlled ChargeTransfer Reactions.

Final rept., L. W. Sieck, and M. Mautner. 1982, 5p Pub. in Jnl. of Physical Chemistry 86, n18 p3646-3650

Keywords: *Cyclohexanes, *Reaction kinetics, *Free energy, *Ionization, Chemical equilibrium, Mass spectroscopy, Enthalpy, Entropy, Thermodynamic properties, Reprints.

Enthalpies and entropies of ionization (delta H ion and delta S ion) of alkylcyclohexanes, as well as cycloheptane, cylooctane, and trans-decalin, have been determined by charge transfer equilibrium measurements. A major effect of alkyl substitution is observed following substitution at a site alpha to a tertiary hydrogen atom (as from mehtyl-cyclohexane to 1,2-dimenthylcyclohexane), or following replacement of a tertiary hydrogen atom (as from methylcyclohexane to 1,1-dimethylcycohexane). The charge transfer reactions involving the cycloalkanes are shown to be fast processes; i.e., the sum of the reaction efficiencies (r=k/k(collision)) of the forward and reverses processes is near unity. The efficiencies of these processes appear to be determined uniquely by the overall free energy change (or equilibrium constant K).

500,266 PB85-205656 Not available NTIS National Bureau of Standards, Gaithersburg, MD Catalysis by Carbides, Nitrides and Group VIII Intermetallic Compound. Final rept.,

S. T. Oyama, and G. L. Haller. 1982, 33p Pub. in Catalysis 5, p333-365 1982.

Keywords: *Catalysis, *Carbides, *Nitrides, *Group 8 compounds, *Intermetallics, Physical properties, Chemical properties, Decomposition, Reaction, Oxidation, Hydrogenation, Isomerization, Hydrolysis, Ammonia, Reprints, Fischer Tropsch synthesis.

A review is presented of catalysis by carbides, nitrides, and Group VIII intermetallic compounds. The catalytic

and other properties of transition-metal carbides and nitrides are discussed for oxidation, hydrogenation, dehydrogenation, isomerization, hydrolysis, Fischer-Tropsch synthesis, and ammonia synthesis. A similar discussion is presented for catalysis by binary compounds of Group VIII metals and lanthanides or actinides. It is not clear at this time whether the unique properties of the latter catalysts are due to the method of preparation (e.g., the extent of decomposition) or to a particular metal-oxide interaction.

PB85-205664 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Bond Homolysis In High Temperature Fluids. S. E. Stein, D. A. Robaugh, A. D. Alfieri, and R. E. Miller. 1982, 4p Pub. in Jnl. of the American Chemical Society 104, n24

Keywords: *Reaction kinetics, *High temperature tests, *Fluids, Vapor phases, Liquid phases, Solutions, Chemical bonds, Chemical reactions, Reprints, *Ethane/diphenyl, *Free radicals, *Homolysis, *Cage effect(Chemistry).

p6567-6570 1982.

Rate constants for the homolysis of 1,2-diphenylethane have been determined in tetralin, in dodecahydrotriphenylene and in the gas phase at temperatures above 350C. The arrhenius expression for this reaction in the gas phase has been found consistent with available thermo-kinetic data. In liquid tetralin up to its criti-cal temperature and in liquid dodecahydrotriphenylene Arrhenius parameters for this reaction were found to be distinctly higher than gas phase values and rate constants to be somewhat lower. Differences between gas and liquid phase kinetics are attributed to recombination of nascent free radicals in solution (the 'cage effect'), the probability of which decreases with decreasing viscosity.

Dielectric Saturation and Dielectric Friction In **Electrolyte Solutions.** Final rept.,

P. J. Stiles, J. B. Hubbard, and R. F. Kayser. 1982,

Pub. in Jnl. of Chemical Physics 77, n12 p6189-6196

Keywords: *Dielectric properties, *Ion currents, *Electrolytes, Solutions, Electrohydrodynamics, Comparison, Experimental design, Reprints, Numerical solu-

Electrohydrodynamic equations developed by Hubbard and Kayser to account for the combined effects of dielectric saturation and dielectric friction on ionic motion in polar solvents are solved numerically to yield ionic conductances. Dielectric saturation is incorporated into this continuum treatment through a phenomenological relationship between the electric permittivity and field strength. The results of the analysis are criti-cally tested by comparison with experimental conductance data.

500,269 PB85-205722 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Laser Intensity Dependence of Multiphoton Excitation vs. Collisional Relaxation in Chlorodifluoromethane and Chlorotrifluoroethylene. Final rept.,

J. C. Stephenson, J. A. Blazy, C. Li, and D. S. King. 1982, 6p Pub. in Jnl. of Chemical Physics 76, n12 p5989-5994

Keywords: *Molecular relaxation, Excitation, Reprints, Methane/chloro-difluoro, *Ethylene/chloro-trifluoro, *Laser induced fluorescence, *Multiphoton processes, *Molecular photon interactions.

CO2 laser pulses for which the intensity vs. time profile is rectangular (10 or 50 ns duration) were used in the multiphoton excitation of CF2HCl and CF2 CFCl dilute in high pressure (400 Torr) argon. Energy deposition mas measured by optoacoustic detection, and CF2 product yield by laser-excited fluorescence. Even at low yield (e.g. .001) more than 100 photons were absorbed per CF2CFCI molecule, while for an identical yield, CF2HCI absorbed 200 times less energy. For the same laser fluorescence, the higher intensity 10 micro-

seconds pulses gave more yield from CF2CFCI (facseconds pulses gave more yield from CF2CFCI (factors up to 500 were observed) than the less intense 50 microseconds pulses: for CF2HCI the two intensities give the same yield. For both molecules, the two intensities gave the same optoacoustic signal for a given fluorescence. These results are related to the dependence on reactant energy of the competing ratio of collisional deactivation to laser excitation.

Photon Stimulated Desorption of Ions from Water
and Methanol Adsorbed on a Titanium(0001) Sur-

Final rept.,
R. Stockbauer, D. M. Hanson, S. A. Flodstrom, E. Bertel, and T. E. Madey. 1983, 3p
Pub. in Physica Scripta 4, p126-128 1983.

Keywords: *Desorption, *Ions, Simulation, Water, Carbinols, Titanium, Surface chemistry, Reprints.

Synchrotron radiation has been used to study ion de-Synchrotron radiation has been used to study ion desorption from water and methanol adsorbed on a Ti(0001) surface, in an effort to understand ion desorption from covalently bonded systems. Both water and methanol dissociate upon adsorption on Ti at 300K. Using variable wavelength UPS, the species OH, O and H are observed for water and CH3O, C, O and H for methanol. No molecular species adsorb at 300K. At 20K dissociation, occurs initially to yield the same 90K, dissociation occurs initially to yield the same products, while at higher exposures, condensed overlayers are formed. PSD of ions from the two adsorbates show very different behavior. In the water experiment ion desorption is dominated by the dissociated species at both 300 and 90K. H(+) emission from dissociated water is correlated with the presence of OH on the surface while ion desorption from the ice multilayer is almost an order of magnitude less. In contrast, ion emission from the dissociated methanol is immeasurably low in our instrument while a large H(+) signal is observed from the condensed layer.

G. E. Walrafen, P. N. Krishnan, D. L. Griscom, R. G. Munro, and M. Hokmabadi. 1982, 7p See also AD-A116899.

Pub. in Jnl. of Chemical Physics 77, n8 p3840-3846

Keywords: *Raman spectra, *Reaction kinetics, *Catalysis, *Oxygen, Surface chemistry, Concentration(Composition), Reprints, *Trapped particles, *Boric acid/peroxy-(sodium-salt).

Raman spectra were obtained from NaBo3(4H2O) and NaBO3(H2O), from electron bombarded peroxyborateds from peroxyborated heated for various times and at temperatures from 110-180C and from solid Na2O2 and BaO2. The Raman spectra indicate that the breakdown of peroxy groups is accompanied by the formation of trapped molecular O2. Quantitative Raman intensity data were also obtained as functions of heating time at 110C for the 1556/cm lines whose intensities scale with the peroxy concentration. These intensity data were treated by logistics theory, and they were found to be consistent with a second-order auto-catalyzed forward reaction dependent on the product of the peroxy and trapped O2 concentrations, plus a first-order reverse reaction dependent upon the trapped O2 concentration.

Interpretation of Quasi-Elastic Light Scattering Data for Flexible Chains: Model Dependence.

Final rept., P. H. Verdier, and D. E. Kranbuehl. 1983, 4p Pub. in Polymer 24, n4 p383-386 1983.

Keywords: *Light scattering, *Mathematical models, *Elastic scattering, *Polymers, Dynamics, Molecular structure, Polarizability(Charge separation), Reprints, Polymer chains.

The autocorrelation functions and corresponding relaxation times obtained from the forward depolarized quasi-elastic light scattering experiment are exhibited

for two quite similar models of flexible polymer chains in solution. A very small change in the chain dynamics is found to be sufficient to change the relaxation time from a relatively short time independent of chain length, with an autocorrelation function suggestive of an unweighted sum of contributions from all the relaxation times in the spectrum of chain motion, to a long time with an autocorrelation function identical with those for the end-to-end vector, strongly dependent upon chain length and dominated by the longest relaxation time in the spectrum. These results raise the question whether widely-used models in which information about short-range chain structure and motion is deliberately omitted can be expected to be appropriate for the interpretation of depolarized scattering experiments.

M. Waxman, and J. S. Gallagher. 1983, 18p Pub. in Jnl. of Chemical and Engineering Data 28, n2 p224-241 1983.

Keywords: *Thermodynamic properties, Tables(Data), Pressure, Density(Mass/volume), Surfaces, Temperature, Reprints, *Virial coefficients, *Propane/methyl.

Tables of isobutane thermodynamic properties are presented for temperatures from 245 to 600 K and pressures from 0.1 to 40 MPa. The tables include saturation and isobaric properties; namely, pressure, specific volume, temperature, internal energy, enthalpy and entropy. The properties are defined by a specific thermodynamic surface, which is expressed analytically in the form of the Helmholtz energy as a function of temperature and density. The surface is developed from only pressure-density-temperature data. The appendix to the paper includes a summary of the correlation development and of new isobutane measurements, saturated vapor pressures and isothermal pressure-density-temperature data for temperatures of 377.59, 394.26, 423.15 and 448.15 K. The isothermal data are reported in the form of a virial series representation of the compressibility factor for pressures up to about 3.5 MPa and as correlated Burnett points for the higher pressures at 423.15 K. The data were used to assess the reliability of literature sources used in the correlation. Surface derived properties are compared with experimental data.

500.279 PB85-205938 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Laser Spectroscopy and Chemiluminescence from the Monomethoxides of Calcium, Strontium, and Barium.

Final rept., R. F. Wormsbecher, and R. D. Suenram. 1982, 14p Pub. in Jnl. of Molecular Spectroscopy 95, n2 p391-404 1982.

Keywords: *Chemiluminescence, *Vibrational spectra, Chemical bonds, Molecular structure, Reprints, *Laser spectroscopy, *Calcium methoxides, *Strontium methoxides, *Barium methoxides.

Production of the monomethoxides of Ca, Sr, and Ba (MOCH3) is described. The production scheme uses a metal vapor flow reactor in which the appropriate metal vapor is mixed with methylnitrite (CH3ONO) to produce the metal methoxides. Chemiluminescence spectra from these reactions is recorded, and features due the metal oxides, and mono-methoxide are observed. Dynamical aspects of these reactions are discussed. Laser excitation spectra are obtained for CaOCH3, CaOCD3, SrOCH3, SrOCD3, using a pulsed dye laser. Vibrational features are observed and assigned for all of the molecules. A summary of frequencies is given. The nature of the bonding and structural considerations of the monomethoxides are described in terms of a localized ionic bonding model which was used previously on the isoelectronic monohydroxides and monohalides of the alkaline-earths.

Two case studies applying the lead isotope ratio method to the identification of lead sources in twelve Oakland, CA children are presented. One study examined lead sources in ten children, ages 3 to 15 years, living together as an extended family in dilapidated housing close to a busy freeway. A second case study examined two-year old male twins, both with elevated blood lead and erythrocyte protoporphrin levels, living in a modest but well maintained inner city duplexapartment. Paint and surface soil samples collected in and around both households had high lead concentrations. The isotopic ratios of lead in the bloods of these children were close to the average lead ratios of paints from exterior walls and to the lead ratios of surface soils in adjacent areas where the children played. In both case studies, the data suggest that the lead in the soil was derived mainly from weathering of lead-based exterior paints and that the lead-contaminated soil was a proximate source of lead in the blood of the children.

SANS (Small Angle Neutron Scattering) Investigation into the Role of Melting and Recrystallization during Solid State Deformation of Polyethylene.

Final rept.,
G. D. Wignall, and W. Wu. 1983, 6p
Pub. in Polym. Communic. 24, n12 p354-359 1983.

Keywords: *Polyethylene, *Plastic deformation, *Neutron scattering, *Melting, *Crystallization, Molecular weights, Blends, Deuterium compounds, Reprints, *Small angle scattering, *Molecular conformation, *Solid state chemistry.

Small angle neutron scattering (SANS) has been used to investigate the role of melting and recrystallization in the solid state deformation of polyethylene. Blends containing 4.3 vol % deuteropolyethylene (PED) in normal polyethylene (PEH) have been prepared with

500,282 31

Group 7D—Physical Chemistry

non-random distribution of PED molecules in PEH. These blends show anomalously high apparent SANS molecular weights (M(sub w)) and radii of gyration, resulting from the correlations in the centers of gravity (clusters) of the PED molecules. A dramatic reduction in the SANS (M(sub w)) was observed in the specimens subject to plastic deformation in a temperature range (50-119C) where annealing alone is known not to affect (M(sub w)). A similar reduction in the apparent SANS-(M(sub w)) may be achieved by melting and rapidly quenching the blend. This implies that large scale reorganization takes place at the molecular level during deformation, with a consequent relative motion and randomization of the centers of gravity of the PED molecules. The implications of these findings are discussed in terms of the mechanisms involved in the plastic deformation process.

Model for the Saturated Water Bilayer on Ru(001) Based on a Comparison of Experimental and Calculated LEED Patterns. Final rept..

E. D. Williams, and D. L. Doering. 1983, 5p Pub. in Jnl. of Vacuum Science and Technology A 2, n2 p1188-1192 1983.

Keywords: *Mathematical models, *Water, *Adsorption, *Surface chemistry, *Molecular structure, Electrolytes, Electrochemistry, Comparison, Experimental design, Ruthenium, Electron diffraction analysis, Chemical bonds, Reprints, *LEED(Low energy electron diffraction), Electron stimulated desorption ion angular distributions, Numerical solution, Thermal desorption sorption.

A complex coverage- and temperature-dependent LEED pattern was observed for water adsorbed on clean Ru(001). This pattern has been modeled in terms of an antiphase structure of two-dimensional, hydrogen-bonded, bilayer domains. A computer simulation of the LEED patterns arising from this model structure gives good agreement with the experimental results. Other considerations in the model determination were based on simple water bilayer island models which were developed to explain experimental thermal desorption and electron stimulated desorption ion angular distribution data. This new insight into the molecular structure of adsorbed water on Ru may lead to a better understanding of the metal-electrolyte interface in electrochemistry.

Keywords: *X ray analysis, *Spectral energy distribution, *X ray fluorescence, Spectrometers, Chemical analysis, Oxides, Alloys, Minerals, Computation, Quantitative analysis, Fortran, Computer programs, Concentration(Composition), Standards, X ray tubes, Gamma radiation, *Alpha coefficients.

A FORTRAN program (NBSGSC) was developed for performing quantitative analysis of bulk specimens by x-ray fluorescence spectrometry. This program corrects for x-ray absorption/enhancement phenomena using the comprehensive alpha coefficient algorithm using the comprehensive alpha coefficient algorithm proposed by Lachance (COLA). NBSGSC is a revision of the program ALPHA and CARECAL originally developed by R.M. Rousseau of the Geological Survey of Canada. Part one of the program (CALCO) performs the calculation of theoretical alpha coefficients, and part two (CALCOMP) computes the composition of the analyte specimens. The analysis of alloys, pressed minerals, and fused specimens can currently be treated by the program. In addition to using measured x-ray ed by the program. In addition to using measured x-ray tube spectral distributions, spectra from seven commonly used x-ray tube targets could also be calculated with an NBS algorithm included in the program. NBSGSC is written in FORTRAN IV for a Digital Equipment Corporation (DEC PDP-11/23) minicomputer using RLO2 firm disks and an RSX 11M operating system.

During the past decade a number of interesting lowdimensional materials have been prepared which have been found to exhibit a combination of unusual proper-ties that are not generally observed in the conventional inorganic semiconductor and metallic systems. Optical diagnostics have provided a key method for obtaining important information about both molecular-metal and conducting polymer systems. For many of these systems the optical measurements and the methods of analysis have been carried out by D.B. Tanner, C.S. Jacobsen and their respective co-workers. At this laboratory the principal effort in this area has been devoted to the development of phthalocyanine based systems with various doping agents. It has been found that the phthalocyanine polymers possess a rather unique blend of properties that show considerable promise for applications. Optical reflectance studies have also provided valuable information about the phthalocyanine systems, but for many compounds single crystal samples have not been successfully prepared as yet. Thus the majority of the optical measurements have been performed on polycrystalline pressed powder compactions. Such specimens also have been used to provide information in other systems that could not be obtained from single crystal data alone.

Importance of Electron-Electron Correlation in the Calculation of Second-Order Nonlinear Optical Properties of Organic Molecules. The Case of

Included in OM85: Basic Properties of Optical Materials. Summaries of Papers, p150-153 Apr 85.

Keywords: *Molecular structure, *Optical properties, *Organic compounds, Excitation, Molecular energy levels, *Electron electron interactions, *Nonlinear optics, *Self constant field molecular orbitals, *SCF MO methods, *Single excitation configuration interactions tions.

In studies of nonlinear optical organic molecules, the theoretical understanding of the relation between the electronic structure of the molecule and the molecular electronic component of the second-order nonlinear optical susceptibility (the hyperpolarizability tensor, beta(i)(j)(k)) has been an important objective (1). The theoretical description of molecular electronic struc-ture improves with the theoretical treatment of elec-tron-electron correlation (EEC) in the molecule. Three general quantum mechanical molecular orbital (MO) general quantum mechanical molecular orbital (MO) formalisms (2) used to study molecular electronic structure, and ordered according to an improving treatment of EEC, are (1) the self-consistent-field (SCF)-MO method, (2) the SCF-MO method with single excitation configuration interaction (SCF-MO-SCI), and (3) the SCF-MO method with single and double excitation configuration interaction (SCF-MO-SDCI). The organic molecular selected for the authors initial theoretical molecule selected for the authors initial theoretical study was urea, (NH2)2C = 0, because its nonlinear optical response has been the subject of extensive theoretical and experimental investigations.

Fluorescence Quenching of Liquid Alkylbenzenes
Excited By Nonionizing and Ionizing Ultraviolet Radiation and By Beta-Radiation.

Final rept., F. P. Schwarz, and M. Mautner. 1983, 8p Pub. in Jnl. of Physical Chemistry 87, n25 p5206-5213 1983.

Keywords: *Benzenes, *Ultraviolet radiation, *Beta particles, *Photoionization, Fluorescence, Excitation, Xylenes, Molecular energy levels, Cations, Reprints, *Fluorescent quench principle, Benzene, Benzene/propyl, Mesitylene, Indan, Decylbenzene, Ion electron collisions. collisions, lon ion collisions.

At wavelengths above the photoionization wavelength, the CCI3H quenching of the benzene, toluene, o-

xylene, p-xylene, mesitylene, propylbenzene, isopro-pylbenzene, indane, and decylbenzene fluorescences results from quenching of the S1 state with quenching constants ranging from 0.6 plus or minus 0.1 M(-1) for benzene to 19 plus or minus 1 M(-1) for p-xylene. At wavelengths below the photoionization wavelength, the S1 fluorescence is generated from recombination of the aromatic cation-electron ion-pairs and the fluorescence yield increases to an average of 0.8 plus or minus 0.1 near 1450 A for the alkylbenzene derivatives. The CCI3H quenching of the recombination fluorescence results from quenching of the ion-pairs and the quenching constants increase from 0 near the estimated photoionization wavelength to a near constant value ranging from 3.0 plus or minus 0.2/M (mesitylene) to 1.7 plus or minus 0.2/M (indane) below 1450

Keywords: *Mathematical models, *Air pollution, *Incinerators, Combustion products, Forecasting, Sources, Reprints, *Dioxin(Herbicides), *Polychlorinated dibenzodioxins, *Chemical reaction mechanisms, Numerical solution, Polychlorinated biphenyls, Homogeneous reactions.

Processes which may contribute to the formation of polychlorinated dibenzo-p-dioxins (PCDDs) are examined. A model mechanism has been constructed to investigate the possibility for homogeneous gas phase formation of PCDDs from polychlorinated phenols in an incinerator environment. Numerical calculations have been performed. The results lead to the conclusion that the probability for gas phase formation of PCDDs is likely to be very low at high temperatures if mixing between fuel and air is efficient. Effects of use of auxiliary hydrocarbon fuel and excess air are examined. Probable sources of non-idealities are examined. The potential role of non-gas phase effects is consid-Conclusions are drawn regarding some future research needs.

Measurement of Relative Extreme-Wing Absorp-

tion Coefficients By Excited-State Degenerate Four-Wave Mixing.

Final rept., P. Ewart, and S. V. O'Leary. Nov 84, 8p Pub. in Jni. of Physics B: Atomic and Molecular Physics 17, n22 p4609-4616 1984.

Keywords: Helium, Neon, Argon, Excitation, Reprints, *Absorption coefficients, *Sodium atoms, *Degenerate four wave mixing.

The population of the 3P state in atomic sodium pro-The population of the 3P state in atomic sodium produced by absorption in the extreme blue wing of the D lines is measured by excited state degenerate fourwave mixing (ESDFWM). The strength of the ESDFWM signal is shown to give a measure of the pressure-broadened extreme-wing absorption coefficient alpha(omega). Relative values of alpha(omega) for the rare gases He, Ne and Ar are measured and compared with values calculated from theoretical interatomic potentials and from extreme-wing emission data. Very good agreement is found demonstrating the ability of the nonlinear technique to make accurate ability of the nonlinear technique to make accurate measurements of small excited-state densities with excellent spatial and temporal resolution. Advantages of the method for other applications are briefly discussed.

Absorption and Saturation Effects on Degenerate

Four-Wave Mixing in Excited States Formed during Collisions.

Final rept., P. Ewart, and S. V. O'Leary. Nov 84, 14p Pub. in Jnl. of Physics B: Atomic and Molecular Physics 17, n22 p4595-4608 1984.

Keywords: Helium, Neon, Argon, Excitation, Reprints, *Degenerate four wave mixing, Sodium atoms, Laser

Degenerate four-wave mixing (DFWM) in excited atoms is investigated as a probe of the excited state density produced by collision assisted transitions. Sodium atoms are excited to the 3P state by absorption of light in the extreme blue wing of the D lines in the presence of He, Ne and Ar perturbers. The rare gas-pressure dependence of the DFWM signals, resonantly enhanced by the 3P-4D transition, is studied to determine the regime where the signals give an unambiguous measure of the excited state (3P) density. The observed behavior is compared with a simple model of DFWM in absorbing media. Good qualitative agreement is obtained and the results illustrate the role of absorption, saturation and finite laser bandwidth. The technique allows small excited state densities (about 10 to the 9th power/cc) to be detected with good temporal and spatial resolution.

Study of Polycation-Anionic-Surfactant Systems. Final rept., P. S. Leung, and E. D. Goddard. 1985, 16p

Pub. in Colloids and Surfaces 13, p47-62 1985.

Keywords: *Polyelectrolytes, *Cations, *Anions, *Surfactants, *Neutron scattering, Copolymers, Molecular structure, Viscosity, Vinyl copolymers, Stability, Reprints, *Sulfuric acid/dodecyl-(sodium-salt), *Small angle scattering, *Molecule molecule interactions, *Ion molecule interactions, Polymer chains, Cellulose

An investigation of the interaction of sodium dodecyl sulfate (SDS) with two cationic polyelectrolytes, Polymer JR, a cationic cellulose ether, and Reten, a synthetic vinyl copolymer, is reported. The study emphasizes small angle neutron scattering but also includes viscosity and dye-solubilization measurements. The results indicate that small additions of SDS to Polymer JR of 1% concentration lead to intermolecular interactions between the polymer chains via the bound surfactant, whereas in the more flexible and globular vinyl polyelectrolyte, intramolecular interaction is favored. Just into the resolubilization zone, where excess anionic surfactant is present (approximately 1.5% SDS), Polymer JR favors a polymer micellar association, whereas the more flexible Reten polymer seems to stabilize a structure involving association of surfactant into smaller units, perhaps surfactant pairs. In both cases the characteristic interaction peak of SDS micelles is absent in the SANS profile. When the surfactant is in large excess (5%) this peak returns, i.e., micelles is a surfactant in large excess (5%) this peak returns, i.e., micelles is a surfactant in large excess (5%) this peak returns, i.e., micelles is a surfactant in large excess (5%) this peak returns, i.e., micelles is a surfactant pairs. cellar structures predominate in both systems, probably with the macromolecule woven into the micellar domains, resembling an entangled string of beads.

Gravimetric Technique for the Preparation of Accurate Trace Organic Gas Standards.

G. C. Rhoderick, W. F. Cuthrell, and W. L. Zielinski. 1985, 8p

Sponsored by Air Pollution Control Association, Pittsburgh, PA. and American Society for Quality Control, Inc., Milwaukee, WI.

Pub. in Proceedings of APCA/ASQC (Air Pollution Control Association/American Society for Quality Control) Speciality Conf. on Quality Assurance in Air Pollution Measurements, Boulder, Co., October 14-18, 1984, p239-246 1985.

Keywords: *Trace elements, *Gravimetric analysis, *Standards, *Hazardous materials, *Organic compounds, Chemical analysis Concentration(Composition), *Air pollution detection. analysis,

An accurate procedure based on micro-gravimetry has been used for the preparation of volatile, hazardous organic chemicals in a nitrogen matrix in pressurized gas cylinders at analyte concentrations ranging from 10 ppb to 10 ppm, by mole. In this technique, the organics of interest are individually weighed into sepaganics of interest are individually weighted into separate glass capillary tubes using a micro-analytical balance. A number of these gravimetric primary mixtures have been prepared and analytically intercompared using gas chromatography (GC) with flame-ionization detection (FID). The paper will focus on a description of the micro-gravimetric technique and the analytical system, and will discuss the estimation of specific uncertainties associated with the preparation of these mixtures and how these uncertainties are used to assign a net uncertainty to the final analyte concentration. Particular attention will be given to mixtures at the 10 to 150 ppb level. A brief description of how the overall network of gravimetric primary standards is used to provide data quality consistency for trace organic gas mixtures over the long-term is included.

Systematics of Multielement Determination with Resonance ionization Mass Spectrometry and Thermal Atomization.

Final rept., L. J. Moore, J. D. Fassett, and J. C. Travis. Dec 84,

Pub. in Analytical Chemistry 56, n14 p2770-2775 Dec

Keywords: *Chemical analysis, Mass spectroscopy, Metastable state, Excitation, Atomizing, Photoionization, Atomic energy levels, Reprints, *Laser spectroscopy, *Thermal atomization, *Resonance ionization spectroscopy.

The systematics for multielement determination using resonance ionization mass spectrometry and thermal atomization is developed. The aspects of atomization, ionization, and detection are discussed and resonance ionization is demonstrated for 19 elements. The selective, sequential ionization of seven elements from a single sample is also demonstrated. A one-wave-length, two-photon ionization scheme generally is used in which the first photon excites a bound transition in the near-ultraviolet region and second photon promotes the electron into the ionization continuum. The wavelength-dependent ion formation from the thermally produced atom reservoirs is demonstrated for these elements by scanning a Nd: YAG-pumped dye laser across its tunable wavelength range. The observed wavelengths where ionization occurs have been correlated where possible with allowed transitions between known electronic energy levels. The elements accessible by using four common dyes are tabulated. More than 20 elements are accessible within the wavelength of each dye.

Monte Carlo Studies of Two Measures of Polymer Chain Size as a Function of Temperature.

Final rept.. C. M. Guttman. Sep 84, 17p

Pub. in Jnl. of Statistical Physics 36, n5/6 p717-733 Sep 84.

Keywords: *Monte Carlo method, *Temperature, Radius of gyration, Reprints, *Polymer chains.

Monte Carlo simulations of single polymer chains with both excluded volume and nearest-neighbor interaction energies are discussed. Two measures of chain size are obtained in the simulation, the radius of gyration of the polymer chain and the inverse radius of the polymer chain. Both of these are reported as a function of temperature, or interaction energy, and chain length, N. The possibility of estimating the fractal dimensions of these measures from the Monte Carlo data is discussed in the context of two different interpolation functions for the temperature dependence of the fractal dimensions. The approach to the fractal di-mension as a function of chain length, N, is studied. It is suggested that the approach to fractal dimension of the measures of chain size of polymers is slow, perhaps a fractional power itself.

The chemical thermodynamic properties of alkane isomer groups from C4H10 to C10H22 have been calculated from 200 to 1500 K from Scott's tables of 1974. The numbers of stereoisomers in each isomer group have been checked and all of them have been included in the calculations. The following properties for alkane isomer groups have been calculated with energy in joules for a standard state pressure of 1 bar; standard heat capacity at constant pressure, standard entropy, standard enthalpy of formation, standard Gibbs energy of formation, standard enthalpy relative to isomer group at 298.15 K, and standard enthalpy relative to the elements at 298.15 K. Equilibrium mole fractions within isomer groups have been calculated for the ideal gas state from 200 to 1500 K. The four basic properties are given for all the individual isomers in joules for a standard state pressure of 1 bar. The properties of individual alkanes from C4H10 to C10H22 have also been calculated using the Benson group method and the resulting isomer group proper-ties and equilibrium mole fractions have been calculat-

Keywords: *Electron capture, *Electron transfer, lon exchanging, Atomic energy levels, Assessments, Mathematical models, Collisional energy transfer, Experimental design, Graphs(Charts), Atoms, Ions, Tables(Data), *Atom ion interactions, *Ion ion interactions, *Charge exchange reactions, *Charge transfer cross sections, Numerical solution, Ion-atom collisions

The theoretical cross-section data for single-electron capture in collisions of multiply charged ions with non-hydrogenic atoms are compiled and their accuracy is assessed. The energy per unit mass range considered is from about 1 eV/u to several MeV/u, u being the unified atomic mass unit. Accuracy is assessed using both pure theoretical arguments and comparison with experimental data, where available. A similar assessment is performed for the two-electron capture cross-section data in ion-atom collisions, as well as for single-and double-charge exchange in ion-ion collisions.

Photoionization of the H Atom in Strong Electric
Fields by Resonant Two-Photon Excitation.

K. H. Welge, and H. Rottke. 1984, 7p Sponsored by Optical Society of America, Washington,

Pub. in Proceedings of Topical Meeting on Laser Techniques Extreme Ultraviolet (2nd), Boulder, CO., March 5-7, 1984, American Institute of Physics Conference Procedures 119, p213-219 1984.

Keywords: Ultraviolet lasers, Electric fields, *Multiphoton ionization, *Hydrogen atoms, *Photoionization, Laser radiation, Tunable lasers.

The photoionization of the H atom in strong electric fields, F, by resonant two-photon excitation, H(1) + VUV -> H(2) + UV -> H(+1) + e, has been investigated at energies from the classical field ionization saddle point, E(sp) = -2 (the square root of F) a.u., through the zero field ionization limit, E = 0, into the continuum, E > 0. The atoms have been excited to single Stark levels in n = 2 with tunable pulsed VUV laser light around the Lyman-alpha line in an atomic beam with sub-Doppler resolution. The ionization from selected Stark levels by the UV was observed as a function of the UV wavelength.

Studies of Microstructure in Native Celluloses Using Solid-State 13C NMR.

Final rept.,
D. L. Vanderhart, and R. H. Atalla. 1983, 9p
Sponsored by Technical Association of the Pulp and Paper Industry, Atlanta, GA.

Pub. in Proceedings of International Conference on Dissolving and Specialty Pulps, Boston, MA., April 5-8, 1983, p207-215.

Keywords: *Cellulose, *Microstructure, *Crystal struc-*Nuclear magnetic resonance, *Isotopic labeling, Polymorphy, Biochemistry.

High-resolution solid-state (13)C NMR spectra have been taken on several native cellulosic materials as well as on a regenerated, low DP cellulose I material. Resonance multiplicities are observed for several carbon positions in the anhydroglucose units. The narrow-line multiplets, which are assigned to chains in the interior of crystallites, show significant variations in relative multiplet intensities, implying that native cellu-loses exhibit heterogeneous crystal structures. On the basis of these spectra it is proposed that all native celluloses are a mixture of two crystalline modifications, cellulose I(sub alpha) and I(sub beta). All native celluloses examined represent mixtures of these two structures in various proportions. There is no indication in the samples that each elementary fibril must contain the mixture of the two forms typical of the bulk sample. Therefore, the possibility that native celluloses are biosynthetically-tailored composites certainly exists.

PSD and ESD (Photon and Electron Stimulated Desorption) of Condensed Films: Relevance to the Mechanism of Ion Formation and Desorption.

R. Stockbauer, E. Bertel, and T. E. Madey. 1983, 2p Pub. in Proceedings of International Workshop on Desorption Induced by Electronic Transitions (DIET I) (1st), Williamsburg, VA., May 12-14, 1982, p267-268 1983.

Keywords: *Thin films, *Water, *Methyl alcohol, *Cyclohexane, *Ionization, Desorption, Electron transitions, Chemical bonds, *Electron stimulated desorption, *Photon stimulated desorption, *Time of flight mass spectroscopy, Ion induced desorption.

Photon and electron stimulated desorption (PSD and ESD) have been used to study the electronic process-es leading to ion formation in condensed films of water, methanol, and cyclohexane (C6H12). The dominant ions from condensed layers of water and methanol are H(+1). Higher mass ions were less than 1% at all thicknesses. In contrast, heavy fragments C2H(sub n) - C5H(sub n) were observed for films of C6H12 at doses above 10L. It is likely that heavy ions are effectively reneutralized in thin films of C6H12 or by a deexcitation mechanism provided by hydrogen-bonding in the thick water and methanol films

J. K. Taylor. 1983, 9p Pub. in Analytical Chemistry 55, n6 pA600-A608 1983.

Keywords: *Chemical analysis, *Laboratory equipment, Standards, Quality assurance, Reprints, *Reference materials, Procedures.

Chemical measurements are made using procedures which operationally describe the methodology employed. A valid method is one which is capable of producing data of adequate quality for the intended use. Such methods are based upon sound principles established as the result of research and development endeavors of the scientific and technical community. Methods based on such validated measurement prin-ciples are developed and tested by individual scientists and are frequently reduced to practical procedures by standardization bodies. Such procedures should clearly describe both their utility and limitations. However, it remains the responsibility of each individual analyst to validate the applicability of every method and procedure used in each measurement situation, since he, alone, is responsible for the validity of his data. The use of reference materials, as available, is an excellent way to accomplish the above purpose, but other approaches are possible. The rationale behind all of the above is described and discussed.

Methanation Activity of W(110).

Final rept., T. J. Udovic, R. D. Kelley, and T. E. Madey. 1985, 6p Sponsored by Department of Energy, Washington, DC. Office of Basic Energy Sciences

Pub. in Surface Science 150, pL71-L76 1985.

Keywords: *Surface chemistry, *Catalysis, *Activation energy, Partial pressures, Temperature, Hydrogenation, Tungsten carbides, Reprints, *Methanation, Auger electron spectroscopy.

The methanation activity of W(110) was measured over a range of reactant partial pressures and temperatures (P sub H2) = 1-1000 Torr, (P sub CO = 0.1-10 Torr, T = 475-820 K). Plotting the results in an Arrhenius fashion yielded a lower apparent activation energy (E sub a = 56 kj/mol) than previously determined for Ni(100) (E sub a) = 103 kj/mol) with an activity surpassing that of Ni at lower temperatures. The H2 pressure dependence of the methanation activity was found to be much stronger for W(110) than for Ni(100), the surface becoming increasingly inactive at the lowest H2 pressures investigated. Auger electron spectroscopy revealed the active catalytic surface to be carbidic in nature.

Determination of Molecular Weight Distribution of

Aromatic Components in Petroleum Products by Chemical Ionization Mass Spectrometry with Chlorobenzene as Reagent Gas.

Final rept., L. W. Sieck. 1983, 4p Sponsored by Department of Energy, Washington, DC. Office of Basic Energy Sciences.

Pub. in Analytical Chemistry 55, n1 p38-41 1983.

Keywords: *Molecular weight, *Aromatic compounds, *Petroleum products, Fuels, Mass spectroscopy, Benzenes, Naphthalenes, Reprints, *Chemical ionization mass spectroscopy, *Chemical reaction mechanisms, *Charge exchange reactions, Benzene/chloro.

A chemical ionization mass spectrometric technique for direct determination of the molecular weight distributions of the major aromatic components in liquid fuels and other petro-products is discussed. The basic mechanism involves selective charge exchange reactions between chlorobenzene cations and the substi-tuted benzenes and naphthalenes present in the sample. Chlorobenzene also serves as the solvent for the fuel, and screening of successive samples can be carried out with a 3-min turn-around time. Depending upon conditions, the paraffinic components present in the fuel are absent in the resulting mass spectrum.

Laser Probing of Chemical Reaction Dynamics. Final rept.,

S. R. Leone. 22 Feb 85, 7p Contracts NSF-PHY82-00805, DAAG29-82-K-0031 Sponsored by Air Force Office of Scientific Research,

Pub. in Science 227, p889-895, 22 Feb 85.

Keywords: *Molecular energy levels, *Chemical reactivity, *Dynamics, Molecular vibration, Molecular rotation, Excitation, Electron transitions, Reprints, *Laser enhanced reactions, *Laser induced excitation, *Laser microprobe analysis.

Lasers are used in increasingly sophisticated ways to carry out reactions between molecules in selected vibrational, rotational, and electronic states and to probe the product states of chemical reactions. Such investigations are providing unprecendented insights into chemical reaction dynamics, which is the study of the detailed motions that molecules undergo in simple chemical reactions. In many cases it is possible to describe the influence that specific types of molecular ex-citation have on reactive events. Experiments are also being carried out to learn about chemical reactivity as a function of the alignment of reagents. There is increasing excitement concerning the potential of laser methods to interrogate the transition states of molecular reactions.

Determination of Molecular Structure at Surfaces

Using Angle Resolved Electron and Photon-Stimulated Desorption.

Final rept.,

T. E. Madey, F. P. Netzer, J. E. Houston, D. M. Hanson, and R. Stockbauer. 1983, 19p Contract DE-AC04-76DP00789 Sponsored by Office of Naval Research, Washington,

Pub. in Proceedings of Int. Workshop Desorption Induced by Electronic Transitions (DIET 1) (1st), liamsburg, VA., May 12-14, 1982, p120-138 1983.

Keywords: *Molecular structure, *Surface chemistry, Chemisorption, Desorption, Comparison, Photons, Electron transitions, *Electron stimulated desorption ion angular distributions, *Photon stimulated desorption ion angular distributions.

The authors review recent data and theoretical models related to the use of angle-resolved electron and photon stimulated desorption in determining the structures of molecules at surfaces. Examples include a variety of structural assignments based on ESDIAD (electron stimulated desorption ion angular distribu-tions), the observation of short-range local ordering effects induced in adsorbed molecules by surface impurities, the influence of electron-beam damage on surface structure, and a direct comparison of ESD and PSD ion yields for the same system.

Group 7D—Physical Chemistry

Concentration Dependence of the Diffusion and Permeability In a Homogeneous Membrane. 1. The Ficklan and Chemical Potential Formulation of the Diffusion Current.

Final rept.,

A. Peterlin. 1985, 7p Pub. in Colloid and Polymer Science 263, n1 p35-41

Keywords: *Membranes, *Sorption, *Permeability, *Polymeric films, *Diffusion coefficient, Polymeric Concentration(Composition), Transport properties, Experimental design, Reprints, *Chemical potential, *Fick law. coefficient,

For the sorption and diffusion coefficient dependence on the concentration of the penetrant the transport properties of a homogeneous medium are calculated. The diffusion current is assumed to be proportional to the negative gradient of the chemical potential. This is in contrast with the first Fick's law that assumes the current to be proportional to the negative gradient of the concentration of the penetrant. The difference between the two cases depends on the concentration dependence of the sorption coefficient. In a homogeneous membrane the chemical potential formulation leads to an equation which is very similar to the Fickian expression. The apparent diffusion coefficient, however, depends not only on the transport resistance but also on the deviation of the sorption coefficient from constancy.

mer Science and Standards Div.

Concentration Dependence of the Diffusion and Permeability in a Homogeneous Membrane. 2. The Differences between the Fickian and Chemical Potential Formulation in the Case of a Linear Increase of the Sorption Coefficient with the Equivalent Penetrant Pressure.

Final rept., A. Peterlin. 1985, 9p Pub. in Colloid and Polymer Science 263, n1 p42-50 1985

Keywords: *Membranes, *Sorption, *Permeability, *Polymeric films, *Diffusion coefficient, *Polymeric films, *Diffusion coefficient, Concentration(Composition), Experimental design, Free energy, Pressure distribution, Reprints, *Chemical potential, *Fick law.

In a linear dependence of the sorption coefficient S on the equivalent pressure of the penetrant the differences between the Fickian and chemical potential formulation of the diffusion current are very soon larger than 20%, the assumed and tolerated error limit of the experiment. It turns out that the zero concentration diffusion coefficient D(sub 0) determined from the sorp-tion or permeation transient on the basis of the chemical potential basis is larger than that determined on the basis of Fick's law.

Surface Tension of Liquid Silicon.

Final rept., S. C. Hardy. 1984, 5p Sponsored by National Aeronautics and Space Administration, Washington, DC.

Pub. in Jnl. of Crystal Growth 69, p456-460 1984.

Keywords: *Silicon, *Interfacial tension, Liquids, Measurement, Impurities, Reprints, Temperature dependence.

The surface tension of liquid silicon has been measured as a function of temperature in purified argon at-mospheres using the sessile drop technique. The measurements show the surface tension is sensitive to low levels of an impurity which is probably oxygen. The highest surface tension values obtained under conditions which minimized the oxygen levels in the apparatus are in good agreement with an isolated previous measurement in pure hydrogen. The surface tension decreases linearly with increasing temperature and has a temperature coefficient of -0.28 mJ/(m squared)K.

KInetic Energy Disposal in the Unimolecular IRMPD of Methyl Nitrite in a Pulsed Molecular

Ream. Final rept.,

D. S. King, and J. C. Stephenson. 15 Mar 85, 6p Sponsored by Army Research Office, Arlington, VA., and Office of Naval Research, Arlington, VA. Pub. in Chemical Physics Letters 114, n5-6, p461-466, 15 Mar 85.

Keywords: *Kinetic energy, *Dissociation, *Spectroscopic analysis, *Molecular beams, *Pulse transmission, Molecular rotation, Molecular energy levels, Excitation, Spin orbit interactions, Doppler effects, Temperature, Nitrogen oxide(NO), Reprints, *Laser excited fluorescence, *Methyl nitrite, *Laser spectroscopy, *Rotational energy levels.

Methyl nitrite, CH3ONO, was dissociated by infrared laser pulses of well defined intensity under collisionless conditions in a pulsed molecular beam. Dopplerresolved laser-excited fluorescence spectroscopy de-termined the kinetic energy of the nitric oxide frag-ments formed in particular quantum states. The observed Doppler profiles were Gaussian over two e-foldings and, when converted to translational tempera-tures, corresponded to temperatures in the range of 260 to 350 K for states with 40 to 1308/cm of rotational energy; no significant correlation was observed be-tween rotational, spin-orbit, or lambda doublet/state and kinetic energy.

Model Describing the Steady-State Pyrolysis of
Bubble-Forming Polymers in Response to an Incident Heat Flux.

dent Heat Flux, I. S. Wichman. May 85, 48p NBSIR-85/3130

Keywords: *Mathematical models, *Bubbles, *Thermorphastic resins, *Heat flux, *Gasification, Steady state, Heat transmission, Transport properties, Nucleation, Equations of state, Surface chemistry, Mass transfer, *Chemical reation mechanisms, Monomers.

A theoretical model is developed to describe the indepth effect of bubbles on the steady-state transport of volatile gases (monomer) from the surface of a poly-mer subjected to an incident heat flux. In this model the effect of the bubbles on the surrounding (liquid) polymer is felt through the bubble number distribution function, n, which appears in the equations for conservation of mass, momentum, species and energy in the melt. The equation for the evolution of n includes the effects of bubble growth, convection and nucleation; its derivation requires preliminary study of the growth and motion of an individual bubble in a liquid with a temperature gradient. With these equations, formulas for the mass flux of volatiles from the polymer surface and the bubble void fraction are developed, for the special case of constant polymer mass fraction.

Determination of Nitro-Polynuclear Aromatic Hy-

drocarbons in Diesel Soot by Liquid Chromatography with Fluorescence and Electrochemical Detection.

Final rept.,
W. A. MacCrehan, and W. E. May. 1985, 12p
Pub. in Proceedings of Int. Symp. Polynuclear Aromatic Hydrocarbons: Mechanisms, Methods, and Metabolism (8th), p857-869 1985.

Keywords: *Aromatic polycyclic hydrocarbons, *Exhaust emissions, *Fluorescence, *Electrochemistry, *Nitroaryl compounds, *Chemical analysis, *Soot, Distillation, Sampling, Air pollution, *Air pollution detection, *High performance liquid chromatography, *Diesel engine exhaust.

Two new detection approaches for the HPLC determination of nitro-polynuclear aromatic hydrocarbons (N-PAH) are described. The molecular fluorescence method is based on the reduction of the nitro group to the fluorescent amine using a post-column zinc reductor. Wavelength programming is used to improve the selectivity and sensitivity of the detection of N-PAH. The electrochemical detection method uses the reduction current of the pitro group for measurement of the tion current of the nitro group for measurement of the N-PAH. A differential pulse waveform is used to enhance the selectivity of the detector. Sample preparation methods for N-PAH in diesel soot are described.

Anisotropic Scattering of Electrons by N2 and Its Effect on Electron Transport.

Final rept., A. V. Phelps, and L. C. Pitchford. May 85, 18p Grant ARO-8-82

Pub. in Physical Review A 31, n5 p2932-2949 May 85.

Keywords: *Electron transfer, *Electron scattering, *Nitrogen, *Anisotropy, Transport properties, Spatial distribution, Ionization, Excitation, Mathematical models, Elastic scattering, Experimental design, Boltzmann equation, Inelastic scattering, Reprints, *Electron melastic scattering, Reprints, *Electron scattering, Reprints, *Electron scattering, *Electron scat tron-molecule collisions.

As part of a systematic study of approximations com-monly made in solutions of the Boltzmann equation for electrons in molecular gases, the authors have investigated the effects of anisotropic scattering on electron transport coefficients in N2 and have extended our study of the multiterm expansion technique to higher E/n. The importance of proper interpretation of ionization and excitation experiments at high E/n is illustrated by calculations which model either an exponential growth of density in time or an exponential growth with position. The calculated excitatioo coefficients are generally higher than experiment at low and high E/n but in agreement with experiment at E/n near 150 Td.

Structures of C6H7(+1) Ions Formed in Unimolecular and Bimolecular Reactions.

S. G. Lias, and P. Ausloos. 15 Apr 85, 12p Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC.

Pub. in Jnl. of Chemical Physics 82, n8 p3613-3624, 15 Apr 85.

Keywords: *Molecular structure, *Reaction kinetics, *Isomerization, *Spectroscopic analysis, Stereochemistry, Heats of formation, Benzenes, Molecular energy levels, Mass spectroscopy, Cyclohexadiene compounds, Reprints, *Benzenium ions, *Chemical reaction mechanisms, *Fragmentation patterns(Mass spectroscopy), *Proton affinity, *Photoisomerization, Ion cyclotron resonance mass spectroscopy, Hexations Cyclohoxydians triene, Cyclohexadiene.

The structures, isomerization mechanisms, and reaction kinetics of C6H+7 ions formed in a variety of systems have been studied. The ions formed in the reactions (H2C=C=CH2(+1)+H2C=C=CH2) and (HC=CCH3(+1)+HC=CCH3) as well as the fragment C6H7(+1) ions in 1,3-cyclohexadiene, 1,4-cyclohexadiene, trans-1,3,5-hexatriene, 1-methylcyclopentene, 3-methylcyclopentene, and 4-methylcyclopentene exhibit at least two structures under the conditions of an ICR experiment. In each case, one isomer transfer a proton to bases with proton affinity higher than that of benzene demonstrating that the species has the benzenium (protonated benzene) structure. The energetics of the fragmentation process leading to C6H7(+1) formation have been examined in a photoelectron-photoion coincidence spectrometer for trans-1,3,5--hexatriene and 1,3- and, 1,4-cyclohexa-diene. It is found that the transition state for the frag-mentation process (C6H8(+1) yields C6H7(+1)+H) is effectively the same in all three systems but lies at an energy level higher than (benzenium ion +H) products. Rate constants for reactions of benzenium ions with a variety of organic and inorganic compounds have been determined.

Angie-Resolved Photoelectron Study of the Valence Levels of BF3 in the Range 17 = h(nu) =28eV.

Final rept. J. L. Dehmer, A. C. Parr, S. H. Southworth, and D. M. P. Holland. Oct 84, 8p Grant NATO-1939

Sponsored by Department of Energy, Washington, DC., and Office of Naval Research, Arlington, VA. Pub. in Physical Review A 30, n4 p1783-1790 Oct 84.

Keywords: *Photochemical reactions, *Ionization, *Boron fluorides, *Molecular energy levels, *Photoelectric emission, Mathematical models, Experimental design, Comparison, Angular distribution, Reprints.

Photoelectron branching ratios and angular distributions have been measured for the six outermost levels of BF3 in the range 17 < or = hv < or = 28 eV with the use of synchrotron radiation. Comparisons are made with a recent multiple-scattering model calculation which indicates that a shape resonance in the e' electronic continuum should appear in five of the six chan-nels studied. Good agreement between experiment and theory is found in a majority of the comparisons; however, experimental evidence for the expected e' shape resonance is clear in some cases but absent in others. The results are discussed in the context of other cases in which shape resonances, well known from inner-shell spectra, are obscured in valence-shell properties. Experiments which would help clarify the role of the e' shape resonance in the photoionization dynamics of BF3 are suggested.

Multiple-Pulse Proton NMR of Pressure-Crystaliized Linear Polyethylene.

Final rept.,

J. R. Havens, and D. L. VanderHart. 1985, 3p Pub. in Jnl. of Magnetic Resonance 61, p389-391 1985.

Keywords: *Nuclear magnetic resonance, *Polyethylene, Molecular relaxation, Crystallization, Anisotropy, Pressure, Reprints, *Chemical shift(Nuclear magnetic resonance).

The multiple-pulse proton NMR spectrum of pressurecrystallized linear polyethylene is reported. A clearly defined axially symmetric chemical shift tensor is observed, whose anisotropy has a width of approximately 6.9 ppm. Use of a spherical sample is seen to reduce broadening from bulk magnetic susceptibility effects. A comparison of the effectiveness of two multiple-pulse sequences is made based on the linewidths. Relaxation behavior under multiple pulse is also reported and leads to an estimate of the percentage crystallinity of this sample in excess of 90%.

Molecular Dynamics Study of the Liquid and Plastic Phases of Neopentane.

Final rept.,

R. D. Mountain, and A. C. Brown. May 85, 7p Pub. in Jnl. of Chemical Physics 82, n9 p4236-4242

Keywords: *Phase transformation, *Liquid phases, Molecular rotation, Plasticity, Reprints, *Molecular dynamics, *Propane/dimethyl, Molecular models.

Molecular dynamics has been used to investigate a model for neopentane. The velocity-velocity and angular momentum-angular momentum time correlation functions were constructed for the liquid and the single particle time correlation functions for the orientation of twofold and threefold axes of symmetry of the molecules were constructed for both the liquid and plastic phases. The model produces liquid properties that are in agreement with those of liquid neopentane. The dynamics of the molecular reorientations in the plastic phase has been examined. These reorientations are found to consist of jumps between equivalent orientations by a rotation of 120 degrees around a threefold molecular symmetry axis.

NMR (Nuclear Magnetic Resonance) Self-Diffusion Study of Polyethylene and Paraffin Meits. Final rept..

I. Zupancic, G. Lahajnar, R. Blinc, D. H. Reneker, and D. L. Vanderhart. 1985, 18p Pub. in Jnl. of Polymer Science, Polymer Physics Edition 23, p387-404 1985.

Keywords: *Nuclear magnetic resonance, *Polyethylene, *Diffusion coefficient, *Alkanes, *Melts, Molecular weight, Transport properties, Reprints.

The self-diffusion coefficient D of paraffin and polyethylene melts--covering the range between N = 19 and 1,000 where N is the number of monomeric units--was measured by the pulsed-magnetic-field-gradient NMR method for diffusion times between 3 ms and 1 s. For the paraffins, D is proportional to 1/sq N though the molecular weights are smaller than the critical molecular weight for entanglement. In polyethylene, melts a strong dependence of the diffusion coefficient on the diffusion time is observed, whereas no such dependence is found in paraffin melts. A mathematical formalism for describing spin-echo attenuation in terms of a velocity autocorrelation function is shown to yield qualitative agreement with the experimental results.

PB85-229276 Not available NTIS National Bureau of Standards (NML), Gaithersburg, MD. Organic Analytical Research Div. Separation and Purification of Diastereomers of Angiotensin i by Weak Anion-Exchange High-Performance Liquid Chromatography.

S. A. Margolis, and M. Dizdaroglu. 1985, 13p Pub. in Jnl. of Chromatography 322, p117-128 1985.

Keywords: *Anion exchanging, *Purification, *Separation, *Chromatographic analysis, *Stereochemistry, Peptides, Separation, Comparison, Assessments, Reprints, *High performance liquid chromatography, *Anaiotensin.

Several diastereomers of angiotensin I were resolved by weak anion-exchange high-performance liquid chromatography (HPLC). All of the diastereomers which were examined contained significant amounts of peptides whose amino acid composition differed from the designated diastereomer of angiotensin I. The results are compared with the results of separations of the same peptides by reversed-phase HPLC. The comparison strongly suggests that the two HPLC methods, utilizing different separation principles, are complementary; hence their combined use leads to a more confident assessment of the purity of a given more confident assessment of the purity of a given peptide preparation.

Excited Electron Correlations in Resonant Multi-photon Ionization via Barium Rydberg States. Final rept.,

G. Leuchs, and S. J. Smith. 1985, 9p Grant NSF-PHY82-00805

Pub. in Physical Review A 31, n4 p2283-2290 Apr 85.

Keywords: *Barium, *Angular distributions, *Photoionization, *Molecular energy levels, Excitation, Reprints, *Rydberg series, *Molecular configuration.

Photoelectron angular distributions have been studied in resonant multiphoton ionization of barium via $J\!=\!0$ states, in the region where the 6sns singlet S(sub 0) Rydberg series interacts strongly with the 5d 7(triplet d)P0 doubly excited state. The interaction is dominantly quadrupole and is localized around n=18. The data analysis reveals spin-orbit coupling and strong channel mixing in the continuum.

Pub. in Jnl. of Chemical Physics 81, n8 p3520-3535

Keywords: *Reaction kinetics, *Fluorescence, *Supersonic nozzles, *lonization chambers, Rotational vibra-tion, Ions, Diatomic molecule, Reprints, *Laser in-duced fluorescence, *lon molecule collision, Laser applications.

A novel experimental technique couples a flowing afterglow ion source with a supersonic nozzle expansion in order to deliver high densities of relatively low kinetic energy ions into a low pressure chamber. The technique is used to study the charge transfer reaction under single collision conditions at 0.24eV c.m. Nascent rotational and vibrational state distributions are obtained by the method of saturated laser-induced fluorescence probing. It is found that a substantial fraction of the available energy is partitioned into internal excitation of the N2(+1) product molecule. The results are compared with a number of recent state-selected experiments on charge exchange in ArN2(+1) ArH2(+1) and NCO (+1) systems. It is suggested the experimental findings are best explained in terms of the detailed locations of potential surface crossing seams, rather than by the widely used energy resonance or diatomic molecule, Franck-Condon ionization models.

Intensity-Dependent Electron Angular Distributions in Resonant Multiphoton Ionization.

Final rept.,

S. Geltman, and G. Leuchs, Mar 85, 8p

Grant NSF-PHY82-00805

Pub. in Physical Review A 31, n3 p1463-1469 Mar 85.

Keywords: *Angular distributions, *Photoionization, Hyperfine structure, Comparison, Experimental design, lonization, Stark effect, Atomic energy levels, Anisotropy, Resonant frequency, Sodium, Reprints, *Sodium

A theoretical investigation has been carried out on the dependence of the photoelectron angular distributions on laser intensity for the case of two-photon-resonant three-photon ionization of sodium. Good overall agreement is obtained with the experimental anisotropy parameters for ionization via the 4D(3/2) and 4D(5/2) intermediate states. The comparison of the theoretical results with the experimental data also clearly shows that the hyperfine splitting of the ground state has to be taken into account at high laser intensities although the low intensity angular distributions do not depend on the initial ground hyperfine state.

Infra-red Bandshapes of Methylene-d2 Bending Vibrations in n-Hexatriacontane-n-Hexatriacontaned74.

Final rept.,

B. Fanconi, F. McCrackin, and D. Sarazin. 1985, 11p Pub. in Polymer 26, p219-228 Feb 85.

Keywords: *Infrared spectroscopy, *Deuterium compounds, *Band spectra, *Methylene, Isotopic labeling, Lattice parameters, Alkanes, Experimental design, Concentration(Composition), Reprints, *Hexatriacontane. Numerical solution.

Infra-red spectra in the CD2 bending vibration region (1080-1100/cm1) have been analyzed for mixtures of deuterated and hydrogenated hexatriacontane. The i.r. data analyses aré based on lattice dynamical calculations of guest deuterated molecules in the host n-C36H74 and infrared intensities calculated using the electro-optical parameter method. The calculated band profiles as a function of the deuterated molecule concentration compare favorably to experimental spectra taken at 80K. The high resolution, low temperature spectra reveal features heretofore only observed at much higher concentrations of deuterated species. Self deconvolution procedures were used to further resolve the spectra. Excellent agreement was found between calculated and experimental ratios of the i.r. intensity of certain dimer arrangements to that of singlet molecules. The intensity ratio was found to be a better measure of deuterated species concentration than the halfwidth of the CD2 bending vibration band that had been previously used.

Sponsored by Office of Naval Research, Arlington, VA. Pub. in Macromolecules 18, n4 p825-827 1985

Keywords: *Complex compounds, *Differential thermal analysis, Inorganic salts, Concentration(Composition), Electrical resistance, Reprints, *Poly(ethylene imine), Monomers.

Sodium iodide can be incorporated into linear poly(ethylene imine) up to 0.3 moles of NaI per mole of monomer repeat. At low concentrations, the incorporation of salt inhibits the normal crystallization of the polymer while at high concentrations the salt and polymer form a complex crystal phase which melts near 150 C. The addition of Nal to the polymer initially increases d-c conductivity but the incorporation of 0.3 moles of Nal per mole of monomer reduces conductivity relative to that of polymer to which no salt has been purposely added.

Static and kinetic parameters of deuterated polystyrene/polyvinylmethylether blends before and during phase decomposition have been studied by the small angle neutron scattering and temperature jump light scattering techniques. Phase diagram, correlation length, critical exponent, binary interaction parameter together with spinodal temperatures and spinodal de-composition rate can all be studied in this approach. Two different decomposition mechanisms--spinodal and nucleation and growth--can be inferred to from experimental results.

Ionic Hydrogen Bond and Ion Solvation. 2. Solvation of Onium Ions by One to Seven H2O Molecules. Relations between Monomolecular, Specific, and Bulk Hydration.

Final rept..

M. Mautner. 1984, 9p See also Part 1, PB85-230415.

Pub. in Jnl. of the American Chemical Society 106, n5 p1265-1272 1984.

Keywords: *Enthalpy, *Water, *Hydration, Hydrogen bonds, Ions, Specific energy, pH, Chemical bonds, Reprints, *Onium ions, Proton affinity.

The relation between enthalpies of solvation of onium ions BH(+1) by one water molecule, -deltaH(sub 0.1), and by four water molecules, -deltaH(sub 0.4), is constant for most onium ions: deltaH(sub 0.4)/deltaH(sub 0.1) is 2.8 + or - 0.1 for all oxonium ions and monoprotonic ammonium and pyridinium ions, and 3.1 + or - 0.1 for polyprotonic ammonium ions. These relations, in conjunction with the correlation between deltaH(sub 0.1) and the proton affinity difference delta PA=PA(B)-PA(H2O), allow the prediction of the total four-molecule specific hydration energy -deltaH(sub 0.4) for all onium ions within the experimental accuracy of + or - 3 kcal/mol. The observed (or predicted) fourfold specific relative hydration energies simulate closely the relative bulk hydration enthalpies for most ions. In other words, for most onium ions differential hydration effects are determined by the specific hydrogenbonding interactions. Deviations are useful to identify bulk solvation effects. For example, such deviations indicate attenuated bulk solvation of ions with phenyl substituents.

The hydrogen-bonded dimer ions BH(+1)-B and monohydrates BH(+1)-H2O of 2-alkylpyridines, 2,6-dial-kylpyridines, and tertiary amines were investigated in the gas phase in the absence of solvent effects. The dissociation energies deltaH(sub D) of the dimers and hydrates are not affected by steric crowding. The authors observations may be summarized as follows: as long as there exists a single confirmation in which the hydrogen bond in BH(+1)-B or BH(+1)-H2O can obtain optimal geometry, the bond strength is not weakened by steric crowding. However, steric crowding may result in major entropy effects due to the hindrance of internal rotors in the dimers and monohydrates.

Keywords: *Hydrog-*Ketones, Stab Keywords: *Hydrogen bonds, *Proton reactions, *Ethers, *Ketones, *Polyethers, *Intermolecular forces, Enthalpy, Stability, Thermochemistry, Entropy, Stereochemistry, Molecular rotation, Reprints, *Proton affinity.

Intramolecular hydrogen bonding in protonated di-, tri-, and tetraethers, as well as cyclic crown ethers, increases the proton affinities of these compounds vs. comparable monoethers. Thus, due to the stretched OH(+1)-O bond and small bond angle, here the 'hydrogen bond' may amount only to the electrostatic stabilization of the cis conformation, and rotation about the C-C bond is still allowed, although the barrier is increased by -delta H(HB). The stability of the internal hydrogen bond decreases in the order diamines > diethers > diketones.

Vibrational Energy Relaxation of Adsorbates on Surfaces.

Final rept.,

E. J. Heilweil, M. P. Casassa, R. R. Cavanagh, and J. C. Stephenson. 1985, 6p
Pub. in Proceedings of the Society of Photo-Optical Instrumentation Engineers 533, Ultrashort Pulse Spectroscopy and Applications, p15-19 1985.

Keywords: *Molecular vibration, *Surface chemistry, *Molecular relaxation, *Silicon dioxide, *Chemisorption, *Adsorbates, Spectroscopic analysis, Substrates, Infrared spectroscopy, Molecular energy levels, Reprints, *Lifetimes(Energy levels), Picosecond pulses, Hydroxyl radicals.

Picosecond infrared transient bleaching experiments have been performed to measure the population life-time (T1) of vibrationally excited (v=1) functional groups chemisorbed on high surface area colloidal silicas (SiO2). The experimental method and results for vibrational modes of -OH, -OD, -NH2 and -OCH3 coordinated to surface silicon atoms and for the -BOH surface species are presented. Lifetimes for these groups at both vacuum and liquid interfaces indicate that the adsorbate degrees of freedom, chemical coordination and nearby substrate modes play an important role in damping vibrational energy. It is also surmised that the vibrational lifetime, especially that for the hydroxyl group (T1=150 ps), is related to the chemical reactivity of adsorbates on surfaces.

D. H. Burgess, I. Hussia, P. C. Stair, H. Viswanaman, and E. Weitz. Nov 84, 7p Contract N00014-79-C-0794 Pub. in Review of Scientific Instruments 55, n11 p1771-1776 Nov 84.

Keywords: *Laboratory equipment, *Surface chemistry, *Carbon monoxide, *Copper, Experimental design, Description, Reprints, *Time of flight mass spectroscopy, *Thermal desorption, *Laser induced desorption, Thermal pulse method, Procedures.

Instrumentation and procedures for performing pulsed laser-induced thermal desorption experiments are described. The influence of various instrumental parameters on the measured desorption signals is dis-cussed. Proper conditioning of the desorption flux is shown to be a critical factor for obtaining desorption signals undistorted by the finite pumping speed of the apparatus. Instrumental effects are illustrated using data for pulsed laser desorption of CO from clean copper surfaces.

Vibrational Energy Transfer Pathways in CH3F
Under Weak and Strong Excitation Conditions: A Comparison.

Final rept.

V. A. Apkarian, J. M. Lindquist, and E. Weitz. Dec 84,

Sponsored by National Science Foundation, Washing-

Pub. in Chemical Physics Letters 112, n4 p328-334, 14 Dec 84.

Keywords: *Molecular vibrations, *Energy transfer, *Mathematical models, *Molecular energy levels, Excitation, Comparison, Fluorine organic compounds, *Methane/ *Laser induced fluorescence, Reprints, fluoro.

Energy transfer processes in CH3F have been reinvestigated under high excitation conditions with and without added rare gas via a mathematical model developed as a consequence of studies under low excitation. The model can be used to describe energy transfer under high excitation conditions with the inclusion of an additional state and energy transfer pathways coupling that state to others in the model. It is also concluded that multiple photon absorption takes place under high excitation conditions.

X-ray Interferometry: The Optical to Gamma-ray
Connection.

Final rept.,

R. D. Deslattes. 1979, 18p Pub. in Proceedings of the International Workshop on Neutron Interferometry, Grenoble, France, June 5-7, 1979, p399-415.

Keywords: *X rays, *Gamma rays, Quantum electrodynamics, Diffraction, *Interferometry.

In the recent past, it has been possible to complete an improved measurement chain connecting the hydrogen Rydberg with gamma-ray reference energies in the range 0.06 < E < 1.1 MeV. Among other applications, these gamma-ray reference energies have been used to calibrate muonic X-ray spectra for tests of QED especially the vacuum polarization terms. Results of this improved calibration of the gamma-ray scale to-gether with improved precision in the mesic X-ray to gamma-ray comparisons have resulted in the emergence of a pattern of substantial harmony between customary QED calculations and experiment. In a second application, the new gamma-ray values are used here as intermediate steps for the re-determination of several high Z X-ray lines where the X-ray to gamma-ray ratios have been previously established with high accuracies. In addition, a smaller number of X-ray lines have already been directly determined. Taken together these results produce an interim set of re-evaluated X-ray lines having higher accuracies than were previously available. When these are compared with research and the state of the search of of with recently available Hartree-Fock-Slater calculations, a systematic pattern of significant disagreement is evident.

PB85-230787 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Comparison of Relativistic Atomic SCF (Self-Consistent Field) Calculations with Improved Experimental Data.

Final rept., R. D. Deslattes, L. Jacobs, E. G. Kessler, and W. Schwitz. 1982, 10p Pub. in Advances in X-ray Spectroscopy: A Reference

Text in Honour of Professor Y. Cauchois, p144-152 1982.

Keywords: *X ray spectra, X ray spectroscopy, Gamma rays, Comparison.

The paper discusses the results of three comparisons between relativistic self-consistent field calculations and various experimental data. It is shown that by combining certain of the recently available optically referenced X-ray and gamma-ray wavelength measurements with a highly selected group of relative X-ray to X-ray and X-ray to gamma-ray comparisons, an improved, though quite limited, data base of transition energies can be obtained. The result shows deviations increasing with Z in a linear fashion. One possible origin for this result is discussed briefly.

Radiocarbon: Nature's Tracer for Carbonaceous Pollutants.

Final rept., A. Currie, G. A. Klouda, and R. W. Gerlach. 1982, 22p

Pub. in Proceedings of the International Conference on Residential Solid Fuels, Environmental Impacts and Solutions, Portland, Oregon, June 1-4, 1981, p365-385

Keywords: *Radiocarbon dating, *Isotopic labeling, *Air pollution, *Environmental surveys, *Carbon isotopes, Carbon 12, Carbon 14, Urban areas, Rural areas, Biological aerosols, Residential buildings, Sam-pling, Sources, Combustion products, Wood, Biomass, Chemical analysis, Particle size, *Tracer studies, *Natural emissions, *Air pollution detection, Wood burning appliances.

Recent developments in radiocarbon dating techniques have made it feasible to determine 14C/12C ratios in samples containing milligram or even microgram quantities of carbon. As a result, it has become practicable to apply these techniques to the study of trace gases and particles in the atmosphere, as a means of resolving anthropogenic from natural source components. Interpretation of 14C data is straightforward: biospheric carbon (such as vegetation) is 'alive' with a 14C/12C ratio of about 1.5 x 10 to the 12th power, whereas fossil carbon is 'dead.' Beyond this dichotomous classification it becomes very interesting to combine the isotopic data with concurrent chemical data, as well as spatial and temporal distributions, in order to infer the strengths of specific sources of car-bonaceous pollutants. A brief review will be presented of program on atmospheric gases and carbonaceous particles. For the latter, the authors have assayed individual chemical and size fractions, and samples collected in urban, rural, and remote locales. The biogenic carbon fraction -- presumably from wood-burning -ranged from 10 percent to 100 percent for the urban samples analyzed.

Keywords: *Electric corona, *Reaction kinetics, *Sulfur hexafluoride, *Chemical analysis, Decomposition reactions, Chemical reactions, Trace elements, Gas chromatography, Mass spectroscopy, *Sulfur fluoride oxides, Chemical reaction mechanisms, Sulfuryl fluoride, Thiopyld Details and Thiopyld Patrofiles (1997). fluoride, Thionyl fluoride, Thionyl tetrafluoride.

The most abundant, long-lived stable gaseous species generated by corona discharges in SF6 gas containing trace levels of O2 and H2O are the oxyfluorides SOF2, SO2F2, and SOF4. Absolute energy and charge rates-of-production of these and the minor products SO2, COS and CO2 have been measured at different total. OCS, and CO2 have been measured at different total gas pressures from 100 kPa to 300 kPa and for discharges of different current, power, and polarity. The discharge current and time dependence of the production rates are discussed in terms of gas-phase mechanisms that have been proposed to explain previous ob-servations of electrical, thermal, and laser-induced de-composition of SF6 and SF6/O2 mixtures. Details of the chemical analysis procedures are given, and appli-cation of the results to the design of chemical diagno-sitcs for SF6-insulated, high-voltage apparatus is discussed.

Vibrational Excitation of D2 by Low Energy Electrons. Final rept.

S. J. Buckman, and A. V. Phelps. Jun 85, 13p Pub. in Jnl. of Chemical Physics 82, n11 p4999-5011, 1

Keywords: *Molecular vibration, *Molecular energy levels, *Deuterium, Excitation, Cross sections, Hydrogen, Carbon dioxide, Carbon monoxide, Nitrogen, Reprints, *Electron molecule collision.

Excitation coefficients for the production of vibrationally excited D2 by low energy electrons have been determined from measurements of the intensity of infrared emission from mixtures of D2 and small concentra-tions of CO2 or CO. The CO2 and CO concentrations were chosen to allow efficient excitation transfer from the D2 to the carbon containing molecule, but to minimize direct excitation of the CO2 or CO. The measured infrared intensities were normalized to predicted values for N2-CO2 and N2-CO mixtures at E/n where the efficiency of vibrational excitation is known to be very close to 100%. For our H2-CO mixtures the excitation of CO via excitation transfer from H2 compared to direct electron excitation of CO molecules. Published experiments and theories on electron-H2 and electron-D2 collisions are reviewed to obtain the cross sections used in the predictions.

Contract DE-Al05-83ER60185
See also DE 85-009047.

Pub. in Jnl. of the Optical Society of America B 2, n6 p891-896 Jun 85.

Keywords: *Beryllium, Excitation, Atomic energy levels, Reprints, *Resonance ionization mass spectroscopy, *Autoionization, Rydberg series.

The authors have made the first reported observations of the Be 2p(sup 2) singlet S state, and of high-lying members of the Rydberg series 2pnd (sup 1)P(sup 0) (n < or = 16), by multiphoton resonance-ionization mass spectrometry (RIMS). The energy of the 1S state is compared with a number of theoretical predictions, which differ from one another over a range of about 0.75 eV. Good agreement is found when corrections are made for intershell electron correlations. These results show that precision spectroscopy can be performed by RIMS with samples of a few hundred atoms and that direct multiphoton excitation of autoionizing states may be a useful new addition to the existing catalog of resonance-ionization schemes.

Ion Chemistry in Silane dc Discharges.

Final rept., H. Chatham, and A. Gallagher. 1 Jul 85, 11p Sponsored by Solar Energy Research Inst., Golden,

Pub. in Jnl. of Applied Physics 58, n1 p159-169, 1 Jul

Keywords: *Silane, *Ionization, *Chemical reactions, *Electric discharges, Comparison, Mass spectroscopy, Reprints, *Ion molecule interactions.

The ion production and reactions in dc silane discharges are calculated. It is noted that almost all ion production and reaction occur in the cathode sheath region for typical low-pressure silicon-deposition dis-charges, so that the calculation considers ion production, drift, and reactions in the sheath region. Sheath models, for inert gas discharges, that utilize local and nonlocal electron energy distributions are compared, and one is adapted to silane conditions. The distribution of ion species (Si(sub I)H(sub m)(+1)) arriving at the cathode is calculated for a range of discharge pressures and currents, for comparison to mass spectrometer measurements. However, the authors do not make quantitative comparisons to reported observa-tions due to sampling-bias issues that have not been taken into account.

Nonadlabatic Molecular Collisions. 2. A Further

Surface Hopping Study of the Trajectory-Surface-Hopping ArH2(+1) System.

Final rept., S. Chapman. May 85, 11p Pub. in Jnl. of Chemical Physics 82, n9 p4033-4043, 1 May 85.

Keywords: *Surface chemistry, Mathematical models, Diatomic molecule, Experimental design, Comparison, Reprints, Ion molecule interactions, *Molecule molecule collisions, *Ion molecule collisions.

Both charge transfer and chemical reaction are studied for the reactants Ar(+1) + H2, Ar + H2(+1), and Ar + D2(+1), using the trajectory-surface-hopping model with diatomics-in-molecules 2A surfaces for ArH2(+1). Results are compared with a number of recent experiments. Agreement with experiment is generally satisfactory. The reactions are direct. The Ar(+1) + H2 yields ArH(+1) + H reaction is well characterized as a stripping process. Charge transfer occurs predominantly by long-range electron jump. Points of disagreement with experiment are discussed in the light of the approximations in the surface and the TSH model.

Laser-Assisted Charge-Transfer Reactions (Li(+3) + H): Coupled Dressed-Quasimolecular-State Approach.

Final rept., T. S. Ho, C. Laughlin, and S. I. Chu. Jul 85, 11p Pub. in Physical Review A 32, n1 p122-132 Jul 85.

Keywords: *Hydrogen, Perturbation theory, Hamiltonian functions, Reprints, *Lithium ions, *Dressed quasi-

molecular states, *Laser_enhanced ionization, Generalized Van Vleck theory, Floquet theory.

semiclassical coupled dressed-quasimolecularstates (DQMS) approach is presented for nonperturba-tive treatment of multichannel charge-transfer reactions at low collision velocities and high laser intensities, incorporating the implementation of the general-ized Van Vleck (GVV) nearly degenerate perturbation theory. The GVV technique allows block partitioning of the infinite-dimensional Floquet Hamiltonian into a finite-dimensional model DQMS space, and thereby reduces greatly the number of effective coupled channels. Further, the GVV-Floquet basis allows minimization of the (usually large in amplitude) field-induced nonadiabatic radial couplings without the need to explicitly construct the transformation between the adiabatic and diabatic DQMS basis. This yields a new set of coupled GVV-DQMS equations (neither adiabatic nor diabatic) which are particularly convenient for multichannel calculations.

Keywords: *Cyanides, *Molecular rotation, *Electron scattering, Mathematical models, Comparison, Experimental design, Excitation, Hartree Fock approximation, Reprints, *Electron molecule collisions.

The authors report results for vibrationally elastic scattering over the energy range 0.0006-11.6eV. The interaction potential is composed of a near-Hartree-Fock static term plus a parameter-free model of the correlation-polarization potential. The exchange interaction is included exactly through a separable expansion. Results with a model-exchange potential (free-electrongas plus orthogonalization) are also reported. A resogas plus orthogonalization) are also reported. A resonance appears in pi symmetry near 2.7eV (width 1.9eV) that may be the same feature observed in several experiments. In the model-exchange calculation the pi resonance is shifted toward higher energy (3.8eV, width 2.4eV). The sigma symmetry was also found to be very sensitive to the treatment of exchange and to the effect of polarization. Differential and rotational excitation cross sections are evaluated and rotational excitation cross sections are evaluated in the multipole-extracted adiabatic-nuclei approxima-tion. Results are compared with the available experimental and theoretical data.

Molecular and Microstructural Factors Affecting

Mechanical Properties of Polymeric Cover Plate Materials, E. J. Clark. Jul 85, 67p NBSIR-85/3197

Sponsored by Department of Energy, Washington, DC. Office of Solar Heat Technologies.

Keywords: *Mechanical properties, *Polymers, *Microstructure, *Degradation, *Coverings, Reviews, Deformation, Structural analysis, Plastics, Molecular structure, Molecular weight, Crosslinking, Materials

The paper reviews the dependence of mechanical properties of polymers on various microstructural factors. The microstructural and molecular factors considered are: molecular weight, crystallinity, crosslinking, branching, copolymerization, plasticization, orientation, and residual stresses. The types of mechanical properties considered are: direct loading, fatigue, creep, wear and abrasion, and environmental stress cracking. The effects of polymer deformation and frac-tion at the molecular level are discussed. Cracking, crazing, and shear yielding are described. Polymeric cover plate materials are discussed and their degradation reviewed. Methods to measure microlevel changes in polymers are identified.

Electron Impact Excitation of Ions In the Magnesium Sequence: Fe XV. Final rept...

R. B. Christensen, D. W. Norcross, and A. K.

Pradhan. Jul 85, 12p Sponsored by Department of Energy, Washington, DC. Pub. in Physical Review A32, n1 p93-104 Jul 85.

Keywords: *Quantum theory, Excitation, Hamiltonian functions, Reprints, *Electron ion interactions, *Electron ion collisions, *Magnesium ions.

Intermediate-coupling collision strengths are calculated for all transitions between the states. Calculations are carried out in a ten-state distorted-wave approximation. Resonance effects are considered by using

multichannel quantum-defect theory, and relativistic effects in the target Hamiltonian are taken into account in the Breit-Pauli formulation. Term coupling among the target states also affects several transitions considerably. Present results are compared with previous calculations; some significant differences are noted. The new results suggest a serious discrepancy between calculated and observed relative intensities of the 284.2-A (resonance) and 417.3-A (intercombination) lines for Fe XV in the Sun, but will reduce the discrepancy for this ratio for other Mg-like ions observed in tokamak plasmas.

ucts, Composite materials, *Municipal wastes, Air pollution sampling, Air pollution detection, Solid wastes, Baltimore County(Maryland), Brooklyn(New York), Refuse derived fuels.

The total chlorine and water soluble chlorine contents of the components of municipal solid waste (MSW) have been determined from sampling studies carried out at two sites, Baltimore County, MD and Brooklyn, NY for a five-day period. The component which conributed the largest fraction to the chlorine content in Baltimore County, MD was the paper fraction while in Brooklyn, NY, the plastics fraction provided the major contribution (0.46 mass % or 52% of the total chlorine). Chemical analyses for sulfur content were performed on composite samples for each day of samples pling at the two sites. American Society for Testing and Materials (ASTM) standard methods for sulfur, total chlorine, and water soluble chlorine contents, developed for refuse-derived fuel, were used in performing the analyses.

Investigation of Wood Pyrolysis Using Solid State (13)C Nuclear Magnetic Resonance.
Final rept.,

W. L. Earl. 1982, 17p

Pub. in Proceedings of 1981 International Conference on Residential Solid Fuels, Environmental Impacts and Solutions, Portland, OR., June 1-4, 1981, p772-778

Keywords: *Nuclear magnetic resonance, *Wood, *Combustion, *Char, Pyrolysis, Carbon 13, Isotopic labeling, Chemical analysis, Heat transfer, Aromatic polycyclic hydrocarbons, *Air pollution detection.

The present state of the art in 13C NMR of solids yields spectra with narrow lines which are useful for obtaining chemical information in intractable solids.
These NMR techniques have been applied to the analysis of a series of chars obtained by subjecting spruce and oak wood to temperatures between 550 and 660 K in nitrogen. The NMR spectra obtained indicate that the cellulose starts to decompose before lignin but by 615 K both components are decomposing. The solid char formed is highly aromatic, probably being composed of a large variety of poly-nuclear aromatics. It is suggested that the rate of pyrolysis is determined by the rate of heat transfer in woody samples.

Empirical Quantitation in Raman Microprobe Anal-

ysis. Final rept.

E. S. Etz. 1981, 6p

Pub. in Proceedings of Annual Conference on Microbeam Analysis Society (16th), Vail, CO., July 13-17, 1981, p73-78.

Keywords: *Raman spectroscopy, *Microanalysis, *Probes, Chemical analysis, Calcium phosphates, Bioassay, Elastic scattering, Forecasting, Sampling.

A non-rigorous exposition of the problems of quantitation in Raman microprobe analysis is presented. The micro-Raman scattering characteristics are reviewed, highlighting analytical advantages and limitations as they apply to the considerations for quantitative analysis. The concepts of quantitation valid for bulk samples are extended to scattering from microscopic samples and the difficulties noted. The conclusions that can be drawn from the results of current on elastic scattering theories are formulated and taken as a basis for the argument that empirical approaches are likely to produce adequate quantitative data for present re-quirements. The case for calibration methods based on the use of standards is presented by a discussion of NBS results obtained in the quantitative estimation of carbonate contents on biological apatites. Future di-rections are noted that promise to advance the prospects for micro-Raman quantitation.

Thermodynamic Models of Alkali-Metai Vapor Transport in Silicate Systems. Final rept..

D. W. Hastie, W. S. Horton, E. R. Plante, and D. W. Bonnell. 1982, 11p Pub. in High Temperature - High Pressures 14, n6

p669-679 1982.

Keywords: *Thermodynamics, *Mathematical models, *Transport properties, *Alkaline earth metals, *Silicates, *Liquid theory, Experimental design, Vaporizing, High temperature tests, Solutions,

A thermodynamic data base has been developed for liquid/solid mixtures containing K2O, Al2O3 and SiO2. Together with the hypothesis of Ideal Mixing of Complex Phases (IMCP) this data base reproduces experimental activity data, expressed here for convenience in terms of P(sub K), over a wide range of composition and temperature. The authors are confident that the model (IMCP + data base) can be applied to the prediction of solution thermodynamics, vaporization rates, and prehaps even phase stability diagrams for systems not readily amenable to experimental study. As a future extension of this work, they will progressively extend the data base and provide model validation tests for systems containing Na2O, CaO, MgO and Fe2O3, in addition to the components considered

PB86-111366 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Beam Broadening in the Analytical Electron Microscope.

Final rept.,

D. E. Newbury. 1982, 5p Sponsored by Microbeam Analysis Society, Bethesda,

Pub. in Proceedings of Annual Conference of Microbeam Analysis Society (17th), Washington, DC., August 9-13, 1982, p79-83.

Keywords: *Electron microscopes, *X ray analysis, Scattering cross sections, Elastic scattering, Mathematical models, Gold, *Beam foil spectroscopy.

Beam spreading in thin foils occurs in the analytical electron microscope as a result of elastic scattering. Various models which attempt to quantify the dimensions of the spreading are cataloged: analytic single, plural, and multiple scattering models, thermal diffusion analog model, and Monte Carlo electron trajectory simulations. Despite apparent differences in the assumptions of the models, calculated results show only a 30% range for a gold foil. This similarity is ascribed to a basic dependence on the single scattering cross section for all of the models.

Monte Carlo Electron Trajectory Calculations of Xray Generation in Tilted, Solid Specimens.

Final rept., D. E. Newbury, and R. L. Myklebust. 1981, 3p Pub. in Proceedings of Annual Conference on Microbeam Analysis Society (16th), Vail, CO., July 13-17, 1981, p175-177.

Keywords: *Solids, *X-ray analysis, *Monte Carlo method, Electron probes, Backscattering, Sampling, Numerical solution.

Monte Carlo electron trajectory calculations provide a useful technique to obtain information on electron beam interactions in solids in situations in which direct

experimental measurements are difficult or impossible. In the present work, electron interactions have been simulated in solid specimens tilted at various angles to the incident beam. Parameters which describe certain aspects of x-ray generation, including the characteristic-bremsstrahlung ratio (peak-to-background), loss of generation due to electron backscattering, and the xray absorption effect, have been determined in support of the development of methods for quantitative x-ray micro-analysis of tilted samples.

Measurements of the Viscosities of Saturated and Compressed Liquid Normal Butane and isobutane. Final rept

D. E. Diller, and L. J. Van Poolen. Jan 85, 20p Sponsored by Gas Research Inst., Chicago, IL., and Department of Energy, Washington, DC. Pub. in Int. J. Thermophysics 6, n1 p43-62 Jan 85.

Keywords: *Viscosity, Compressed liquid, Density(Mass/volume), Saturation, Piezoelectric crystals, Butanes, Reprints, *Butane, *Propane/methyl, Numerical solution.

The shear viscosity coefficients of saturated and compressed liquid normal butane and isobutane have been measured with the torsional piezoelectric crystal method at temperatures between 115 and 300 K and at pressures to 30 MPa. The measurements have been correlated with a modified Hildebrand equation. The experimental error is estimated to be smaller than 3%. The measurements of normal butane and isobutane have been compared with a global extended corresponding states model and with each other. Differences between measured and calculated viscosities are discussed.

Excited States Created in Charge Transfer Coilisions between Atoms and Highly Charged ions. Final rept..

R. K. Janev. 1983, 14p

Pub. in Proceedings of International Symposium on Production and Physics of Highly Charged Ions, Stockholm, Sweden, June 1-5, 1982, Physica Scripta T3, p208-221 1983.

Keywords: *Atomic energy levels, Excitation, Electron transfer, Electron capture, *Atom ion collisions, *Charge exchange reactions.

A survey of theoretical achievements and problems in the study of formation of excited states in atom-highly charged ion charge-exchange collisions is presented. Both one- and many-electron colliding systems are considered. Apart from the basic single electron transfer reactions, other multi-electron transition processes leading to creation of excited product states are also discussed. The theoretical data on the final state distributions of capture electrons are critically analyzed and the problems which require further investigations are emphasized.

Round Robin Test on ELS (Electron Energy Loss Spectroscopy) Quantitation.

Final rept.,

D. C. Joy, and D. E. Newbury. 1981, 3p Pub. in Proceedings of Annual Conference of the Mi-crobeam Analysis Society (16th), Vail, CO., July 13-17, 1981, p178-180 1981.

Keywords: *Carbon, *Chemical analysis, Electron microscopy, *Electron energy loss spectroscopy, *Scanning electron microscopy, *Transmission electron croscopy.

A round robin test has been performed for analysis by electron energy loss spectroscopy on the analytical electron microscopy. Carbon thin films were measured and several parameters were calculated from the spectrum, including the number of atoms per square centimeter of target the pre-absorption and post about the centimeter of target, the pre-absorption and post-ab-sorption edge, exporential background parameters, and the total spectrum intensity to zero-loss intensity ratio. Good agreement for these parameters among three of the participating laboratones was noted. Substantial disagreement in two other measurements is attributed to errors in data collection and/or reduction.

Pump-Probe Techniques Applied to Spectroscopic and Kinetic Studies of Radicals.

D. S. King, and R. F. Wormsbecher. 1981, 6p Sponsored by SPIE-The International Society for Opti-

cal Engineering, Bellingham, WA.
Pub. in Proceedings of the SPIE Laser Spectroscopy
for Sensitive Detection Conference, Washington, DC., April 23-24, 1981, v286 p111-116.

Keywords: *Free radicals, *Reaction kinetics, *Electron probes, Dissociation, Molecular relaxation, Mass transfer, Electronic pumping, Combustion products, Gas analysis, *Laser spectroscopy, Air pollution detection, Nitride/methyl, Atmospheric chemistry.

In response to recent interests in laser applications to monitoring the role of radical species in combustion and atmospheric chemistry several new techniques have been developed. In this paper the authors dis-cuss a laser-probe technique utilized in our lab to obtain spectroscopic data for such in situ or long range studies and kinetic data on mass transport, vibrational and rotational relaxation, and chemical delay. The work utilizes a pulsed photolysis (excimer, YAG, CO2) laser to generate the radical in a well defined spatial region and a second probe (tunable dye) laser delayed in time. Applications of this technique to relaxation processes in CF2 and to new spectroscopic data on OCH3 will be discussed.

Estimating the Impact of Atmospheric Carbonaceous Particulates on Urban and Rural Environments by Radiocarbon Measurements. Final rept.,

G. Klouda, L. Currie, R. Gerlach, R. Continetti, and

G. Tompkins. 1982, 18p
Pub. in Proceedings of Residential Wood and Coal
Combustion Specialty Conference, Louisville, KY.,
March 1-2, 1982, Spec. Conf. Proc. SP-45, p189-206.

Keywords: *Environmental surveys, *Radioactive age determination, *Radiocarbon dating, Isotopic labeling, Mass spectroscopy, Chemical analysis, Assessments, Particles, Urban areas, Rural areas, *Accelerator Particles, Urban areas, Rural areas, *Accelerator mass spectroscopy, *Air pollution detection, Natural emissions, Wood burning appliances, Tracer studies.

Natural radiocarbon ((14)C) has been extensively utilized to decipher the history of the earth and more re-cently to reconstruct episodes of environmental pollution. Radiocarbon measurements of atmospheric carbonaceous particulates via low-level counting (Ilc) have demonstrated its usefulness as a unique discriminator of fossil and biogenic contributions to the degradation of air quality. In addition, the revolution in ((14)C) single atom counting by Accelerator Mass Spectrometry (AMS) will allow one to investigate individual organic compounds for source identification. Preliminary steps in development of an analytical technique for AMS sample preparation are discussed. The dichotomous model of fossil/biogenic source contributions to air pollution is resolvable by identifying the fraction of contemporary carbon of carbonaceous particulates through radiocarbon measurements. Studies currently underway include characterizing the rural for-ested areas of Abastumani, USSR and the Shenandoah Valley, Virginia and source assessment of particles collected at Pt. Barrow, Alaska for examining the 'Arctic Haze' episodes. The power of ((14)C) as an environmental tracer is being enhanced by including this information in the Receptor Model approach. Research is underway to produce a simulated data set for fictitious receptor sites which can be used to validate existing models.

Applications of Equilibrium Diagrams to Corrosion and Electrodeposition.

Final rept.,
J. Kruger. 1982, 19p
Pub. in Proceedings of Diagrams of Chemical and Electrochemical Equilibria: Their Setting-Up and Applications, Brussels, Belgium, September 2-5, 1981, p215-233 1982.

Keywords: *Chemical equilibrium, *Corrosion prevention, *Electrodeposition, *Phase diagrams, Passivity, pH, Electrolysis, Oxidation, Reviews, Metal coatings, *Electrodeposition, *Phase diagrams, Passivity, Solutions

The application of the equilibrium pH-potential diagrams to corrosion has been a crowning accomplishment of CEBELCOR, especially its founder, M. Pourbaix. This review will describe the application of these diagrams to both corrosion and electrodeposition problems in aqueous systems at room temperature. For corrosion the diagrams have been used in the or corrosion the diagrams have been used in the classic applications of establishing theoretical domains of conditions for corrosion, immunity and passivation, resistance of metals to pure water, the use of oxidizing corrosion inhibitors, and the classification of the degree of nobility of metals. Other applications have been to localized corrosion, passivity, problems in complex practical environments, e.g., atmospheric corrosion, useful corrosion processes and corrosion protection measures. For electrodeposition, the diagrams have been used to determine conditions to promote desired cathodic and anodic processes and to select suitable electrolytic solutions. The application of the diagrams to the development of new electrodeposition technologies, e.g., pulsed electrodeposition of alloy coatings, looks promising.

Group 7D—Physical Chemistry

Keywords: *Molecular structure, *Surface chemistry, *Iron, *Iron oxides, *Corrosion, Chemical bonds, Crystal structure, Fine structure, Reprints, *Extended X ray absorption fine structure.

There exists considerable controversy about the structure, the bonding, and the composition of the passive films that form on iron surfaces in aqueous electrolytes. A major problem is that most of the surface analytical techniques used to characterize the passive film require exposure to vacua, which can alter the structure of the passive film. This study seeks to overcome this problem through the application of a new surface-EXAFS (extended x-ray absorption fine structure) technique that is both extremely sensitive to structural and bonding changes in the 2 to 3 nm passive film and does not require the use of a vacuum environment. Near edge and extended x-ray absorption fine structure spectra from passive films on iron were measured and compared with those from pure iron and a polycrystalline iron oxide of known structure. The EXAFS data provide a measure of the relative disorder in the passive films, and they were used to derive bond lengths for the iron-to-oxygen and the iron-to-iron coordination shells.

Final rept., A. R. P. Rau. 1984, 14p Grant NSF-PHY81-20243

Sponsored by National Science Foundation, Washing-

Pub. in Proceedings of International Conference on Atomic Physics (9th), Seattle, WA., July 1984, Atomic Physics 9, p491-504.

Keywords: *Atomic energy levels, Excitation, Quantum numbers, Oxygen, *Electron electron interactions.

Doubly-excited states of high excitation in atoms and ions - their description through appropriate quantum numbers, mechanisms for their excitation and very recent experimental evidence for them - are reviewed. The states are divided into two classes depending on whether the two electrons have comparable excitation or are widely disparate in their radial extent. Different sets of quantum numbers are appropriate to the description of the two kinds of states. In particular, the states of high and comparable excitation are best viewed as a single entity, the pair, attached to the grandparent ion, with a reference throughout only to quantum numbers characteristic of the pair. Elements from the literature on planetary atoms, ridge states, O4 group symmetry for two electrons, the adiabatic hyperspherical method, and the Wannier theory for twoelectron escape are brought together in the description of pathways to, and properties of, high excitation.

Liquid-Vapor Interface of a Binary Liquid Mixture

Near the Consolute Point.

Final rept.. J. W. Schmidt, and M. R. Moidover. 15 Aug 85, 6p Sponsored by National Aeronautics and Space Administration, Washington, DC.

Pub. in Jni. of Chemical Physics 83, n4 p1829-1834, 15 Aug 85.

Keywords: *Surface chemistry, systems(Materials), *Critical point, Polarimetry, Molecular structure, Mixtures, Ternary systems, Refractivity, Adsorption, Liquid phases, Vapor phases, Temperature, Reprints, *Isopropyi alcohol, *Cyclohexane/ fluoro-methyl.

The liquid-vapor interface above mixtures of isopro-panol (i-C3H7OH) and perfluoromethylcyclohexane (C7F14) has been studied in the vicinity of the consolute point T(sub c) = 363 K). As three-phase coexistence is approached, the excess fluorocarbon adsorbed at this interface increases; the adsorption is expected to diverge at T(sub c) for a mixture of the critical composition. A simple model of the interface which incorporates the adsorption anomaly is compared with out ellipticity measurements. Both the model and our data yield ellipticities which have a finite maximum at 0.1 K above T(sub c). Ellipticity data for noncritical compositions are presented; however, their analysis will be presented elsewhere.

Two-Laser Pulse-and-Probe Study of T-R,V Energy Transfer Collisions of H $\,+\,$ NO at 0.95 and 2.2 eV. Final rept

C. A. Wight, D. J. Donaldson, and S. R. Leone. 15 Jul 85, 8p

Sponsored by Army Research Office, Research Triangie Park, NC ub. in Jnl. of Chemical Physics 83, n2 p660-667, 15

Keywords: *Molecular rotation, *Molecular vibration, *Spin orbit interactions, Nitrogen oxide(NO), Excitation, Temperature, Reprints, *Atom molecule collision, *Laser induced fluorescence, Hydrogen atoms.

Vibrational, rotational, and spin-orbit state distributions are obtained for inelastic collisions of H+NO at 2.2 and 0.95 eV. The H atoms are generated by excimer laser photolysis of H2S at 193 and 248 nm, respectively, and the excited states of the NO molecules are probed by laser-induced fluorescence using a tunable dye laser. The rotational state distribution accompanying the T-V excitation of nu = 1-3 at 2.2 eV is approximately characterized by a Boltzmann distribution at 1275 K, and is essentially independent of the vibrational level excited. At 0.95 eV, the rotational populations are approximately characterized by a 1050 K distribution. in each case, the temperatures of the spin-orbit state populations and the rotational states are the same. No selective population of lambda doublet states is observed. The results are discussed in terms of chemical interactions between these two open-shell species on the HNO potential energy surfaces.

Dielectronic Recombination as a Direct Free-Bond Radlative Process.

Final rept.,

S. Geltman. 1985, 18p Grant NSF-PHY82-00805

Sponsored by National Science Foundation, Washing-

Pub. in Jnl. of Physics B: Atomic and Molecular Physics 18, n7 p1425-1442 1985.

Keywords: *Atomic energy levels, Ionization, Chemical equilibrium, Elastic scattering, Comparison, Excitation, Reprints, *Autoionization, *Dielectronic recombination, *Dipole radiation, Electron ion collision, Rydberg series.

The process of dielectronic recombination is studied in terms of the standard treatment of a free-bound dipole radiative transition between stationary states. The initial free state of electron-ion resonant elastic scattering is analysed using the Fano formulation for discrete-state-continuum configuration mixing. In most cases there is reasonable overall qualitative agreement, but uncertainties in the final-state distributions involved in the measurements prevent a fully quantitative compar-ison. The effects of external fields on the dielectronic recombination process are also discussed in the context of the present method.

High Sensitivity Neutron Activation Analysis of En-

vironmental and Biological Standard Reference Materials.

Final rept., R. R. Greenberg, R. F. Fleming, and R. Zeisler.

Pub. in Environment International 10, p129-136 1984.

Keywords: *Neutron activation analysis, *Environmental surveys, Chemical analysis, Sampling, Trace elements, Laboratory equipment, Reprints, *Standard reference materials, *Biological processes.

Neutron activation analysis is a sensitive method with unique capabilities for the analysis of environmental and biological samples. Since it is based upon the nuclear properties of the elements, it does not suffer from many of the chemical effects that plague other methods of analysis. Analyses can be performed either with no chemical treatment of the sample (instrumentally), or with separations of the elements of interest after neutron irradiation (radiochemically). Typical examples of both types of analysis are discussed, and data ob tained for a number of environmental and biological SRMs are presented.

Product Vibrational State Distributions of Thermai Energy Charge Transfer Reactions Determined by Laser-Induced Fluorescence: N(+1) + CO yields CO(+1)(nu=0-2) + N.

Final rept. C. E. Hamilton, V. M. Bierbaum, and S. R. Leone. Jul 85, 10p

Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC.
Pub. in Jnl. of Chemical Physics 83, n2 p601-610, 15

Keywords: *Molecular vibration, Carbon monoxide, Nitrogen, Dynamics, Reprints, *Laser induced fluorescence, *Ion molecule interactions, *Flowing afterglow, Nitrogen ion.

The nascent vibrational state distribution of the N(+1)+ CO yields CO(+1)(v=0-2)+N charge transfer reaction is measured at thermal energy. The reaction is carried out in a flowing afterglow and the vibrational state populations are determined by laser-induced fluorisms. orescence on the $CO(+1)(A(\sup 2) \text{ pi-X}(\sup 2) \text{ sigma}(+1)$ system. The observed vibrational distribution suggests that neither a long-range Franck-Condon mechanism nor an energy resonant process adequately describes the charge transfer reaction. A dual channel mechanism of the reaction is considered, in which a fraction of the reactive collisions proceed by a long-range Franck-Condon mechanism while the remainder proceed via a long-lived NCO(+1) intermediate. The intermediate may lead to the observed extent of CO(+1) vibrational excitation either through statistical partitioning of the energy or by dynamical changes in the CO bond length through specific molecular orbital occupancies.

Nascent Product Vibrational State Distributions of Thermal Ion-Moiecule Reactions Determined by Infrared Chemiluminescence.

C. E. Hamilton, and S. R. Leone. 1985, 18p Grant NSF-PHY82-00805

Sponsored by National Science Foundation, Washington, DC., and Air Force Office of Scientific Research, Bolling AFB, DC.

Pub. in Gas Phase Chemiluminescence and Chemi-Ionization, p139-156 1985.

Keywords: *Molecular vibration, *Infrared analysis, *Chemiluminescence, Excitation, Chemical reactions, Reprints, *Ion molecule interactions, *Flowing after-

A flowing afterglow apparatus is used to study the dynamics of ion-molecule reactions by detection of vibra-tional states in the products with infrared chemiluminescence. Other reactions of polyatomic molecules have been studied to test whether the products are formed in a 'direct' fashion or through a long-lived collision intermediate. The results are compared to successful theoretical models of Gauyacq, in which the electron is released by dynamically-induced transitions on the outer region of the potential upon the initial reagent approach.

Analysis Society, Bethesda, MD.
Pub. in Proceedings of Annual Conference on Microbeam Analysis Society (17th), Washington, DC., August 9-13, 1982, p88-92.

Keywords: *Electron microscopy, *Electron scattering, *Uranium alloys, *X ray analysis, Experimental design, Beam width, Chemical analysis, Monte Carlo method.

Beam broadening has been studied in alloys of uranium-niobium and uranium-molybdenum. Profiles have been measured across interphase boundaries for which the solute element is located exclusively in one phase. Experimental measurements have been compared with calculated profiles obtained with a Monte Carlo electron trajectory simulation. Good agreement is obtained in the immediate region of the boundary. A long low intensity tail is indicated from the calculations but this tail is not observed experimentally. Studies of the effect of varying specimen and beam parameters indicate the difficulty in obtaining accurate experimental profiles.

Final rept., L. P. Cook. 1981, 12p Sponsored by Department of Energy, Washington, DC. Pub. in Materials Science Research 14, p143-154

Keywords: *Potassium carbonates, *Potassium aluminates, *Interfacial tension, Melting points, Crystallog-raphy, Liquid phases, Experimental design, Reprints, Clathrate compounds.

Anomalous melting behavior is described in the system K2CO3-KA102. Compositions with less than 90 mole % K2CO3 show no evidence of melting at 1150C despite the known melting of pure K2CO3 at 901C. X-ray analysis of the products shows primarily well-defined patterns of K2CO3 and KA102. The influence of platinum reaction and surface tension effects is discussed. The possibility of a regular intergrowth of potassium carbonate with potassium aluminate along a crystallographically-controlled interface at temperatures above the melting point of K2CO3 is suggested as a way of explaining the experimental data. This intergrowth could occur either in the form of an intercalation-type solid or as a partially ordered liquid (mesomorphic) phase.

Keywords: *Semiconductor diodes. Semiconductors(Materials), Semiconductor doping,

Group 7D—Physical Chemistry

Density(Mass/volume), Platinum, Silicon, Reprints, *Deep level transient spectroscopy.

The procedures reported here provide a way to analyze data from nonexponential transient capacitance measurements made under conditions such that (a) the traps are charged in only a part of the depletion the traps are charged in only a part of the depletion layer or (b) the trap density is not small compared with the net shallow dopant density. This analysis requires 1/(C squared) vs. V data to be linear over the voltage range used, which may be a small range at low temperatures because of the compensation effect of traps. Computer simulations of 1/(C squared) vs. V plots are given for various ratios of trap and dopant densities at several temperatures and show ranges which are sufficiently linear but which have a trap density. which are sufficiently linear, but which have a trap-density-dependent slope. These effects are illustrated by experimental 1/(C squared) vs. V, isothermal transient capacitance (ITCAP), and DLTS measurements for a wide range of densities of platinum in p(sup +)n and $n(\sup +)p$ silicon diodes.

Defects and Charge Transport in Stabilized alpha-Ta205.

Final rept.,

A. McHale, and H. L. Tuller. Aug 83, 15p Pub. in Radiation Effects 75, n1-4 p267-281 Aug 83.

Keywords: *Tantalum oxide, *High temperature tests, Stability, Electronic conductivity, Transport properties, Ions, Thermodynamics, Reprints.

The high temperature form of tantalum oxide, alpha-Ta2O5, stabilized by the addition of several mol% Sc2O3 has been shown to be an excellent oxygen conductor, comparable to stabilized zirconias in the range 500-950C. Electrical conductivity is characterized by the dominant ionic component in air, with an activation ene of about/ev. N-type electronic conduction, proportional to P(sub O2)(sup -1/4), becomes significant at highly reduced oxygen partial pressures and high temperatures. Transport properties have been characterized using complex impedance methods. Galvanic cell measurement of ionic transference number was used to confirm oxygen ions as dominant charge carriers. Both polycrystalline and single crystal specimens were examined. Stabilization of high Ta2O5 via incorporation of aliovalent impurities is discussed in relation to its probable effects on crystalline anisotropy and charge transport.

PB86-113693 PC A03/MF A01 National Bureau of Standards (NML), Gaithersburg, MD. Office of Standard Reference Materials. Development of a One-Micrometer-Diameter Particle Size Standard, SRM (Standard Reference Mate-

rials) 1690.

Final rept., G. W. Mulholland, A. W. Hartman, G. G. Hembree, E. Marx, and T. R. Lettieri. May 85, 36p NBS/SP-260/

Also available from Supt. of Docs as SN003-003-02665-4. Library of Congress catalog card no. 85-600539.

Keywords: *Particle size, *Standards, *Particle size distribution, Refractivity, Aerosols, Light scattering, Polystyrene, Spheres, Error analysis, *Standard reference materials, Transmission electron microscopy.

The average diameter of the first micrometer particle size standard (Standard Reference Material 1690), an aqueous suspension of monosized polystyrene spheres with a nominal 1micrometers diameter, was accurately determined by three independent tech-niques. In one technique the intensity of light scattered by a diluted suspension of polystyrene spheres was measured as a function of scattering angle, using a He-Ne laser polarized in the vertical direction. The second technique consisted of measuring the intensity of light scattered from individual polystyrene spheres suspended in air as a function of angle, using a He-Cd laser with light polarized parallel and perpendicular to the scattering plane. The measurement of row length by optical microscopy for polystyrene spheres ar-ranged in close-packed, two-dimensional hexagonal arrays was the basis of the third technique. The measurement errors for each technique were quantitatively assessed.

PB86-119229 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Inorganic Materials Div. Studies of Passive Film Breakdown by Detection

and Analysis of Electrochemical Noise. Final rept.,

U. Bertocci, and J. Kruger. 1980, 11p Pub. in Surface Science 101, n1-3 p608-618 1980.

Keywords: *Electric current, *Electrodes, *Electrochemistry, *Acoustic measurement, Passivity, Corrosion, Aluminum, Amorphous alloys, Surface chemistry, Reprints, *Passivation(Semiconductor), *Noise exposures.

Random fluctuations in the passive current of electrodes under potentiostatic conditions have been measured on aluminum in boric acid: borate solution and on a Fe-Cr-Ni alloy, both in the amorphous and in the crystalline state, in sulfuric acid. The onset of pitting can be detected by the large increase in current noise. The noise level is different in the amorphous and crystalline Fe-Cr-Nialloy, indicating that the breakdown of the passive film differs in the two conditions. The experimental aspects involved in carrying out meaningful noise measurements in electrochemical systems are also discussed.

Martensitic Transformations in Iron-Nickel-Carbon Allovs. Final rept.,

T. N. Durlu, and J. W. Christian. 1979, 6p
Pub. in Proceedings of International Conference on
Martensitic Transformations (ICOMAT), Cambridge,

MA., June 24-29, 1979, p343-348.

Keywords: *Phase transformation, *Crystallography, Martensite, Reaction kinetics, Stress strain analysis, *Iron nickel carbides.

Small austenitic single crystals of two alloys with subzero M(sub s) (burst) temperatures were spark-ma-chined from recrystallized samples and used in both the undeformed and deformed conditions to investigate the subsequent transformation. The M(sub s) temperature as a function of reduction in area by rolling increased to a broad maximum at 40-50% deformation and then decreased again. Crystallographic investigations were made of the preferred habit plane variants formed in the first burst in single crystals of many different orientations predeformed in compression. Most of the crystals were orientated for single slip and the initial transformation occurred by the co-operative formation of a single group of plates with four habit plane variants. It is believed that the results indicate that an active slip system stimulates particular habit plane variants rather than inhibits others. Studies were also made of deformation-induced martensite in polycrystalline samples of Fe-Ni-C alloys. Different morphologies were found for stress-induced and strain-induced martensites.

Far-Infrared Laser Magnetic Resonance Spectrum

of the SiH Radical and Determination of Ground State Parameters.

Final rept.. J. M. Brown, R. F. Curl, and K. M. Evenson. 1984, 7p Sponsored by National Aeronautics and Space Administration, Washington, DC.

Pub. in Jnl. of Chemical Physics 81, n7 p2884-2890, 1

Keywords: *Molecular energy levels, *Silane, Free radicals, Reprints, *Laser spectroscopy, *Far infrared laser magnetic resonance spectroscopy.

The far-infrared laser magnetic resonance (LMR) spectrum of the SiH radical in the nu=0 level of its X (sup 2)pi state has been recorded. The signals are rather weak. The molecules were generated in the reaction between fluorine atoms and SiH4. Rotational transitions have been detected in both (sup 2)pi(sub 1/2) and (sub 2)pi(sub 3/2) spin components but no fine structure transitions between the spin components were observed. Proton hyperfine splittings were re-solved on some lines. The measurements have been analyzed, subjected to a least-squares fit using an effective Hamiltonian and the appropriate molecular parameters determined. The weakness of the spectrum and the failure of attempts to power saturate favorable lines are both consistent with a small value for the electric dipole moment for SiH.

Modeling of Axially Symmetric Flow Reactors.

Final rept., R. L. Brown. 1984, 7p

Pub. in Computers and Chemistry 8, n2 p139-145 1984

Keywords: *Mathematical models, *Axisymmetric flow, *Chemical reactors, Reaction kinetics, Velocity measurement, Concentration(Composition), Reprints. *Axisymmetric

A method of calculating the velocity profiles and species concentrations in axially symmetric flow reactors is presented. The method is illustrated with a reactor consisting of three concentric tubes arranged so that reactants flow through the inner tube and inner annulus to a mixing region and the products flow out through the outer annulus. A single bimolecular reaction is used in the example. The method involves two steps; calculation of the velocity field from a solution of the Navier-Stokes equations, followed by solution of the species conservation equations. The technique provides a way of analyzing reactors with variable cross sections and sampling ports near mixing regions.

Orientational Ordering in a Strongly Chemisorbed System: Na on Ru(001). Final rept.,

D. L. Doering, and S. Semancik. 1984, 4p Sponsored by Department of Energy, Washington, DC. Pub. in Physical Review Letters 53, n1 p66-69, 2 Jul

Keywords: *Sodium, *Surface chemistry, *Chemisorption, *Crystal structure, Rhuthenium, Substrates, Mathematical models, Rare gases, Orientation, Reprints, *Low energy electron diffraction.

The study of Na on Ru(001) at 80 K provides the first detailed examination of orientational ordering in a strongly chemisorbed monolayer. The relative orientation of a Na layer on Ru(001) varies with the Na-Ru lattice misfit in a way consistent with predictions from theoretical models that have been used to explain orientational ordering of rare gases physisorbed on graphite. The similarity between physisorbed systems and the chemisorbed Na on Ru system suggests a universal behavior of rigid overlayers on hexagonal substrates.

Critical-Point Conditions for Classical Polydis-

perse Fluids. Final rept.,

K. A. Johnson, D. A. Jonah, J. M. Kincaid, and G. Morrison. 1985, 6p

Sponsored by Department of Energy, Washington, DC. Office of Basic Energy Sciences. Pub. in Jnl. of Chemical Physics 82, n11 p5178-5183, 1

Keywords: *Critical point, *Fluids, Density(Mass/volume), Temperature, Chemical composition, Gibbs free energy, Dispersion, Reprints.

The critical-point conditions for a polydisperse mixture are shown to be equivalent to those for the existence of nontrivial solutions to two homogeneous integral equations of the Fredholm type. This mathematically rigorous treatment is not dependent on the form of any particular model free energy and hence shows that there is no formal distinction between the critical-point conditions of a polydisperse fluid and those conditions derived by Gibbs for the critical point of a mixture with a finite number of components. Using the method of Fredholm, the authors express the critical-point conditions in terms of the zeros of two absolutely convergent expansions, and demonstrate how the expansions may be used to determine the shifts in critical density and temperature caused by changes in the composition of the fluid.

Electron- and Photo-Stimulated Desorption of Condensed Molecular Films: Relevance to the Mechanisms of Ion Formation and Desorption.

R. Stockbauer, E. Bertel, and T. E. Madey. 1983, 2p Pub. in Jnl. of Vacuum Science and Technology A1, n2 pt2 p1162-1163 Apr/Jun 83.

Keywords: *Ionization, *Desorption, *Monomolecular films, Comparison, Methyl alcohol, Cyclohexane, Hydrogen, Water, Chemical bonds, Surface chemistry, Reprints, *Electron stimulated desorption, *Photon stimulated desorption, *Chemical reaction mechanisms.

Electron and photon stimulated desorption (ESD,PSD) have been applied mainly to adsorbed monolayers and ionic solids. In an attempt to clarify mechanisms of ion deexcitation and desorption in covalent systems we compare ESD of condensed films of hydrogen-bonded methanol (CH3OH) and water, and non-hydrogen-bonded cyclohexane (C6H12). There are striking differences in the results. These results are qualitatively consistent with a model by which more massive ions are preferentially neutralized close to the metal surface. The reneutralization rate decreases with increasing film thickness causing an increased yield of higher mass fragments. It appears that the hydrogen-bonding in the methanol layer provides an effective de-excita-tion mechanism for higher mass fragments at all thick-

Reliable Data for Flue Gas Desulfurization Processes.

B. R. Staples. 1982, 16p Sponsored by American Chemical Society, Washing-

ton, DC. Pub. in Proceedings of Meeting of the American Chemical Society Flue Gas Desulfurization, Atlanta, GA., March 29-30, 1981, p41-56 1982.

Keywords: *Air pollution control equipment, *Scrubbing, *Electrolytes, *Thermodynamic properties, Physical properties, Guidelines, Chemical equilibrium, Enthalpy, Entropy, Performance evaluation, Chemical properties, Flue gases, Specific heat, Gibbs free energy, Activity coefficient, Tables(Data), Flue gas desulfurization.

A wide variety of physical chemical data and vapor liquid equilibria is required to predict and extrapolate performance reliability of flue gas desulfurization processes. A chemical and physical model capable of predicting actual scrubber performance is a continuing goal, but any model is only as reliable as the input data. Carefully evaluated thermodynamic and kinetic data are needed to ensure consistency, accuracy, and to provide a basis for comparing processes or models. The methodology for the critical evaluation of thermodynamic properties of electrolytes is discussed in general, with emphasis on processes important in flue gas washing systems. How we intend to use the present evaluation systems to provide updated data for flue gas washing processes is also discussed. A number of these specific processes was chosen to illustrate the evaluation procedure. Guidelines are provided for calculating an equilibrium constant, activity coefficient, Gibbs energy and enthalpy of reaction, enthalpy of di-lution, and standard enthalpy, Gibbs energy, entropy, and heat capacity. Sources of data and how to use them are discussed.

Angular Momentum Transfer and Charge Cloud Ailgnment in Atomic Collisions: intuitive Concepts, Experimental Observations and Semiciassical Modeis.

Final rept., I. V. Hertel, H. Schmidt, A. Bahring, and E. Meyer.

1985, 40p

Pub. in Reports on Progress in Physics 48, n3 p375-414 Mar 85.

*Angular momentum, Mathematical Keywords: models, Experimental design, Excitation, Reprints, *Atom atom interactions. *Laser spectroscopy, *Atom atom interactions, *Laser spo Sodium atoms, Xeon atoms, Barium atoms.

The authors discuss intuitive concepts to describe alignment and orientation effects in collision processes with, or leading to, an atomic np charge cloud state. For direct excitation one understands the atomic angular momentum transferred to terms of a rolling ball; and for excitation (deexcitation) in a molecular picture one can visualize the alignment angle of the atomic p charge cloud in terms of a transition from a body fixed molecular picture (small internuclear distances R) to a space fixed picture (large R). These concepts are illustrated by experimental results for e + Na* and Na+ + Na* collisions. Further examples are the molecular processes N2 + Na* and the atomic process Xe + Ba* at thermal energies.

Elemental Ratioing Technique for Assessing Concentration Data from a Complex Water System.

Final rept., H. M. Kingston, and R. R. Greenberg. 1984, 9p Pub. in Environment International 10, p153-161 1984.

*Water analysis Keywords: Concentration(Composition), Sites, Sampling, Chemical analysis, Sediments, Particles, Assessments, Comparison, Reprints, *Water pollution sampling, *Water pollution detection.

Water samples have been collected at the surface and bottom layers at 51 locations throughout Chesapeake Bay. The suspended particulate and dissolved fractions of these samples have been analyzed for Cd, Ce, Co, Cu, Fe, Mn, Mo, Ni, Pb, Sc, Sn, Th, U, and Zn using neutron activation analysis and atomic absorption spectrometry. Special chemical procedures were used to preconcentrate the elements of interest in the dis-solved samples and separate them from the salt water matrix. The elemental concentrations observed in the dissolved samples were evaluated by direct comparison to those found in coastal seawater; however, the elemental concentrations in the particulate samples (mass per volume of water) were strongly influenced by the total amount of particulate material suspended in the water at time of collection. A double normalization procedure was used to calculate crustal enrichment factors for each sample, and these enrichment factors provided both a means to observe sample-tosample variations, and also allowed a crude comparison with the natural levels occurring in the earth's crust.

Torsional-Wagging Tunneling Problem and the
Torsional-Wagging-Rotational Problem in Hydra-

Final rept.. N. Ohashi, and J. Hougen. 1985, 17p

Pub. in Jnl. of Molecular Spectroscopy 112, p384-400

Keywords: *Hydrazine, *Molecular rotation, *Molecular vibration, Molecular energy levels, Reprints.

Results derived previously for the rotational levels of the eight-framework and three-large-amplitude vibra-

tional problem in N2H4, using a tunneling formalism based on a treatment of the vibration-rotation problem as a whole, are rederived here in a much simpler fashion, using a tunneling formalism based on a separate treatment of the vibrational and rotational problems. The present formalism is thus much more akin to the usual vibration-rotation formalism, and the origins of the various contributions to the vibration-rotation energy levels can be understood relatively easily. It is convenient here, as earlier, to make extensive use of permutation-inversion and extended-group (double-group) ideas, but it is necessary in the present treatment to consider tunneling between 16 minima in molecular coordinate space, i.e., between a number of minima which is twice the number of nonsuperimposable molecular frameworks that can actually be constructed for N2H4. Thermal Conductivity of Hydrogen for Temperatures between 78 and 310 K with Pressures to 70

MPa.

H. M. Roder. 1984, 28p Sponsored by National Aeronautics and Space Admin-

istration, Washington, DC. Pub. in International Jnl. of Thermophysics 5, n4 p323-350 Dec 84.

Keywords: *Hydrogen, *Thermal conductivity, *Laboratory equipment, Temperatures, Pressures, Experimental design, Isotherms, Density(Mass/volume), Re-

The paper presents new experimental measurements of the thermal conductivity of hydrogen. The ortho-para compositions covered are normal, near normal, para, and para-rich. The measurements were made with a transient hot wire apparatus. The temperatures covered the range from 78 to 310 K with pressures to 70 MPa and densities from 0 to a maximum of 40 mol/ L. For compositions normal and near normal, the isotherms cover the entire range of pressure, and the temperatures are 78, 100, 125, 150, 175, 200, 225, 250, 275, 294, 300, and 310 K. The para measurements in-Clude eight isotherms at temperatures from 100 to 275 K with intervals of 25 K, pressures to 12 MPa, and densities from 0 to 12 mol/L. Three additional isotherms at 150, 250, and 275 K cover para-rich compositions with para percentages varying from 85 to 72%. For these three isotherms the pressures reach 70 MPa and the density a maximum of 30 mol/L. The data for all compositions are represented by a single thermal conductivity surface. The data are compared with the experimental measurements of others through the new correlation. The precision (2 sigma) of the hydrogen measurements is between 0.5 and 0.8% for wire temperature transients of 4 to 5 K, while the accuracy is estimated to be 1.5%.

Use of Isotope Dilution Mass Spectrometry for the Certification of Standard Reference Materials. Final rept.,

L. J. Moore, H. M. Kingston, T. J. Murphy, and P. J. Paulsen. 1984, 5p

Pub. in Environment International 10, p169-173 1984.

Keywords: *Environmental surveys, *Trace elements, *Chemical analysis, Lead(Metal), Water analysis, Fly ash, Mercury(Metal), Uranium, Air pollution, Gas analysis, Concentration(Composition), Reprints, *Isotope dilution mass spectroscopy, *Standard reference materials, *Natural emissions, SRM 1643, SRM 1633a, SRM 1577a, SRM 1642.

Isotope dilution mass spectrometry (IDMS) has been used extensively at the U.S. National Bureau of Standards as an accurate method to determine trace element concentrations in natural materials. Thermal ionization mass spectrometry is a single element technique capable of high accuracy and precision, and has been used for 'definitive' measurements of trace elements in sera with 95% confidence limits less than 0.25%. Spark source mass spectrometry is a complementary multielement, high-sensitivity technique that has been used to determine up to 20 elements in a sample, with typical accuracies of 2%-5%. Together with appropriate chemical separations, such as anion and cation exchange, chelate resins, electrodeposition, and chemical extraction, IDMS has been applied to elemental concentration measurements ranging over eight orders of magnitude, from decigrams/gram to picograms/gram. Many of these applications have been used for the certification of a broad spectrum of biological and environmental Standard Reference Materials, including lead in Trace Elements in Water (SRM 1643), 15 elements in Coal Fly Ash (SRM 1633a), uranium in Bovine Liver (SRM 1577a), and mercury in water (SRM 1642).

Degradation of Poly(Vinyl Fluoride) Poly(Vinylldene Fluoride). Final rept.,

T. Nguyen. 1985, 49p

Sponsored by Department of Energy, Washington, DC. Pub. in JMS-Rev. Macromol. Chem. Phys. C25, n2 p227-275 1985.

Keywords: *Degradation, *Polyvinyl fluoride, *Chemical analysis, *Construction materials, Comparison, Additives, Impurities, Copolymers, Reprints, *Vinylidene fluoride polymers.

Available literature on the degradation of vinyl fluoride and vinylidene fluoride homo- and copolymers has been reviewed. It is apparent from these data that the thermal and high-energy radiation degradation of these materials have been extensively investigated; however, other types of degradation have not been investigated in depth. The data reviewed reveal several problems for workers interested in these materials. (1)

Lack of information on the combined effects of UV and temperature, UV and moisture, or of the combined three factors. (2) Methods used for the detection and characterization of the degradation varied from mechanical tests to spectral analysis, and the results of these analyses can not be compared from one to another. (3) Inability to compare the results of the various studies, due to differences in materials, preparation methods, test conditions and sample sizes used for the analyses by various authors. The presence of additives and impurities, and recent advancements in processing and method of preparation of these materials compound the problem of interpreting and comparing various studies. Research is needed to address the three key problems cited above.

Applications of Fourier Transform Infrared Spec-

troscopy In Surface and Interface Studies. Final rept.,

T. Nguyen. 1985, 34p Pub. in Progress in Organic Coatings 13, p1-34 1985.

Keywords: *Infrared spectroscopy, *Chemical analysis, *Surface chemistry, *Organic coatings, Reviews, Reprints, *Fourier transform spectroscopy.

The development of Fourier transform infrared (FTIR) spectrometers, which have superior sensitivity, more rapid sample measurement and more versatile spectral processings, has revised interest of infrared spec-troscopy as an analytical method for surface and interface studies. The article will briefly review the background of FTIR and extensively review the current liter-ature on the applications of FTIR spectroscopy for surface and interface studies. The literature surveyed in this review indicates the strength and suitability of FTIR, coupled with appropriate IR spectroscopic technique for surface and interface studies. The selection of a specific technique for a particular surface application depends upon factors such as sample nature and morphology and sensitivity required. Despite remarka-ble advancement of FTIR instrumentation, the applications of this technique in surface and interface studies are still in the infancy stage. With much interest in obtaining molecular level information in a wide range of materials applications, FTIR spectroscopy is expected to be increasingly utilized for providing qualitative and quantitative molecular information on the surface and interface of materials.

Detailed Look at Aspects of Optical Pumping in Sodlum.

Final rept.

J. J. McClelland, and M. H. Kelley. 1985, 7p Sponsored by Department of Energy, Washington, DC. Office of Basic Energy Sciences.

Pub. in Physical Review A: General Physics 31, n6 p3704-3710 Jun 85.

Keywords: *Optical pumping, *Sodium, Ground state, Electron spin, Polarization(Spin alignment), Reprints, Bloch equations, Laser radiation.

Calculations and measurements are presented of the increase in (F bar)=1 ground-state population as a function of incident laser intensity in optically pumped sodium. The calculations involve numerical integration of a multilevel version of the optical Bloch equations. Agreement between experiment and theory is good when proper account is taken of the residual Doppler width in the atomic beam, which causes a larger increase in the (F bar)=1 population. The (F bar)=1 population increases by 3.5% at 35 mW/sq cm, the highest laser intensity investigated.

Calculations of the Dimerization of Aromatic Hydrocarbons: Implications for Soot Formation.

J. H. Miller, K. C. Smyth, and W. G. Mallard. 1984,

Pub. in Proceedings of International Symposium on Combustion/The Combustion Institute (20th), Ann Arbor, MI., August 1984, p1139-1147 1985.

Keywords: *Aromatic polycyclic hydrocarbons, ' Air pollution, Combustion, Flames, Van der Waals forces, Equations of state, Nucleation, Concentration(Composition), Monomers, Hydrocarbons, Dimers, Chemical reaction mechanisms.

Polynuclear aromatic hydrocarbons (PAH) are found in all sooting hydrocarbon flames. These species are ideally suited to be chemical precursors and building blocks in soot formation, yet their possible role has not been elucidated. From a knowledge of the magnitude of the van der Waals interaction between pairs of PAH the equilibrium constants for dimer formation have been calculated. These values have been used with experimentally measured PAH concentrations to compute dimer concentrations, which were then compared to soot nuclei number densities to determine whether or not the dimers are numerous enough to serve as nucleation sites. The dimers of benzene coronene (7 rings), and circumcoronene (19 rings), as well as mixed dimer pairs, have been examined. Despite choosing monomer concentrations and theoretical approaches which favor dimer formation, the dimerization of PAH does not yield a sufficient number of nucleation sites to account for soot formation in a homogeneous nucleation mechanism. If PAH do participate in the early

stages of soot formation, irreversible chemical steps must be important.

Dielectric Properties of Polymers at Microwave Frequencies: A Review.

Final rept.,

A. J. Bur. 1985, 15p Sponsored by Construction Engineering Research Lab. (Army), Champaign, IL. Pub. in Polymer 26, p963-977 Jul 85.

Keywords: *Polymers, *Dielectric properties, *Microwave frequencies, Reviews, Reprints.

A review of the dielectric loss spectra of polymers at microwave frequencies has been carried out. While the main focus of attention is the frequency range from 100 MHz to 100 GHz, loss spectra outside this region are also reviewed because variations in temperature can cause a shift of dielectric loss into or out of the microwave range. A large volume of data for low loss polymers (polyethylene, polypropylene and poly(tetrafluoroethylene)), which are used in the communications industry, was available for review. Also, the microwave dielectric properties of engineering thermoplastics such as poly(phenylene oxide), polycarbonate and polysulphane have been reviewed. The origins of microwave dielectric loss in polymers are categorized as: (a) dipolar absorption dispersions in both crystalline and amorphous polymers; (b) dipolar losses due to impurities, additives or fillers in a polymer material; (c) microwave absorption in conducting polymers (polyacetylene and poly(sulphur nitride)) for which the current carriers are electrons; and (d) photon-phonon absorption spectra corresponding to the density of states in amorphous regions of a polymer material.

Air pollution detection.

Analyses of environmental samples of known homogeneity by different laboratories often disagree seriously. Discrepant data may result from poor methodology, improper instrument calibration, faulty experimental techniques, or from a combination of these factors. One approach towards obtaining accurate data is through the use of Standard Reference Materials (SRMs) issued by the National Bureau of Standards under federal statutes. SRMs are homogeneous, stable materials with certified chemical or physical proporties and are used in calibrating instruments wall. properties and are used in calibrating instruments, validating laboratory data, developing methods of known accuracy, and referring data from different laboratories to a common base. Of the approximately 900 SRMs listed in the current SRM catalog, over 90 have been developed for use in improving the accuracy of environmental analyses. Environmental matrix SRMs certified for priority pollutants include gases, atmospheric fied for priority pollutants include gases, atmospheric dust, water, sediments, biological materials, and fuels. In addition, calibrator solutions of organic priority pollutants, such as halocarbons, and polycyclic aromatic hydrocarbons, are available for determining instrumental response factors, and adding accurate amounts of these compounds to samples.

istration, Washington, DC. Pub. in Jnl. of the Optical Society of America B2, n5 p857-861 May 85.

Keywords: *Nitrogen oxide(N2O), *Infrared spectroscopy, Calibrating, Molecular vibration, Absorption, Standards, Performance evaluation, Reprints, *Laser spectroscopy, Heterodynereactions.

Heterodyne frequency measurements on the 01(sup 1)1-00(sup 0)0 band of N2O have been made with the use of a tunable-diode laser, a CO laser transfer oscillator, and a CO2 laser frequency synthesizer. A beat frequency was measured between a CO laser and a tunable-diode laser whose frequency was locked to the peak of N2O absorption features. The frequency of the CO laser was simultaneously determined by measuring the beat frequency with respect to a reference synthesized from two CO2 lasers. New rovibrational constants are given for the 01(sup 1)1 state of N2O, which are in excellent agreement with previous results, although the band center is 4 MHz higher than in the previous measurements. A table of the line frequencies and their absolute uncertainties is given for the N2O absorption lines in the wave-number region from 1830 to 1920/cm. Some additional frequency measurements near the lower-frequency end of the 02(sup 0)0-00(sup 0)0 band have also been made with respect to a (12 sup)C(18 sup)O2 laser.

Alternative Approach to the Calculation of Four-Probe Resistances on Nonuniform Structures.

J. Albers, and H. L. Berkowitz. 1985, 4p Pub. in Jnl. of the Electrochemical Society: Solid-State Science and Technology 132, n10 p2453-2456 Oct 85.

Keywords: *Electrical resistivity, *Structural analysis, *Probes, Calibrating, Substitutes, Electrochemistry, Reprints, *Spreading resistance, Numerical solution.

An alternative approach to the calculation of the fourprobe resistance of nonuniform resistivity structures is presented. This approach is based upon two simplifications in the form of the four-probe resistance integral. The first arises from the integral's being independent of the probe current density as well as the probe radius. The second simplification involves the rewriting of the integral as one involving only the kernel (without any Bessel functions) and with finite limits which depend only upon the probe spacing. The form of these limits is determined by analytic calculation of the four-probe resistance for the case of a semi-infinite slab. For the case of a uniform layer over an insulating or conducting boundary, the simplified integral leads to analytic expressions for the four-probe resistance which are compared with the more extensive technique and are also investigated as a function of the probe spacing. For nonuniform resistivity structures, the simplified integral can be capital explanated by the simplified integral can be easily evaluated by means of the Newton-Cotes numerical procedure. For general multilayer cases, the results obtained from the Newton-Cotes method are compared with those obtained from more extensive numerical techniques and are shown to be in excellent agreement. This allows for a vastly simplified implementation of the previously proposed spreading resistance calibration technique.

PB86-132230 Not available NTIS National Bureau of Standards (NEL), Gaithersburg, MD. Semiconductor Materials and Processes Div. Investigation of the Relation between the Correction Factor and the Local Slope in Spreading Resistance.

Final rept.,
J. Albers. 1983, 1p
Pub. in Jnl. of the Electrochemical Society 130, n8 pC327 1983.

Keywords: *Correction, *Mathematical models, *Electrical resistivity, Electrochemistry, Reprints, *ing resistance, *Local slope, Laplace equation. Spread-

The local slope method for the calculation of the spreading resistance correction factor has been proposed by Dickey. The method is based on two asymptotic models for the conduction process involved in the spreading resistance measurement for the cases of (1 a conducting layer over an insulating substrate, and (2) a high resistivity layer over a low resistivity or conducting substrate. The two extreme cases are bridged by means of an assumed single-valued relation between the correction factor and the local slope of the spreading resistance data. The paper examines the two asymptotic models and the assumed single-valued rela-tion in terms of the multilayer Laplace equation description of spreading resistance. It is shown that the asymptotic models adequately describe the behavior of the correction factor for a thin uniform layer over

insulating or conducting boundaries. In addition, the single-valued relation between the correction factor and the local slope which is assumed by the local slope method is shown not to be an adequate representation of the multiple-valued relation between these two quantities found from the Laplace equation description. A comparison of the two correction factor vs. local slope relations provides the basis for the understanding of the results of these schemes when model spreading resistance data are used. Nonetheless, the local slope results qualitatively follow the multilayer results thus making the technique a usable one for the calculation of approximate correction factors.

Coherence Study of 2p(sigma)-2p(pl) Rotational Coupling: LI(2 doublet P) and He(2 singlet P) Orientation and Alignment in 1-25 keV LI(+1)-He Collisions.

Final rept..

N. Andersen, T. Andersen, H. Neitzke, and E. H.

Pedersen. 1985, 23p Pub. in Jnl. of Physics B: Atomic and Molecular Physics 18, n11 p2247-2269 1985.

Keywords: *Molecular energy levels, *Lithium, *Helium, Molecular rotation, Reprints, *Ion molecule collisions, Lithium ions.

The authors have studied the alignment and orientation of the electron cloud of the Li(2 doublet P) and He(2 singlet P) states excited by 2p(sigma)2p(pi) rotational coupling for impact parameters between 0.2 and 1.1 au in 1-25 keV Li(+1)-He collisions by coherence and correlation analysis techniques. It is found that for collision energies below 5 keV the shape of the excited electron cloud is very nearly that of a p orbital, aligned perpendicular to the asymptotic internuclear axis, independent of impact parameter and of whether the electron stays on the He core or is transferred to the Li centre during the collision. These findings agree with the predictions based on an analysis of the simple diabatic MO diagram for the Li-He system. At energies above 5 keV, the shape changes significantly. Also, the alignment angle deviates from the perpendicular direction, being larger than 90 deg for Li and smaller for He. The angular momentum perpendicular to the collision plane shows a pronounced variation with collision energy but is only weakly dependent on impact parameter. Possible origins for this behavior are discussed.

Multiply Excited Three-Electron Systems Studled by Optical Emission Spectroscopy. Final rept.,

T. Andersen, and S. Mannervik, 1985, 14p. Pub. in Comments on Atomic and Molecular Physics 16, n4 p185-198 1985.

Keywords: *Emission spectroscopy, *Molecular energy levels, *Lithium, *Boron, *Beryllium, Excitation, Reprints.

Recent developments in the study of radiative multiply excited states in three-electron systems are reviewed. The progress concerns experimental and theoretical studies of the term schemes for quartet states in Li I, Be II, and B III, the first term schemes for doublet states in Li I and Be II, absolute term values for Li I, the existence of two bound states in Li(-1), and the first accurate autoionization widths for autoionizing resonances in Li I and Be II. This comment concentrates on the low Z numbers for which strong effects of eLectron correlation and configuration interactions are important.

Radiation-Induced Ionization and Excitation in

Liquid p-Dioxane.

P. Ausloos, C. Lutz, F. Schwarz, and S. G. Lias. 1984, 8p Pub. in Radiation Physics and Chemistry 23, n1-2 p97-

104 1984.

Keywords: *Ionization, *Dioxanes, *Ultraviolet spectroscopy, Liquid phases, mixtures, Excitation, Molecular energy levels, Water, Reprints, *Dioxane, *Fluorescence induced ionization.

The fluorescence of neat liquid p-dioxane-and p-dioxane-water mixtures has been studied as a function of wavelength in the range 200-110 micrometers, and in the system under beta irradiation. It is seen that the quantum yield of fluorescence declines from the absorption threshold to the ionization onset (about 160-170 micrometers), because of the increasing importance of the competing decomposition processes. Above the ionization onset, there is a slight increase in the quantum yield of fluorescence as a result of the occurrence of 'recombination fluorescence'. However, it is estimated that in the region, neutralization does not always lead to a vibrationally equilibrated excited state. This explains in part why the G-value of thermal-ly equilibrated s(sub 1) states is considerably lower than G(ion)(about 5), under conditions that fluorescence originates mainly from charge recombination.

Auxiliary experiments carried out in the gas phase, in an ion cyclotron resonance spectrometer, elucidated the reaction of p-C4H8O2 ions with p-dioxane molecules.

Surface Chemistry of Water on Clean and Oxygen-Covered Copper (110). Final rept.,

K. Bange, D. E. Grider, J. K. Sass, and T. E. Madey. 1984, 27p
Pub. in Surface Science 137, n1 p38-64 1984.

Keywords: *Surface chemistry, *Water, Copper, Adsorption, Desorption, Chemical reactions, Reprints.

Adsorption of water at 110 K on clean and oxygencovered Cu(110) has been studied using UPS, TDS, delta phi and LEED measurements. A model of the arrangement of oxygen atoms and water molecules is presented, based upon the LEED observations for these layers and an estimate of the relative oxygen and water coverages. The intensity variation of a thermal desorption peak at 290 K, attributed to adsorbed OH-species, with oxygen coverage is in accordance with this model. For low oxygen coverages, the TDS and delta phi results indicate that small oxygen-water clusters with an enhanced ratio of water molecules per adsorbed oxygen atom are present.

Copper Standard Reference Materials (Benchmark Final rept.,

L. Barnes, T. E. Gills, and W. P. Reed. 1984, 10p Pub. in Sampling and Analysis of Copper Cathodes, ASTM (American Society for Testing and Materials) STP 831, p145-154 1984.

Keywords: *Copper, *Standards, Chemical analysis, Metals, Reprints, *Standard reference materials.

The Standard Reference Materials Program has experienced increasing demands for new kinds and types of standard materials. In order that the largest number of users be served by these materials and the avail-able resources be used to best advantage, careful planning is required. The planning process helps to ensure that, among other factors, the fewest number of different materials will be produced, a widerange of needs will be met, and production and certification can be accomplished at a level consistent with the intended uses. One output of this process has been the concept of 'Benchmark Series' SRMs. These are usually a set of similaar materials with varying amounts of a number of elements covering a wide range of concentrations. Largely through the auspices of ASTM Committee E-2 on Emission Spectroscopy, more than 70 persons from NBS, ASTM, and from throughout the copper industry contributed to the planning of a series of Copper Benchmark Standard Reference Materials. As a result, 12 different materials issued as chips, rods, and cast solids and representing as many as 25 different SRMs have been prepared and certified for as many as 29 elements. The production and certifica-tion process and the certified values for this important series are described and the certified values are given.

Decay Channels of the 3p Resonance in the 3d

Transition Metals and Their Relevance to the Mechanism of Electron- and Photon-Stimulated Ion Desorption.

Final rept.,
E. Bertel, R. Stockbauer, R. L. Kurtz, T. E. Madey, and D. E. Ramaker. 1985, 8p
Sponsored by Office of Naval Research, Arlington, VA.

Pub. in Surface Science 152/153, p776-783 1985.

Keywords: *Transition metals, *Molecular energy levels, *Chromium, Excitation, Oxygen, Ions, Reprints, *Photon stimulated ion desorption method, *Electron stimulated desorption, Oxygen ions.

The 3p excitation cross section in the 3d transition metals shows a resonant maximum in photoabsorption and electron energy loss spectroscopy. The resonant 3p excitation is shown to decay into various decay channels with Auger decay and direct recombination being most prominent. Electron and photon stimulated ion desorption from the 3d transition metal oxide surfaces is initiated by Auger induced 2 hole and 2 hole, 1 electron final states. In Cr(110)/O2 the O(+1) yield differs significantly from the total secondary electron yield. This rules out electron stimulated ion desorption induced by secondary electrons. It is the first instance of a pronounced core hole state sensitivity observed in

Photon-Stimulated Desorption of H(+s) lons from OH on TI and Cr: Comparison with Bulk Solid H2O. Final rept.

E. Bertel, D. E. Ramaker, R. L. Kurtz, R. Stockbauer,

and T. E. Madey. 1985, 3p Sponsored by Office of Naval Research, Arlington, VA. Pub. in Physical Review B: Condensed Matter 31, n10 p6840-6842, 15 May 85.

Keywords: Comparison, Excitation, lons, Reprints, *Photon stimulated ion desorption method, *Hydrogen ions, Hydroxyl radicals.

An interpretation and comparison of photon-stimulated desorption yields of H(+1) ions from OH on Ti and Cr and from bulk solid H2O indicate that desorption occurs through two entirely different mechanisms. The first involves an intramolecular excitation of the OH adsorbate producing a H(+1) yield similar to that in bulk H2O. The second involves metal core-level excitation followed by Auger decay and is an example of molecular adsorbate dissociation arising from a metal-sub-strate Auger decay. This is a further generalization of the Knotek-Feibelman model applicable for desorption in ionic systems.

Pub. in Jnl. of the Electrochemical Society 131, n5 p1011-1017 1984.

Keywords: *Chromium steels, *Passivity, *Pitting, *Electrochemistry, *Corrosion, *Acoustic measurement, Comparison, Reprints.

Random fluctuations of the passive current for Fe-Cr alloys of various Cr content have been examined, both in borate buffer and in the same solution with 0. mol/L NaCl added. Frequency spectra of these fluctuations have been recorded before and during pit initiation. No detectable fluctuations were observed in the absence of chlorides, when pitting does not occur. Comparison with the current noise measured before pit initiation in-dicates that the most important role of the aggressive ions is that of increasing the chance of local break-down of the passive film. Frequency spectra give infor-mation concerning the time constants of the various processes, including repassivation. No correlation was found between the rate of attack during pitting and noise amplitude.

Deposition, relocation, transformations, biological uptake, and metabolism are among major kinds of information available for organic molecules in the environment, whether toxic or essential. Present-day information for comparable processes of metals and metalloids in environmental media in terms of their molecular processes lags far behind, though almost all Main Group elements play a crucial role in living organisms and geochemistry. The review emphasizes inorganic studies, many drawn from classical examples, as aids to surveying recent contributions to the environmental chemistry of Main Group metals and metalloids. Se-lected topics, including transmethylation kinetics, pho-tomethylation, direct surface reactions, membrane attachment and lipophilicity, and naturally-occurring organometalloids and organo-metals, are discussed as a means to illustrate future needs and prospects in the field. The relationships between purely inorganic molecular species and their more labile methyl derivatives provides a useful range of comparisons, based upon over 150 references.

Comment on 'New Critical Point in the Vicinity of the Freezing Temperature of Potassium-Cesium (K2Cs)'.

Final rept.

capacity.

J. W. Cahn, and J. L. Murray. 1983, 1p Pub. in Physical Review Letters 51, n16 p1493 1983.

Keywords: *Critical point, *Freezing, *Cesium alloys, Potassium alloys, Phase diagrams, Calorimetry, Heat

A recent report of a critical point in the K-Cs system seemed unlikely to the authors. With the existing phase diagram and calorimetric data the authors could fit quite accurately almost all the data including those that led to the hypothesized critical point. The only discrepancy was resolved when they contacted the author and found that a power outage had occurred which they had not deemed significant enough to report. They conclude that no change in the phase dia-

gram is needed to account for these data.

Nonequilibrium Surface and Interface Thermodynamics.

Final rept., J. W. Cahn. 1983, 5p

Pub. in Proceedings of NATO Advanced Research Institute on Atomistics of Fracture, Calcatoggio, Corsica, France, May 22-31, 1981, Atomistics of Fracture, p427-431 1983.

Keywords: *Surface chemistry, *Thermodynamics, *Adsorption, *Fractures(Materials).

Thermodynamics of surfaces has played an important role in the development of fracture criteria. It seems clear that many of these classical papers were based on simplifying assumptions whose validity needs to be reexamined. The recent concerns with the subtleties of the effects of adsorption underscore this point. The difficulty of finding and proving the validity of simple inequalities for surface creation in nonequilibrium systems and Gibbs' counterexample should serve as warning that these concerns are real and deserve our

R. R. Cavanagh. 1985, 2p Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC.

Pub. in Jnl. of Vacuum Science and Technology A3, n3 p1655-1656 May/Jun 85.

Keywords: *Molecular relaxation, *Molecular vibration, *Silicon dioxide, *Surface chemistry, Infrared spectroscopy, Reprints, *Hydroxyl radicals.

The vibrational population relaxation rate of the O-H stretching fundamental of hydroxyl groups on SiO2 surfaces was measured directly using picosecond infrared pulses. The vibrational lifetime determined for hydroxyls at the silica-vacuum interface is 204 + or -20 ps. For silica-bound hydroxyls in a saturated atmosphere of CCI4, the lifetime decreases to 159 + or - 16 ps. Both lifetimes are many times longer than would be inferred from infrared absorption linewidths.

Keywords: *Mathematical models, *Carbon dioxide, *Ethane, *Phase transformation, Thermodynamic properties, Equations of state, Mixtures, Critical points, Comparison, Reprints, Numerical solution.

Leung and Griffiths have proposed a thermodynamic fundamental equation for a binary mixture near the crit-

Group 7D—Physical Chemistry

ical line. The equation is of the scaling form which in-corporates nonclassical exponents. They developed the equation based on the idea that the thermodynamic properties of mixtures can be obtained from the interpolation between the critical properties of pure components when a set of suitable variables are used. They demonstrated the applicability of the idea successfully in the mixture of He3 and He4 in which the critical line is a nearly linear function of composition. We have used a Leung-Griffiths type equation of state to describe the thermodynamiic properties of the mix-ture of carbon dioxide and ethane. The critical line of this mixture is, unlike that of He3 and He4, a non-linear function of composition and the azeotropic line ex-tends to the critical line. Comparison of the predictions of the equation to experimental data shows a good agreement for the mixtures of CO2 and C2H6.

Ni/Cr Interface Width Dependence on Sputtered Depth. Final rept.,

F. Davarya, M. L. Roush, J. Fine, T. D. Andreadis, and O. F. Goktepe. 1983, 4p

Jnl. of Vacuum Science and Technology A-Vacuum

Surfaces and Films 1, n2 p467-470 1983.

Keywords: *Interfaces, *Thin films, *Topography, *Nickel, *Chromium, Monte Carlo methods, Auger electrons, Sputtering, Reprints. *Thin films, *Topography,

The composition depth distribution of an interface as determined by Auger sputter depth profiling is dependent, to a large extent, on both the ion bombardment induced cascade mixing and on the surface topography generated as a result of ion erosion. The authors assess the relative influence of these two processes on the depth resolution by comparing interface widths obtained by Auger sputter depth profiling (resulting from both the cascade mixing and the topography) to interface widths obtained by computer simulation (due to cascade mixing alone). Depth profiles were measured at eight successive interfaces of a multilayered Ni/Cr/Ni/Cr...thin-film structure using both 1 and 3keV argon ion beams for sputter profiling. These interface widths increase with sputter depth, the increase being more rapid for the 3-keV bombardment. The calculations with the computer code EVOLVE contain

modeling of all contributions to interface broadening except that of surface topography, thus resulting in constant values of interface widths. The difference in width obtained from the measured and calculated data is used to estimate the extent of the topography produced as a function of sputtered depth.

J. L. Dehmer, D. Dill, and A. C. Parr. 1985, 68p Pub. in NATO ASI Ser., Ser. C, Photophys. Photo-chem. Vac. Ultraviolet 142, p341-408 1985.

Keywords: *Photochemical reactions, *Ionization, Dynamics, Excitation, Reprints, *Autoionization.

Photoionization dynamics of small molecules are discussed with emphasis on shape and autoionizing resonances. These resonant processes are important probes of the photoionization process for various reasons, the most obvious one being that they are usually displayed prominently against nonresonant behavior in such observables as the total photoionization cross section, photoionization branching ratios, and photoe-lectron angular distributions. More importantly, the study of these resonant features has repeatedly led to a deeper physical insight into the mechanisms of excitation, resonant trapping of the photoelectron, and decay of the excited complex that occur during the photoionization process. Of particular interest in this context are the uniquely molecular aspects resulting from the anisotropic molecular field and the interplay among rovibronic modes. The authors review the fundamental aspects of both types of resonant process and discuss recent progress and prospects for future work from both experimental and theoretical points of view. Finally, a brief overview of various approaches not covered in the main discussion is presented to stress the variety of complementarity of alternative probes of molecular photoionization dynamics.

Crosslinks.

Final rept., M. Dizdaroglu, and M. G. Simic. 1984, 6p Pub. in International Jnl. of Radiation Biology and Related Studies in Physics, Chemistry and Medicine 46, n3 p241-246 1984.

Keywords: *Dimers, *Radiation effects, Crosslinking, Gas chromatography, Reprints, *Thymine, *Hydroxyl Gas chromatography, Reprints, radicals, Chemical reaction mechanisms.

The formation of thymine dimers as a major consequence of radiation-generated OH radical reactions with thymine in aqueous solutions is reported. About one half of the intermediates which resulted from OH reactions with thymine, i.e., thymine radicals, dimerize, indicating dimerization as one of the major reaction pathways. The other half of thymine radicals disproportionate and give previously observed monomeric products. One should point out that the 'thymine dimers' observed in this work are not the same as the UV light-induced dimers of thymine.

Correlation Effects of a Phase-Diffusing Field on Two-Photon Absorption.

Final rept.,

D. S. Elliott, M. W. Hamilton, K. Arnett, and S. J.

Smith. 1985, 9p Sponsored by Department of Energy, Washington, DC. in Physical Review A: General Physics 32, n2 p887-895 Aug 85.

Keywords: Reprints, *Two photon absorption, Sodium atoms, Laser radiation.

Experimental evidence of field-correlation effects on weak-field two-photon absorption in atomic sodium is presented. In the case of a nearly Lorentzian laser power spectrum, the absorption profile has four times the spectral width of the exciting field, in agreement with predictions by Mollow. The measurement is carout with counterpropagating laser beams to cancel Doppler broadening. The width of the two-photon absorption spectrum is decreased by partially decorrelating the counterpropagating laser beams. Increasing the correlation time of the frequency fluctua-tions, resulting in a nearly Gaussian laser power spectrum, has also been observed to decrease the width of the absorption spectrum. An extension of the time-dependent second-order perturbation theory to these additional cases yields good agreement.

Ammonia Adsorption on the Ag(311) Surface. Final rept., S. T. Ceyer, and J. T. Yates. 1985, 12p

Pub. in Surface Science 155, p584-595 1985.

Keywords: *Silver, *Surface chemistry, *Adsorption, Molecular structure, Chemical bonds, Ammonia, Performance evaluation, Reprints, Electron stimulated de-sorption ion angular distribution method, Thermal desorption spectroscopy, Electron energy loss spectros-

The adsorption of ammonia on the Ag(311) surface has been studied by ESDIAD (electron stimulated desorption-ion angular distributions), high resolution electron energy loss spectroscopy and thermal desorption spectroscopy. Two desorption peaks are observed in the thermal desorption spectra and are correlated with two bonding geometries. The more strongly bound state corresponds to ammonia bound on top of the ridge atom through the nitrogen end with its C(sub 3v) axis perpendicular to the macroscopic surface. It is suggested that the less strongly bound state corresponds to ammonia molecules lying down in the troughs.

Monte Cario Modeling of Kinetics of Polymer Crystal Growth: Regime III and its Implications on Chain Morphology.

Final rept., C. M. Guttman, and E. A. DiMarzio. 1983, 13p Pub. in Jnl. of Applied Physics 54, n10 p5541-5553 Oct

Keywords: *Mathematical models, *Crystal growth, *Monte Carlo method, Crystallization, Reprints, *Polymer chains.

A Monte Carlo simulation of polymer crystal growth from the melt is presented. This two dimensional model approximates growth by laying down crystal stems one at a time. The Monte Carlo simulation of various geometric models of the crystal surface yields Regime I and Regime II growth similar to that predicted

by Lauritzen and Frank. The analytical expression of rank is shown to be accurate. A recent prediction by Hoffman of a low temperature region (Regime III) with properties similar to Regime I has been verified. Regime III is lattice dependent. Specifically the solid on solid model (SOS) commonly used to model mona-tomic systems yields Regime III but is not space filling. The hexagonal lattice yields correctly formed crystals but does not show Regime III as long as we require that the crystals grow on one plane. On the hexagonal lattice, if we allow growth on more than one growth plane, we obtain both space filling crystals and Regime Ill growth. There are no regimes of growth other than the three discussed here.

Product Vibrational State Distributions of Thermal Energy Charge Transfer Reactions Determined by Laser-Induced Fluorescence in a Flowing Afterglow: Ar(+1) + CO yields CO(+1) (v=0-6) + Ar. Final rept.,

C. E. Hamilton, V. M. Bierbaum, and S. R. Leone.

1985, 9p

Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC. Pub. in Jnl. of Chemical Physics 83, n5 p2284-2292, 1

Sep 85.

Keywords: *Carbon monoxide, *Dynamics, *Molecular vibration, Afterglows, Reprints, *Ion molecule interactions, *Laser induced fluorescence.

The Ar(+1) + CO yield CO(+1)(nu=0-6) + Archarge transfer reaction is studied at thermal energy in a flowing afterglow and the vibrational state distribu-tion is determined by laser-induced fluorescence on the CO(+1)(A (sup 2)pi-X(sup 2)sigma(+1) bands. The Ar(+1) + CO reaction is described as proceeding via a bent ArCO(+1) intermediate that forms in a sideon attack. Vibrational excitation may then result from delocalization of the bonding electron density of CO and the corresponding dynamical changes in the CO bond length in the intermediate.

Reaction Diffusion in a Medium Containing a Random Distribution of Nonoverlapping Traps.

Final rept.. R. F. Kayser, and J. B. Hubbard. 1984, 4p Pub. in Jnl. of Chemical Physics 80, n3 p1127-1130 1984.

Keywords: *Reaction kinetics, *Diffusion, *Traps, Density(Mass/volume), Random functions, Reprints.

The transient reaction-diffusion kinetics in a system containing a random distribution of stationary spherical traps is analyzed. It is shown that recently obtained results concerning the long-time behavior of the trapaveraged density at the origin, may be readily extended to the cases of partially absorbing and non-overlapping traps, independently of the number density of traps. The authors also estimate the size of the relative fluctuations and show that these fluctuations diverge at long times.

Diffusion in a Medium with a Random Distribution of Static Traps.

Final rept..

R. F. Kayser, and J. B. Hubbard. 1983, 4p Pub. in Physical Review Letters 51, n2 p79-82, 11 Jul

Keywords: *Reaction kinetics, *Diffusion, *Traps, Density(Mass/volume), Random functions, Reprints.

The authors consider particles diffusing in d-dimensional space among a random distribution of stationary spherical traps. Given a particle at the origin at time t=0, they show that the density of particles at the origin as t goes to infinity must decay at least as fast as $(-t(sub\ d/(d+2)))$. The density here is obtained by averaging the diffusive field for a given configuration of traps over all configurations. The upper bound coincides with the lower bound recently derived by Grassberger and Procaccia.

Concentration Dependence of the Diffusion Coefficient and the Longest Relaxation Time of Polymer Chains in Solution.

Final rept., D. E. Kranbuehl, and P. H. Verdier. 1985, 3p Sponsored by American Chemical Society, Washing-Pub. in Macromolecules 18, n8 p1638-1640 1985.

Keywords: *Diffusion, *Molecular relaxation, *Dynamics, *Mathematical models, *Polymers, Solutions, Monte Carlo method, Concentration(Composition), Reprints, *Polymer chains.

The concentration dependence of the translational diffusion constant of polymer chains in non-dilute solutions has been examined by direct computer simulation for simple lattice-model chains. In agreement with several recent experimental studies, the results show no sign of regions of constant power-law dependence of diffusion constant upon concentration predicted by some theoretical models. They also appear to suggest that the major part of the concentration dependence may be accounted for by simple free-volume consider-

Time Dependence of Mechanical and Transport Properties of Drawn and Annealed Linear Polyeth-

ylene. Final rept.

F. Decandia, V. Vittoria, and A. Peterlin. 1985, 18p Sponsored by Consiglio Nazionale delle Ricerche,

Milan (Italy). Pub. in Jnl. of Polymer Science, Polymer Physics Edition 23, p1217-1234 1985.

Keywords: *Polyethylene, *Mechanical properties, *Transport properties, Polymers, Reprints, *Crystalline polymers.

Linear polyethylene both as drawn, or drawn and subsequently annealed with free ends, changes its length, density, crystallinity, elastic modulus, sorption, and diffusivity as the sample stands completely unrestrained at room temperature. Most of these changes occur during the first few hours. But they are important on a molecular scale since they suggest strongly that drawn, and drawn and annealed samples are far from equilibrium. As a consequence of the tendency of each mobile tie molecule in the amorphous conformation to retract and to crystallize, the specimen approaches but does not reach complete equilibrium. The transient seems to be caused by slow crystallization of tie mole-cules which creates crystalline bridges across the amorphous layers.

Morphology of Poly(ethylene terephthalate) Fibers as Studled by Multiple-Pulse (1)H NMR (Nuclear Magnetic Resonance).

Final rept.,

J. R. Havens, and D. L. VanderHart. 1985, 14p Pub. in Macromolecules 18, n9 p1663-1676 1985.

Keywords: *Polyethylene terephthalate, *Nuclear magnetic resonance, Fibers, Molecular relaxation, Surfaces, Reprints, *Crystalline polymers.

Drawn poly(ethylene terephthalate) (PET) fibers annealed under various conditions are investigated by proton spin diffusion as detected through nuclear magnetic resonance. The primary objective is to study morphology on the 1-50-nm scale, the smaller dimensions of which have proved difficult to characterize for PET by conventional techniques. The spin diffusion experi-ment is comprised of three periods: generation of a magnetization gradient among different domains, relaxation of the gradient by diffusion for a variable time, and separate detection of the magnetization corresponding to each domain. The use of a multiple-pulse sequence permits spin diffusion to be confined to the second period, resulting in enhanced resolution among the domains. The procedure allows the magnetization decay observed during the detection period to be decomposed into three components, which are assigned to mobile noncrystalline, constrained noncrystalline, and crystalline domains. Rates of polarization redistribution among these three components are studied as a function of the diffusion time. Computer modeling is carried out in order to relate these measurements to the spatial arrangement and size of the three components. The results quantify the increase in crystallinity and in crystallite size upon annealing. Information pertaining to the structure of the noncrystalline region, the importance of noncrystalline chain orientation, and the relative surface areas of the crystallites is also presented.

L. R. Hilpert, H. S. Hertz, W. E. May, S. N. Chesler, and S. A. Wise. 1979, 8p
Pub. in Proceedings of Oil Shale Symposium on Sampling, Analysis and Quality Assurance, Denver, Colorado, March 1979, p355-362 1980.

Keywords: *Shale oil, *Chemical analysis, *Environmental impacts, *Organic compounds, Gas chromatography, Mass spectroscopy, Phenols, Aromatic polycyclic hydrocarbons, Extraction, *Alternate fuels, *Toxic substances, High performance liquid chromatography. tography, Standard reference materials.

A serious and largely unknown complication of developing alternate fuels such as shale oil is the potentially deleterious impact on the environment. Identification and quantitation of toxic organic compounds in the feedstock, process streams, and plant effluents will become increasingly important as mutagenicity testing on chromatographic fractions generated from various fuels and effluents expands. In preparation for certifying a Standard Reference Material for toxic constituents in alternate fuels, our laboratory has been investi-gating various techniques for quantitating individual organic compounds in shale oil. Emphasis has focused on acid-base extraction and high performance liquid chromatography as independent methods of shale oil fractionation. Gas chromatographic, gas chromatographic-mass spectro-metric, and high performance liquid chromatographic methods have been used to quantitate several phenols, N-heterocyclics, and polynuclear aromatic hydrocarbons in shale cil.

Charge Transfer, Vibrational Excitation, and Dissoclative Adsorption in Molecule - Surface Collisions: Classical Trajectory Theory.

Final rept.,

S. Holloway, and J. W. Gadzuk. 1985, 13p Pub. in Jnl. of Chemical Physics 82, n11 p5203-5215, 1 Jun 85.

Keywords: *Diatomic molecules, *Surface chemistry, Excitation, Potential energy, Adsorption, Molecular vibration, Dynamics, Reprints, *Atom diatom collisions.

The consequences of charge transfer processes occurring when a molecular beam of diatomic molecules is directed upon a solid surface are here considered. In analogy with resonance electron scattering from molecules or harpooning processes in atom-diatom collisions, the incident beam could either be scattered into a highly vibrationally excited molecular state, dissociatively scattered, or dissociatively adsorbed due to formation of temporary negative molecular ions which enable redistribution of the incident translation energy of the beam into intramolecular degrees of freedom. In the work, the exact classical trajectories for the diatomic molecule, including internal vibrational motion, are calculated for motion over model diabatic potential surfaces in which surface hopping due to charge transfer/harpooning is accounted for. Connections be-tween classes of trajectories and topological features of the potential energy surfaces (PES) are illustrated. The model is used to study the average translational to vibrational energy transfer as a function of incident kinetic energy and of PES parameters. Branching ratios between scattered and dissociatively adsorbed molecules are obtained as a function of both incident translational and total energy and the role of the intermediate negative ion resonance in influencing the dynamics of molecular processes at surfaces is illustrated. Comparison with quantum mechanical theories is given in a subsequent paper.

Preliminary Studies of the Effects of Semiconductor Reagents on Polymers Containing Fluorine and of Trace Metallic Leachate from Molded Fluorocarbon Resin.

Final rept.,

J. F. Imbalzano, and J. R. Moody, 1985, 6p Pub. in Jnl. of Environmental Sciences 28, p53-58 Jul/

Keywords: *Semiconductors, *Trace elements, *Metals, *Chemical analyses, *Polymers, Leaching, Diffusion, Exposures, Physical properties, Reprints, Vinylidene fluoride resins.

Traces of undesired materials in semiconductor devices are a serious processing deficiency and their elimination is widely sought. To this end, the effects of semiconductor reagents on discs molded from com-mercial materials of construction-perfluoroalkoxy (PFA) fluorocarbon resin and polyvinylidene fluoride (PVDF)-were assessed by measuring retained physical properties and by analytical microscopic inspection. At the National Bureau of Standards, Center for Analytical Chemistry, ultrapure nitric acid was stored, in a class 10 environment, in a container molded from PFA, and the level of leachable selected trace metallics was determined by graphite furnace atomic absorption spectrometry, flame emission spectrometry with repetitive optical scanning, and isotope dilution spark source mass spectrometry. The results from the expo-sure tests indicated that PVDF was significantly affected in the exposures; PFA was essentially unaffected. The amounts of leachable metallics from PFA were at or below low part-per-billion levels, since they were indistinguishable from those in the extractant blank.

When the products of the reaction between F atoms formed in a microwave discharge and CH3Cl, CH3Br, or CH3I were frozen in a large excess of argon at 14 K, the infrared spectra of the primary reaction products wre obtained. Isotopic substitution experiments have provided evidence for two major reaction channels in each of these three reaction systems. Attack of the F atom at the halogen position results in the formation of the CH3XF addition product, which has a moderately strong X-F bond and is photochemically stable at wavelengths as short as 250 nm. F-atom reaction with a hydrogen atom of the methyl halide results in the sta-bilization of a weakly bound F-HCH2X complex, intermediate to the formation of H2CX + HF. For all of the species studied except CH3CI, the barrier to the decomposition of this complex is sufficiently great to require exposure of the solid deposit to visible light for the production of H2CX and HF. The infrared spectra of the H2CX-HF hydrogen-bonded complexes isolated in solid argon are discussed.

I. Fujishiro, G. J. Piermarini, S. Block, and R. G. Munro. 1982, 3p

Pub. in Proceedings of 8th AIRAPT - 19th EHPRG Conference on High Pressure in Research and Industry, Uppsala, Sweden, August 17-27, 1981, v2 p608-611 1982

Keywords: *Viscosity, *Transition points, *Methyl alcohol, *Ethyl alcohol, *Water, Mixtures, Pressure.

The pressure dependence of the viscosity and glass transition pressures for the binary methanol-water and ternary methanal-ethanol-water system have been measured at room temperature for several methanolwater compositions. A diamond-anvil falling-sphere viscometer, which uses the ruby fluorescence method of pressure measurement, was employed. Glass transition pressures were determined for the various mixtures by the ruby fluorescence line-broadening method. A new hydrostatic pressure transmitting medium was found having the composition 16 methanol: 3 ethanol: 1 water solution which extends the hydrostatic limit to 14.4 GPa at room temperature. A correlation between the pressure dependence of viscosity and the glass transition pressure is discussed for these solutions.

Spin Coupling through Oxygen. Influence of Struc-

ture and Solvent on doublet J((119)Sn,(117)Sn) in the (119)Sn NMR of Hexaorganodistannoxanes. Final rept..

T. P. Lockhart, W. F. Manders, and F. E. Brinckman. 1985, 6p

Sponsored by Office of Naval Research, Arlington, VA. Pub. in Jnl. of Organometallic Chemistry 286, p153-158 1985.

Keywords: *Oxygen, *Tin isotopes, *Molecular structure, Solvents, Molecular energy levels, Reprints, *Chemical shifts(Nuclear magnetic resonance), *Distannoxanes.

Sn,Sn spin coupling though oxygen, doublet J(119)Sn,(117)Sn), has been measured for seven hexaorganodistannoxanes (R3Sn)2O). The magnitude of the coupling constant depends strongly on the organic ligand, varying over the range 421 to 651 Hz in benzene solution. The substituent effect on doublet J is interpreted as arising from changes in the Sn-O-Sn bond angle, which should strongly influence the mag-nitude of the Fermi contact term contribution to the coupling constant. A pronounced solvent effect on doublet J(119Sn, 117Sn) was also observed; solvent studies with (n-Bu3Sn)2O indicate that the electron acceptor strength of the solvent determines the magnitude of the interaction. The utility of the coupling constant as a means of distinguishing between distannoxanes and related compounds is noted.

Thermodynamic Properties of bcc Crystals at High

Temperatures: The Transition Metals.

Final rept., R. A. MacDonald, and R. C. Shukla. 1985, 8p Pub. in Physical Review B 32, n8 p4961-4968, 15 Oct

Keywords: *Vanadium, *Niobium, *Tantalum, *Molybdenum, *Tungsten, *Thermodynamic properties, Perturbation theory, Body centered cubic lattices, Electronic specific heat, Transition metals, Reprints.

The second-neighbor central-force model of a bcc crystal, previously used in lowest-order anharmonic perturbation theory to calculate the thermodynamic properties of the alkali metals, is here applied to the transition metals V, Nb, Ta, Mo, and W. The limitations of the model are apparent in the thermal-expansion results, which fall away from the experimental trend above about 1800 K. The specific heat similarly fails to exhibit the sharp rise that is observed at higher temperatures. A static treatment of vacancies cannot account for the difference between theory and experiment. The electrons have been taken into account by using a model that specifically includes d-band effects in the electron ground-state energy. The results thus obtained for the bulk moduli are quite satisfactory. In the light of these results, the authors discuss the prer-quisites for a better treatment of metals when the electrons play an important role in determining the thermodynamic properties.

Decomposition Products from Corona In SF6/N2 and SF6/O2 Mixtures.

M. C. Siddagangappa, and R. J. Van Brunt. 1985, 4p Sponsored by Department of Energy, Washington, DC. Div. of Electric Energy Systems.

Pub. in Proceedings of International Conference on Gas Discharges and Their Applications (8th), Oxford, England, September 16-20, 1985, p247-250.

Keywords: *Electric corona, *Decomposition reactions, Concentration(Composition), Nitrogen, Nitrogen oxides, Sulfur dioxide, Oxygen, Sulfur hexafluoride, Mixtures, Reaction kinetics.

Absolute concentrations of SOF4, SOF2, SO2F2, SO2, NO, N2O, and H2O produced from continuous, dc, point-plane negative corona at a current of 40 A were measured in SF6/N2 and SF6/O2 mixtures containing trace amounts of H2O and 1 to 95% N2 or 1 to 10% O2 for a total gas pressure of 200 kPa (about 2atm). The absolute and SF6-normalized charge ratesof-production for these by-products have been determined as a function of N2, or O2 content. The results are interpretted in terms of a model for electric-discharge-induced decomposition of SF6 discussed previously by Van Brunt. The presence of N2 accelerates the rate of SF6 decomposition by inhibiting the recombination of SF6 dissociation products. At levels up to 10%, O2 actually lowers the rates of oxyfluoride and SO2 production due to its effect in reducing the mean energy of electrons in the discharge and thus the dissociation rate of SF6.

Virial Coefficients of Ethylene.

Final rept.,
J. M. H. Levelt Sengers, and J. R. Hastings. 1981, 5p
Pub. in Proceedings of the Thermophysical Properties
Symposium (8th), Thermophysical Properties of Fluids, Gaithersburg, Maryland, June 15-18, 1981, v1 p66-70.

Keywords: *Ethylene, *Virial coefficients, *Burnett method.

The authors report virial coefficients for ethylene, obtained in the vapor phase in the range 223-273 K by means of the Burnett method, at pressures from near saturation down to 0.23 MPa. The uncertainty of the pressure measurements is 5 parts in 10 to the 5th power; temperature was controlled and measured to better than 1 mK. Noxious volumes were absent. The data were tested for adsorption by coupling the isotherms isochorically; a small effect was found. Additional values of the second and third vinal coefficient were derived from two sets of recent PVT data. Recent virial data from five sources, including the authors own, were correlated in the range 223 - 448 K by means of a simple empirical relationship. The data for the second virial from three of the sources generally agree to better than 0.5 cu cm/mol. Virials derived from speedof-sound data are in excellent agreement with these data. There seems to be no need for further PVT data on low-density ethylene in the temperature range. Comparisons are also made of the predictions of two recent correlations of thermodynamic properties of ethylene. There is room for improvement, and suggestions are made as to how to achieve this.

Final rept., T. Hirata, T. Kashiwagi, and J. E. Brown. 1985, 9p Pub. in Macromolecules 18, n7 p1410-1418 1985.

Keywords: *Polymethyl methacrylate, *Thermal degradation, *Oxidation, Diffusion, Weight measurement, Comparison, Impurity, Samples, Reprints.

The effects of gas-phase oxygen on the weight loss of poly(methyl methacrylate) (PMMA) were studied by comparing weight loss behavior of PMMA degraded in nitrogen with that of PMMA degraded in air. gravimetry (TG) and isothermal heating experiments were conducted to obtain kinetic constants for the degradation of PMMA. The results show that there are two distinct effects of oxygen on the weight loss of PMMA; one is an increase in PMMA stability at low temperatures and the other is destabilization of PMMA at high temperatures by enhanced random scission. There are two reaction stages for the weight loss from PMMA degraded in nitrogen and four reaction stages for PMMA degraded in air. These four reaction stages are, however, caused mainly by impurities in the sample. The effects of purification of the commercial PMMA on the weight loss are small for samples degraded in nitrogen, but they are significant for samples degraded in air.

Spectroscopy and Photochemistry of Free Radicals Formed by the Reaction of F Atoms with Small Moiecuies.

Final rept.,

M. E. Jacox. 1985, 44p

Pub. in Review of Chemical Intermediates 6, p77-120

Keywords: *Spectrochemical analysis, *Photochemistry, *Free radicals, Chemical bonds, Infrared spectroscopy, Comparison, Reprints, *Matrix isolation techniques, *Fluoride atoms, *Chemical shifts(Nuclear magnetic resonance).

The techniques used for both gas phase and matrix isolation spectroscopic studies of the primary products of the reaction of F atoms with small molecules are surveyed. A review of the spectra of free radicals formed by F-atom reaction is presented, with emphasis on contributions of spectral studies to our understanding of the detailed reaction mechanism. When an F atom abstracts a ll atom from a molecule trapped in solid argon, the resulting HF is hydrogen-bonded to the free radical product. Trapping of the R..HF species in solid argon somewhat strengthens the hydrogen bond compared to that typical of the gas-phase complex. An attempt is made to assess the extent of perturbation of the utilization of the purity by the turbation of the vibrations of the HF moiety by the argon matrix. Shifts in the vibrations of the free radical, R, as a result of the formation of R--HF are also considered.

Nonlinear Mechanical Behavior of Polymer Solutions at Various Concentrations.

Final rept.,

J. Zapas. 1982, 1p

Pub. in Proceedings of IUPAC Macromol. Symposium (28th), 1p 1982.

Keywords: *Mechanical properties, *Polymers, *Solutions, Concentration(Composition).

The reduction scheme proposed by Zapas and Phillips for concentrated polymer solutions, was derived for materials which obey certain conditions. In the paper it is shown that these conditions were very strict, and more relaxed conditions give the same reduced properties even for a class of materials whose behavior can not be described with a single integral.

Vapour-Liquid Equilibria Measurements for
Carbon Dioxide with Normal and Isobutane from
250 to 280 K.

Final rept.,

L. A. Weber. 1985, 5p Sponsored by Department of Energy, Washington, DC. Div. of Chemical Sciences.

Pub. in Cryogenics 25, p338-342 Jun 85.

Keywords: *Chemical equilibrium, *Carbon dioxide, Vapor phases, Liquid phases, Binary systems(Materials), Gibbs free energy, Reprints, *Iso-

Vapour-liquid equilibria measurements were made on binary mixtures of carbon dioxide with normal and isobutane at 250, 260, 270 and 280 K. Both liquid and vapour compositions were measured. The data correlated using the Peng-Robinson equation of state, and values are given for the activity coefficients and the excess Gibbs free energy, G(sup E). The heat of mixing is estimated from the temperature dependence of G(sup E).

The thermodynamics of the conversion of aqueous xylose to xylulose has been investigated using high-pressure liquid chromatogrphy (HPLC) and microcalorimetry. The reaction was carried out in aqueous phosphate buffer over the pH range 6.8-7.4 using solubilized glucose isomerase with MgSO4 as a cofactor. The temperature range over which this reaction was investigated was 298.15-342.15 K. A combined analysis of both the HPLC and microcalorimetric data leads to the following results at 298.15 K for the conversion process. Comparisons are made with literature data.

Effect of Water on Maleic Acid and Salicyclic Acid

Extractions.

Final rept., L. Struble. 1985, 6p Grant NSF-CEE82-10791

Sponsored by National Science Foundation, Washington, DC.

Pub. in Cement and Concrete Research 15, p631-636

Keywords: *Maleic acid, *Salicylic acid, *Extractions, *Cement, *Water, Reprints.

Contamination of methanol by water was evidenced by the occurrence of ettringite in residues of cement ex-tracted using a solution of maleic acid in methanol. Therefore, an analytical method was developed to determine water contents, based on the reaction of 2,2dimethoxypropane with water, which forms acetone and methanol. Methanol analyzed by the method was found to contain as much as 2 percent H2O. Thus it is necessary to use freshly dried methanol for extracting the silicates from cement or clinker. However, it was found that removal of all water causes the solution of maleic acid in methanol to gel when the cement or clinker is added, and the salicylic acid procedure is thus preferred because it does not form such a gel. It was shown that methanol containing levels of water as low as 0.5 percent will cause loss of water-soluble phases from cement or clinker.

Non-Newtonian Flow of a Model Liquid between

Concentric Cylinders. Final rept.,

J. C. Rainwater, H. J. M. Hanley, T. Paszkiewicz, and Z. Petru. 1985, 9p Sponsored by Department of Energy, Washington, DC. Office of Basic Energy Sciences.

Pub. in Jnl. of Chemical Physics 83, n1 p339-347, 1 Jul

Keywords: *Non-newtonian fluids, *Mathematical models, *Liquids, Cylindrical bodies, Compressibility,

Equations of motion, Pressure, Reprints, *Concentric cylinders, Computer applications, Numerical solution, Weissenberg effect.

Computer simulations of fluids out of equilibrium indicate that even the simplest fluid is in principle non-Newtonian. In particular, the simulations can provide explicitly the pressure tensor as a function of shear rate at a given temperature and density. In this paper the steady state flow of a model soft sphere liquid between rotating vertical concentric cylinders is discussed from a microscopic standpoint, given the coefficients that characterize the pressure tensor. The equations of motion are solved numerically. It is found that the normal pressure differences lead to an enhanced depression of the free surface at the inner cylinder, in contrast to a climbing (Weissenberg effect) which is usually regarded as the consequence of such differences. Reasons for the behavior observed for the soft sphere system are discussed. A consequence of the analysis is that a unique and self-consistent solution of the equations of motion is obtained only if the effects of finite compressibility are included.

Final rept. L. J. Moore, J. D. Fassett, J. C. Travis, T. B. Lucatorto, and C. W. Clark. Sep 85, 5p Sponsored by Department of Energy, Washington, DC. Office of Health and Environmental Research. Pub. in Jnl. of the Optical Society of America B 2, n9 p1561-1565 Sep 85.

Keywords: *Carbon, *Chemical analysis, Mass spectroscopy, Graphite, Reprints, *Resonance ionization mass spectroscopy.

Resonance-ionization mass spectrometry (RIMS) for carbon has been demonstrated. A two-photon-resonant, three-photon ionization scheme provided large ionization signals from carbon atoms obtained by heating microgram samples of graphite. These results show that elemental carbon vapor can be detected at densities at least as low as 10 to the 7th power/cc. The feasibility of efficient resonance ionization is a first step to the development of a RIMS-analysis capability for elemental and isotopic carbon.

Chemical Society, 1155 16th St., NW, Washington, DC 20036.

Keywords: *Viscosity, *Nitrogen, *Oxygen, *Binary systems(Materials), Density(Mass/volume), Temperature, Mixtures.

The paper presents a concise and accurate representation of the viscosity of nitrogen, oxygen, and their binary mixtures at the limit of zero density and in the temperature range 110-2100K, which can be programed easily on a computer. The correlation is founded upon the semiclassical kinetic theory of polyatomic gases and a body of critically evaluated experimental data. Use is also made of the principle of corresponding states to extend the correlation outside of the temperature range for which direct experimental results exist. The optimum correlation has an associated uncertainty of + or - 0.3% around room temperature, but it rises to a maximum of + or - 2% at either extreme of the temperature range. A secondary representation of the viscosity of the same gases, providing some saving in computational effort and a further extension of the temperature range at the expense of a small loss of accuracy, is also presentd. The relationship of this second representation to similar correlations for other gases makes it attractive for some purposes.

Thermal Conductivity of Fluid Air,
K. Stephan, and A. Laesecke. c1985, 8p

Sponsored by National Bureau of Standards, Gaithersburg, MD.

Data, v14 n1 p227-234 1985. Available from American Chemical Society, 1155 16th St., NW, Washington, DC 20036.

Group 7D—Physical Chemistry

Keywords: *Thermal conductivity, *Air, Thermophysical properties, Thermodynamics, Equations of state, Density(Mass/volume), Fluids, Pressure, Temperature (Charte) ture, Graphs(Charts).

Based on available experimental data, the thermal conductivity of fluid air has been critically evaluated. A new set of recommended values is presented covering a pressure range from 1 to 1000 bar and a temperature range from 70 to 1000K. Using the concept of residual thermal conductivity the recommended values are described by a 13-parameter equation of state in terms of temperature and density which may be applied up to a density of 900 kg/cu m. From comparisons of all data sources, the uncertainty of the recommended values was estimated to be below + or -4%. Additional experiments are needed, especially in the subcritical region of liquid air.

Electronic Spectrum and Energy Levels of the Deuterium Molecule, R. S. Freund, and J. A. Schiavone. c1985, 149p

Prepared in cooperation with Argonne National Lab., IL. Sponsored by National Bureau of Standards, Gaithersburg, MD.

Included in Jnl. of Physical and Chemical Reference Data, v14 n1 p235-383 1985. Available from American Chemical Society, 1155 16th St., NW, Washington, DC 20036.

Keywords: *Molecular energy levels, *Electronic spectra, *Deuterium, Hydrogen isotopes, Tables(Data).

Beginning in the 1930s, G. H. Dieke and his students carried out an extensive program of measuring the optical spectrum of molecular hydrogen and its isotopes. Parts of the work were published but the project was interrupted by Dieke's death in 1965, with much of the latest and most accurate work unpublished. This paper gives the 27,488 lines of molecular deuterium, measured by Dieke, arranged the 8243 assigned lines into band systems, and derives rotational-vibrational energy levels for over 50 electronic states. It also derives energy levels from published vacuum ultraviolet spectra of D2.

The microwave spectrum of sulfur dioxide (SO2) is critically reviewed and supplemented with spectral frequency calculations derived from rotational and centrifugal distortion terms in the molecular Hamiltonian. The primary objective of this review is to provide the microwave transition frequencies applicable to molecular radio astronomy for the ground vibrational state of the most abundant isotopic forms, i.e., the singly sub-stituted atoms (33)S and (34)S.

Keywords: *Sodium chloride, *Chemical equilibrium, *Heat measurement, Solutions, Thermodynamic properties, Least_square methods, Specific heat, Activity coefficients, Boiling point, Solubility, Tables(Data).

A new weighted least-squares method is described which is generally applicable for the nonsubjective evaluation of the best set of thermodynamic functions from a given data set of equilibrium (delta G) and calorimetric (delta H, C(sup p)) measurements. The method, applied to model a wide range of 2428 measurements for the water-sodium chloride system between -21 and 154C, accurately represents all measurements within experimental error. The resulting model is used to predict the thermodynamic functions and their standard errors for aqueous sodium chloride up to 110C. Tables are given for freezing point, solubility, boiling point, osmotic and activity coefficients, vapor pressure, apparent molal relative enthalpy, partial molal relative enthalpies, integral heat of solution, specific heat, apparent molal heat capacity, partial molal heat capacities, apparent molal relative heat capacity, partial molal relative heat capacities, standard thermodynamic functions, and their changes for dissolution.

A survey of the available experimental data and the existing equations for the refractive index of water is given. The dependence of the molar refraction on wavelength, temperature, and density is shown over an extended range. Based upon the electromagnetic theory of light an equation for the refractive index of water with wavelength, temperature, and density as in-dependent variable is constructed. Its coefficients are directly deduced from all available experimental data by least-squares fit. Good agreement exists between the new relation, the availble experimental data, and several existing equations.

Keywords: *Viscosity, *Thermal conductivity, *Air, Transport properties, Temperature, Pressure, Graphs(Charts), Tables(Data), Dry methods.

In view of the importance of air in science and technology and the abundance of experimental data, the authors present in this report a consistent set of critically evaluated data and an up-to-date correlation of the thermal conductivity of air in the gaseous phase over a wide range of temperature and pressure. This is especially important for the viscosity, since the recent data show systematic differences compared with the old standard value used for many years. The present paper was written in order to document the critical evaluation of the latest data sets and to present a new set of correlations of the viscosity and thermal conductivity of air. The range covered is from 85 to 2000K for temperature and up to 100 MPa for pressure.

Sponsored by National Bureau of Standards, Gaithersburg, MD.

Included in Jnl. of Physical and Chemical Reference Data, v14 n4 p1107-1132 1985. Available from American Chemical Society, 1155 16th St., NW, Washington, DC 20036.

Keywords: *Thermodynamic properties, *Cyclopentanes, *Cyclohexanes, *Standards, Specific heat, Gibbs free energy, Enthalpy, Entropy, Pressure, Tables(Data), *Isomers, Benson method.

The standard chemical thermodynamic properties of the alkylcyclopentane isomer groups have been calculated through C9H18 in the ideal gas phase from 298.15 to 1000K, and the properties of the alkylcyclohexane isomer groups have been calculated through C10H20. The properties of individual species for which literature data are not available have been estimated using the Benson method. The increments per carbon atom in the isomer group properties have been calculated to determine the extent to which extrapolations

may be made to higher carbon numbers. Since alkylcy-clopentanes and alkylcyclohexanes of the same carbon number are isomers, the chemical thermodynamic properties of these combined isomer groups have also been calculated.

The issue of the NBS Journal of Research is devoted entirely to one topic: Chemometrics. A conference by that title held earlier this year at NBS brought together experts in analytical chemistry and applied mathematics, disciplines which are the constitutents of this new field. This conference was probably the first one in the United States by that title. The roots of the interdisciplinary effort go back to the late Dr. William (Jack) Youden and the authors dedicate this issue to him. A brief description of Youden's career serves at the introduction to the collection of conference papers which the authors present in this volume of the Journal. The authors of this biographical sketch, Drs. Ku and DeVoe, worked very closely with Youden while he was at NBS. With the publication of the papers presented at this conference the authors hope to stimulate further work in the field of chemometrics. Special recognition goes to the organizers of the conference who also served as invited editors of this special issue of the NBS Journal of Research: Drs. Clifford H. Spiegelman of the Center for Applied Mathematics, Robert L. Watters of the Center for Analytical Chemistry, and Jerome Sacks from the University of Illinois.

Keywords: *Research projects, *Management planning, *Chemometrics.

The wide range of disciplines represented by the participants and attendees of the Chemometrics Research Conference held at the Gaithersburg Holiday Inn on May 20-22, 1985, exemplifies the depth and diversity of the chemometrics community. The Conference was sponsored by several important professional societies whose members are involved in chemometric activity. As organizers, the authors had two main goals in mind when deciding on the form and substance of the Conference. The first was to provide a forum for reporting on some of the most recent and important research activities in diverse areas relating to chemometrics. The second and more important goal can only be achieved gradually. This was to increase the willingness of chemists, statisticians, and probabilists to meet as colleagues and to solve problems as a team. This will necessarily involve the exercise of communication skills as well as combining scientific skills.

Limitations of Models and Measurements as Revealed Through Chemometric Intercomparison. L. A. Currie. 1 Jul 85, 14p Included in Jnl. of Research of the National Bureau of Standards, v90 n6 p409-422 Nov-Dec 85.

Keywords: *Chemical analysis, Linear regression, Comparison, Mathematical models, Laboratories, Sampling, Measurement, Units of measurement, *Chemometrics, Intercomparison, Reference materials, Case studies.

Interlaboratory Comparisons using common (reference) materials of known composition are an established means for asessing overall measurement precilished means for assessing overall measurement precision and accuracy. Intercomparisons based on common data sets are equally important and informative, when one is dealing with complex chemical patterns or spectra requiring significant numerical modeling and manipulation for component identification and quantification. Two case studies of 'Chemometric Intercomparison' using Simulation Test Data (STD) are presented the one comprising STD vectors as applied presented, the one comprising STD vectors as applied to nuclear spectrometry, and the other, STD data matrices as applied to aerosol source apportionment. Generic information gained from these two exercises includes: (a) the requisites for a successful STD inter-comparison (including the nature and preparation of the simulation test patterns); (b) surprising degrees of bias and imprecision associated with the data evaluation process, per se; (c) the need for increased attention to implicit assumptions and adequate statements of uncertainty; and (d) the importance of STD beyond the Intercomparison-i.e., their value as a chemometric

Physical Chemistry—Group 7D

research tool. Open research questions developed from the STD exercises are highlighted, especially the opportunity to explore 'Scientific Intuition' which is essential for the solution of the underdetermined, multi-collinear inverse problems that characterize modern Analytical Chemistry.

Statistical Properties of a Procedure for Analyzing
Pulse Voltammetric Data,

T. P. Lane, J. J. O'Dea, and J. Osteryoung. 24 Jun

85, 9p Prepared in cooperation with State Univ. of New York at Buffalo. Sponsored by National Bureau of Stand-

ards, Gaithersburg, MD. Included in Jnl. of Research of the National Bureau of Standards, v90 n6 p423-431 Nov-Dec 85.

Keywords: *Electrical measurements, *Mathematical models, Autocorrelation, Error analysis, Kinetics, Confidence limits, *Voltammetry, Maximum likelihoodd estimation, Procedures.

O'Dea et al. (1983, J. Phys. Chem. 97, 3911-3918) proposed an empirical procedure for obtaining estimates and confidence intervals for kinetic parameters in a model for pulse voltammetric data. Their goal was to find a procedure that would run in real time, not necessarily one that would have well-defined statistical properties. In this paper the authors investigate some of the statistical properties of their procedure. The authors show that their estimation method is equivalent to maximum likelihood estimation, and their confidence intervals, while related to likelihood ratio confidence regions, have a coverage probability that is not fixed and that is potentially quite large. The authors suggest modifications of their procedure that lead to more tra-ditional confidence intervals. The authors examine the effect on their procedure of the presence of nuisance parameters. Finally, the authors discuss the possibility of serially correlated errors.

Strategles for the Reduction and Interpretation of Multicomponent Spectral Data, I. M. Warner, S. L. Neal, and T. M. Rossi. 1 Jul 85,

Sponsored by National Bureau of Standards, Gaithers-

burg, MD. Included in Jnl. of Research of the National Bureau of

Standards, v90 n6 p487-493 Nov-Dec 85. Keywords: *Fluorescence, *Spectrochemical analysis,

Eigenvectors, Pattern recognition, Excitation, Molecular energy levels, Procedures.

Fluorescence data can be rapidly acquired in the form of an emission-excitation matrix (EEM) using a novel fluorometer called a video fluorometer (VF). An EEm array of 4096 data points composed of fluorescence intensity measured at 64 different emission wavelengths can be acquired in less than one second. The time-limiting factor in using this information for analytical measurement is the interpretation step. Consequently, sophisticated computer algorithms must be developed to aid in interpretation of such large data

sets. Recently, a new instrument has been described sets. Recently, a new instrument has been described which rapidly acquires fluorescence detected circular dichroism (FDCD) data for chiral fluorophores as a function of multiple excitation and emission wavelengths. The FDCD matrix is similar in form to EEM data. However, since the FDCD matrix may have legitimate negative entries while the EEM is theoretically popular assumptions are required. This non-negative, different assumptions are required. This paper will describe the mathematical algorithms developed in this laboratory for the interpretation of the EEM in various forms. Particular emphasis will be placed on linear algebraic and two-dimensional Fourier Transform procedures.

Polymers and Rendom Walks - Renormalization

Group Description and Comparison with Experi-

K. F. Freed. 1 Jul 85, 4p Sponsored by National Bureau of Standards, Gaithersburg, MD.

Included in Jnl. of Research of the National Bureau of Standards, v90 n6 p503-506 Nov-Dec 85.

Keywords: *Polymers, *Random walk, Experimental design, Physical properties, Solutions, Molecular structure, Chemical bonds, Comparison, *Molecular configuration, Monomers.

Although real polymers involve the sequential addition of monomers having fixed bond lengths, fixed bond angles and some freedom of rotation about single bond, the properties of polymers over large length scales can be modeled by treating the polymer config-uration as that of a random walk formed by the monomer units. Serious complications arise in the theoretical description of these polymers because of excluded volume constraints which prohibit different monomers from occupying the same position in space. This polymer excluded volume problem has been modeled in terms of a simple continuous random walk with short range repulsive interactions. The expansion of polymer properties in this repulsive interaction can readily be shown by dimensional analysis to involve an expansion in a large parameter, in the limit of long polyumers. The renormalization group method is utilized as a systematic means for resuming this divergent perturbation expansion. The theory proceeds by analytically continued theory. The renormalization group approach is described from a heuristic physical stand-point and extensive comparisons are provided to show how it quantitatively reproduces vast amounts of dilute solution polymer properties with no adjustable parameters.

Keywords: *Pattern recognition, *Chemical analysis, Artifical intelligence, *Chemometrics, *Expert systems, Relational data bases, Robotics.

Chemometrics and pattern recognition had their start in chemistry in the late 1960's. The most recent review of the area by Micheal DeLaney listed 438 journal articles and books. The three most important areas of future development will be Expert Systems, Relational Data Bases, and Robotics. It should now be possible to combine existing robotics and artifical intelligence software to create a system which will generate its own expert systems using relational data bases. The data will be in the chemical domain and the system I describe the authors are calling the Analytical Director. The Analytical Director will be an artificial intelligence/ robotic expert system for the analytical laboratory. The Analytical Director will develop, test, implement and interpret chemical analysis procedures. It will learn from its own experience, the experience of others and communicate what it has learned to others. The Analytical Director will be a self-generating Expert System. The author believes that such systems will, in the future, provide all the advantages of pattern recognition, expert systems and relational data bases in experimental settings. Problems will continue to be defined by human beings, but more and more, the laboratory will design, execute and evaluate its own experiments.

Standards, v90 n6 p531-541 Nov-Dec 85.

One of the most important problems in chemical analysis is the interpretation of analytical data. The difficulty of this task has been further compounded by the data explosion. Chemical information relevant to the particular analysis problem is hidden within excessive amounts of data. This problem could be alleviated through knowledge and control of the information content of the data. Information theory provides a means for the definition, evaluation, and manipulation of quantitative information content measurements. This paper provides a general review of some of the basic concepts in information theory, including history, terminology, entropy, and other information content measures. The application of information theory to chemical problems requires some modifications. The analyst is usually only interested in a subset of the information (data) which has been collected. Also, this relevant chemical information is dependent upon not only the informational goals of the problem, but the completely specified procedure as well. This paper reviews chemical applications of information theory which have been reported in the literature including applications of information theory which have been reported in the literature including applications to qualitative analysis, quantitative analysis, structural analysis, and analytical techniques. Measures of information and information content and figures of merit for performance evalua-tions are discussed. The paper concludes with a de-tailed discussion of the application of information theory to electrochemical experiments and the empirical determiantion of the information content of electroanalytical data.

67

Field 7—CHEMISTRY

Group 7D—Physical Chemistry

Chromatographic fingerprinting of complex biological samples is an active research area with a large and growing literature. Multivariate statistical and pattern recognition techniques can be effective methods for the analysis of such complex data. However, the classification of complex samples on the basis of their chromatographic profiles is complicated by two factors: (1) confounding of the desired group information by experimental variables or other systematic variables. ations, and (2) random or chance classification effects with linear discriminants. The authors will treat several current projects involving these effects and methods for dealing with the effects. Complex chromatographic data sets often contain information dependent on ex-perimental variables as well as information which dif-ferentiates between classes. Previously, Monte Carlo simulation studies were carried out to assess the probability of chance classification for nonparametric and parametric linear discriminants. The level of expected chance classification as a function of the number of observations, the dimensionality, and the class mem-bership distributions were examined. These simulation studies established limits on the approaches that can be taken with real data sets so that chance classifications are improbable.

Parker. 19 Jun 85, 18p Included in Jnl. of Research of the National Bureau of Standards, v90 n5 p341-358 Sep-Oct 85.

Keywords: *Thermodynamics, *Sulfur dioxide, *Solutions, Water, Gibbs free energy, Specific heat, Enthalpy, Entrapy, Chemical equilibrium, Heat measurement, Tables(Data), Oxidation.

A consistent set of thermochemical property values at 298.15K is given for the known constitutents of aqueous sulfur dioxide. Also tabulated are values of the mean ionic activity coefficients, osmotic coefficients, partial pressure of SO2(g), and the relative apparent molar enthalpy as a function of concentration of SO2(aq) at 298.15K. The data analysis considered a wide variety of measurement techniques: calormetric enthalpies of solution and reaction, heat capacities, equilibrium constants, solubilities, and vapor pressure measurement, both partial and total, over aqueous solutions of SO2 for the temperature range 278 to 393K.
All auxiliary data have been taken from the most recent set of CODATA values which were converted to a standard state pressure of one bar (0.1 MPa). Parameters are given which extend the predictions to temperatures up to 373K.

Pulse-Radiolysis and Gamma-Ray-Radiolysis Cyclohexane - Ion Recombination Mechanisms. Final rept.,

P. Ausloos, R. E. Rebbert, F. P. Schwarz, and S. G. Lias. 1983, 17p

Pub. in Radiation Physics and Chemistry 21, n1-2 p27-

Keywords: *Cyclohexane, *Radiolysis, Ions, Ethylene, Butadiene, Neutralization, Reprints, *Pulse radiolysis,

*Gamma ray radiolysis, Ion molecule interactions, Chemical reaction mechanisms, Ion fragmentation.

The products formed in the gamma-radiolysis and pulse-radiolysis of gaseous cyclohexane have been in-terpreted in terms of the ion fragmentation, ion-mole-cule reaction, and ion recombination mechanisms. It is shown that the fragmentation of the parent ion is partly quenched at a pressure of 55 torr. Ethylene and 1,3butadiene are the major products resulting from electron neutralization of these ions. Fragmentation is strongly reduced when the neutralization process involves an atomic- or polyatomic-anion rather than an electron. For instance, addition of CCl4 to cyclohexane results in a sharp drop of the yield of 1,3-butadiene, and a concurrent rise in the yield of 2-C4H8.

This volume is based on a symposium which took place at the March 1980 National ACS Meeting in Houston, Texas. The general objective of the Symposium was to review the latest developments and stateof-the-art of scientific (physicochemical) dating methods together with biogeochemical applications. In view of that objective the contents of this volume focus on advances in knowledge, testing of assumptions, and model validation which can be brought about through the use of complementary or multi-technique approaches--i.e., chemical vs nuclear chronometers, and dating with nuclides differing in decay characteristics and chemical behavior. Among the topics included are: advances in isotope mass spectrometry and low-level counting, resonance ion spectroscopy, direct atom counting with nuclear accelerators, amino acid racemization, thermoluminescence, and the extraction of isotopic and chemical records from meteorites, ice cores, sediment cores, and tree rings.

J. E. Faller, Y. G. Guo, J. Gschwind, T. M. Niebauer, and R. L. Rinker. 1983, 12p Sponsored by Air Force Geophysics Lab., Hanscom

AFR. MA.

Pub. in Proceedings of the International Union of Geodesy and Geophysics General Assembly (18th), Hamburg, Germany, August 15-27, 1983, p87-97.

Keywords: *Gravimeters, *Gravity, Portable equipment, Accuracy, Laser interferometry.

At the Joint Institute for Laboratory Astrophysics, the authors have developed a new and highly portable absolute gravity apparatus based on the principles of free-fall laser interferometry. A primary concern over the past several years has been the detection, understanding, and elimination of systematic errors. In the Spring of 1982, the authors used the instrument to carry out a survey at twelve sites in the United States. time required to carry out a measurement at each location was typically one day. Over the next several years, the intention is to see absolute gravity measurements become both usable and used in the field. To this end, and in the context of cooperative research programs with a number of scientific institutes throughout the world, the authors are building additional instruments (incorporating further refinements) which are to be used for geodetic, geophysical, geological, and tec-tonic studies. With these new instruments, the authors expect to improve (perhaps by a factor of two) on the 6-10 microgal accuracy of their present instrument. Today one can make absolute gravity measurements as accurately as -- possibly even more accurately than -- one can make relative measurements.

PC A10/MF A01 PB85-178093 Energy Analysts, Inc., Norman, OK. Blowout Fire Simulation Tests. Final Report, D. B. Pfenning. Jan 85, 204p NBS/GCR-85/484

Keywords: *Blowouts, *Fire tests, Data, Oil wells, Gas wells, Fire fighting, Fire extinguishing agents, Water injection, Methane, Water spray.

The blowout of oil and gas wells during drilling, production, and workover presents a serious hazard to per-sonnel, the environment, and equipment. The only practical method to control a well fire subsequent to a blowout is to shut in the hydrocarbon at the well. Although some individuals have effectively used water to mitigate well fire hazards, the quantitative effect of water sprayed into the fire zone is not known. To design effective oil and gas well blowout fire control systems, both the hazards associated with the fire and the efficiency of water to control fire hazards must be quantitatively understood. The Center for Fire Research (CFA) of the National Bureau of Standards has studied for the Department of the Interior the effectiveness of water spray to control and extinguish fires resulting from gas well blowouts. Laboratory scale tests have been performed by the CFR on 0.01-10 megawatt fires to study the effects of water injection on the combustion of high velocity methane jets. This report presents the results of two 100 megawatt and five 200 megawatt fire tests performed to measure the effects of water spray on fires from large velocity gas dis-charges characteristic of natural gas well blowouts.

F. Y. Yokel, R. Dobry, D. J. Powell, and R. S. Ladd. 1980, 10p Pub. in Proceedings of Int. Symposium on Soils Under Cyclic and Transient Loading 2, Swansea, England, January 7-11, 1980, p571-580.

Keywords: *Liquefaction, *Sands, *Earthquakes, Velocity, Secondary waves, Shear strain, Soil properties, Shear modulus, Tangent modulus, Evaluation, Predictions, Correlation, Earthquake engineering, Pore water

A method for evaluating the liquefaction potential of level sandy sites subjected to earthquake loads on the basis of anticipated cyclic shear strains is proposed. The data includes tests as well as test results. A method is proposed by which the maximum tangent shear modulus, which can be measured by shear wave propagation velocities, can be used to predict liquefaction potential.

PC A05/MF A01 PB85-208494 National Bureau of Standards, Gaithersburg, MD. Development of an NBS (National Bureau of Standards) Polymer Gage for Dynamic Soil Stress Measurement,

R. M. Chung, A. J. Bur, and E. Reasner. Apr 85, 89p NBSIR-85/3135
Sponsored by Air Force Armament Center, Elgin AFB, FL., and Air Force Engineering and Services Center, Tyndall AFB, FL. Engineering and Services Lab

Keywords: *Measuring instruments, *Soils, *Stresses, Blast loads, Performance tests, Polymers, Protective coverings, Calibrating, Dynamic loads.

Polymer gages developed by the National Bureau of Standards (NBS) have been tested extensively in the NBS Geotechnical Engineering Laboratory to evaluate their capability and reliability for use in determining dynamic soil stresses generated by blast loadings. Pene-tration of soil grains into the gage surface was found to be the major concern and a major effort was undertaken to develop the most appropriate protective covering. Gages were dynamically loaded to develop their corresponding calibration curves.

Group 8M—Soil Mechanics

Keywords: *Sands, *Earthquake resistant structures, *Liquefaction, Pore pressure, Shear strain, Shear strength, Saturated soils.

The liquefaction potential of a saturated sand depends on both the characteristics of the seismic shaking and of the soil. The paper reviews available evidence showing that overconsolidated sands have a larger re-sistance to liquefaction than normally consolidated sands, and it also presents new data from strain-con-trolled tests. Finally, the liquefaction potential of an overconsolidated sand site in Massachusetts, is discussed.

PB85-182913 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Improved Concepts for Predicting the Electrical Behavior of Bipolar Structures in Silicon. Final rept.

H. S. Bennett, 1983, 8p

Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Electron Devices 30, n8 p920-927 1983.

Keywords: *Field effect transistors, Silicon, Electrical properties, Carrier mobility, Predictions, Reprints.

Most bipolar device models contain empirical methods for computing the effective intrinsic carrier concentrafor computing the effective intrinsic carrier concentra-tion, n sub ie, mobility, and lifetime. These methods usually are based upon electrical measurements, assume that the majority hole (electron) mobility equals the minority hole (electron) mobility at high doping densities, use Boltzmann statistics, and assume that the carrier lifetime is much greater than the carrier transit time. More physically correct concepts are reported in this paper and are applied to bipolar transistors in silicon. These concepts use the perturbed densities of states and nonparabolic bands which arise from a quantum-mechanical description of bandgap narrowing to compute n sub ie and the carrier mobility separately, use minority carrier lifetimes which agree much better with measured lifetimes in processed silicon, and use Fermi-Dirac statistics. When these concepts are incorporated into a device analysis code such as SEDAN and then used to compute the dc common-emitter gain of two npn transistors, the predicted gains agree very well with the measured gains. In addition, these concepts offer potential improvements in predicting the temperature dependence of the gain.

PB85-184752 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Reverse-Blas Second Breakdown of High Power Darlington Transistors.

Final rept., D. Y. Chen, F. C. Lee, D. L. Blackburn, and D. W. Berning, 1983, 8p

Prepared in cooperation with Virginia Polytechnic Inst. and State Univ., Blacksburg.
Pub. in IEEE (Institute of Electrical and Electronics En-

gineers) Transactions on Aerospace and Electronics Systems 19, n6 p840-847 Nov 83.

Keywords: *Transistors, Nondestructive tests, Reprints, *Second breakdown, *Darlington transistors, *Power transistors.

The reverse-bias second breakdown (RBSB) characteristics of high power Darlington transistors are discussed. The Darlingtons investigated are rated at 400 V maximum voltage and 100 A maximum current. Devices both with and without speed-up diodes (connected between the bases of the input and output transistor) were studied. A nondestructive system for characterizing the RBSB behavior of these devices is described. The RBSB behavior was found to vary in an unpredictable manner with varying reverse base current magnitude. It was also found that the RBSB behavior of the Darlingtons was a function of the forward base current magnitude. This is in marked contrast to what has been found for discrete devices. The presence of a speed-up diode also influenced the RBSB behavior of these devices.

Solid-State Reference Waveform Standard.

R. A. Lawton, N. N. Nahman, and J. M. Bigelow. Sep. 84, 5p
Pub. in IEEE (Institute of Electrical and Electronics En-

gineers) Transactions on Instrumentation and Measurement IM-33, n3 p201-205 Sep 84.

Keywords: *Waveforms, *Standards, Electric filters, Solid state devices, Reprints.

A solid-state reference waveform filter has been developed which uses the Maxwell-Wagner capacitor effect. This filter is realized in a stripline configuration with a lossy dielectric consisting of a thick (5 micrometers) layer of SiO2 on Si. The equivalent circuit of this filter is equivalent to that for previously developed filters which used a lossy liquid dielectric. A preliminary design has been completed and a filter fabricated for which the design characteristic impedance, 38 ohms, and transition duration (rise time), 300 ps, agree with measured values to within 2 and 17 percent, respectively. The temperature dependence of the filter transition duration has been estimated from the temperature dependence of the filter conductance to be about 1 dependence of the filter conductance to be about 1 percent/C.

Keywords: *Semiconductor devices, *Mathematical models, Elliptic differential equations, Partial differential equations, Monlinear differential equations, Metal oxide transistors, Solar cells, Simulation, Reprints, Bipolar transistors, Mesh generation.

The static simulation of semiconductor devices re-The static simulation of semiconductor devices requires the solution of a system of three coupled nonlinear elliptic partial differential equations in two space dimensions. The solution of this system of equations is essential in simulation of bipolar and MOS transistors and more specialized devices such as large area photovoltaic cells and power transistors. This application presents two unusual problems which are a consequence of the exponential non-linearities which couple the system of equations. The exponential nature of the coupling imposes stringent accuracy requirements. These requirements are discussed in detail using a single elliptic equation in one space dimension. Extensingle elliptic equation in one space dimension. Extension of one-dimensional methods to two-dimensions requires some form of non-uniform, preferably adaptive, mesh generation so that reasonable accuracy can be obtained in the memory space of existing computers. The solution is also characterized by steep fronts whose location is strongly dependent on the value of the boundary condition. Small changes in these boundary values commonly result in large displace-ments of these fronts.

Final rept., R. J. Phelan. 1984, 11p

Pub. in Semiconductors and Semimetals 21, Part D p249-259 1984.

Keywords: Amorphous materials, Amorphous silicon, Optical modulators, Optical detectors, Picosecond pulses.

It is interesting to determine if a-Si:H can be used to create useful electro-optic devices with picosecond response speeds. Although one normally does not associate fast devices with low mobility materials, subnanosecond optical detectors and modulators have been made using hydrogenated amorphous silicon. Fast speeds are achieved by using very short lifetime matenals or by making the structures sufficiently small that transit times are the limiting factor. A major factor favoring a-Si:H is the fact that it can be deposited on a wide variety of substrates allowing for the fabrication of structures that would otherwise be very difficult to construct.

Operation of ion Counters Near High Voltage DC

Transmission Lines.

Final rept.,
R. H. McKnight, and P. M. Fulcomer. Jan 85, 3p
Sponsored by Department of Energy, Washington, DC.
Pub. in Proceedings of Int. Symposium on High Voltage Engineering (4th), Athens, Greece, September 5-9, 1983, Paper 64.03, 3p, Jan 85.

Keywords: *Power transmission lines, High voltage, Direct current, *Ion counters.

Measurements of electrical quantities such as electric field, vertical current density, and space charge densi-ty are necessary to characterize the electrical environment around high voltage dc transmission lines. Ion counters are used to measure space charge densities. A monopolar line has been used in the laboratory to study the effects of external electric fields on the operation of ion counters located above ground. Space charge densities were determined as functions of counter air flow, electrical potential, and inlet geometry. The effects of counter potential were not large until the potential was approximately equal to that of the space potential near the counter, when the indicated ion density dropped significantly. A dependence on flow rate was observed, which appears to be due to the large external electric fields existing at the inlet to the ion counter causing a loss of ions to the counter walls at lower flow rates.

infrared Characterization of Defect Centers in

Quartz, H. G. Lipson. Apr 85, 5p Included in OM85: Basic Properties of Optical Materials. Summaries of Papers, p145-149 Apr 85.

Keywords: *Quartz, *Crystal defects, *Crystal oscillators, *Infrared spectroscopy, Radiation effects, Frequency shift.

The radiation hardness and ageing properties of quartz oscillator devices depend strongly on the impurity and defect content of the synthetic quartz material. Low temperature infrared Fourier spectroscopy is a powerful tool for characterizing changes in quartz defect centers introduced by ionizing radiation and process-ing techniques such as electrodiffusion (sweeping). The technique of scanning large crystals normal to the growth of sweeping axis reported in this paper has revealed localized changes in defect center distribution produced by irradiation and the effect of impurity concentration on vacuum sweeping.

Quantum Yield of Silicon In the Ultraviolet,

J. Geist. 1982, 5p
Pub. in Proceedings of Int. Symp. Technical Committee on Photon Detectors of the Int. Measurement Confederation (10th), Berlin, West Germany, September 20-22, 1982, p49-53.

Keywords: *Photodiodes, *Silicon, *Quantum efficiency, Ultraviolet radiation, Self calibration.

Charge carriers produced in silicon by photons with energies above 3.4 eV can produce a second electronhole pair by impact ionization, leading to a quantum yield that is greater than unity and that increases with photon energy. Accurate values of the quantum yield are required in order to extend the technique of silicon photodiode self-calibration into the ultraviolet spectral region. The author reports on recent experimental and theoretical studies that have yielded new and more accurate values for the quantum yield of silicon in the ultraviolet.

EPRI-NBS (Electric Power Research Institute-National Bureau of Standards) Coupling Capacitor Voltage Transformer Calibration Systems.

D. L. Hillhouse. 1985, 26p Sponsored by Electric Power Research Inst., Palo Alto, CA.

Pub. in Proceedings Workshop: Metering-type Cou-pling Capacitor Voltage Transformers (CCVTs), Gaith-ersburg, Maryland, June 2-3, 1983, p7-1--7-25 Apr 85.

Keywords: *Transformers, Calibrating, *Coupling capacitor voltage transformers, Metering.

The paper describes briefly a prototype system for field calibration of CCVTs developed by NBS in EPRI project RP-134-1, and in more detail, a simplified, less costly system developed later with partial support from the Pennsylvania Power and Light Co. The latter system was breadboarded as part of the above EPRI project. The prototype system contains five major dedicated components: (1) a current-comparator

bridge, (2) a modular capacitive transfer standard divider, (3) a compressed-gas standard capacitor, (4) a resonant power supply, and (5) a calibration truck. Its field accuracy is estimated to be 0.1% and 0.3 mrad, but it would be extremely expensive to reproduce. The simplified system contains only three major components: (1) the transfer standard divider above, (2) a voltage comparator, and (3) a combined standard-power transformer module. The latter two items repre-sent much less cost and weight than items (2), (3) and (4) in the prototype system, which they replace.

NBS (National Bureau of Standards) Experience, Field Calibration of Coupling Capacitor Voltage Transformers.

Final rept.,

D. L. Hillhouse. 1985, 15p Sponsored by Electric Power Research Inst., Palo Alto, CA.

Pub. in Proceedings Workshop: Metering-type Cou-pling Capacitor Voltage Transformers (CCVTs), Gaith-ersburg, Maryland, June 2-3, 1983, p1-1--1-14 Apr 85.

Keywords: *Transformers, Calibrating, Coupling capacitor voltage transformers, Metering.

Since its completion in 1976, the EPRI-NBS field calibration system for coupling capacitor voltage transformers (CCVTs) has been in NBS custody and has been used in field calibrations at six utilities. Measurements have been performed on 61 CCVTs, including 51 of metering class (12 of which were not using the X1X3 metering tap) and on nine metering VTs. The paper discusses the measurements at the six utilities, and summarizes all zero burden and connected burden results on metering windings. A large proportion of these CCVTs were found to be out of metering tolerance at both zero and connected burdens. How-ever, the data base is not large enough to allow exten-sion of these results to metering CCVTs in general.

Point Contact Diode at Laser Frequencies.

Final rept., K. M. Evenson, M. Inguscio, and D. A. Jennings. 1 Feb 85, 5p

Pub. in Jnl. of Applied Physics 57, n3 p956-960, 1 Feb

Keywords: Tungsten, Nickel oxides, Reprints, *MIM diodes, *Point contact diodes.

Dramatic improvements in the stability of the metal-insulator-metal point contact diode has been achieved by the use of blunter whisker tips. The optimum values for tip radius and diode resistance were experimentally determined. Both sensitivity and high-speed response of W-NiO-Ni point contact diodes were investigated at different laser frequencies and mixing orders as a function of tip radius, resistance, and coupling. The tip radii were changed by more than an order of magni-tude, and surprisingly, the sensitivity and the harmonic generation up to 88 THz were not significantly affected. A conical antenna was found to be superior to the conventional longwire antenna at wavelengths shorter than 10 micrometers. Responsivity measurements as a function of the diode resistance showed evidence for two different physical mechanisms responsible for the operation of the diode.

Chaos and Thermal Noise in the rf-Biased Joseph-

son Junction.

R. L. Kautz. 1985, 17p Contract N00014-84-F-0038

Sponsored by Office of Naval Research, Arlington, VA. Pub. in Jnl. of Applied Physics 58, n1 p424-440, 1 Jul

Keywords: *Josephson junctions, Superconductivity, Reprints, Johnson noise, Chaos.

The effect of thermal noise on chaotic behavior in the rf-biased Josephson junction is studied through digital simulations. In instances for which chaotic behavior occurs in the noise-free system, it is found that the dynamics of the system are almost unchanged by the addition of thermal noise unless the level of thermal noise exceeds that of the chaotic state. In instances for which the only stable states of the noise-free system are periodic solutions, small amounts of thermal noise can induce the junction to hop between two different dynamical states, producing a low-frequency noise level much higher than that of the thermal noise. Such noise-induced hopping can occur either between two periodic solutions or between a periodic solution and a metastable chaotic solution. When a metastable chaotic state is involved, temperatures somewhat higher than those which produce hopping can destablize the periodic solution to the point where the system spends virtually all of its time in the metastable chaotic state, creating noise-induced chaos. The similarities between chaotic behavior at zero temperature and noise-induced chaos are sufficiently strong that it may be difficult to distinguish the two cases experimentally.

strumentation Engineers-International Society of Optical Engineers 308, p2-6 1981.

Keywords: *Photodiodes, *Radiometry, *Calibrating, Infrared radiation, Silicon, *Self calibration.

The recently developed, simple and highly accurate technique for self-calibration of the absolute response of a silicon photodiode is described. The silicon photo-diode self-calibration (SPSC) technique is independent of both electrical substitution radiometers (ESR's) and blackbodies - the traditional standards of absolute ra-diometry. Using the SPSC technique one can obtain high accuracy over a limited wavelength range with a very small investment of time and money. This means that the SPSC technique can be conveniently used to calibrate an ESR, thus avoiding the long and tedious characterization measurements required to evaluate the radiant to electrical power calibration factor of an

(eywords: *Electronic packaging, Leakage(Electrical), Tests, Hermetic seals, Electric *Electronic Kevwords: devices.

In the electronics industry the requirements are for leak testing large numbers of relatively small sealed packages to very fine leak rates. A wide variety of package materials are used; internal volumes range from less than 0.001 cubic cm. to greater than 10 cubic cm.; and the leak size reject level may be less than 1 x 10 to the minus 9 power Pa cubic m/s. No single test can cover the leak size range. Present preferred methods such as the radioisotope, helium leak detector, and others are assessed as to range, precision, efficiency, and usefulness as based upon fluid transport mechanisms and experimental data.

Final rept.,

D. L. Blackburn. 1985, 7p
Pub. in Proceedings of Annual IEEE (Institute of Electrical and Electronics Engineers) Power Electronics Specialists Conference (16th), Toulouse, France, June 24-28, 1985, p429-435.

Keywords: *Field effect transistors, Reliability(Electronics), Failure, *MOSFET, Bipolar transistors, Second breakdown.

Experimental results of the failure of power MOSFETs during inductive turn-off are discussed. The eletrical characteristics of these devices during failure are shown to be identical to those of a bipolar transistor undergoing second breakdown. Other comparisons of the power MOSFET failure and bipolar second breakdown are made. A nondestructive measurement system is used which allows repeated measurements of the failure characteristics as a function of various parameters to be made on a single device.

ELECTRONICS AND ELECTRICAL ENGINEERING—Field 9

Components—Group 9A

Keywords: *Circuits, *Simulators, Wafers, Simulation, Dynamic response, Sensitivity, Chips(Electronics)

The paper presents examples of how well model parameters extracted from a test chip can predict the ac response of a dynamic circuit element on the same wafer. Simulation results show which model parameters are critical to performance. A comparison between measurement and simulation results is given and the importance of intrachip and intra-water parameter variations is discussed. For the samples tested, the polysilicon gate linewidth variation was determined to be the primary cause of the ring oscillator frequency variation.

Included in Proceedings of Seminar on Digital Methods in Waveform Metrology, pA50-A54 Oct 83.

Keywords: Gallium arsenides, Photoconductivity, Substrates, Pulse generators, *Optoelectronic switches.

The paper describes the design of a set of optoelectronic switches having an interdigitated electrode structure and implemented with high resistivity GaAs photoconductive substrates. A theoretical analysis is developed for determining the pulsed light ON state resistance (peak conductance), OFF state (dark) resistance, and the associated capacitances for the various designed gap geometries. Data are provided on the processing type of the processing the processing steps used in successfully fabricating a working set of switches based on the theoretical design. A test apparatus is used to make measurements of the pulsed light conductance of these devices having nominal gap spacing of 5, 10, 20, and 40 micrometers

Amplification by a Voltage Locked Array of Josephson Junctions.

Final rept.,
D. G. McDonald, and N. V. Frederick. Sep 85, 3p
Pub. in Applied Physics Letters 47, n5 p530-532, 1 Sep

Keywords: *Amplifiers, Josephson junctions, Superconductivity, Reprints.

The authors have studied a new type of Josephson junction amplifier which is based on a two-junction array; the junctions are mutually phase locked at the Josephson self-oscillation frequency. With the frequency at 82 GHz, the voltages of the junctions remain equal (locked) for a bias current range as large as 60% of the critical current. Over a much smaller bias range, with an applied signal frequency of 1 kHz, a small-signal power gain of 19 dB was measured, accompanied by a negative resistance input impedance. The performance is consistent with a quasistatic theory of the amplifier.

Amplification by the Phase-Locking Mechanism in a Four-Junction SQUID.

Final rept.,

D. G. McDonald. Dec 84, 3p

Pub. in Applied Physics Letters 45, n11 p1243-1245, 1

Dec 84.

Keywords: *Amplifiers, Josephson junctions, Microwaves, Superconductivity, Reprints, SQUID devices.

It is shown that the phase-locking property of an array of Josephson junctions can be used as a basis for am-plification. The particular device simulated is a superconducting quantum interference device (SQUID) with four junctions in the loop, rather than the usual one or two. Novel consequences of the design are that it allows direct rather than inductive coupling to the SQUID and, because of its potentially compact form, it probably can have a bandwidth well into the gigahertz range, in agreement with the simulations. 500.657 PB86-166634 PC A03/MF A01 National Bureau of Standards (NEL), Gaithersburg, MD. Semiconductor Electronics Div. CSFIT: A FORTRAN Program for Charge-Sheet Model Fitting of MOSFET Data, L. C. Witte. Nov 85, 38p NBSIR-85/3145 Sponsored by Defense Nuclear Agency, Washington,

Keywords: *Metal oxide transistors. *Field effect transistors, *Computer programs, Electric current, Electric potential, Fortran, *MOSFET, CSFIT computer program, Charge sheet model, Voltage.

A FORTRAN program, CSFIT, has been developed for fitting an expression for the current-voltage (I-V) characteristics of a long-channel MOSFET to experimental I-V curves. The one-dimensional charge-sheet model developed by Brews provides the basis for the I-V characteristics. The I-V characteristics given by this model are optimized with respect to a set of experimental data using the flatband voltage and the mobility as the only adjustable parameters. The program is written so that multiple sets of I-V data can be fit simultaneously if desired. The user must supply, in specified formats, a current-voltage data file, a device parameter file, and a starting value file.

Keywords: *Data file, *Metropolitan areas, *Coding, *Urban areas, Magnetic tapes, *Standard Metropolitan Statistical Areas, *Federal information processing standards, Geographical areas.

The Office of Management and Budget (OMB) announced revised definitions of the nation's metropolitan statistical areas (MSAs) effective June 30, 1983. Based on demographic data derived from the 1980 decennial census, a comprehensive review was under-taken by the Federal Committee on MSAs, which adtaken by the Federal Committee on MSAs, which advises OMB on MSA matters. The previous term 'Standard Metropolitan Statistical Area (SMSA) has been shortened to 'Metropolitan Statistical Area' (MSA). Under the new standards, an area qualifies for recognition as an MSA in one of two ways: if there is a city of at least 50 000 an outstand a court of at least 50,000 population, or an urbanized area of at least 50,000 with a total metropolitan population of at least 100,000. If an area has more than 1 million population and meets certain other specified requirements, it now will be termed a 'Consolidated Metropolitan Statistical Area' (CMSA), consisting of major components recognized as 'Primary Metropolitan Statistical Areas' (PMSAs). A total of 257 MSAs are recognized. In addi-(PMSAs). A total of 257 MSAs are recognized. In addition, there are 23 CMSAs, consisting of 78 PMSAs. This tape contains computer files documenting titles, components and Federal Information Processing Standards (FIPS) codes for Metropolitan Statistical Areas and related statistical areas. It includes two computer files to convert titles, components, and FIPS codes for Standard Metropolitan Statistical Areas to June 30, 1983 MSA definitions.

Guide on Workload Forecasting. Final rept.,

H. Letmanyi. Mar 85, 71p NBS/SP-500/123 Also available from Supt. of Docs as SN003-003-02634-4. Library of Congress catalog card no. 85-600504.

Keywords: *Data processing, *Forecasting, *Work measurement, Time series analysis, *Data base administrators, *Data base management systems, ministrators, *Workload.

The purpose of this guide is to provide ADP managers and technical personnel with useful quantitative techniques for forecasting future workload requirements. It additionally provides a step-by-step approach to the forecasting process. Readers can then, in a timely manner, provide the computing resources needed to perform the user's workload at required service levels throughout the life-cycle of an ADP system. These techniques are described so that readers with little or no training in statistics should find them useful. However, this guide does not intend to give an exhaustive treatment of the techniques discussed. Readers requiring more information are referred to Appendix A ('Suggested Readings and References').

Performance Measurement of OSI (Open System Interconnection) Class 4 Transport implementa-

tions, K. L. Mills, J. W. Gura, and C. M. Chernick. Jan 85, 53p NBSIR-85/3104

Keywords: *Computer networks, Performance evaluation, Measurement, Implementation, *Protocols, Open system interconnections.

A measurement system to evaluate the performance of open system interconnection (OSI) transport proto-col implementations is described. Several metrics are proposed to establish a quantitative characterization of layered protocol performance. Metrics specific to the OSI transport protocol are also proposed. The measurement system and metrics are applied to a multi-vendor National Computer Conference demonstration network and the results are reported.

500,674 PB85-177970 PC A06/MF A01 National Bureau of Standards, Gaithersburg, MD. Center for Programming Science and Technology Guide on Logical Database Design. Final rept.,

E. N. Fong, M. W. Henderson, D. K. Jefferson, and J. M. Sullivan. Feb 85, 119p NBS/SP-500/122 Also available from Supt. of Docs as SN003-003-02631-0. Library of Congress catalog card no. 85-600500.

Keywords: *Information systems, Systems design, Systems analysis, Methodology, *Data base design, *Data bases, *Data management, *Data base management systems, Data dictionaries, User needs, Relational data base.

This report discusses an iterative methodology for Logical Database Design. The methodology includes

four phases: Local Information-flow Modeling, Global Information-flow Modeling, Conceptual Schema Information-flow Modeling, Conceptual Schema Design, and External Schema Modeling. These phases are intended to make maximum use of available information and user expertise, including the use of a previous Needs Analysis, and to prepare a firm foundation for physical database design and system implementation. The methodology recommends analysis from different points of view--organization, function, and event--in order to ensure that the logical database design accurately reflects the requirements of the entire population of future users. The methodology also recommends computer support from a data dictionary system, in order to conveniently and accurately handle the volume and complexity of design documentation and analysis. The report places the methodology in the context of the complete system life cycle. An appendix of illustrations shows examples of how the four phases of the methodology can be implemented.

Guldance on Planning and Implementing Computer System Reliability. Final rept.,

L.S. Rosenthal. Jan 85, 53p NBS/SP-500/121 Also available from Supt. of Docs as SN003-003-02628-0. Library of Congress catalog card no. 84-601159.

Keywords: *Systems management, Computers, Reliability, Specifications, Measurement, Quality, Projects, *Computer system reliability, *Computer system design, Systems engineering.

Computer systems have become an integral part of most organizations. The need to provide continuous, correct service is becoming more critical. However, decentralization of computing, inexperienced users, and larger more complex systems make for operational environments that make it difficult to provide continuous, correct service. This document is intended for the computer system manager (or user) responsible for the specification, measurement, evaluation, selection or management of a computer system. This report ad-dresses the concepts and concerns associated with computer system reliability. Its main purpose is to assist system managers in acquiring a basic understanding of computer system reliability and to suggest actions and procedures which can help them establish and maintain a reliability program. The report presents discussions on quantifying reliability and assessing the quality of the computer system. Design and implementation techniques that may be used to improve the reliability of the system are also discussed. Emphasis is placed on understanding the need for reliability and the elements and activities that are involved in implementing a reliability program.

Integrity and Security Standards Based on Cryp-

Final rept., D. K. Branstad, and M. E. Smid. 1982, 6p Pub. in Computer Security 1, n3 p255-260 Nov 82.

Keywords: Security, Standards, Reprints, *Computer security, *Data Encryption Standard, *Cryptography, Federal Information Processing Standard, Authentication.

Since the Data Encryption Standard (DES) was published in January 1977, as a Federal Information Processing Standard (FIPS), it has become the basis for the development of several security and integrity standards. Seven DES based security standards have already been approved, and several others are in development. Five standards making organizations are now involved with DES based standards; the American now involved with DES based standards: the American Bankers Association (ABA), the American National Standards Institute (ANSI), the General Services Administration (GSA), the International Organization for Standardization (ISO), and the National Bureau of Standards (NBS). While these standards are all based on the DES, future standards may make provision for using other cryptographic algorithms. For example, public key cryptographic algorithms could offer some advantages over the traditional, secret key cryptographic algorithms in certain applications. In anticipa-tion of this future requirement NBS has published a Solicitation for Public Key Cryptographic Algorithms to be based in special application standards. 500.677

Survey of Mathematical Software for Elliptic

Boundary Value Problems. Final rept.,

R. F. Boisvert, and R. A. Sweet. 1982, 3p Sponsored by International Association for Mathematics and Computers in Simulation and Concordia Univ.,

Loyola Campus, Montreal (Quebec).
Pub. in Proceedings of World Congress on System Simulation and Scientific Computation (10th), Montreal, Canada, August 8-13, 1982, Numerical Methods for Scientific Computation, v1, p449-451 1982.

Keywords: *Boundary value problems, *Elliptic differential equations, *Partial differential equations, Reviews, *Computer software.

In this paper, the authors summarize the state of mathematical software for elliptic boundary value problems. These problems are fundamental to the study of static physical phenomena such as electromagnetic fields and steady-state diffusion. In addition, they often arise as intermediate steps in the modelling of dynamic processes such as fluid flow. The authors limit this discussion to portable general-purpose mathematicallyoriented software, and hence much useful applications-oriented is necessrily omitted.

Structural Dimensions of Small Programming Environments.

Final rept..

G. Lyon. Jan 85, 13p
Pub. in Jnl. of Software--Practice and Experience 15, n1 p105-117 Jan 85.

Keywords: *Computer programming, Reprints, *Computer software.

Although substantial variety exists among small programming environments, common points-of-choice in their design suggest the following structural character-ization: real or virtual hardware; message-passing or procedure-calling; static or dynamic binding; horizontal or vertical organizations; abstract or concrete struc-tures; fixed or extensible language. Often these dimen-sions must support a very focused programming idiom, which combined with other requirements such as portability or performance, establishes structural dependencies, precludes features and forces exceptions. The characterization provides a rough framework that is useful in evaluating programming environments.

Reference Model for DBMS (Database Management System) Standardization, D. K. Jefferson, and E. N. Fong. May 85, 79p NBSIR-85/3173

Keywords: Standardization, Models, Concepts, Proposals, *Data management, *Data base management systems, *DBMS systems, *Data dictionary, Reference models, Data representation, DL programming language, i-DL programming language.

The report proposes a Reference Model (RM) for database management system (DBMS) standardization. A Reference Model is a conceptual framework whose purpose is to divide standardization work into manageable pieces and to show at a general level how these pieces are related with each other. The proposed RM comprises a Data Mapping Control System (DMCS) that retrieves and stores application data, application schemas, and data dictionary schemas. This DMCS is bounded by two interfaces: the Data Language (DL) bounded by two interfaces: the Data Language (DL) interface which defines the services offered by the DMCS to various Data Management Tools (DMT), and the internal Data Language (i-DL) interface which de-

fines the services required by the DMCS from the host operating system. The report suggests two candidates for standardization: the DL and the i-DL.

Performance Simulation of the IEEE Token Bus

Protocol Using SIMAN,
J. R. Pimentel. Jun 85, 31p
Included in Workshop on Analytic and Simulation Modeling of IEEE 802.4 Token Bus Local Area Networks, p5-35 Jun 85.

Keywords: *Computer networks, Standards, Simulation, Meetings, SIMAN simulation language, *Token bus networks.

The SIMAN simulation language is used to simulate the performance of the physical and data link layers of a local area network suitable for manufacturing. The protocol standards specified by the IEEE project 802.4 has been chosen for the study. A detailed network queueing model is developed and implemented using the process view approach provided by SIMAN. Simulation results are shown in terms of average number of frames awaiting transmission, average response time, and medium utilization versus traffic intensity.

Simulation of the IEEE 802.4 Token Passing Bus

Protocol Using SIMSCRIPT,
A. R. K. Sastry, and M. W. Atkinson. Jun 85, 9p
Included in Workshop on Analytic and Simulation Modeling of IEEE 802.4 Token Bus Local Area Networks, p52-61 Jun 85.

Keywords: *Computer networks, Standards, Simulation, Meetings, SIMSCRIPT, *Token bus networks, *Local area networks.

A simulation model has been developed for the performance evaluation of the IEEE 802.4 token passing bus local area network protocol using SIMSCRIPT. The model has indentifiable 'processes' corresponding to the four 'machines' of the protocol, i.e., access control, receive, transmit, and interface machines. In addition, a 'frame process' is used to simulate the signal flow on the bus. An initialization 'routine' serves. signal flow on the bus. An initialization 'routine' serves to input the network parameters and to initially activate the processes in the proper order, while a statistics extraction routine gathers output data during a simulation run. The entire model is developed in an incremental mode, gradually increasing the detail and complexity so that code can be validated by 'walking through' at every stage of the development. Queues with four different priorities, a message generation process at each queue, random selection of frame lengths, and token rotation timers have been incorporated. Results from a number of simulation runs suggest the need to develop methodology to relate the timer values with the desired priorities under given traffic conditions, which seems to be a very significant user-oriented issue.

The Token Bus Network Simulator (TBNS), developed by Motorola Semiconductor Israel (MSIL), is a soft-ware tool which aids in Token-Bus (IEEE 802.4) protocol developments, verification and performance evaluation. It is a discrete event-driven simulator that is coded in PASCAL and provides predictions of delay, throughout and many other performance measures as a fuction of offered load. The simulator implements the IEEE 802.4 (Rev. A, 1984) Token-Passing Bus Medium Access Control (MAC) Specification of protocols for local area networks. It models token-bus network behavior in batch mode and under interactive user control (MAC) Specification of protocols for local area networks. It models token-bus network behavior in batch mode and under interactive user control. The simulator can trace the progress through the network of each message/event to facilitate model validation and analysis. Use of the simulator at MSIL has resulted in the discovery of several protocol errors (including one deadlock situation) which were reported back to the IEEE 802.4 committee.

J. Y. Chien. Jun 85, 41p Included in Workshop on Analytic and Simulation Modeling of IEEE 802.4 Token Bus Local Area Networks, p113-152 Jun 85.

Keywords: *Computer networks, Standards, Simulation, Meetings, *Token bus networks, *Local area networks.

IEEE Standard 802.4--1984 defines a local area network protocol based on the concept of token-passing for controlling access to a broadcast medium. A per-formance analysis of such a network using simulation techniques has been conducted. Performance is characterized in terms of stability, fairness, throughput, and acquisition delay. The paper is a report on some of

those efforts. The authors analysis shows that the network remains stable as the load increases. Fairness can be attained if enough time is allowed for the system to become saturated. The acquisition delay is sensitive and degrades greatly as load increases. A comprehensive discussion of how the performance of the network is affected by system parameters like data length, network sizes, token hold time, and station delay is also included.

Simulation of a Token Passing Bus Using a Static

Logical Ring,

M. E. Ulug, and N. R. Shapiro. Jun 85, 11p Included in Workshop on Analytic and Simulation Mod-eling of IEEE 802.4 Token Bus Local Area Networks, p168-179 Jun 85.

Keywords: *Computer networks, Standards, Simulation, Meetings, *Token bus networks, *Local area net-

Process oriented and critically timed communications requirements necessitates a real-time, failure-proof network for factory automation. The ability to control the accessing at the data link level by assigning priorities and timers make token passing more advantageous in the factory environment. The performance of token passing schemes depends greatly on the value of various timers that can be controlled at the data link level. A hierarchical policy to assign values for various timers in token passing access method in an optimiza-tion framework is reported. The basic idea in the scheme is to decompose the decision making capability into two hierarchically arranged levels. In the higher level, a centralized linear programming problem is solved to maximize the overall bus utilization of the network. In the lower level, a distributed integer programming problem is solved at each station to maximize the buffer utilizations. The higher level problem is solved at a slower time scale compared to lower level problem.

Keywords: *Image processing, Image analysis, Image enhancement, User manuals, Pixels.

An image analysis system has been developed which allows the user to evaluate images in either an interactive or a batch mode. The manual provides instructions for assessing the imaging system (hardware and software) and describes the structure and function of each of the available commands. The imaging software is for an 80826 based minicomputer operating under a multi-user operating system with five imaging boards. The interactive run time environment is menu driven. To execute the imaging system in batch format, commands of a specific structure are placed into a datafile from which they are subsequently read and executed one at a time.

500,709 PB86-105814 Not available NTIS National Bureau of Standards, Gaithersburg, MD Measurement Center for the NBS (National Bureau of Standards) Local Area Computer Network. Final rept.,

P. D. Amer. 1982, 7p Pub. in Institute of Electrical and Electronic Engineers Trans. Comput. C-31, n8 p723-729 Aug 82.

Keywords: *Computer networks, *Network flows, Performance evaluation, Radio broadcasting, *Local area networks, *NBSNET computer network, Multiple access, Distributed computer systems.

The paper describes a measurement center for a local area computer network (LAN). A LAN measurement center is a tool that allows careful testing and evaluation of a network under diverse and highly controlled conditions. Three measurement center components are discussed: a monitoring system, analysis software, and an artificial traffic generator. The monitoring system captures measurement information about the traffic being transmitted over the network. The analysis software provides ten measurement reports which are generated following each monitoring period. Finally, the traffic generator can place varied loads on the network, allowing for controlled experimentation and functional testing. The measurement center described here is being implemented for the NBSNET, a distributed, broadcast LAN at the National Bureau of Standards. Implementation issues and problems are discussed.

Modular Expansion in a Class of Homogeneous Networks.

Final rept.,

A. Mink, and C. B. Silio. 1982, 5p Sponsored by Association for Computing Machinery,

Pub. in Proceedings of Computer Network Performance Symposium, College Park, MD., April 13-14, 1982, v11 n1 p95-100.

Keywords: *Computer networks, Modular structures, Expansion, Capacity, Performance, Queuing theory, *Computer architecture, Computer systems design.

The authors consider a special class of homogeneous computer network comprising several essentially identical but independent computing systems (ICSs) sharing a single resource. Of interest here are the effects of modularly expanding the network by adding ICSs. The authors use a previously presented approximate queuing network model to analyze modular expansion in this class of network. The performance measure used in this analysis is the mean cycle time, which is the mean time between successive requests for service by the same job at the CPU of an ICS. In this analysis the authors derive an intuitively satisfying mathematical relation between the addition of ICSs and the incremental increase in the service rate of the shared resource required to maintain the existing level of system performance.

Developing a Programming Environment.

Final rept.,

M. V. Zelkowitz. 1981, 6p Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC.

Pub. in Proceedings of Annual Technical Symposium of the Washington, DC. Chapter of ACM (20th), Crisis in Computing: Innovation in a Constrained Environment, College Park, MD., June 18, 1981, p23-28.

Keywords: *Computer programming, Prototypes, Specifications, System analysis, *Translators, *Software engineering, *Software tools, *SNOBOL programming language, *High level languages.

There is a need to develop a prototype rapidly in order to be able totest systems specifications before a costly implementation is undertaken. The paper describes two research projects that aid in this effort. In one project, SNOBOL4 is used as a very high level executively in the standard of able design language in order to develop a rapid proto-type of a language translater. In a second project, an intelligent data base is being designed to aid in developing PL/I programs. This PL/I system will have some of the characteristics of the earlier SNOBOL4 system. An eventual goal of this research is to later include a high level design language like SNOBOL4 to totally merge the two concepts into one system.

Data Transfer Protocol for Remote Database Access.

Final rept.,
P. S. C. Wang, and S. R. Kimbleton. 1980, 82p
Pub. in Proceedings of Trends and Applications: 1980
Computer Network Protocols, Gaithersburg, MD., May 29, 1980, p701-782.

Keywords: *Computer networks, *Data transfer protocols, Data bases, Access, Remote systems.

A Data Transfer Protocol (DTP) is a protocol for transfering data, in a meaning-preserving way, among dif-ferent hosts of a computer network. The design of DTPs is separated into the following components: (1) specification of the services provided; (2) description of the internal structure of the protocol (in the form of descriptions of the individual entities of the DTP and the messages exchanged among these entities); and (3) identification of the required lower level support functions. The paper considers, in detail, the above three aspects of the design of a specific DTP.

500,728

Not available NTIS PB86-124807 National Bureau of Standards, Gaithersburg, MD. Center for Computer Systems Engineering. Network Access Technology: A Perspective.

Final rept., S. W. Watkins, and S. R. Kimbleton. 1978, 9p Pub. in AFIPS (American Federation of Information Processing Societies), Conference Proceedings, Anaheim, CA., June 5-8, 1978, v47 p495-503.

Keywords: *Telecommunication, *Computer networks, Computer components, Evaluation, *Access methods, Support services.

Effective user access to network resources is inhibited by differences in command languages, operating systems functions, file naming conventions, and system idiosyncracies. This has resulted in the gradual development of network access support aids which offload many access related problems from the user to a support system. The paper: (i) overviews the area of net-work access; (ii) identifies related research efforts; (iii) identifies some of the factors which make network access support difficult; and (iv) structures major access support components. Insights resulting from the current implementation of one of these components, expert assistance, are also presented.

Final rept.. M. H. Whitworth,, and P. A. Szulewski. 1980, 9p Pub. in Proceedings of COMPSAC 80 IEEE (Institute of Electrical and Electronics Engineers) Computer Society's International Computer Software and Applications (4th) Conference, Chicago, IL., October 27-31, 1980, p735-743.

Keywords: *Software engineering, *Data flow analysis, *Software quality control, *Computer systems design.

Progress in the areas of software development methodology and software quality measurement have lagged far behind the advances made in other computer-related fields. Most previous work in software quality assessment has addressed the quality of computer code. In the paper, the focus is shifted and the quality of software designs is emphasized. Two metrics of design complexity are proposed (complexity is often cited as having a negative impact upon software quality). By allowing software quality assessment techniques to be applied in the design phase of the development. opment cycle, continuous evaluation of alternative designs is facilitated.

Tomographic Image Reconstruction from Limited Projections Using Iterative Revisions in Image and Transform Spaces. Final rept.,

T. Sato, S. J. Norton, M. Linzer, O. Ikeda, and M Hirama. 1981, 5p Pub. in Applied Optics 20, n3 p395-399, 1 Feb 81. J. Norton, M. Linzer, O. Ikeda, and M.

Keywords: Fourier transformations, Ultrasonic radiation, Iterations, Reprints, *Image reconstruction, Tomography.

An iterative technique is proposed for improving the quality of reconstructions from projections when the number of projections is small, or the angular range of projections is limited. The technique consists oftransforming repeatedly between image and transform spaces and applying a priori object information at each iteration. Information which is often known a priori and may be used in this manner are the outer boundaries of the object and the limits on the range of variation of the physical parameters of interest. This process of forcing the image to conform to a priori object data can help to reduce artifacts arising from incomplete or limited data available in the Fourier transform plane. The results of computer simulations show clearly the effectiveness of the proposed approach.

Prepared in cooperation with Duke Univ., Durham, NC.

Keywords: Life cycles, *Software quality control, *Software engineering, *Software tools, Computer software maintenance.

As part of the program to provide information to Federal agencies on software tools for improving quality and productivity in software development and maintenance, data was collected on software engineering environments. Software engineering environments surround their users with software tools necessary for systematic development and maintenance of software. The purpose of this report is to characterize software engineering environments by type and by their relationship to the software life cycle and by their capabilities, limitations, primary users, and levels of support. This report provides examples of existing soft-ware engineering environments that are available commercially or in research laboratories with the features and characteristics they provide.

*Programming Keywords: languages, Evolution(Development), Problem solving, Automation, Transformational grammars, Cognition, Computation, Design, Reprints, *Foreign technology, *High level languages, User needs.

Backus has observed that von Neumann programming languages are fat and weak. Though there are current efforts to provide alternate models of computation, an examination of the genealogy of programming languages suggests that it is unlikely that the issues now facing programming language designers will be re-solved by the simple expedient of replacing one model with another. What such an examination does suggest is that each succeeding generation transfers new and more difficult cognitive functions from the programmer to the computer. If this is correct, then the author can predict that the next generation will come about not by some revolutionary advance in computer technology, but by the successful automation of higher-order cognitive functions which now require human attention. One ideal solution would be a cluster of programming languages that are expressive enough to reflect as nearly as possible the user's own cognitive framework, i.e., the structured world of abstract objects which define the user's application domain, together with the set of transformation rules on that domain which permit the user to create and/or modify those objects.

Group 9B—Computers

The paper examines existing programming languages and then shows how ideal programming languages could be realized in practice.

Final rept.,
G. M. Castore. 1984, 15p
Pub. in Solid Modeling by Computers: From Theory to Applications, p277-292 1984.

Keywords: *Pattern recognition, *Computer vision, *Robot vision, PADL-2 system, Geometric modelling.

At the National Bureau of Standards, a method is being developed for transferring sufficient information directly from the solid modeling system to the robot vision system to enable the robot to recognize a part. The information is encoded in the form of a graph, called an asptec graph, together with functions associated to each vertex of the graph. Aspect graphs were developed by J.J. Koenderink of the State University of Utrecht in the Netherlands, as part of an attempt to understand how shape information is represented by the human vision system. Currently the method is being developed for parts designed on the PADL-2 system. In particular, it does not yet handle contoured surfaces. Extensions to deal with contoured surfaces appear to be feasible and are mentioned briefly.

Operating a Local Area Network.

Final rept

Final rept.,

R. J. Crosson. 1983, 5p Pub. in Proceedings of Computer Networking Symposium, Silver Spring, MD., December 3, 1983, p73-77.

Keywords: *Computer networks, Standards, Operations, *Ethernet computer network, *NBSNET computer network, *Local area network, Computer systems design, Protoci systems(Computers), User needs. Protocols, Operating

NBSNET is a baseband Ethernet-like network at the National Bureau of Standards serving over 400 nodes. Connected devices communicate with the network using three types of protocols - one for terminals, and two for computers. The protocols contain flexibility to accomodate the unique facilities of the user's equipment. The lessons learned from the NBSNET experience are that capabilities for coping with user's equipment and for diagnosing problems encountered in the network's operation must be integral parts of the net-work's design. Also, the lack of standards increases the amount and level of support required.

Procedure Language Access to Proposed American National Standard Database Management Sys-

Final rept..

L. J. Gallagher. 1984, 12p

Pub. in Comput. Networks 8, n1 p31-42 Feb 84.

Keywords: *Procedure oriented languages, Standards, Specifications, Reprints, *Data base management systems, *Application programs(Computers), *Relational data bases, *Open system interconnections, *Access methods, Distributed processing.

Network and relational database standards are under development by technical committee X3H2 of the American National Standards Institute. This paper is an overview of the procedure language interface to these proposed standards. It introduces the basic structures and operations of each data model, focuses on the procedure language interface as a facility for database access from external languages, and dis-cusses various alternatives for use of the database language standard with existing standard programming languages. The paper contains example application programs of each access alternative and con-cludes with a discussion of basic requirements for application of the standard specifications to distributed database processing in an open systems environment.

Pattern Recognition Using Incoherent OTF (Optical Transfer Function) Synthesis and Edge Enhancement.

Final rept., Y. Katzir, M. Young, and I. Glaser. Mar 85, 5p Pub. in Applied Optics 24, n6 p863-867, 15 Mar 85.

Keywords: *Pattern recognition, Character recognition, Holography, Reprints, Optical correlators, Optical transfer functions, Optical processing, Robot vision, Image enhancement.

The paper describes a system for pattern recognition using an incoherent-optical correlator. The system uses optical transfer function synthesis to perform correlations with an edge-enhanced image of the object relations with an edge-enhanced image of the object or pattern being sought. The resulting correlations are free of bias and show good discrimination between objects. In addition, the difficult or time-consuming computations are performed before the operation of the system; this reduces the amount of postprocessing by computer and should allow real-time operation at video rates.

Online Help Systems - A Conspectus.

Final rept.

R. C. Houghton. 1984, 8p Pub. in Communications of the Association for Computing Machinery 27, n2 p126-133 1984.

Keywords: *Assistance, Human factors engineering, Reprints, *On line systems, *Help systems, Man machine systems.

Users of computer systems have become accustomed to the convenience of on-line help systems and, as a result, require the availability of help systems on computers they purchase. There are many types of assistance that can be provided by help systems and there are many issues to be considered by the developers of such systems. The types of assistance include command assistance, help assistance, error assistance, on-line tutors and on-line documentation. Development issues include the quality and style of the assistance, query-in depth, contextual assistance, use of natural language, use of simulation, consistency, and contextual mode switching. Experiments with help systems underline many of these issues.

Emerging New Requirements for Electric Power and Energy Measurements. Final rept.

J. D. Ramboz, and O. Petersons. 1985, 10p Pub. in Proceedings of the National Conference of Standards Laboratories Workshop and Symposium (1985), Boulder, Colorado, July 15-18, 1985, p3-12.

Keywords: *Electric measuring instruments, *Electric energy meters, Calibrating, Measuring instruments,

Precision, Measurements, Electric power meters, Watt hour meters.

Advances in electronic instrumentation technology have brought greater stability and precision to transducers that are utilized for measuring electric power and energy. An advantage of instruments based on electronic transducers is that they can be readily adapted to the measurement of other quantities such as current, voltage, reactive and apparent power, power factor, demand, time-of-day readings, etc. The calibration accuracies requested from NBS for power and energy measurements have increased at least fivefold (uncertainty reduction from + or - 0.05% to + or - 0.01%) within the past several years. Calibrations for different quantities and values are being requested. These changing calibration requirements and the response of NBS to meet the requests of its calibration clientele are discussed.

Power Calibration Standard Based on Digitally

Synthesized Sinewaves.

Final rept., N. M. Oldham. Nov 85, 5p Pub. in IEEE Transactions on Power Apparatus and Systems PAS-104, n11 p3117-3121 Nov 85.

Keywords: *Digital to analog converters, Inverters, Phase angle, Measurements, Reprints, *Calibration, *Calibration standards, Sine waves.

The unit of electric power at 60 Hz is often derived using impedance bridge techniques in which the alternating voltage is referred to the direct voltage standard through a thermal converter. An alternative calibration technique is described in which the ac to dc transfer is made through digital-to-analog converters (DACs) in the form of a dual-channel digital sinewave generator. The power is calculated from measurements of voltage, current, and phase angle, all of which rely on the accuracy of the digital generator and ultimately on the accuracy of the DACs.

Theory of Mutual Impairs Theory of Mutual Impedances and Multiple Reflec-

tions in an N-Element Array Environment. Technical note.

L. A. Muth. Feb 85, 36p NBS-TN-1078 Also available from Supt. of Docs as SN003-003-

02632-8. Keywords: *Antenna arrays, Impedance, Theories, Re-

A general theoretical approach is formulated to describe the complex electromagnetic environment of an N-element array. The theory reveals the element-to-element interactions and multiple reflections within the array. From the formulation, it is found that the interac-tion between an excited element and an open-circuited element can be viewed as the sum of terms describing all possible signal paths within the array envi-ronment which start from the radiating element and terminate on the element under observation. Within all paths except the most direct one, multiple reflections between subgroups of elements take place. The resulting solution is highly structured and recursive and is discussed in detail in the text. Illustrative examples are provided to facilitate understanding of these ideas.

Temperature Dependence of Translent Electron
Radiation Upset In TTL NAND Gates.

Final rept., T. Leedy, G. McLane, and C. Guenzer. 1981, 9p Sponsored by Defense Nuclear Agency, Washington,

Pub. in Proceedings on IEEE (Institute of Electrical Electronics Engineers) Annual Conference on Nuclear and Space Radiation Effects, Seattle, WA., July 21-24, 1981, IEEE Transactions on Nuclear Science 28, n6 p4597-4605 Dec 81.

Keywords: *Integrated circuits, Radiation effects, Electron irradiation, Logic circuits, Gates(Circuits), Transistor transistor logic.

The temperature dependence of transient upset caused by a 40-MeV electron flux was investigated for junction-isolated gold-doped and nongold-doped TTL NAND gate devices in the temperature range from 20 to 125C. Data for five devices are presented.

PB85-202760 Not available NTIS National Bureau of Standards (NEL), Gaithersburg, MD. Center for Electronics and Electrical Engineering. Materials Measurements: Present Abilities and **Future Needs.**

Final rept., R. I. Scace. Mar 85, 4p Pub. in Solid State Technology 28, n3 p155-158 Mar

Keywords: *Integrated circuits, *Standards, Quality control, Measurement, Semiconductors(Materials), Processing, Reprints, Very large scale integration.

Standard measurement methods and specifications for the semiconductor industry are reviewed and discussed with emphasis on applications to VLSI processes. The standards development process is an excellent way for material producers and users to devel-op good working relations and to solve their shared measurement problems; this process is described in some detail. Because the semiconductor industry is an international one, serious efforts have been made for a number of years to rationalize the technical differences between test method standards in Europe and the U.S. with considerable success. The present state of such cooperative activity with Japan, which has a more recent origin, is also reported.

Out-of-Rand Possess

Out-of-Band Response of Reflector Antennas,
D. A. Hill. Apr 85, 76p NBSIR-85/3021
Sponsored by Defense Nuclear Agency, Washington,
DC.

Keywords: *Antennas, Performance evaluation, Applications of mathematics, Responses, Parabolic antennas, Out of band response.

The response of reflector antennas to out-of-band frequencies has been analyzed using physical optics. A simple approximate expression has been obtained for the effective aperture, and the expression yields both the receiving pattern and the frequency dependence of the on-axis gain. The theory has been compared with published out-of-band measurements, and the pattern agreement is good, but the measured gain falls below the theory. The discrepancy is caused by mismatch loss in the coax-to-waveguide adapter, and the mismatch loss has been analyzed theoretically. The basic physical optics model for symmetrical reflectors has been extended to include offset and dual reflec-

Improved Test Structure and Kelvin-Measurement Method for the Determination of Integrated Circuit Front Contact Resistance.

Final rept., J. A. Mazer, L. W. Linholm, and A. N. Saxena. 1985,

Pub. in Jnl. of the Electrochemical Society 132, n2 p440-443 Feb 85.

Keywords: *Integrated circuits, Electrical resistance, Electric contacts, Measurement, Test equipment, Re-

The use of an improved microelectronic test structure and associated Kelvin measurement method for determining front contact resistance (circuit loading resistance) of a metal/semiconductor ohmic contact is described. The values of front contact resistance for aluminum/silicon contacts are determined using this Kelvin-cross contact resistance test structure and are compared with values determined by a two-terminal contact chain method and with values determined by a Kelvin voltage divider method. The values of front contact resistance using the Kelvin-cross structure and associated measurement method are shown to be less sensitive to photolithographic process variations and electrical measurement errors than those determined using the other two structures and measurement methods.

Screenroom Measurements of Antenna Factors. Final rept.,

Pub. in Proceedings of the IEEE (Institute of Electrical and Electronic Engineers) Instrumentation and Measurement Technology Conference, Tampa, Florida, March 20-22, 1985, p208.

Keywords: *Antennas, *Electromagnetic fields, Measurement, Anechoic chambers.

The measurement of electromagnetic fields in a shielded enclosure (screenroom) has serious problems because of uncertain antenna factors and multipath reflections from conductive surfaces. Most electromagnetic interference antennas at NBS are calibrated in a known field at an open field site using the standard antenna method. Because these antenna factors are not necessarily applicable for making measurements in a screenroom, the measurement errors are difficult to determine. This paper presents the results for antenna factors determined in a screen the results for antenna factors determined in a screen-room using the two-antenna method. These antenna factors are compared with antenna factors determined at an open field site and in an anechoic chamber. Experimental data are presented to show the variability of antenna factor as a function of frequency and location in the screenroom, thereby providing an indication of error bounds.

Near-Field Array of Yagi-Uda Antennas for Electromagnetic Susceptibility Testing.

D. A. Hill, and G. H. Koepke. Jul 85, 84p NBS/TN-1082

Also available from Supt. of Docs as SN003-003-02669-7.

Keywords: *Antenna arrays, Yagi antennas, Electromagnetic fields, Electromagnetic susceptibility, Near

In electromagnetic susceptibility testing of electronic equipment, the ideal incident field is a plane wave. To approximate this condition, a seven-element array of Yagi-Uda antennas has been constructed and tested at a frequency of 500 MHz. The element weightings are determined by a near-field synthesis technique which optimizes the uniformity of the field throughout a rectangular test volume in the near field of the array. The amplitude and phase of the electric field have been measured throughout the test volume with a short dipole probe, and the agreement with the theory is excellent.

Automatic Frequency Response of Frequency-Modulated Generators Using the Bessel Null

Final rept., J. R. Major, E. M. Livingston, and R. T. Adair. 1985, 23p

Sponsored by Army Communications-Electronics Command, Fort Monmouth, NJ.
Pub. in Proceedings of ARFTG Conference (24th), Columbia, MD., December 5-6, 1984, p131-153 Mar 85.

Keywords: *Signal generators, *Frequency response, Frequency modulation, Curve fitting, Frequency meters, Bessel null.

The paper describes a Bessel null technique to measure the frequency response of a frequency-modulated rf carrier and a program to automate frequency response measurements of signal generators with output frequencies from 0.450 to 2000 MHz. The measurements obtained using this technique are more accurate than those obtained by a highly trained technician using a manual system. Automated measurement of this process is desirable since the manual method is subject to the following problems: (1) excessive time; (2) error in finding the null; and (3) lack of assurance that the null is the first Bessel null. Automated measurements can be performed using a system controller, a spectrum analyzer, a function generator, and a voltmeter (all of which are compatible and controllable remotely).

Determination of Near-Field Correction Parameters for Circularly Polarized Probes.

Final rept..

A. C. Newell, M. H. Francis, and D. P. Kremer. 1984, 29p

Pub. in Proceedings of Annual Conference of the Antenna Measurement Techniques Association, San Diego, CA., October 2-4, 1984, p3A3-1 - 3A3-29.

Keywords: *Antennas, *Antenna radiation patterns, Measurement, Far field, Circular polarization, Near

In order to accurately determine the far-field of an antenna from near-field measurements the receiving pattern of the probe must be known so that probe correction can be performed. When the antenna to be tested is circularly polarized, the measurements are more accurate and efficient if circularly polarized probes are used. Further efficiency is obtained if one probe is dual polarized to allow for simultaneous measurements of both components. A procedure used by the National Bureau of Standards for determining the plane-wave receiving parameters of a dual-mode, circularly polarized probe is described herein. First, the on-axis gain of the probe is determined using the three antenna extrapolation technique. Second, the on-axis axial ratios and port-to-port comparison ratios are determined for both the probe and source antenna using a rotating linear horn. Far-field pattern measurements of both amplitude and phase are then made for both the main and cross components.

PB86-124955 Not available NTIS National Bureau of Standards (NEL), Gaithersburg, MD. Semiconductor Materials and Processes Div. Hermetic Testing of Large Hybrid Packages. Final rept.,

S. Ruthberg. 1982, 18p

Pub. in Proceedings of International Microelectronics Symposium, Reno, NV., November 15-17, 1982, Inter-national Jnl. of Hybrid Microelectronics 5, n2 p215-

Keywords: *Leak detectors, *Microelectronics, Semi-conductor devices, Tests, *Hybrid circuits, *Hermetic seals, Krypton 85.

Hermetic testing is a routine operation in the microelectronics industry with millions of packages being screened each year. Yet disagreements in test results between supplier and user are common, different test methods provide different results for the same leak range on the same parts, results are dependent on package configuration, and the specified reject limits as set forth in the standards are somewhat arbitrary. The leak rate reject level for the larger package is considered from the viewpoint of moisture infusion rates, and their impact on test parameters is examined. Range, efficiency, and usefulness are examined for such popular test procedures as the helium leak detector, radioisotope, weight gain, and bubble methods as well as for others such as the tracer probe, differential pressure, and rapid cycle methods that are more appropriate for the larger package. The issues described above are discussed with the aid of graphical solutions and actual test data.

Estimation of True Power Ratios in Six-Port Network Analyzers Using Diode Detectors.

Final rept.,

D. R. Holt, and C. A. Hoer. 1985, 2p Pub. in Proceedings of IMTC '85 IEEE Instrumentation and Measurement Technology Conference, Tampa, Florida, March 20-22, 1985, p140-141.

Keywords: Network analyzers, Estimating, Detectors, Diodes.

A model for detector nonlinearity is included in the determination of six-port parameters without using additional standards. A computer simulation was performed assuming that the true power into each six-port detector is related to the power observed by the detector. Simultaneous estimation of the six-port and detector parameters is accomplished through a nonlinear least squares algorithm. Results of the simulation compare Gamma computed from corrected power readings and Gamma calculated from observed power readings.

Practical Optical Modulator and Link for Antennas.

Final rept..

J. C. Wyss, and S. T. Sheeran. 1985, 6p

Pub. in Jnl. of Lightwave Technology LT-3, n2 p316-321 Apr 85.

Keywords: *Fiber optics transmission lines, Antennas, Electrooptics, Electromagnetic interference, Photodiodes, Reprints, Fiber optics.

The paper describes a practical application of a technique for coupling an antenna to a receiver using a passive fiber-optic link. This technique should avoid pickup and electromagnetic perturbations normally associated with the use of electrically conductive cables. Laser light (632.8 nm) is modulated at the antenna by an electrooptic lithiumtantalate crystal and is then transmitted with a fiber-optic cable to the receiver electronics. Using an avalanche photodiode, the amplitude modulated optical signal is converted to an electrical signal. The crystal is mounted directly on an antenna without amplifiers or other electrically powered components.

Total Dose Effects on Circuit Speed Measurements.

Final rept.

M. D. Lantz, and K. F. Galloway. 1983, 6p Pub. in IEEE Trans. Nuclear Science 30, n6 p4264-

Keywords: *Integrated circuits, *Radiation effects, Ionizing radiation, Radiation dosage, Time lag, Metal oxide transistors, Reprints, *Physical radiation effects, Delay, CMOS.

Measurements of propagation delay as a function of total ionizing dose were made using ring-oscillators, inverter chains, and NAND chains fabricated on the same CMOS test chip. The data illustrate the impact of the bias conditions of the MOS transistors during irradiation on the propagation delay time of the circuits. The data show no difference in propagation delay time for the three circuit types if comparable bias conditions are maintained during radiation exposure. The threshold voltage shift of the n-channel transistor in the 'ON' state appears to be the dominant factor controlling the decrease in propagation delay as the total dose in-creased. The ultimate failure of the test circuits is due to the shift of the n-channel transistors to a negative threshold voltage.

Using Infrared Thermography for Industrial
Energy Conservation. Final rept.,

P. Sheahen, Y. Y. Haimes, and M. A. H. Ruffner.

Pub. in Proceedings of Energy Auditing Conservation: Methods, Measurements, Management, and Case Studies Conference, Cleveland, OH., March 14, 1979,

Keywords: *Infrared thermal detectors, *Industrial heating, *Thermography, Furnaces, Heat loss, Temperature distribution, Measurement, Heat balance, Ovens, Numerical analysis, Measuring instruments, *Energy conservation.

The experimental techniques of infrared thermography have been used in factories to locate heat losses from furnaces, ovens and similar industrial equipment. Infrared thermography data have been used to generate temperature maps of furnaces, based on precise measurements made with a calibrated instrument. From these temperature maps, we have calculated total radiation losses, and have estimated convective heat losses as well. By combining these calculations with other numerically estimated losses, we have carned out a full heat-balance on a furnace, leaving no 'unaccounted' amount as in typical calculations of the past. This paper explains how infrared thermography works, and gives a variety of examples from both qualitative applications (leakage, hotspot identification, etc.) and quantitative measurements of heat balances.

Method to Abbrevlate Hourly Climate Data for
Computer Simulation of Annual Energy Use in Buildings.

Final rept., E. Arens, L. Flynn, and D. Nall. 1979, 5p Pub. in Proceedings of National Passive Solar Conference (4th), Kansas City, MO., October 3-5, 1979, p282-286.

Keywords: *Buildings, Statistical analysis, Data, Climate, Thermal analysis, Predictions, Computerized simulation, *Energy consumption.

A building's future energy performance is commonly estimated by simulating its thermal behavior over a

'typical' year representative of the most statistically probable future climate. A technique is presented to abbreviate the hourly climate data used in such analysis. It is incorporated in a computer program that selects from each month of a full year's climate record a shorter segment that represents the month. The technique's empirical basis is reported, followed by the results of various tests of its effectiveness at representing full-length data. The results suggest how far one can actually abbreviate climate data before the thermal lag of the building begins to distort predicted energy. The paper finally discusses the potential for using the technique for other applications, such as creating typical years and synthesizing hourly data for sites for which there is only summarized data.

G. Gillette, W. Pierpoint, and S. Treado. 1984, 11p Pub. in Jnl. of the Illuminating Engineering Society 13, n4 p330-340 Jul 84.

Keywords: *Daylight, *Illuminance, Solar radiation, Availability, Intensity, Reprints, Sky radiation.

Based largely on extensive sky measurements at the National Bureau of Standards, plots have been made of sky and sun illuminances as functions of solar altitude and time of year. Comparisons have also been made of how these plots relate to values currently used by the I.E.S., and against similar measurements made by others within the U.S. and abroad. A value of extraterrestrial illuminance and its atmospheric attenuation have also been developed using related solar principles. Algebraic expressions have been prepared for obtaining, (1) the extraterrestrial illuminance, (2) direct normal solar illuminance inside the atmosphere, and (3) horizontal sky illuminance without the sun. While the extraterrestrial and direct normal solar values have been found to be functions also of Julian date, all plots seem to show a consistent correlation with solar altitude.

Sponsored by Department of Energy, Washington, DC. Pub. in Proceedings of the National Passive Solar Conference (5th), Amherst, Massachusetts, October 19-26, 1980, p670-674.

Keywords: *Residential buildings, Urban areas, Solar energy, Heat balance, Statistical data, *Energy consumption, Energy conservation, Weatherization, Retrofitting.

Two hundred and twenty houses were selected in 14 cities across the country to be weatherized and evaluated. Infiltration rates, mechanical efficiencies, building dimensions, solar data and energy consumption data before and after weatherization were collected on each of these houses. This paper presents the before weatherization data on 33 houses at Charleston, S.C., Colorado Springs, CO, and Fargo, N.D. It also compares modified steady-state heat balance calculations which include solar data to the utility data of each of these houses.

Industrial/Commercial Insulation for Mechanical Systems Applications.

Final rept.

F. J. Powell. 1981, 3p Pub. in Proceedings of Energy Technology Conference and Exposition (8th), Washington, DC., March 9-11, 1981, p547-549.

Keywords: *Thermal insulation, *Energy conservation.

The article gives the potential for energy savings and the justifications for using industrial/commercial thermal insulations on mechanical systems and equipment such as pipes, ducts, tanks, vessels, boilers, furnaces, and surfaces at which heat is transferred within the temperature range of -300F to +2800F. A potential savings of 250 million equivalent barrels of oil per year exists with 104 million equivalent barrels per year by improving the insulation on industrial steam process pipes alone. For pipes, this would cost \$6.2 billion with a payback in 30 months. Activities that feature the reduction of heat gain or loss in existing or new mechanical systems and their components by application of cost effective levels of thermal insulation and from effective installation, operation, and maintenance practices are suggested.

Pub. in Proceedings of the American Electroplaters
Society Coatings for Solar Collectors Symposium
(2nd), St. Louis, MO., October 16-17, 1979, 21p.

Keywords: *Standards, *Solar absorbers, Solar space heating, Solar cooling systems, Solar collectors.

Absorber materials used in solar heating and cooling systems absorb energy from the sun and convert it to thermal energy. It is essential that materials used for this purpose be durable for extended periods of time. However, the environment in which absorber materials are used can cause rapid degradation. Numerous problems in solar energy systems have clearly shown the need for standards by which solar absorber materials and other materials can be evaluated. Laboratory Simulated Service Testing of Flat Plate Solar Heat Transfer Liquid Containment Systems. Final rept.,

P. W. Brown. 1980, 8p

Sponsored by Department of Energy, Washington, DC. Office of Solar Applications and Commercialization. Pub. in Proceedings of International Corrosion Forum Devoted Exclusively to the Protection and Performance of Materials, Chicago, IL., May 3-7, 1980, p102.1-102.8.

Keywords: Accelerated tests, Simulators, Ethylene, Glycols, *Solar collectors, *Heat transfer fluids, Flat plate collectors.

The design of an accelerated test simulative of the operation of a solar collector system requires consideration of a variety of possible design and operating parameters. These include operating and stagnation temperatures, flow rate, mode of heat transfer and degree of aeration. Cognizant of these parameters, a simulated service test, which allows stagnant empty and full conditions to be simulated at temperatures either above or below the boiling temperature of the heat transfer liquid, has been developed. The chemical and thermal stabilities of ethylene and propylene glycol have also been examined.

PB86-123049 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Testing Solar Collector Materials Durability by Integrated Day-Long Stagnation Temperature Measurements.

W. C. Thomas, A. G. Dawson, and D. Waksman. 1983, 7p

Pub. in Proceedings of ASME (American Society of Mechanical Engineers) Solar Energy Division Annual Conference (5th), Orlando, FL., April 18-21, 1983, p301-307.

Keywords: *Solar collectors, Materials tests, Durability, Tests, Temperature measurement, Degradation.

Measurements of the maximum temperatures reached by solar energy absorbing surfaces provide a useful method for detecting possible degradation in the opti-cal and heat transfer properties of materials used in collectors. The test method is based on measuring the absorber temperature continuously over a period of several days along with total daily solar irradiation. The absorber temperature rise above ambient is integrated to determine daily values. The investigation shows that the all-day integration method is a viable approach which has advantages over alternative test methods based on steady-state measurements of either absorber stagnation temperature or collector energy output.

Field Evaluation of Aerial Infrared Surveys for Residential Applications.

Final rept.

S. J. Treado, and D. M. Burch. 1982, 7p

Pub. in Proceedings of the Society of Photo-Optical Instrumentation Engineers, Ottawa, Ontario, September 1-4, 1981, Paper in Thermal Infrared Sensing Applied to Energy Conservation in Building Envelopes (Thermosense IV) 313, p28-34 1982.

Keywords: *Residential buildings, Aerial surveys, Roofs, Thermal analysis, Remote sensing, *Infrared thermography, Energy conservation.

The effectiveness of aerial infrared thermography as an energy audit procedure for residences having pitched ventilated roofs is investigated. Three adjacent unoccupied houses were instrumented to provide ground-truth comparison data under various weather conditions. Factors affecting the accuracy of this technique are identified and analyzed, and guidelines are presented concerning the recommended use of aerial infrared thermography as a procedure for assessing the thermal performance of residences.

Role of Thermography in the Assessment of the Thermal Integrity of Federal Office Buildings. Final rept.

Y-M. Chang, and R. A. Grot. 1984, 9p Pub. in Proceedings of SPIE (Society of Photo-Optical Instrumentation Engineers) International Conference on Thermal Infrared Sensing for Diagnostics and Control (Thermosense 6), Oak Brook, IL., October 2-5, 1983, v446 p47-55 1984.

Keywords: *Office buildings, Ground based detectors, Thermal analysis, *Infrared thermography, Energy conservation, Federal buildings.

Results were presented from ground-based infrared thermographic studies performed by NBS on eight Federal Office Buildings. Infrared thermography was used to observe the thermal anomalies in those buildings, as part of a diagnostic program to evaluate the thermal integrity of building envelopes. Thermographic data were collected via complete exterior scannings and selected interior scannings at regions where thermal defects were identified or suspected during the outside inspections. Analysis from thermographic inspections with examples of defects found in some of these buildings are also included. The potential applications of the diagnostic procedures to both new and existing buildings are discussed.

Wind Loads on Solar Collectors: Development of Design Guidelines.

Final rept., T. A. Reinhold. 1981, 8p

Pub. in Proceedings of U.S. National Conference on Wind Engineering Research (4th), Seattle, Washington, July 26-29, 1981, p313-320.

Keywords: Wind pressure, Design, Guidelines, Structural engineering, *Solar collectors.

Measurements obtained from model and full-scale tests are used to develop guidelines for determining minimum design wind loads on solar collectors. The approach followed is to use the proposed 1980 draft revisions to ANSI A58.1, 'Building Code Requirements for Minimum Design Loads in Buildings and Other Structures' as a base document. Guidelines are then developed which will extend the use of tables in the 1980 Draft ANSI A58.1 Provisions to the specification of minimum wind loads on solar collectors in a variety of installations. This paper includes comparisons of model with full-scale test results. Also included are comparisons of roof and wall pressures specified in the 1980 Draft ANSI A58.1 Provisions with corre-sponding measured pressures. These comparisons are used to evaluate the validity of the model test results and to develop pressure coefficients compatible with the 1980 Draft ANSI A58.1 Provisions.

Keywords: *Lead acid batteries, *Neutron diffraction, *Electrochemistry, *Electrodes, *Cations, Molecular structure, Lead oxides, Reprints.

neutron powder diffraction study of alpha-and beta-PbO2, both chemically prepared and electrochemically

formed in cycled battery plates, was carried out to correlate the electrochemical activity of the lead-acid bat-tery with the atomic arrangement of the electrode con-stituents. The authors results indicate that there are stituents. The authors results indicate that there are neither lead nor oxygen deficiencies, and therefore, any hydrogen which is present must be accompanied by a reduction of Pb(+4). In addition, they have observed a significant increase in the lattice parameter a of beta-PbO2 in cycled battery electrodes relative to the value in chemically prepared beta-PbO2. No change in the c parameter, however, was detected. This suggests that the OH groups present in the structure are probably oriented perpendicular to c along (110). This configuration is similar to that observed in SnO2.

Viscoelastic Fracture Behaviour for Different Rubber-Modified Epoxy Adhesive Formulations.

D. L. Hunston, and G. W. Bullman. Apr 85, 6p Pub. in International Jnl. of Adhesion and Adhesives 5, n2 p69-74 Apr 85.

Keywords: *Viscoelasticity, *Epoxy resins, *Adhesives, *Fracture tests, Elastomers, Rheology properties, Reprints.

The viscoelastic fracture behaviour of various rubbermodified epoxy formulations was analysed using a time-temperature superposition approach. The shift factors for all of these systems were quite similar. In addition, an equivalent analysis of yield stress data was performed for one of the samples; it gave shift factors similar to those from the fracture experiments thus indicating a close correlation between yield and toughening. A simple empirical equation was found to describe the fracture data for all the materials and, consequently, the parameters in this equation provide a good method to characterize the fracture behaviour and to compare different materials.

Controlled Indentation Flaws for the Construction

of Toughness and Fatigue Master Maps, R. F. Cook, and B. R. Lawn. 30 Aug 84, 13p Sponsored by Office of Naval Research, Arlington, VA. Prepared in cooperation with New South Wales Univ., Kensington (Australia).

Included in Jnl. of Research of the National Bureau of Standards, v89 n6 p453-465 Nov-Dec 84.

Keywords: *Nondestructive testing, *Toughness, *Fatigue(Materials), Glasses. *Ceramics.

A simple and economical procedure for accurate determinations of toughness and lifetime parameters of ceramics is described. Indentation flaws are introduced into strength test pieces, which are then taken to failure under specified stressing and environmental conditions. By controlling the size of the critical flaw, via the contact load, material characteristics can be represented universally on 'master maps' without the need for statistical considerations. This paper surveys both the theoretical background and the experimental methodology associated with the scheme. The theory is developed for 'point' flaws for dynamic and static fatigue, incorporating load explicitly into the analysis. A vital element of the fracture mechanics is the role played by residual contact stresses in driving the cracks to failure. Experimental data on a range of Vickers-indented glasses and ceramics are included to illustrate the power of the method as a means of graphic materials evaluation. It is demonstrated that basic fracture mechanics parameters can be measured di-rectly from the slopes, intercepts and plateaus on the master maps, and that these parameters are consistent, within experimental error, with macroscopic crack growth laws.

Measurement of Thin-Layer Surface Stresses by

Indentation Fracture.

Final rept., B. R. Lawn, and E. R. Fuller. 1984, 7p Pub. in Jnl. of Materials Science 19, p4061-4067 1984.

Keywords: *Glass, *Brittleness, *Stresses, Measurement, Surface properties, Fractures(Materials), Reprints. Indentation,

A model is developed for evaluating stresses in the surfaces of brittle materials from changes in indentation crack dimensions. The underlying basis of the model is a stress intensity formulation incorporating the solution for a penny-like crack system subjected to a constant stress over a relatively thin surface layer. Results from a previous study of surface damage in previous irradiated along are used to illustrate the sense. proton-irradiated glass are used to illustrate the scope of the method. The indentation fracture analysis also provides some fresh insight into the susceptibility of brittle surfaces to spontaneous cracking. Implications of the study concerning the potential effect of surface stresses on mechanical properties, such as strength, erosion and wear, are briefly discussed.

Microscale Homogeneity and Compositional Profiling of Borosilicate Glass Materials.

J. W. Mitchell, J. E. Riley, and B. S. Carpenter. 1983,

Pub. in Mikrochimica Acta III, p253-261 1983.

Keywords: *Borosilicate glass, *Glass, *Boron, Non-destructive tests, Optical fibers, Measurement, Re-

The instrumental analytical methods most widely used for providing information on the microscale homogeneity and depth profile distribution of major elements have deficiencies for characterizing borosilicate glasses. Several nuclear methods provide particularly specific, high sensitivity, and high resolution detection of boron. Thermal neutron bombardment with detection of promptly emitted alphas using silicon surface barrier detectors provides depth profile information on trace boron levels. The alternative, determination of boron by detecting emitted alpha particles by the track counting technique, is particularly attractive for establishing compositional homogeneity of trace boron distribution. This paper describes the use of the method for the detection of boron when present as a major constituent. The examples selected to demonstrate applicability of the method include characterization of commer-cial glasses, synthesized rods, and optical fibers. The potential of the nuclear track counting technique as a new method for quantitative non-destructive determination of boron as a major constituent is also being assessed in continuing work.

Deformation-Induced Crack Initiation by Indenta-

tion of Silicate Materials.

Final rept.,

H. Multhopp, B. R. Lawn, and T. P. Dabbs. 1984, 13p Sponsored by Office of Naval Research, Arlington, VA. Pub. in Deformation of Ceramic Materials II, p681-693

Keywords: *Glass, *Silicon dioxide, *Quartz, *Crack initiation, Indentation, Kinetics, Reprints.

The micromechanics of radial crack initiation produced in indentation of soda-lime glass, fused silica and quartz are discussed in terms of a two-step, nucleation and growth model. Particular attention is focussed on the strong rate effects in the presence of environmen-tal water, as manifested by a tendency to delayed crack pop in with decreasing contact duration. Microscopic examination of the indentations indicates that deformation 'shear faults', which accommodate the intense strains associated with the penetrating indenter, control the kinetics of the initiation process. The geometrical constraints which determine the stress con-centrations for crack nucleation from these faults are structure-sensitive.

Estimation of Power-Law Creep Parameters from

Bend Test Data, T. J. Chuang. Feb 85, 44p NBSIR-85/2997 Contract DE-AI05-80OR20679

Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC.

Keywords: *Ceramics, *Creep properties, Creep tests, Aluminum oxide, Applications of mathematics.

Power-law creep parameters of brittle ceramic materials are commonly deduced from load-point displace-ment data generated by four-point bend experiment, under the assumption that tensile and compressive behaviors obey the same constitutive law. However, thanks to different roles played by microcracking and cavitation, it is now well recognized that this premise on occasions may not be valid. The present paper undertakes an analysis which takes the differences into account. Governing equations are first derived for the locations of neutral axis of a beam under bending and for the creep responses in terms of both curvature rate

89 500.818

Group 11B—Ceramics, Refractories, and Glasses

and load point displacement rate as functions of the applied moment and power-law creep parameters. Numerical solutions are obtained for any given set of materials constants over a wide range of applied moments.

National Bureau of Standards, Gaithersburg, MD. Comparison of Failure Predictions by Strength and Fracture Mechanics.

Final rept.

B. J. Pletka, and S. M. Wiederhorn. 1982, 22p Pub. in Jnl. of Materials Science 17, n5 p1247-1268, 5 May 82.

Keywords: *Ceramics, *Failure, Strength, Predictions, Mechanical properties, Data, Stressing, Crack propagation, Confidence limits, Micro structure, Life(Durability), Reprints, Fracture mechanics.

Failure predictions for five ceramic materials were compared using fracture mechanics and strength techniques. Double torsion specimens were used to obtain the fracture mechanics data and stressing rate experi-ments were used to obtain the strength data. An error analysis based on the error propagation law was performed to determine confidence limits for the failure predictions. The implications of these results with regard to microstructural effects on crack propagation and design applications are discussed.

500,823 PB85-196053 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Effect of Deformation on the Fracture of Si3N4 and Sialon. Final rept., R. J. Fields, T. J. Chuang, E. R. Fuller, and N. J.

Tighe. 1983, 8p Sponsored by North Atlantic Treaty Organization, Brussels (Belgium).

Pub. in Proceedings of the NATO Conference on Nitrogen Ceramics (2nd), Falmer, Sussex, England, July 27-August 7, 1981, p507-514 1983.

Keywords: *Silicon nitrides, Ceramics, Fracture properties, Creep properties, Toughness, Deformation, *Sialon, *Aluminum silicon oxynitride.

At high temperatures, ceramics can deform inelastically by time-dependent processes such as creep. The resulting strains are stress and time dependent, and must be added to the elastic strain to calculate the total strain. Whether or not it is appropriate to apply linear elastic fracture mechanics depends on the extent of the creep deformation zone relative to certain specimen dimensions. With this in mind, the loadingrate dependences of the fracture toughness of silicon nitride and various sialons were investigated at elevated temperatures. The resulting variations in toughness are explained in terms of possible micromechanisms of deformation and fracture. Schemes are presented for estimating the toughness in the case of small scale creep deformation and in the case of general creep deformation, in which the creep strain exceeds the elastic strain throughout the body.

Investigation of the Phase Transition in ZrTiO4 and ZrTiO4-SnO2 Solid Solutions.

Final rept., A. E. McHale, and R. S. Roth. Feb 83, 3p Pub. in Jnl. of the American Ceramic Society 66, n2 p18-20 Feb 83.

Keywords: *Tin oxides, *Solid solutions, *Phase transformations, *Crystal structure, X-ray diffraction, Titanium dioxide, Reprints, *Zirconium titanates.

'continuous' phase transition was found to occur in ZrTiO(4), with a major discontinuity at 1125 plus or minus 10 degrees C. The space group of both forms of ZrTiO(4) is Pcnb. For specimens quenched from high temperatures, the volume of the unit cell was found to decrease linearly from about 1450 degrees C to the discontinuity with the major change occurring in the caxis. The volume decreases considerably at this temperature and again continues to decrease with lower temperature annealing. The maximum unit cell dimensions in the high temperature structure are a=4.806, b = 5.035, and c = 5.498A with the minimum unit cell values of a=4.828, b=5.035 and c=5.348A in the low temperature form. Substitutional tin in solid solution was found to stabilize the high temperature structure type.

Fatigue Properties of Ceramics with Natural and Controlled Flaws: A Study of Alumina. Final rept..

A. C. Gonzalez, H. Multhopp, R. F. Cook, B. R. Lawn, and S. W. Freiman. 1984, 14p
Pub. in American Society for Testing and Materials
Special Technical Publication 844, p43-56 1984.

Keywords: *Ceramics, *Fatigue(Materials), *Aluminum oxide, Strength, Defects, Stresses, Tests, Life(Durability), Loads(Forces), Predictions, Reprints.

A systematic study of the fatigue properties of an asfired polycrystalline alumina containing either 'natural' (sawing damage) or indentation-induced (Vickers) strength-controlling flaws has been made. All fatigue strengths were measured in four-point bending in water. The study is presented in three steps: first, comparative Weibull analyses are made of inert strength data for the two flaw types, both to demonstrate the reduction in scatter that attends the indentation method and to characterize the flaw distributions for the as-sawn surfaces; next, fatigue data are taken on indented surfaces to determine relatively accurate fracture parameters for the alumina and to confirm that constant stressing rate tests can be used as a base for predicting the response in static loading; finally, the results from the two previous, independent steps are combined to generate lifetime responses for the surfaces with natural flaws, and fatigue data taken on such surfaces are used to evaluate these predictions.

Subthreshold Indentation Flaws in the Study of Fa-

tigue Properties of Ultrahigh-Strength Glass. Final rept.

T. P. Dabbs, C. J. Fairbanks, and B. R. Lawn. 1984, 12p

Sponsored by Office of Naval Research, Arlington, VA. Pub. in American Society for Testing and Materials Special Technical Publication 844, p142-143 1984.

Keywords: *Defects, *Fatigue(Materials), *Glass, Crack propagation, Stresses, Failure, Strength, Fiber optics, Reprints.

The rate-dependent characteristics of subthreshold indentation flaws in glass are surveyed. In the first part, the kinetics of radial crack initiation within the indentation field are described. In the second part of the presentation, the fatigue properties of specimens with in-dentation flaws on either side of the threshold are discussed. Finally, the implications of the results concerning design criteria for the ultra-high strength domain of optical fibers are considered.

Effects of Water and Other Dielectrics on Crack-Growth.

Final rept., S. M. Wiederhorn, S. W. Freiman, E. R. Fuller, and C. J. Simmons. 1982, 19p See also PB82-235896. Pub. in Jnl. of Materials Science 17, n12 p3460-3478

Ceramics, Refractories, and Glasses—Group 11B

Keywords: *Alkali glass, *Crack propagation, Water, Dielectrics, Silica glass, Fractures(Materials), Reprints.

The effect of water and a variety of organic liquids on the crack growth rate in soda lime silica glass was investigated. When water is present in organic liquids, it is usually the principal agent that promotes subcritical crack growth in glass. In region I, subcritical crack growth is controlled primarily by the chemical potential of the water in the liquid; whereas in region II, crack growth is controlled by the concentration of water and the viscosity of the solution formed by the water and the organic liquid. In region III webers water does not the organic liquid. In region III, where water does not affect crack growth, the slope of the crack growth curves can be correlated with the dielectric constant of the liquid. It is suggested that these latter results can be explained by electrostatic interactions between the environment and charges that form during the rupture of Si-O bonds.

ganic Materials Div. Sharp vs. Blunt Crack Hypotheses In the Strength of Glass: A Critical Study Using Indentation Flaws. Final rept.

B. R. Lawn, K. Jakus, and A. C. Gonzalez. 1985, 10p Sponsored by Office of Naval Research, Arlington, VA. Pub. in Jnl. of American Ceramic Society 68, n1 p25-34

Keywords: *Glass, Cracks, Strength, Defects, Indentation, Reprints.

The fundamental question as to whether the tip structure of brittle cracks is atomically sharp or has a rounded contour is examined in relation to current descriptions of strength-controlling flaws. The distinction between the two opposing viewpoints lies in the control-ling flaw dimensions in the strength formulation; crack length in the first and tip radius in the second. Definitive evidence on the issue is obtained from aging tests on soda-lime glass, using indentations as controlled flaws.

High-Temperature Toughness of Silicon Carbide Materials in a Controlled Gaseous Environment.

Final rept.,
R. F. Krause, L. Chuck, and E. R. Fuller. 1982, 1p
Sponsored by Department of Energy, Washington,
DC., Gas Research Inst., Chicago, IL., and Electric
Power Research Inst., Palo Alto, CA.
Pub. in Proceedings of Annual Conf. on Materials for

Coal Conversion and Utilization, Gaithersburg, MD., November 16-18, 1982, 159p.

Keywords: *Silicon carbides, Toughness, Controlled atmospheres.

The fracture toughness of three silicon carbide materials was measured in a controlled gaseous environment at elevated temperatures up to 1500C. Chevron-notched, four-point bend specimens were fractured at different displacement rates to obtain both a measure of fracture toughness and an indication of environmental crack growth and/or of crack-tip creep deformation. Experiments were conducted both in air and in a gaseous mixture of steam, carbon dioxide, sulfur dioxide, oxygen, and nitrogen thereby simulating the combustion of a producer gas.

Keywords: *Silicon carbides, *Materials tests, *Coal gasification, Ceramics, Nitridation, Oxidation, Chemical reactions.

The reactions of commercially manufactured silicon carbide ceramics--two materials without free silicon and two materials with free silicon('siliconized')--with air, N2 + SO2, and a simulated coal-combustion gas containing about seven volume percent O2 were investigated. Samples were annealed in air and N2 + SO2 at 1400C for successive annealing times up to a total time of 12 hours. Samples were annealed in the simulated combustion gas at 1350C for four hours. For anneals in air and in simulated combustion gas, low critobalite and, possibly, some tridymite were the main reaction products. The presence of SO2 in N2 appears to promote the nitridation of the silicon carbide ceram-

Elastic Constants of Two Dental Porcelains.

H. R. Kase, J. A. Tesk, and E. D. Case. 1985, 9p Pub. in Jnl. of Materials Science 20, p524-531 1985.

Keywords: *Dential materials, *Acid bonded reaction cements, *Determination of stress, *Porcelain, *Elastic properties, Temperature coefficient, Stress strain diagrams, Forecasting, Dynamic modulus of elasticity, Sonic tests, Reprints, *Ceramic metal seals, Numerical solution.

The development of stress that affects the bonding in porcelain-fused-to-metal (PFM) systems can be influenced by the temperature dependence of the elastic constants of both systems. Instead of using the normal, static procedure, e.g. determining the slope of a stress-strain curve, and measuring the lateral and vertical strains, in the study the sonic resonance technique was used to determine the elastic moduli for two dental body-porcelains. Young's and shear moduli for two dental porcelains obtained in the range from 20C (293 K) to 500C (773 K) are presented in the study. The data may in the future be used for refined stress calculations in PFM systems.

A. L. Dragoo, and C. K. Chiang. 1983, 14p
Pub. in Proceedings of Conference on High Temperature Solid Oxide Electrolytes, Upton, NY., August 16, 1983, v1 p268-281 1983.

Keywords: *Cerium dioxide, *Ceramics, *Electrical properties, *Electrolytes, Fuel cells, Molecular structure. Additives.

High-density, yttria- and gadolinia-doped ceria ceramics were found to exhibit notable differences in electrical properties which correlated with differences in the processing methods used to form the materials. Dopant concentrations of 8.5, 20 and 30 mol percent, with respect to cation concentration, were prepared. Three chemical processes were used to prepare well-mixed precursors which were calcined to oxide powders. Following forming and isostatic compaction, most samples were thermally sintered. Inhomogeneity impedance appeared to be influenced by calcination temperature, densification method, and dopant concentration. Microstructure examination and elemental analysis of samples by means of a scanning electron microscope (SEM) equipped with an analytical x-ray apparatus suggested A1 as a source of the different lattice impedance of the hot-pressed material and showed high Si concentrations associated with regions of large pores in gadolinia-doped materials.

Final rept., G. A. Senich, and R. E. Florin. 1984, 86p Pub. in Jnl. of Macromolecular Science Review Macromol. Chem. Phys. C24, n2 p239-324 1984.

Keywords: *Coatings, *Curing, *Radiation effects, Industrial plants, Polymerization, Thermosetting resins, Plastics, Reprints.

The science and technology of curing organic materials with radiation is reviewed. Electron beam, ultravio-let, infrared, microwave, and high frequency radiation sources and the resin systems suitable for use with these sources are considered. Equipment necessary to affect a radiation cure is discussed and some practi-cal problems unique to each radiation method are indicated. The application of radiation curing to industrial processes which employ inks and coatings is covered, with particular emphasis given to printing with radiation curable formulations. Included are discussions of the advantages and disadvantages of radiation curing inks, some typical ink components and formulations, the specialized machinery required, and the influence of parameters unique to radiation curing methods on the printing process. Other nonprinting but related industrial operations utilizing radiations for treating thin films and coatings are also considered. Some costs, examples and market attributes for the second examples, and market statistics are given for these commercial procedures. New nonconventional, but also nonradiation, alternative curing methods are discussed briefly. A bibliography of recommended further reading and a list of over two hundred fifty references are included.

Method for Preparing Cross-Sections of Films on Wear Surfaces for Transmission Electron Microscopy Study.

Final rept., L. K. Ives. 1983, 6p Pub. in Wear 86, n1 p151-156, 1 Apr 83.

Keywords: *Protective coatings, Wear, Metal films, Coatings, Electron microscopy, Surfaces, Reprints.

A method for preparing cross sections for transmission electron microscopy study of surface layers which exist on bulk metal substrates is described. The surface layer or film is protected by a vacuum deposited or sputtered coating of a suitable metal. A mask is placed over the surface and non-masked areas are exposed to ion beam etching until the substrate is exposed to in beam eterining until the substrate is ex-posed. A subsequently applied thick electroplated layer adheres well to the ion etched substrate and seals the coated surface film against damage during slicing, grinding, etc. that are usual steps in preparation from bulk materials of thin foils for transmission electron microscopy study. The method was specifically developed for the analysis of boundary and extreme pressure lubrication films on wear surfaces. However, it is also applicable to the investigation of oxide, corrosion and other surface films.

Simple Model for the Numerical Simulation of Reflectance of Black Chrome Coating Systems.

S. T. Wu, and L. W. Masters. 1984, 4p Sponsored by Department of Energy, Washington, DC. Pub. in Jnl. of Coatings Technology 56, n711 p29-32

Keywords: *Coatings, Mathematical models, Reflectance, Reprints, *Black chrome, Solar collectors.

Black chrome has been used extensively as an absorptive coating in solar collector systems because of its high absorptance/emittance ratio as well as its general stable characteristics under various environmental conditions. This paper is to present a numerical simulation on the optical properties of black chrome coating systems. A simple model is developed based on the analytical studies as well as the experimental results. The black chrome coating is considered to be composed of three 'pseudo' layers. The dielectric constants of the material are determined with the mean field approach. Rouard's method is used for computing the reflectance spectra of the coating system. The model can be used to serve the engineering needs for correlating the optical performance with the properties of the material. A numerical example is provided to illustrate the approach.

Selection of a Spatial Sampling Procedure for Evaluating the Defect Area of a Coated Steel Panei.

Final rept.,
D. P. Bentz, and J. W. Martin. Jul 85, 7p
Pub. in Jnl. of Coatings Technology 57, n726 p43-49

Keywords: *Coatings, Evaluation, Defects, Sampling, Monte Carlo method, Reprints.

Various spatial sampling procedures for determining the defect area of a coated panel are assessed using Monte Carlo techniques. Spatial sampling procedures have many advantages over the comparative visual standards currently used in evaluating defect area. In a previous report, a full grid sampling procedure was employed; the primary disadvantage of this procedure was its long evaluation time. This procedure can be was its long evaluation time. This procedure can be replaced by other sampling procedures with shorter sampling times as long as these other procedures are both accurate and easy to implement into actual practice. From the Monte Carlo simulations, systematic point sampling is found to be superior to both random point and stratified random point sampling in quickly estimating defect area proportion. Two other spatial sampling procedures may also find applications in coatings evaluation, linear sampling which effectively quantifies the corrosion area around a scribe mark and systematic area sampling which provides valuable insystematic area sampling which provides valuable information on the defect size distribution as well as the total defect area.

Reflection/Absorption Fourier Transform Infrared Spectroscopy Studies of the Degradation of Organic Protective Coatings on Steel.

Final rept.,

T. Nguyen, and W. E. Byrd. 1985, 6p Pub. in Proceedings of the American Chemical Socie-ty, Polymeric Materials Science and Engineering, Chicago, Illinois, September 7-12, 1985, v53 p568-573.

Keywords: *Protective coatings, *Steels, *Corrosion, *Degradation, Absorption, Polybutadiene, Reflection, Complex compounds, Oxidation, Infrared spectroscopy, *Fourier transform spectroscopy.

The application of FTIR-RA for studying the degradation, resulting from exposure to a 40C and 82% RH environment, of two types of organic coatings on cold-rolled steel is presented in the paper. FTIR-RA results indicate bond weakening in the polymer, dehydration and bond scissions at the aryl-isopropylidene group of amine-cured epoxy coatings on cold-rolled steel. On the other hand, the polybutadiene coating on steel specimens show, not only bond weakening both within the coating and at the interface, but also extensive corrosive-related degradation which results in the formation of various highly oxidized products and losses in unsaturation. The characterization of fairly complex organic molecules formed during the oxidation and degradation by FTIR-RA offers a powerful means for studies of the degradation processes, both in the bulk and at the interface of protective coatings on steel subjected to corrosive environments.

Abrasive Wear of Aluminum Matrix Composites. Final rept.,

K. J. Bhansali, and R. Mehrabian. 1982, 5p Pub. in Jnl. of Metals 34, n9 p30-34 1982.

Keywords: *Wear, Composite materials, Aluminum oxide, Silicon carbides, Abrasion, Reprints, *Aluminum matrix composites.

Abrasive wear resistance of aluminum matrix composites containing Al2O3 and SiC was investigated using a dry sand/rubber wheel abrasion tester. Composites containing Al2O3 were found to be superior to those containing SiC. This behavior was attributed to the formation of a brittle bond at the interface between aluminum matrix and SiC. Wear resistance of a composite containing large 142 micrometers Al2O3 was better than that of composites containing smaller Al2O3 particles, and was comparable to AlSI 1345 steel heat treated to a hardness of 67 HRC.

Not available NTIS PB85-196194 National Bureau of Standards, Gaithersburg, MD. Erosion of Ceramic Materials: The Role of Plastic

B. J. Hockey, and S. M. Wiederhorn. 1979, 27p Pub. in Proceedings of International Conference on Erosion by Liquid and Solid Impact (5th), Cambridge, England, September 3-6, 1979, p1-26.

Keywords: *Ceramics, *Erosion, Wear, Aluminum oxide, Plastic flow, Glass, Silicon carbide, Magnesium oxides.

Plastic flow has been shown recently to play a crucial role in the erosive wear of ceramic materials that are brittle at room temperature. In this paper, evidence for plastic flow during the erosion of brittle solids by solid particles is reviewed and discussed. Evidence for plastic flow comes from three sources: optical and scanning electron microscopy studies of single particle impact sites; investigations of erosion rate as a function of impact angle; and investigations of impact sites by transmission electron microscopy. This discussion plastic flow will include an evaluation of several recent theories developed to explain the erosion of ceramic materials. The importance of dynamic values of both the hardness and the critical stress intensity factor to the erosion process is emphasized.

Stiffness and Internal Stresses of Woven-Fabric Composites at Low Temperatures.

Final rept.,

R. D. Kriz. 1984, 7p Sponsored by Department of Energy, Washington, DC.

Office of Fusion Energy.
Pub. in Advances in Cryogenic Engineering Materials 30, p1-7 1984.

Keywords: *Woven fiber composites, Cryogenics, Stiffness, Residual stress, Reprints.

Woven-fabric composites are used in superconducting magnets and in containment of cryogenic liquids. Here, the mechanical response of a plain-weave laminated composite at cryogenic temperatures is studied by predicting the load-deformation response of a fundamental 'unit cell.' At present, only tensile loads are studied in the warp direction. Results show that stresses normal to the warp-fill interface increase with increasing warp angle; the largest effect occurs in the matrix region. Thermal loads increase these stresses in the matrix region and decrease these stresses in the fill region. Stiffness increases with decreasing warp

Influence of Ply Cracks on Fracture Strength of Graphite/Epoxy Laminates at 76 K.

Final rept.,

R. D. Kriz. 1984, 16p Sponsored by National Research Council, Washington, DC and Department of Energy, Washington, DC. Office of Fusion Energy.

Pub. in American Society for Testing and Materials, Special Technical Publication 836, p250-265 1984.

Keywords: *Epoxy laminates, Fracture strength, Cryogenics, Oriented fiber composites, Reprints, Carbon fiber reinforced plastics, Epoxy matrix composites, Graphite reinforced composites, Cracks, Finite element analysis.

Quasi-isotropic laminates were fabricated from graphite/epoxy and quasi-statically loaded in tension at 76 K until fracture occurred. Fibers in 0-deg plies carry the largest portion of the tensile load; the weaker 90- and 45-deg plies crack at loads much lower than fracture strength. The effect of ply cracks on fracture of load-bearing 0-deg plies was examined to understand how defects affect laminate strength. A generalized planestrain finite-element model was used to predict stress gradients in the 0-deg ply near the crack tip. Variations in residual stress caused by changes in temperature and absorbed moisture were included in the analysis. 500,853 Not available NTIS PB85-207330 National Bureau of Standards (NML), Boulder, CO. Elastic Constants of an Anisotropic, Nonhomogeneous Particle-Reinforced Composite.

Final rept.

H. M. Ledbetter, S. K. Datta, and R. D. Kriz. 1984, 7p. Sponsored by Defense Advanced Research Projects Agency, Arlington, VA.
Pub. in Acta Metallurgica 32, n12 p2225-2231 1984.

Keywords: *Particulate composites, Single crystals, Silicon carbides, Elastic properties, Reprints, Aluminum matrix composites.

Experimentally and theoretically, we studied the elastic constants of a particle-reinforced-composite wrought plate produced by powder-metallurgy methods. The particles, 30% by volume, consisted of single crystals of alpha-SiC with sizes near 5 micrometers. The matrix consisted of 6061 Al alloy with original sizes up to 20 micrometers. By measuring ultrasonic-wave velocities using a pulse-echo method, we determined the com-plete nine-component elastic-constant tensor. Thermal-mechanical processing introduced orthotropic macroscopic elastic symmetry into the material. Besides the Voigt elastic constants, we report all the usual engineering elastic constants: Young moduli, shear moduli, Poisson ratios, and bulk modulus (reciprocal compressibility). The elastic stiffnesses show rocal compressibility). The elastic stiffnesses show large negative departures from a rule-of-mixture: up to 42%. Large elastic anisotropies also occur: 13% in Young's modulus, 12% in shear modulus, and 13% in Poisson's ratio. Explanation of these physical-property peculiarities lies in the microstructure. SiC particles are distributed nonhomogeneously. With AI, they form an enriched 'sea' that surrounds 'islands' of AI. These nonspherical islands are aligned and produce anisotropy. Using wave-scattering methods and ensemble averaging, we develop a theory that predicts all the observed physical-property phenomena.

Monitoring Elastic Stiffness Degradation in Graph-Ite/Epoxy Composites.

Final rept., R. D. Kriz. 1982, 5p

Sponsored by American Society for Nondestructive Testing, Columbus, OH.

Pub. in Proceedings of American Society for Nondestructive Testing Conference, Boston, MA., March 22-25 and Pittsburgh, PA., October 4-7, 1982,p160-164.

Keywords: *Graphite composites, *Epoxy resins, *Stiffness methods, Composite materials, Elastic analysis, Degradation, Moisture, Nondestructive testing.

Stiffness-critical design utilizes the high elastic moduli of graphite/epoxy composites. Elastic-stiffness degra-dation is therefore important. Here, we describe a nondestructive technique that measures the degree of degradation of the fiber or matrix stiffness. This technique monitors an acoustic beam's propagation direction, which depends on the composite's degree of elastic anisotropy. The epoxy-matrix used in this study is a commonly produced TGDDM-DDS epoxy resin that was saturated with absorbed moisture. The fiber experiment verified that the moisture degradation of the epoxy elastic stiffness altered the elastic anisotropy; the direction of the acoustic beam changed 5 de-grees. The authors consider also the effect of fiberstiffness degradation on the direction of propagation.

Influence of Damage on Mechanical Properties of Woven Composites at Low Temperatures.

Final rept.,

R. D. Kriz. 1985, 4p

Sponsored by Department of Energy, Washington, DC. Office of Fusion Energy.

Pub. in Jnl. of Composites Technology and Research

7, n2 p55-58 1985.

Keywords: *Mechanical properties, *Composite materials, *Woven fiber composites, *Damage, Low temperature tests, Stress strain diagrams, Laminates, Reinforced plastics, Modulus of rupture tests, Reprints.

Large quantities of nonmetallic woven composites will be used in magnetic fusion energy structures at low temperatures. The authors predicted and measured the influence of crack formation on the mechanical performance of standard glass/epoxy laminates (G-10CR, G-11CR) at low temperatures. From experiments with tension loads, the authors studied the formation of damage as a collection of fiber breaks, fiber bundle cracks, and delaminations between adjacent fiber bundles. The authors measured fiber bundle riber bundles. The authors measured fiber bundle cracks in the laminate interior and individual fiber fracture at the laminate edges. They discovered that the sequence and type of damage control the discontinuities ('knee) in the load-deformation (stress-strain) diagrams. The authors found that G-11CR has two knees and three distinct moduli, whereas G-10CR has only two moduli and a single knee at a lower strain than G-11CR. Decrease in moduli measured part the knees. 11CR. Decrease in moduli measured near the knees compared well with predictions from the finite element model.

Elastic Representation Surfaces of Unidirectional Graphite/Epoxy Composites.

Final rept.,

Final rept., R. D. Kriz, and H. M. Ledbetter. 1985, 15p Sponsored by Department of Energy, Washington, DC. Pub. in Proceedings of Recent Advances in Compos-ites in the United States and Japan, Hampton, Virginia, June 1983, ASTM STP 864, p661-675 1985.

Keywords: *Oriented fiber composites, Elastic properties, Carbon fiber reinforced plastics, Epoxy matrix composites, Graphite reinforced composites.

Unidirectional graphite/epoxy composites exhibit high elastic anisotropy and unusual geometrical features in their elastic-property polar diagrams. From the five-component transverse-isotropic elastic-stiffness tensor we compute and display representation surfaces for Young's modulus, torsional modulus, linear compressibility, and Poisson's ratios. Based on Christoffel-equation solutions, we describe some unusual elastic-wave-surface topological features. Musgrave considered in detail the differences between phasevelocity and group-velocity surfaces arising from high elastic anisotropy. For these composites, we find effects similar to, but more dramatic than, Musgrave's. Some new, unexpected results for graphite/epoxy include: a shearwave velocity that exceeds a longitudi-nal-wave velocity in the plane transverse to the fiber; a wave that changes polarization character from longitudinal to transverse as the propagation direction sweeps from the fiber axis to the perpendicular axis.

Effects of Lay-up, Temperature, and Loading Rate in Double Cantilever Beam Tests of interlaminar Crack Growth.

Final rept.

D. L. Hunston, and W. D. Bascom. 1983, 2p Pub. in Composites Technology Review 5, n4 p118-119 1983.

Keywords: *Composite materials, *Delaminating, Crack propagation, Temperature, Loading rate, Cantilever beams, Tests, Reprints.

The problem of delamination in composites has led to an interest in techniques for studying interlaminar crack growth. The double cantilever beam specimen is a major tool in this area. In an effort to help establish this test as a more quantitative technique, the variables of ply orientation, test temperature, and loading rate were examined. In selecting the lay-up pattern for the specimen, it was found that control of the crack path, specimen symmetry, and specimen stiffness were important considerations. In performing such experiments, the test temperature and loading rate were found to have relatively little effect with brittle matrix resins.

Flame Retardation of Cellulose By Thiocyanates. Preliminary Study.

Final rept., R. J. McCarter. 1981, 12p Pub. in Jnl. of Fire Retardant Chemistry 8, n3 p157-168 Aug 81.

Keywords: *Fire resistant materials, *Insulation, *Cellulose, "Combustion inhibitors, Sodium thiocyanates, Safety, Potassium thiocyanates, Newsprint, Fibers, Reprints

Sodium and potassium thiocyanate were found effective flame retardants for cellulose at addition levels circa 1 1/2 weight percent. The properties of these deliquescent salts permit their interstitial deposition in newsprint fibers with a minimal amount of aqueous solvent and suggest their possible utility for retarding cel-lulosic loose-fill insulation. Samples of such insulation were prepared in laboratory-scale equipment, using the thiocyanates in combination with other required in-hibitors of smoldering and corrosion. Combustion tests of these samples were found to approximate the requirements of federal safety standards for such insulation. Thermal analysis is reported of the effects of various retardants upon the pyrolysis of cellulose and newsprint fibers.

Thermosolutal Convection during Directional So-Ildification.

Final rept., G. B. McFadden, R. G. Rehm, S. R. Coriell, W. Chuck, and K. A. Morrish. Dec 84, 13p Pub. in Metallurgical Transactions 15A, p2125-2137

Keywords: *Convection, *Solidification, Prandtl number, Nonlinear differential equations, Diffusion, Temperature, Concentration(Composition), Fluid flow, Velocity, Schmidt number, Reprints, *Binary alloys

During solidification of a binary alloy at constant velocity vertically upwards, thermosolutal convection can occur if the solute rejected at the crystal-melt de-creases the density of the melt. The authors assume that the crystal-melt interface remains planar and that the flow field is periodic in the horizontal direction. The time-dependent nonlinear differential equations for fluid flow, concentration, and temperature are solved numerically in two spatial dimensions for small Prandtl numbers and moderately large Schmidt numbers. For slow solidification velocities, the thermal field has an important stabilizing influence: near the onset of instability the flow is confined to the vicinity of the crystal-melt interface. For fixed velocity as the concentration increases, the horizontal wavelength of the flow decreases rapidly; a phenomena also indicated by linear stability analysis. The lateral inhomogeneity in solute concentration due to convection is obtained from the calculations. For a narrow range of solutal Rayleigh numbers and wavelengths, the flow is periodic in time.

G. B. McFadden, and S. R. Coriell. Jul 84, 9p Sponsored by Defense Advanced Research Projects Agency, Arlington, VA. Pub. in Physica 12D, n1-3 p253-261 Jul 84.

Keywords: *Solidification, Interfaces, Morphology, Reprints, *Binary alloys.

During directional solidification of a binary alloy, a planar solidification interface may become unstable and develop into a cellular nonplanar interface, exhibiting periodic structure transverse to the growth direction. Steady state two-dimensional temperature, solute concentration, and interface shapes are calculated numerically and the solute inhomogeneity (microsegregation) in the solidified material obtained. Specific results are presented for an aluminum alloy containing silver for solidification velocities of 0.01 and 1.0 cm/s, which corresponds to the constitutional supercooling and absolute stability regimes, respectively.

Keywords: *Friction, *Copper alloys, *Aluminum alloys, Steels, Friction tests, Microstructure, Wear, Sliding friction, Copper alloy 15Ag, Aluminum alloy

A ball-on-flat, stroke-by-stroke friction tester (tribometer) was used to study the initial friction changes which occurred when 52100 steel balls were slid unlubricated on several alloys: Cu-15wt%Ag, Al-17wt%Si-4.5wt%Cu, and a dual phase steel with 0.14wt%C-1.56wt%Mn-0.63Si and rare earth additions. Computer test control, recording of data, and plotting of data aided analysis of various break-in effects on friction coefficient: air versus Argon environments, surface finishes, and applied loads. Differences in the properties of the tested materials and their microstructures were used to interpret the differences in their sliding friction behavior. The shapes of friction coefficient versus number of stroke plots were used in these interpretations.

Morphological Stability in the Presence of Fluid

Flow in the Melt. Final rept.,

G. B. McFadden, S. R. Coriell, R. F. Boisvert, M. E. Glicksman, and Q. T. Fang. Dec 84, 8p Pub. in Metallurgical Transactions A, 15A p2117-2124

Keywords: *Melting, *Fluid flow, Stability, Morphology, Hydrodynamics, Reprints.

Recent experiments have shown that the presence of a vertical buoyancy-driven flow adjacent to an initially cylindrical crystal-melt interface may produce a time-dependent helical deformation of the interface, with a rotation period ranging from several minutes to many hours, depending upon the width of the melt. The temperature distribution is such that the interface is ex-pected to be morphologically stable in the absence of fluid flow. A linear stability analysis reveals that the instability is due to a coupling between a basic hydrodynamic instability in the buoyant flow and the deforma-ble boundary separating the two phases. The crystal-melt interface lowers the critical Grashof number of an analogous rigid-walled system by an order of magnitude for succinonitrile with a Prandtl number P=22.8; furthermore, the hydrodynamic mode that is actually destabilized by the interface is not the least stable mode in the rigid-walled system for P=22.8. The results show that the instability may be regarded either as a rather large alteration of a basic hydrodynamic instability by the crystal-melt interface, or as a significant modification of the morphological stability of the interface by the presence of the buoyant flow.

Sponsored by American Ceramic Society, Columbus,

Pub. in Proceedings of a Special Conference of the Annual Meeting of the American Ceramic Society (84th), Cincinnati, OH., May 4-5, 1982, Advances in Ceramics, v6 p202-212 1983.

Keywords: *Grain boundaries, *Diffusion, Migration, Ceramics, Metals, Kirkendall effect.

The diffusion of a solute into or out of polycrystalline materials at temperatures at which only grain boundary diffusion is significant has been observed to induce grain boundaries to migrate in a large number of binary metal systems. This unexpected grain boundary migra-tion leads to vastly enhanced mass transport and leaves altered concentrations of solute atoms in the regions traversed by the boundary. Recently suggested mechanisms for this effect depending on a grain boundary Kirkendall effect may explain why it has not yet been observed in ceramic systems.

Monitoring the Sliding Contact Conditions In Laboratory Wear Tests of Metals Using Time-Dependent ent Variations in Friction Coefficients.

Final rept., P. J. Blau. 1982, 10p

Pub. in Proceedings of Conference on Time-Dependent Failure Mechanisms and Assessment Methodologies, Gaithersburg, MD, April 20-22, 1982, p145-154.

Keywords: *Wear, Friction, Metals, Monitoring, Wear tests, Reprints.

The concept of monitoring sliding conditions by observing changes in friction coefficient (i.e. friction forces) may lead to improved reproducibility in laboratory testing as well as to a better knowledge of basic sliding processes. This approach involves the identifi-cation and characterization of friction coefficient versus time (or cycles, or distance) curves. It also involves detailed microscopy of metal sliding contact surfaces which have been subjected to dry wear conditions. Systematic analysis of data for various metals and alloys sliding under similar controlled conditions has shown quite different running-in behavior. The balance of dominant wear processes was seen to influence the friction curve 'signatures'. Several examples of friction coefficient variation analysis for dry sliding of metals will be given.

Field 11-MATERIALS

Group 11F—Metallurgy and Metallography

Keywords: *Melting, *Aluminum alloys, Steady state, Heat transmission, Aluminum alloy 4.5Cu, Rapid solidi-

A combined theoretical and experimental study is described for the surface melting of an Al-4.5 wt% Cu alloy substrate subjected to a high intensity stationary heat flux. Both the calculations and the experiments were done under steady state conditions. That is, the heat flux absorbed, through the circular region on the bounding surface of the substrate, is exactly balanced by conduction of heat into the substrate - thermal profiles remain the same after an initial transient. The heat flow model is based on a new formulation and solution methodology of the heat flow equation for the two free moving boundary problem at hand. The experiments were carried out on an electron beam welding apparatus especially modified for rapid solidification studies. Agreement between theory and experiment is shown to be reasonably good considering the limitations of the former due to a number of assumptions.

Final rept., R. J. Schaefer, S. R. Coriell, R. Mehrabian, C. Fenimore, and F. S. Biancaniello. 1982, 11p Sponsored by Office of Naval Research, Arlington, VA. Pub. in Proceedings of Symposium on Rapidly Solidified Amorphous and Crystalline Alloys, Boston, MA, November 16-19, 1981, v8, p79-89 1982

Keywords: *Aluminum alloys, Stability, Solidification, Melting, Rapid solidification.

For constant velocity solidification, morphological stability theory delineates the temperature gradients required for plane front solidification of a specific alloy. Using electron beams, surface heating of metals can be carried out with sufficiently well characterized thermal input to permit reliable use of computer models of melting and solidification. From numerical calculations, the growth velocity and temperature gradients as a function of position during resolidification can be obtained; combining these results with (constant velocity) morphological stability theory indicates the resolidification regimes for which the plane front is unstable. Presumably, completely planar solidification may be attained by selecting heating modes such that the region of instability is totally avoided, but the expected interface morphology is more difficult to predict if the interface passes briefly through an unstable region and then re-enters a region of stability. Aluminum-silver and aluminum-manganese alloys were melted under an electron beam with particular emphasis on attaining solidification sufficiently rapidly to satisfy the gradient-independent absolute stability condition.

Quantitative Kinetic and Morphological Studies Using Model Systems.

Final rept.,

R. J. Schaefer, and M. E. Glicksman. 1981, 9p Sponsored by Metallurgical Society of AIME, Warren-dale, PA., and American Society for Metals, Metals Park, OH.

Pub. in Proceedings of a Symposium on Modeling of Casting and Welding Processes, Rindge, NH., August 3-8, 1980, p375-383 1981.

Keywords: *Solidification, Morphology, Dendritic crystals, Stability, Supercooling.

The usefulness for metallurgists of solidification studies using transparent model systems depends to a large extent on quantitative correlation to detailed theories of specific solidification phenomena. By designing experiments in which the thermal and geometrical conditions considered by the theory can be attained as closely as possible, and by making detailed kinetic and morphological measurements of the resulting solidification behavior, one can carry out incisive tests of the theory. Thus detailed study of dendritic growth in pure succinonitrile, together with auxiliary experiments which measured relevant thermodynamic properties, led to the important conclusion that the maximum velocity hypothesis for dendrite growth was not correct. This result has stimulated further theoretical work, which now appears to relate dendrite growth velocities to morphological stability considerations. Moreover, additional experimental and theoretical work is now revealing the regimes in which convection and solute effects are significant.

Keywords: *Iron, *Corrosion, *Coatings, Solutions, Chromates, Nitrites, Crystalline structure, Vitreous state, Iron oxides, Reprints, *Extended X ray absorption fine structure.

A new surface EXAFS technique has been applied to the determination of the nature of the passive films formed on iron by chromate and nitrite passivating solutions. It found that the films formed that the EXAFS signatures of the passive films measured resemble those of the cubic spinel ferric oxides. The sharpness of the peaks, however, is significantly reduced from a crystalline structure, indicating that, at least the chromate-formed film is more vitreous than the model crystalline oxides.

PB85-202034 Not available NTIS National Bureau of Standards, Gaithersburg, MD Effect of Fluid Flow on Macrosegregation in Axl-Symmetric Ingots.

S. D. Ridder, S. Kou, and R. Mehrabian. 1981, 13p Pub. in Metallurgical Transactions B 12, n3 p435-447 Sep 81.

Keywords: *Ingots, *Continuous casting, Fluid flow, Mathematical models, Solidification, Separation, Heat transmission, Reprints.

A combined theoretical and experimental study of steady-state fluid flow, heat flow and segregation in axi-symmetric ingot production is presented, with specific applications in continuous casting and ESR. The fluid flow-segregation model involves the coupling of convective heat and fluid flow in the fully liquid metal pool ahead of the liquidus isotherm to the interdendritic fluid flow responsible for macrosegregation in the 'm ushy' zone of ingots solidifying under axi-symmetric conditions. Experiments on low-temperature Sn-Pb alloys verify the solidification model.

T. J. Piccone, D. B. Butrymowicz, D. E. Newbury, J. R. Manning, and J. W. Cahn. 1982, 5p Pub. in Scripta Metallurgica 16, n7 p839-843 1982

Keywords: *Copper alloys, *Diffusion, *Zinc, Grain boundaries, Microstructure, Metallography, Reprints.

Results are presented from an investigation of diffusion-induced grain boundary migration in the Cu-Zn system. Diffusion couples were prepared by annealing high-purity copper with brass powder. Zinc from the powder was diffused into the copper at temperatures at which grain boundary diffusion dominates and lattice diffusion is negligible. Boundary migration at or near the surface of the copper was examined through metallography, light microscopy, scanning electron microscopy, and the electron microprobe. Composition profiles across alloyed regions formed by boundary migration were determined with an electron microprobe and show unanticipated results.

Relationships between Knoop and Scratch Micro-Indentation Hardness and Implications for Abrasive Wear.

Final rept., P. J. Blau. 1985, 21p

Pub. in Microstructural Science 12, p293-313 1985.

Keywords: *Microhardness tests, *Abrasion resistance, *Indentation hardness tests, *Wear, *Metals, Coatings, Loads(Forces), Correlations, Scratch hardness tests.

Micro-indentation hardness test methods are an important tool for the evaluation of thin metallic layers and coatings. Both vertically moving and horizonally moving (scratch) indentation methods are currently in wide use. An investigation was conducted on pure samples of Cu, Fe, Sn, Cd, Ni, and Co and on 1010 steel, 52100 steel, 638 bronze, 688 bronze, and Nitinol (NiTi alloy) to study the relationships between vertical and horizontal (scratch) micro-indentation hardness numbers. Indenter loads between 0.0098 and 0.196 N (10-200 g) were used. A standard Knoop indenter was

Metallurgy and Metallography—Group 11F

used for vertical testing and a 90 degree cone was used for scratch testing on a commercial scratch testing machine. Correlations between vertical and scratch hardness numbers varied with the testpiece material and the applied load. Microstructural features of the scratches were studied to analyze the cause of these variations. The implications of these variations for abrasive wear/microhardness number correlations are discussed.

Pub. in Jnl. of Vacuum Science and Technology A 1,

n2 p491-493 1983.

Keywords: *Ion irradiation, Reprints, *Binary alloys, Ion bombardment.

lon-bombardment-induced sputtering of a multi-element solid results in the preferential movement of the constituents, producing a composition profile which is dependent upon the beam energy. Recent studies have demonstrated transient changes in surface composition of such samples when the bombarding energy is abruptly changed. It is important to be able to treat multiple-energy ion beams since most sputtering systems have a contaminant of multiply-charged ions with higher energy than the principal component. The authors have studied the various competing processes thors have studied the various competing processes that result in the equilibrium profile in order to develop the capability to predict the equilibrium profile which will result, once the parameters of the bombardment have been specified. They found that the equilibrium profile produced by a beam containing two energies cannot be obtained simply by interpolating between the two profiles that would result from the ion components individually. Interpolation is possible only in the nents individually. Interpolation is possible only in the near surface region.

Controlled Indentation Flaws for Construction of Toughness and Fatigue Master Maps.

Final rept.,
R. F. Cook, and B. R. Lawn. 1984, 21p
See also PB85-179042. Sponsored by Office of Naval
Research, Arlington, VA.
Pub. in American Society for Testing and Materials,
Special Technical Publication 844, p22-42

Keywords: *Toughness, *Fatigue(Life), *Life(Durability), *Defects, Indentation, Crack propagation, Predictions, Graphs(Charts), Failure, Stresses.

A simple and economical procedure for accurate determinations of toughness and lifetime parameters is described. Indentation flaws are introduced into strength test pieces, which are then taken to failure under specified stressing and environmental conditions. By controlling the size of the critical flaw, via the contact load, material characteristics can be represented universally on 'master maps' without the need for statistical considerations. The paper surveys both the theoretical background and the experimental methodology associated with the scheme. The theory is developed for 'point' flaws for dynamic and static fatigue, incorporating load explicitly into the applicable. fatigue, incorporating load explicity into the analysis. A vital element of the fracture mechanics is the role played by residual contact stresses in driving the cracks to failure. Experimental data on a range of Vickers-indented glasses and ceramics are included to illustrate the power of the method as a means of graphic materials evaluation. It is demonstrated that basic fracture mechanics parameters can be measured directly from the slopes, intercepts and plateaus on the master maps, and that these parameters are consistent, within experimental error, with macroscopic crack growth laws.

Sponsored by National Aeronautics and Space Admin-

istration, Washington, DC. Pub. in Jnl. of Crystal Growth 69, n1 p15-22 Nov 84.

Keywords: *Solidification, *Lead alloys, Couette flow, Tin containing alloys, Convection, Interfaces, Melts, Crystal growth, Reprints, Instability.

The effect of a forced Couette flow, parallel to a horizontal crystal-melt interface during directional solidification of an alloy of lead containing tin, on the onset of convective and morphological instabilities, is calculated numerically via a linear stability analysis. Such a flow does not affect perturbations with wave vectors perpendicular to the flow. For perturbations with wave vectors parallel to the flow, the onset of morphological instability is somewhat suppressed and thermosolutal convection is greatly suppressed. When instabilities occur, they are oscillatory and correspond to travelling waves. For values of the crystal growth velocity for which mixed morphological and convective modes occur, the presence of a forced flow produces sufficient decoupling to allow otherwise degenerate branches to be identified.

Steels. Final rept.,

C. G. Interrante. 1982, 15p

Pub. in Proceedings of International Conference on Current Solutions to Hydrogen Problems in Steels (1st), Washington, DC., November 1-5, 1982, p3-17.

Keywords: *Hydrogen embrittlement, *Steels, *Blistering, Diffusion, Transport properties, Surface chemistry, Solubility, Absorption.

The solubility, diffusion, and permeation of hydrogen in steels, the various proposed mechanisms of hydronen embrittlement and attack, some of the prominent observed effects of hydrogen on the properties and behavior of steels, and some understanding of the ways in which hydrogen interacts with steels are described herein. Basic aspects of the problem involve the limited solubility of hydrogen, the adsorption of hydrogen on both internal and external steel surfaces, the ab-sorption into the steel lattice, the transport of hydrogen by diffusion and by the motion of dislocations, and the localization of hydrogen at internal sites in the bulk metal. This localization may be as adsorbed hydrogen atoms on surfaces, as molécular hydrogen thát exerts a gas pressure in void spaces, or as interstitial hydrogen in solution. While our overall understanding of the mechanisms that explain the harmful effects is incomplete, the proposed mechanisms furnish a context within which we can view the problem and classify the observed behavior and effects of hydrogen in steels.

Basic Mechanisms of Atomic Redistribution in Alloys Undergoing Irradiation.

Final rept.,

J. R. Manning. 1981, 19p Pub. in Proceedings of Phase Stability During Irradiation, Pittsburgh, PA., October 5-9, 1980, p3-21 1981.

Keywords: *Point defects, *Crystal defects, *Diffusion theory, *Irradiation, *Segregation process, Alloys, *Physical radiation effects.

In alloys undergoing irradiation, vacancies and interstitials can be created in great numbers by radiation damage processes. These point defects then migrate and produce large defect fluxes directed from the interior of the alloy to grain boundaries, pores and the alloy surface. The resulting vacancy and interstitialcy fluxes can appreciably affect diffusion processes and cause significant solute redistribution, even in originally homogeneous alloys. In this paper, basic driving forces and diffusion equations governing this process are discussed. Two distinct forces which arise from the irradiation-rpduced defects can be identified: (1) steady state macroscopic defect concentration gradients affect the basic atom jump frequencies, and (2) defect fluxes, especially if the fluxes are non-uniform in character, change the local microscopic defect distributions around individual atoms and after the effective atom jump frequencies. A general equation for the steady state segregation gradient in binary alloys is presented, and simple applications are made to dilute alloys.

Isotope Dilution Spark Source Mass Spectrometric Determination of Sulfur in Selected NBS (National Bureau of Standards) Iron-Base Alloys. Final rept.,

P. J. Paulsen, R. W. Burke, E. J. Maienthal, and G. M. Lambert. 1981, 8p

Sponsored by American Society for Testing and Mate-

rials, Philadelphia, PA.
Pub. in American Society for Testing and Materials,
Special Technical Publication 747, p113-120 1981.

Keywords: *Chemical analysis, *Isotopic labeling, *Sulfur, *Iron containing alloys, Sampling, Mass spectroscopy, Chemical equilibrium, Physical properties, Hydrogen sulfide, Silver sulfides, Metals, Concentration(Composition), Reprints, *Isotope dilution spark source mass spectroscopy.

A procedure has been developed at NBS utilizing spark source mass spectrometric (SSMS) isotope dilution for the determination of sulfur in iron-base alloys. With this technique a known amount of highly enriched (Sup 34)S isotope (spike) is added to the sample and, following physical and chemical equilibration between the spike sulfur and the natural sulfur in the sample, the equilibrated sulfur is isolated by reduction to H2S and precipitation as Ag2S. The altered isotopic ratio of the sulfur (Sup 34)S/(Sup 32)S is then measured with the SSMS. Sulfur concentrations are calculated from the SSMS. Sulfur concentrations are calculated from the sample weight, spike weight, measured altered isotope ratio, and known isotopic abundance of (Sup 34)S and (Sup 32)S in both natural and spike sulfur. The key step in obtaining a quantitative sulfur analysis is the dissolution of the sulfur-containing iron samples in a sealed tube. This dissolution procedure enables the sample sulfur and the spike sulfur to completely equilibrate without any possibility of loss of either species by volatilization.

Keywords: *Automobiles, *Corrosion, Expenses, Costs, Maintenance costs.

The costs of automobile corrosion presented in the NBS report, 'Economic Effects of Metallic Corrosion in the United States' have been collected from that report and preser' id separately. Costs are given as incurred by the automobile manufacturing sector for corrosion resistant inputs such as copper and stainless steel, and as incurred by the industrial sectors, the private consumer, the Federal Government and state and local government for maintenance and shortened lifetime. Total costs are given as well as the portion that is avoidable by the use of economic best practice. The uncertainties in the estimates of the costs and their origins are discussed.

Beryllium Microdeformation Mechanisms.

Final rept.,

R. S. Polvani, B. W. Christ, and E. R. Fuller. 1981,

See also AD-A111 499. Sponsored by Office of Naval

Research, Boston, MA. Pub. in Proceedings of International Conference on Creep and Fracture of Engineering Materials and Structures, Swansea, Wales, March 24-27, 1981, p85-

Keywords: *Beryllium, *Deformation, Dimensional measurement, Tensile strength, Creep properties.

Microtensite and microcreep behaviors of beryllium were studied using a capacitance type extensometer capable of resolving .1 um/m over long times. The nature of the dislocation processes responsible for mi-crodeformation are not entirely clear; but surely, the primary difference between micro and conventional deformation is the extent to which the dislocations move and not the nature of the processes. Despite low temperatures, microcreep of Instrument Grade Berylli-um appears to be diffusion limited.

Processing/Microstructure Relationships in Surface Melting.

Final rept.,

Pub. in Proceedings of Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA., November 1-4, 1982, v13 p733-744 1983.

Keywords: Melting, Electron beam melting, Homogeneity, Aluminum, Interfaces, Stability, Solidification, Microstructure, Process control, *Surface melting, Rapid solification.

The development of predictive models for rapid surface melting and resolidification requires coupling of realistic heat flow models to emerging theories of rapid solification processing. An overview is given of the emerging guidelines for prediction and control of rapid solification conditions and microstructures. Homogenization of the liquid by convection and diffusion is also discussed. Electron beam surface melting of alloy substrates is used as an example of these processes.

Fatigue Crack Growth of Duplex Stainless Steel Castings at 4 K.

P. T. Purtscher, Y. W. Cheng, and P. N. Li. 1985, 5p Sponsored by Department of Energy, Washington, DC. Office of Fusion Energy.

Pub. in Jnl. of Engineering Materials and Technology 107, p161-165 Apr 85.

Keywords: *Stainless steels, *Crack propagation, Cryogenics, Fatigue(Materials), Reprints.

Constant-load-amplitude stage II fatigue crack growth rates at 4 K were measured for duplex stainless steel castings. The results show that at a delta K of 60 MPa(m to the 1/2 power), da/dN = 0.00076 mm/cycle for an alloy with 1 percent ferrite. For an alloy with 8 percent ferrite, da/dN is 35 percent, and for an alloy with 29 percent ferrite, da/dN is 260 percent greater than for the 1 percent ferrite alloy.

Manganese Contributions to the Elastic Constants of Face Centred Cubic Fe-Cr-Ni Stainless Steel.

Final rept.

H. M. Ledbetter. 1985, 7p Sponsored by Department of Energy, Washington, DC. Office of Fusion Energy.

Pub. in Jnl. of Materials Science 20, p2923-2929 1985.

Keywords: *Stainless steels, *Elastic properties, *Manganese containing alloys, Mechanical properties, Poisson ratio, Ultrasonic tests, Bulk modulus, Reprints.

The author determined experimentally the effect of manganese on the elastic constants of face centred cubic Fe-Cr-Ni alloys with chemical compositions near 304-type stainless steel. By a pulse-echo-overlap method, longitudinal and transverse soundwave velocities were determined in ten alloys containing up to 6% manganese. All the elastic stiffnesses decrease linearly with increasing manganese. The bulk modulus decreases most strongly. Poisson's ratio changes least. We consider what the elastic constants reveal concerning changes in chemical bonding, caused by manganese additions.

Standards and Metadata Requirements for Computerization of Selected Mechanical Properties of Metallic Materials.

Final rent.

H. Westbrook. Aug 85, 50p NBS/SP-702 Library of Congress catalog card no. 85-600585. Also available from Supt. of Docs as SN003-003-02691-3. Sponsored by National Bureau of Standards (NML), Gaithersburg, MD. Office of Standard Reference Data, and Army Materiel Development and Readiness Command, Alexandria, VA.

Keywords: *Standards, *Metals, Mechanical properties, Tests, Computer applications.

To assist in building a computerized information system on the engineering properties of materials, the standards and metadata requirements for a representative group of mechanical property categories are considered. These categories include: tensile behavior, hardness numbers, notch-bar impact test parameters and fatigue properties. For each property group, definitions of terms, synonyms (and non-synonyms), standard test methods, standards for reporting data, precision and accuracy, and correlations of properties are addressed. The principal findings and recommenda-tions are as follows. Existing test methods are generally adequate for the properties considered but better standards are needed for data reporting. Appraisal of materials variability and testing machine variability would be assisted by acess to standard reference materials, certified as to their mechanical properties.

Numerical and Experimental Verification of Compllance Functions for Compact Specimens. Final rept.,

R. L. Tobler, and W. C. Carpenter, 1985, 10p. Sponsored by Department of Energy, Washington, DC. Office of Fusion Energy.
Pub. in Engineering Fracture Mechanics 21, n3 p547-

Keywords: *Modulus of elasticity, Numerical analysis, Mechanical properties, Cracking(Fracturing), Reprints, Finite element analysis

A two-dimensional finite element study of the compact specimen was performed in verification of its elastic compliance calibration functions. The results confirm Newman's boundary collocation solutions to within 2%. Empirical calibrations were also performed using alloys with well-known elastic moduli. The numerical and empirical agreement depends on the state of stress assumed in the model, with better agreement for plane stress than for plane strain.

Competition between Wear Processes during the Dry Silding of Two Copper Alloys on 52100 Steel. Final rept.,

P. J. Blau. 1983, 8p

Pub. in Proceedings of Wear of Materials Conference, Reston, VA., April 11-14, 1983, p526-533.

Keywords: *Wear, *Copper alloys, Steels, Sliding, Tests, Friction, Microhardness.

More than one wear process may be operating simultaneously during the dry sliding of metals. Moreover, the relative contributions of these processes may change with time. Flat blocks of two commercial alloys of copper (CDA 638 and 688) were held against rotating rings of 52100 steel under a normal load of 10 N and 20 cm/s velocity for a series of tests in Ar gas environments. Microscopy revealed two different operating wear processes on the alloy 638 wear scars. Separate wear volumes were computed for the two mechanisms (metallic and dull-colored wear zones). Microhardness gradients were obtained below these zones.

Midrange Fatique Crack Growth Data Correlations for Structural Alloys at Room and Cryogenic Temperatures.

Final rept.

R. L. Tobler, and Y. W. Cheng. 1985, 26p Sponsored by Department of Energy, Washington, DC. Office of Fusion Energy.
Pub. in Fatique at Low Temperatures, ASTM STP 857,

p5-30 1985.

Keywords: *Structural steels, *Crack propagation, Cracking(Fracturing), Fatigue(Materials), Austenitic stainless steels, Cryogenics, Modulus of elasticity, Re-

Fatigue crack growth rate data for pure metals, structural alloys, and welds at temperatures from 295 to 4K are selectively reviewed. The data for more than 200 material and temperature combinations are discussed in terms of the parameters C and n for the midrange of the da/dN-versus-Delta K curve. Fatigue resistance varies greatly among the different alloy classes and crystal structure types, especially at extreme cryogenic temperatures, where alternative failure mechanisms emerge. Good general correlations were achieved on the basis of Young's modulus, fracture toughness, and empirical equations relating C and n for each alloy class.

Fracture and Deformation: Technical Activities 1985.

Rept. for Oct 84-Oct 85, R. P. Reed, and H. I. McHenry. Nov 85, 70p NBSIR-85/3189

Keywords: *Deformation, Research projects, Metals, Composite Composite materials, Ceramics, Fractures(Materials), *Fracture(Mechanics). Polymers, The report summarized the technical program of the Fracture and Deformation Division of the Institute for Materials Science and Engineering, National Bureau of Standards for the fiscal year 1985. The division's two major program areas are: elastic-plasti fracture mechanics and fracture mechanisms and analysis. Elastic-plastic fracture mechanics includes contributions from stress analysis, material properties, nondestructure-, and temperature- dependent properties, composite mechanics, and material performance comprise the second area, fracture mechanisms and analysis. Significant technical programs relating to each of these are presented. Major accomplishments are highlighted, including very successful dynamic crack arrest measurements using 10-m-long specimens, develop-ment of the dynamic theory of crack tip-dislocation interactions, and continued development and application of finite-element analysis and scattering theory for prediction of composite properties.

Keywords: *Metallurgy, Research projects, Microstructure, Mechanical properties, Wear, Corrosion, Electrodeposition, Nondestructive tests, Magnetic materials.

The report summarizes the FY1985 activities of the Metallurgy Division of the National Bureau of Standards. The research centers upon the structure-processing-properties relations of metals and alloys, and on the methods of their measurement. Task efforts comprise studies of synchrotron radiation research for materials characterization, metallurgical processing, wear and mechanical properties, chemical metallurgy, corrosion and protection of metals, electrodeposition, and nondestructive characterization. The work herein described includes three cooperative data programs with American professional socieities and industry: the American Society for Metals-NBS Alloy Phase Diagram Program, the National Association of Corrosion Engineers-NBS Corrosion Data Program, and the American Iron and Steel Institute-NBS Steel Sensor Program. The scientific publications, invited talks, committee participation, and other professional interactions of the 91 full-time and part-time members of the Metallurgy Division and its 33 guest researchers are identified.

500.930

Development of an Oxidation-Wear Coupled Test for the Evaluation of Lubricants.

Final rept.,

R. S. Gates, and S. M. Hsu. 1984, 7p

Pub. in Lubrication Engineering 40, n1 p27-33 Jan 84.

Keywords: *Wear tests, *Oxidation, *Lubricants, *Degradation, Separation, Reprints.

Lubrication usually involves complex interactions between lubricant and metal surfaces under oxidizing conditions. The effects of lubricant degradation/oxidation on friction and wear are not well understood. Normal simulation of actual engine or bearing condi-tions usually examine wear and oxidation separately. Sometimes misleading conclusions are drawn. A thinfilm micro-sample wear test has been developed using a four-ball wear tester in which the lubricant is subjected to oxidizing conditions and the time to seizure is measured. This measures both the friction and wear characteristics as well as the oxidation resistance of the lubricant. The test has been found useful in simulating ASTM engine sequence IIID wear test.

PB85-196178 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Lubrication Mechanism of SbSbS4. Final rept.

J. S. Harris, L. K. Ives, and M. B. Peterson. 1982, 2p Sponsored by Electron Microscopy Society of America, Oak Ridge, TN.
Pub. in Proceedings of Annual Meeting of the Electron

Microscopy Society of America (40th), Washington, DC, August 9-13, 1982, p530-531.

Keywords: *Solid lubricants, *Lubricant additives, *Wear tests, Blends, Electron microscopy, Experimental design, *Antimony thioantimonate.

Recent laboratory investigations have reported that SbSbS4 is a promising solid lubricant when blended with several fluid lubricants. A series of different wear tests were conducted to determine the conditions and limits within which SbSbS4 functions as a lubricant. Results of these tests together with scanning and transmission electron microscopy analyses of surfaces on AISI 52100 steel were used to investigate the mechanism of lubrication. It was determined that SbSbS4 does not function as a solid lubricant at temperatures below about 225C. As an additive in lithium grease the lubricating mechanism of SbSbS4 is complex involving the formation of a solid film of SbSbS4 as well as the release of sulfur and its reaction with the steel surface.

SbSbS4. Final rept.,

L. K. Ives, J. S. Harris, and M. B. Peterson. 1983, 7p Pub. in Proceedings of Wear of Materials, Reston, VA., April 11-14, 1983, p507-513.

Keywords: *Wear resistance, *Lubricant additives, *Greases, Electron microscopy, Performance evaluation, Lithium, *Antimony thioantimonate.

The addition of solid SbSbS4 powder to conventional lubricating base greases has been shown to result in reduced wear and a significant increase in load carrying capacity. In this investigation the antiwear behavior and response mechanisms of SbSbS4 when used as an additive to a lithium base grease are studied. Comparative block and ring tests were carried out on lithi-um base grease and on the base grease with separate additions of 5 wt% SbSbS4, and 0.43 wt% S. The tests were conducted under boundary lubrication conditions at a load of 267 N and a sliding speed of 5 cm/s utilizing 52100 steel specimen materials. Addition of 5 wt% SbSbS4 resulted in a reduction in wear rate by more than an order of magnitude compared to the base grease. The same effect, however, was achieved by the addition of 0.43 wt% S. This finding together with the identification of iron sulfide films on wear scar surfaces after lubrication with both SbSbS4 and S containing greases, indicated that the response of SbSbS4 was associated with the release of S and its reaction with the steel surface. The surface film studies described were carried out by means of analytical electron microscopy.

Role of Iron and Copper in the Oxidation Degradation of Lubricating Oils.

Final rept., D. B. Clark, E. E. Klaus, and S. M. Hsu. 1985, 8p Pub. in Lubrication Engineering 41, n5 p280-287 May

Keywords: *Lubricating oils, *Oxidation, *Iron, *Copper, *Surface chemistry, Reaction kinetics, Metal containing organic compounds, Reprints, *Chemical reaction mechanisms.

In lubricant degradation, the role of metal surfaces in oxidation mechanisms has long been a subject of extensive study. In particular, copper and iron surfaces have been studied most frequently. However, data in the literature suggest both prooxidant and inhibiting characteristics for copper. A thin film microoxidation technique was used in this study to examine the role of copper and iron surfaces in the degradation process of lubricants. Metal analysis of the oxidized oil reveals that organometallic compounds are formed as a result of the lubricant-surface interactions. Different high-mo-lecular-weight-reaction products from iron, copper, and glass result in varying effects on oxidation rates. This observation helps to explain the observed inhibit-ing effects and the prooxidant effects of copper in different systems. Iron has been found to promote oxidation much faster than copper.

Soild Lubrication of Steel by SbSbS4.

Final rept.,

L. K. Ives, and M. B. Peterson. 1984, 12p Sponsored by Office of Naval Research, Arlington, VA Pub. in Proceedings of Meeting of the Mechanical Failures Prevention Group (37th), Gaithersburg, Maryland, May 10-12, 1984, p208-219.

Keywords: *Solid lubricants, Steels, Antimony inorganic compounds, Antimonates, Friction, Wear, *Antimony thioantimonate.

The lubricating behavior of the amorphous solid, antimony thioantimonate (SbSbS4), in the form of a dry powder and as compressed pellets is investigated and compared to MoS2 and several other sulfides. The friction and wear response of the dry powders was determined by utilizing a three-pin-on-disk test configura-tion. Pins were of 52100 steel and disks were of 0-2 tool steel. Sliding experiments with compressed pel-lets of SbSbS4, MoS2, Sb2S3, FeS2, and Fe0,9S were used to study the friction, film forming, shear, and adhesion characteristics of the solid lubricant materials in the absence of metal to metal contact. A pin-on-ring configuration was employed with 52100 steel rings. The lubrication mechanism of SbSbS4 is discussed on the basis of the results of these experiments. Simple models of solid film lubrication are presented to assist in the analysis.

L. L. Sparks, and J. M. Arvidson. 1984, 14p Sponsored by Gas Research Inst., Chicago, IL. Pub. in Proceedings of Society of the Plastics Industry (SPI) 28th Annual Technical/Marketing Conference, San Antonio, TX, November 5-7, 1984, p273-286.

Keywords: *Polyurethane resins, *Foam, *Thermal properties, *Mechanical properties, *Insulation, Cryogenics, Physical properties, Gas chromatography, Mass spectroscopy, Thermal expansion, *Expanded

Expanded plastics are used extensively for thermal insulation in cryogenic fuel facilities. Properties determined were thermal conductivity, thermal expansion, strength and moduli in compression and in tension, proportional limit, yield strength, ultimate strength, and shear strength. Physical properties were determined both parallel and perpendicular to the direction of foam rise. The gas content of the specimens was determined using a gas chromatograph-mass spectrometer, and the cell morphology was studied optically. Empirical procedures for estimating the temperature dependent thermophysical properties are discussed. These procedures utilize the characterization parameters for molar gas concentration and cell morphology.

Specimens of 1.5 mm thick absorber-free PMMA containing about 1/2% monomer have been photolytically degraded in air at 50, 85 and 115C and thermally degraded in air at 115 and 125C. A simulated solar spectral range was used. Degradation was followed by GPC determinations of molecular weight as a function of depth in the specimen. The results show increased photo-degradation at the plate edges (back and front) over that occuring in the centers of the plates, and a rapidly attained constant amount of degradation for thermal degradation. The thermal degradation is as-cribed to weak links, perhaps inchain peroxides intro-duced during polymerization. The products of photo-oxidation absorb the shorter (300-320 nm) radiation significantly and progressively screen the remainders of the plate as degradation proceeds. Degradation mechanisms are proposed.

Pub. in Proceedings of the SPE Annual Technical Conference and Exhibition (43rd), ANTEC 85, Plastics 85, p582-585 1985.

Keywords: *Plastic deformation, *Polyisobutylene, *Polymethyl methacrylate, *Strain measurement, *Mechanical tests, *Aging tests(Materials), Viscoelasticity, Solutions, Glass, Polymers, Nonlinear systems, *BKZ fluids, BKZ theory.

The incremental moduli, delta G(+), for a concentrated solution of polyisobutylene (PIB) and for a PMMA

glass have been determined from step shear experiments in which a small deformation, delta gamma, was superimposed upon a large deformation, gamma(sub 1). Delta G(+) for both systems was found to decrease with increasing gamma, and to increase with time, t(sub e), after the imposition of the large deformation. The results for the PIB are well described by the nonlinear constitutive equation of the BKZ elastic fluid theory. However, the polymer glass shows less nonlinearity than predicted by the BKZ theory. The results are used to show the ambiguity of molecular interpretations from these types of experiments.

Pub. in Proceedings of ANTEC/82, Annual Technical Conference and Exhibition of the Society of Plastics Engineers (40th): Plastics - Meeting Challenges of the Future, San Francisco, California, May 10-13, 1982, p55-58

Keywords: *Molecular relaxation, *Creep tests, *Stress relaxation tests, *Polyethylene, *Compression tests, Molecular weight, Morphology, Mechanical properties, Plastics, Cold flow.

The manuscript represents the text of a paper which will be presented at the 40th Annual ANTEC sponsored by the Society of Plastics Engineers. The work described in the abstract is concerned with a study of the relationship of morphology to the mechanical behavior of ultra high molecular weight polyethylene (UHMWPE) used in the manufacture of orthopedic protheses, and it is being done under contract with the Food and Drug Administration, Bureau of Medical Devices. Both the morphology and mechanical behavior have been studied for samples of UHMWPE prepared under widely different processing conditions. Two results of significance are (1) that in uniaxial extension deformation of the material does not occur uniformly on a microscopic scale, rather it reflects the particulate nature of the raw polymer powder, and (2) that small changes in the crystallinity of the material can signifi-cantly alter the creep and stress-relaxation behavior. It is also shown that the environmental stress-crack re-sistance of UHMWPE is highly dependent upon the thermal history given compression molded samples.

Study of Oxygen Effects on Nonflaming Translent Gasification of PMMA and PE during Thermal Irradiation. Final rept.

T. Kashiwagi, and T. J. Ohlemiller. 1982, 9p Sponsored by Combustion Inst., Pittsburgh, PA.
Pub. in Proceedings of Symposium on Combustion
(19th), Haifa, Israel, August 8-13, 1982, p815-823.

Keywords: *Oxygen, *Polymethyl methacrylate, *Polyethylene, *Gasification, *Thermal degradation, *Surface chemistry, Pyrolysis, Oxidation, Nitrogen, Mixture, Low density polyethylene.

The effects of gas phase oxygen on the rate of gasification and surface temperature history of large sam-ples of PMMA and low density PE were investigated under transient, nonflaming heating by thermal radiation. Four different ambient gas mixtures, nitrogen, 10% O2/90% N2, 20% O2/80% N2, and 40% O2/ 60% N2, were used. Two different radiant fluxes, 1.7 and 4.0 W/sq cm, were used. For PMMA, large bubbles are formed in the hottest, near-surface layer in a nitrogen environment; these bubbles are smaller and more frequent in oxygen-containing environments. An increase in oxygen concentration significantly decreases the surface temperature of PMMA and even more significantly increases that with PE.

Small-Angle Neutron-Scattering of Partially Segregated Blends of Polyethylene and Deuteropolyeth-

ylene. Final rept., W. Wu, and G. D. Wignall. 1985, 6p Pub. in Polymer 26, n5 p661-666 1985.

Keywords: *Polyethylene, *Deuterium compounds, Melting, Crystallization, Neutron scattering, Plastic de-formation, Comparison, Sampling, Molecular weight, Substitutes, Neutron scattering, Temperature, Mathe-matical models, Reprints, *Small angle scattering, Chemical reaction mechanisms.

In previous paper, polyethylene (PEH) blended with 4.3 vol % deuterated polyethylene (PED) was annealed and plastically deformed at different temperatures. The most prominent change resulting from the deformation is a significant reduction in the apparent molecular weight measured from the extrapolated small-angle neutron scattering (SANS) data. The model adopted in the data interpretation was based on a heterogeneous distribution of the centers of mass of the labeled (PED) chains which form a two phase system of enriched and depleted regions described by a Debye like correlation function. A comparison between this model and alternative approaches based on the correlation network and random phase approximation will be delineated. The results from these models lead to the conclusion that for typical melt crystallized samples the centers of mass of the labeled chains are only slightly perturbed from a random distribution. Plastic deformation of the blends tends to lessen the degree of segregation of the PED molecules and the results suggest that a portion of the specimen must undergo a melting and recrystallization mechanism during deformation.

Thermal and Photolytic Degradation of Plates of Poly(methyl methacrylate) Containing Monomer.

B. Dickens, J. W. Martin, and D. Waksman. 1984.

Pub. in Polymer 25, n5 p706-715 1984.

Keywords: *Polymethyl methocrylate, *Degradation, *Thermal analysis, Oxidation, Photochemical reactions, Plates(Structural members), Temperature, Reprints, Monomers, Chemical reaction mechanisms

Specimens of 1.5 mm thick absorber-free PMMA containing about 0.5 percent monomer have been photolytically degraded in air at 50, 85, and 115 C and thermally degraded in air at 115 and 125 C. Specimens were exposed to a simulated solar spectral range. Degradation was followed by GPC determinations of molecular weight as a function of depth in the specimens. The results show increased photo-degradation at the plate edges (back and front) over that occurring in the centers, and a rapidly attained constant amount of degradation for thermal degradation. The effect of temperature is mostly to decrease the importance of the cage effect and to allow the initial radicals formed to diffuse away from one another. The products of photo-oxidation absorb the shorter (300 to 330 micrometers radiation significantly and progressively screen the remainder of the plate as degradation proceeds. Degradation mechanisms are proposed.

Review of the Literature on the Gaseous Products and Toxicity Generated from the Pyrolysis and Combustion of Rigid Polyurethane Foams, M. Paabo, and B. C. Levin. Dec 85, 113p NBSIR-85/

3224

Sponsored by Consumer Product Safety Commission, Bethesda, MD.

Keywords: *Urethane resins, *Pyrolysis, *Flammability testing, *Air pollution, *Toxicity, Reviews, Combustion products, Foam, Biochemistry, Carbon monoxide, Hydrogen cyanide, Dosage, Indoor air pollution, Consumer products.

The literature on rigid polyurethane foam has been reviewed with an emphasis on the gaseous products generated under various thermal decomposition conditions and the toxicity of those products. The review is limited to publications in English through 1984. Carbon monoxide (CO) and hydrogen cyanide (HCN) were the predominant toxicants found among more than 100 other gaseous products. The generation of CO and was found to increase with increasing combustion temperatures. Many test methods were used to assess the acute inhalation toxicity of combustion products from various rigid polyurethane foams. Lethality, incapacitation, physiological, and biochemical parameters were employed as biological and points. In general, the combustion products generated from ngid polyurethane foam in the flaming mode appear to be more toxic than those produced in the non-flaming mode. The LC50 values for 30 minute exposures ranged from 10 to 17 mg/l in the flaming mode and were greater than 34 mg/l in the nonflaming mode. With the exception of one case in which a reactive type phosphorus containing fire retardant was used, the addition of fire retardants to rigid polyurethane foams does not appear to generate unusual toxic combustion products.

D. L. Hunston, and W. D. Bascom. 1984, 17p Prepared in cooperation with Naval Research Lab., Washington, DC. Chemistry Div. Pub. in ACS (American Chemical Society) Advances in

Chemistry Series, n208 p83-99 1984.

Keywords: *Rubber adhesives, *Composite materials, *Epoxy resins, *Failure, Temperature, Viscoelasticity, Reprints.

Rubber-modified epoxies were first developed empirically in the 1960's to improve the poor crack-growth resistance of epoxies with a minimum sacrifice in other desirable properties. In 1971 a major effort was launched to study the failure behavior of these materials as structural adhesives. Since then, this program has been expanded to include numerous laboratories and researchers, and the objectives have been broadened to include the failure behavior of bulk specimens and fiber-reinforced composites as well. The authors discuss the effects on failure behavior of rubber modification, test temperature, and loading rate for all three specimen types. For adhesive bonds, the effects of bond thickness are also discussed.

Final rept.,

G. B. McKenna, and L. J. Zapas. 1983, 5p See also PB85-104750.

Pub. in Polymer 24, n11 p1502-1506 Nov 83.

Keywords: *Natural rubber, *Strain tests, Experimental design, Crosslinking, Compressing, Modulus of elasticity, Extensions, Tension tests, Elastomers, Reprints.

Experiments were carried out to characterize the small strain tension and compression behavior of dicumvl peroxide crosslinked natural rubber. Strains which were smaller by an order of magnitude than any reported previously on natural rubber were achieved. The authors results support the contention that the compression and extension moduli of natural rubber are different. A new finding is reported. That is, the moduli in tension and compression do not become constant but rather they increase significantly as zero deformation is approached.

The following features of five polyethylene films used by NASA in the construction of heavy lift balloons have been examined: molecular weight, molecular weight distribution, branching, melting behavior, density, surface texture, birefringence, orientation of crystalline regions, uniaxial deformation in the machine and transverse directions, and the effect of sample geometry and strain rate on deformation behavior. The goal of this exploratory study was to determine whether there are significant differences in any of the above mentioned features, or combination of features between the films. The acquisition of such information is a first step towards determining whether there are any spe-cific correlations between film characteristics and the incidence of catastrophic failure of balloons during ascent through the troposphere. This exploratory study has resulted in the identification of similarities and differences between various features of the films. Close similarities have been found in methyl group content, crystallinity, and peak melting temperature.

Field 11—MATERIALS

Group 11J—Rubbers

The preferred orientations in the crystalline regions appear to be qualitatively similar or related. Differences among the films have been revealed in two features, namely between their molecular weights, and in the balance of the strain to break behavior in the machine direction relative to that in the transverse direc-

Superposition of Small Deformations on Large Deformations: Measurements of the Incremental Relaxation Modulus for a PolyIsobutylene Solution.

G. B. McKenna, and L. J. Zapas. 1985, 10p Pub. in Jnl. of Polymer Science, Polymer Physics Edition 23, p1647-1656 1985.

Keywords: *Modulus of elasticity, *Molecular relaxation, *Deformation, Solutions, Viscoelasticity, Aging tests(Materials), Elastomers, Reprints, *Polyisobutylene, BKZ theory.

The incremental relaxation modulus deltaG(t) for a concentrated solution of polyisobutylene has been determined from step-shear experiments in which a small deformation delta/gamma was superimposed on a large deformation gamma(sub 1); deltaG(t) was found to decrease with increasing gamma (sub 1), and to increase with the t(sub e) after the imposition of the large deformation. It was aso observed that the 'apparent relaxation spectrum' associated with deltaG (t) narrows and shifts to shorter times when compared to the spectrum associated with the linear viscoelastic relaxation modulus G(t). The results are well described by the nonlinear constitutive equation of the BKZ elastic fluid theory.

Calculating Bounds on Reachability and Connectedness In Stochastic Networks.

Final rept., M. O. Ball, and J. S. Provan. 1983, 26p Pub. in Networks 13, n2 p253-278 1983.

Keywords: Algorithms, Approximation, Graphics, Networks, Probability theory, Reliability, Reprints, *Stochastic networks.

The paper presents computational procedures for generating bounds on measures of network reliability. The two measures considered, reachability and connect-edness, are the probability that there is an operating path from a node to all other nodes in a directed (respectively undirected) stochastic network. The bounds, which are given in terms of polynomials in p, the common arc failure probability, are based on recent bounding results the authors developed for the class of shellable independence systems. Two pairs of bounds are given weaker bounds whose computation time is bounded by a polynomial in the size of the net-work and tighter bounds whose computation time is bounded by a polynomial in the size of the network and the number of minimum cardinality network cuts. Computational results are also given that evaluate the quality of the bounds. The generation of the bounds involves several interesting path and cut counting prob-

Interdependent and determinate behavior is studied between variables subject to a system of linear equali-ties. For each pair of variables in such a system, four definitions of 'correlation' are introduced which relate the behavior of the variables to a chosen set of 'basic' variables for the system. These definitions correspond directly to such terms as statistical correlation, rates of substitution in economics, sensitivity in linear programming, and sign-solvability in linear algebra. For each definition of correlation, there is a stronger property of determinacy between two variables, established by the consistency in sign of the correlation between the two variables over every set of basic variables. The authors show that the property of determinacy is independent of which definition of correlation is used. The author also examines correlation and determinacy in systems related to networks, and derive good characterizations of determinacy in terms of properties of the underlying networks.

Inverse Gaussian Pulse in the Experimental Determination of Linear System Green's Functions,
S. Carasso, and N. Hsu. Feb 85, 16p
Sponsored by Army Research Office, Research Triangle Park, NO.

gle Park, NC. Pub. in Transactions of the Second Army Conference on Applied Mathematics and Computing, Troy, New York, May 1984, ARO Report 85-1, p389-404 Feb 1985.

Keywords: *Greens function, Linear systems, Time invariant systems, Acoustic emissions, Deconvolution, Impulse response.

A new time domain deconvolution method is presented for determining the 'impulse response' of linear time invariant systems. The method is based on the use of the one-sided, causal, inverse Gaussian pulse as an approximation to the Dirac delta-function. Deconvolution of that kernel is equivalent to an inverse heat conduction problem. The method is particularly useful in cases where the Green's function for the useful in cases where the Green's function for the linear system has singularities such as jumps, cusps, spikes, and the like. Computational reconstructions of singularities, from smooth synthetic data, are presented in the context of Acoustic Emission Green's func-

matics) Jnl. on Applied Mathematics 45, n3 p369-382

Keywords: *Signal processing, Greens function, Linear systems, Cauchy problem, Reprints, *Impulse response, Acoustic emissions, Initial value problems, Deconvolution.

The authors propose a new time domain method for the experimental determination of the 'impulse responsaveforms are particular (C sup infinity symbol) approximations to the Dirac delta-function and the Heavisidee' of linear systems. The technique centers around the use of specifically designed probe waveforms. These w unit step function, and lead to a subsequent time domain deconvolution problem which can be implemented as a Cauchy initial value problem. This approach allows for continuous deconvolution, a powerful option in the presence of noise. The authors orient the discussion to the context of acoustic emission and elastic Green's functions, and present several numerical reconstructions of sharp signals from smooth synthetic data.

Computational Experience with Confidence Reglons and Confidence Intervals for Nonlinear Least Squares.

Final rept.,

J. R. Donaldson, and R. B. Schnabel. May 85, 30p Pub. in University of Colorado Department of Comput-er Science Technical Report CU-CS-302-84, 30p May

Keywords: *Least squares method, Monte Carlo method, Confidence limits, Computation, *Parameter estimation, Nonlinear analysis, Linearization.

The authors present the results of a Monte Carlo study of the most commonly discussed methods for con-structing approximate confidence regions and confidence intervals for parameters estimated by nonlinear least squares. The methods examined are the three varianTs of the linearization method, the likelihood method, and the lack-of-fit method. The linearization method is the most frequently implemented method. It is computationally inexpensive and produces easily understandable results. The likelihood and lack-of-fit methods both are much more expensive and more difficult to report. Based on results, it is concluded that among the three variants of the linearization method, the variant based solely on the Jacobian appears preferable because it is simple, less expensive, more numerically stable, and at least as accurate as the other two variants which utilize the full Hessian.

Successive Overrelaxation, Multigrid, and Preconditioned Conjugate Gradients Algorithms for Solv-Ing a Diffusion Problem on a Vector Computer. Final rept.,

J. Gary, S. McCormick, and R. Sweet. 1983, 25p Pub. in Proceedings of International Conference on Multigrid Methods, Dillon, CO., April 6-8, 1983, Applied Mathematics and Computation 13, n3/4 p285-309

Keywords: *Diffusion theory, Elliptic differential equations, Matrices(Mathematics), Numerical integration, Algorithms, *Successive overrelation method, *Multigrid methods, *Conjugate gradient method, Vector processors.

The purpose of the paper is the treatment of three numerical algorithms (successive overrelaxation (SOR), multigrid (MG) and conjugate gradients preconditioned by a fast Poisson solver (CG)) for solving large but mildly behaved diffusion problems on a vector computer with memory-to-memory architecture. The problem is a symmetric nonnegative definite matrix equation arising from a cell-centered finite difference approximation of a 3-d diffusion equation with full Neumann boundary conditions.

Keywords: *Chemical analysis, Least squares method, Data reduction, Covariance, *Kalman filtering, Computer applications.

The increased power of small computers makes the use of parameter estimation methods attractive. Such methods have a number of uses in analytical chemistry. When valid models are available, many methods work well, but when models used in the estimation are in error, most methods fail. Methods based on the Kalman filter, a linear recursive estimator, may be modified to perform parameter estimation with erroneous models. Modifications to the filter involve allowing the filter to adapt the measurement model to the experimental data through matching the theoretical and observed covariance of the filter innovations sequence. The adaptive filtering methods that result have a number of applications in analytical chemistry.

Regression Analysis of Compartmental Models,
T. L. Lai. 24 Jun 85, 6p
Sponsored by National Bureau of Standards, Gaithers-

Included in Jnl. of Research of the National Bureau of Standards, v90 n6 p525-530 Nov-Dec 85.

Keywords: *Regression analysis, *Mathematical models, *Compartment analysis, Least squares method, Decay, Kinetics, System identification.

Herein the authors study the problem of assessing, on the basis of noisy and incomplete observations, how much information there is in the data for model identification in compartmental systems. The underlying concept is that of and 'information distance' between competing models, and estimation of this distance on the basis of the given data is discussed. Useful reduction of the dimensionality of the corresponding least squares problem is accomplished by regarding the decay rate constant as primary parameters of interest and the other parameters of the model as nuisance parameters. Estimation of the decay rate function is also discussed.

Computing Network Reliability in Time Polynomial in the Number of Cuts. Final rept., J. S. Provan, and M. O. Ball. 1984, 11p

Pub. in Operations Research 32, n3 p516-526 1984.

Keywords: *Networks, Computation, Reliability, Polynomials, Algorithms, Reprints, *Stochastic networks, Probability.

In this paper, the authors present a new algorithm for computing the probability that there exists an operating path from a node s to a node t in a stochastic network. This algorithm has the special property thats computation time is bounded by a polynomial in the number of (s.t)-cuts in the network. They also investigate other connectedness reliability problems in terms of their complexity with respect to the number of cutsets and pathsets in the network. They indicate which problems do have algorithms which are polynomial in the number of such sets, and which ones will not have such algorithms unless P=NP.

matics) Jnl. on Numérical Analysis 21, n6 p1146-1161

Keywords: *Nonlinear programming, Convergence, Algorithms, Reprints, *Constrained optimization.

In order to achieve a robust implementation of methods for nonlinear programming problems, it is necessary to devise a procedure which can be used to test whether or not a prospective step would yield a 'better' approximation to the solution than the current iterate. In this paper, the authors present a family of descent or merit functions which are shown to be compatible with local Q-superlinear convergence of Newton and quasi-Newton methods. A simple algorithm is used to verify that good descent and convergence properties are possible using this merit function.

Global Solutions to Factorable Nonlinear Optimiza-

tion Problems Using Separable Programming Techniques,

G. P. McCormick. Jul 85, 46p NBSIR-85/3206

Keywords: *Mathematical programming, Least squares method, Computation, Optimization, Algorithms, Nonconvex programming, Branch and bound method, Nonlinear analysis.

Many algorithms for obtaining global solutions to non-convex optimization problems have been proposed in recent years. The methods farthest along computa-tionally are those for separable problems. These use linear programming codes to solve sequences of LP problems formed from piece-wise linear approximations to the nonlinear functional forms. For a large class of optimization problems, called factorable pro-gramming problems, it is possible to create equivalent separable problems. This is done at a cost: additional variables and constraints. In this paper the procedure for creating the equivalent separable problems is outlined and a brief description is given of a global solution algorithm due to Falk. A small example is given illustrating the above techniques. The example is also solved using a more direct method. Application to the solution of nonlinear least squares is illustrated with another example. Discussion of areas of research for improving the efficiency of this approach concludes the paper.

Field Performance of Three Residential Heat

Pumps In the Cooling Mode, W. H. Parken, D. A. Didion, P. H. Wojciechowski, and L. Chern. Mar 85, 82p NBSIR-85/3107

Keywords: *Heat pumps, Residential buildings, Thermostats, Cooling systems, Air conditioning, Field tests, Performance evaluation, Tests, Efficiency, Data acquisition, Energy conservation.

Field data was acquired for three residential heat pumps and the part load performance factor and seasonal cooling energy efficiency ratio were evaluated. Laboratory tests were conducted on a unit identical to one of the field-tested heat pumps and performance results compared. Thermostat data was also acquired and a semi-empirical model developed.

Flow Rate Calibration for Solar Heating and Cooling System Evaluation.

Final rept..

G. E. Mattingly. 1978, 7p
Pub. in Proceedings of Conference on Performance
Monitoring Techniques for Evaluation of Solar Heating
and Cooling Systems, Washington, DC., April 3-4,
1978, p299-305.

Keywords: *Calibrating, *Flow rate, Flow measurement, Flowmeters, Performance evaluation, Solar heating, *Solar collectors, Solar cooling systems.

A description is given of the flow metering calibration facilities at the National Bureau of Standards that pertain to solar collectors and the instrumentation required to evaluate their performance. Alternative methods are also briefly described for obtaining the quantified assurance that the pertinent flow measurements are as good as they are quoted to be. Flow metering problem areas are also discussed with suggestions for preventative or remedial action.

Rating Procedure for Solar Domestic Water Heating Systems.

Final rept., S. A. Klein, and A. H. Fanney. 1983, 10p Sponsored by Department of Energy, Washington, DC. Office of Solar Heat Technologies.
Pub. in Jnl. of Solar Energy Engineering 105, n4 p430-

439 Nov 83.

Keywords: Ratings, Standards, Tests, Reprints, *Solar water heating, Residential sector.

A rating procedure for solar domestic hot water systems is described which combines the advantages of short-term system tests and correlations of long-term thermal performance. The testing procedure consists of two indoor tests which are in accordance with ASHRAE Standard 95-1981 except for one additional measurement needed only for systems employing a heat exchanger between the collector fluid and the po-table water. The test results are plotted in a manner in which they can be used to estimate the long-term performance of the solar water heating system for any lo-cation where site-specific monthly-average meteorological data are available. The annual solar fraction obtained in this manner provides the recommended rating indicator. The validity of this rating procedure is first demonstrated by simulations. Further support is provided by experiments conducted at the National Bureau of Standards.

Laboratory Tests of a Gas Fueled Modulating Type

Hot Water Boller, E. R. Kweller. Apr 85, 59p NBSIR-85/3142 Sponsored by Department of Energy, Washington, DC.

Keywords: *Boilers, *Hot water heating, Space heaters, Simulation, Fuel consumption, Gas furnaces, Efficiency, Tests, Heat transfer, *Gas fired.

The objective of this study was to set up a modulating controlled hot water boiler in the laboratory and to simulate a variety of conditions that were cited by manufacturers of boilers as influencing and being distinct operating parameters for boilers. A further objective of these tests was to compare these responses of the fuel input rate with the mode of operation which was previously described for modulating controlled space heaters and furnaces. The variation of controlled fuel rate to the burner via the fuel modulating valve was measured under several controlled conditions. Effects of heating load, burner cycling rate and zone control, were investigated. The response of gas pressure modulation to the burner of a hot water boiler heating system was studied in several series of tests in the laboratory. A boiler load simulator was set up and used for these tests to control the heating load (heat transfer rate at the radiators) and to simulate a variety of operating conditions that would be expected to exist with a boiler installed in the home. The effects of heat transfer rate and boiler water operating temperature on the modulated gas pressure are presented as a series of data in charts showing controlled gas pressure versus time.

Recent Developments in Self-Contained Cryo-

coolers for SQUIDS and Other Low-Power Cryoelectronic Devices.

Final rept..

Pub. in Proceedings of Int. Cryogenic Engineering Conference (10th), Helsinki, Finland, July 31-August 3, 1984, p13-19.

Keywords: *Refrigerators, Cryogenics, *Cryocoolers, SQUID devices.

The particular requirements of refrigeration for very low power cryoelectronic devices have been addressed only during the last few years. A number of laboratory prototypes are now near realization, and commercial systems may be available soon. These include Stirling and Gifford-McMahon machines and a four-stage Joule-Thomson machine, or a combination of one of the former with a final Joule-Thomson stage to achieve 4K, and small liquid-helium cryostats with integral intermittent reliquefying capability. The most difficult technical problem outstanding is to design reliable, non-contaminating, miniature compressors for these machines.

Analysis of the Forced Ventilation in Container-

ship Holds.

Final rept., H. R. Baum, and J. A. Rockett. 1984, 34p Sponsored by Coast Guard, Washington, DC. Pub. in Jnl. of Fluid Mechanics 142, p309-342 1984.

Keywords: *Ventilation, *Cargo ships, Mass transfer, Fluid flow, Computer programs, Hazardous materials, Fires, Reprints, Fire models.

An analysis of the fluid flow and mass transfer induced by ventilation systems in containership holds was carried out. The analysis consists of a detailed calculation of the forced motion through an interconnected set of narrow, stably stratified vertical air passages which represent an idealized containership hold. The results of the calculation are then used in a study of the concentration boundary layers formed by the pickup of spill material assumed to lie at the bottoms of the air passages. The results are incorporated in a computer program which is described in detail. A variety of computed results are presented, together with a listing of the program.

Passive and Hybrid Solar Energy Div.
Pub. in Proceedings of the Passive and Hybrid Solar
Energy Update, Washington, DC., September 5-7, 1984, p38-42.

Keywords: *Walls, Concrete blocks, Masonry, Test fa-cilities. Heat measurement, Calorimeters, Thermal cilities, Heat measurement, Calorimeters, Thermal measurements, Heat transfer, *Passive solar heating systems, *Energy storage, *Solar collectors.

Studies of the thermal performance of passive solar buildings have indicated a need for precise measurement of solar and thermal energy transfer in modular passive/hybrid solar components under conditions of actual use. A calorimetric test facility designed for performance testing of passive solar components provided test data for several passive solar components during 1983/1984 winter test season. A description of the test facility is presented along with a summary description of four collector-storage wall (CSW) components tested. One of these components, a CSW consisting of a double-glazed window and non-vented concrete masonry block wall with a radiatively selective foil on the outer surfaces was characterized using transfer function techniques. The study suggests that the transfer function analysis technique is well suited for correlating dynamic heat transfer measurements to the environmental variables of solar irradiance and ambient temperature.

The paper examines the energy effect of sensing errors of an air handling system. The energy waste caused by errors of various automatic control sensors in a variable air volume system are simulated with a computer program and the results are presented and discussed. Some sensing errors cause substantial energy waste. The paper also describes the causes of sensing errors frequently seen in an air handling system - from building design and installation to building operation. Recommendations for minimizing these errors are given.

Laboratory Design and Test Procedures for Quantitative Evaluation of infrared Sensors to Assess Thermai Anomailes,

Y. M. Chang, and R. A. Grot. Jun 85, 86p NBSIR-85/ 3131

Sponsored by Department of Energy, Washington, DC. Prepared in cooperation with DCS Corp., Alexandria,

Keywords: *Infrared thermal detectors, Evaluation, Tests, Calibrating, Temperature, Buildings, Variability, Display devices, Infrared radiation, Heat loss, *Infrared thermography, Modulation transfer functions

The report presents the description of the laboratory apparatus and preliminary results of the quantitative evaluation of three high-resolution and two low-resolution infrared imaging systems. These systems which are commonly used for building diagnostics are tested under various background temperatures (from -20C to 25C) for their minimum resolvable temperature differences (MRTD) at spatial frequencies from 0.03 to 0.25 cycles per milliradian. The calibration curves of absolute and differential temperature measurements are obtained for three systems. The signal transfer function and line spread function at ambient temperature of another three systems are also measured. Comparisons of the dependence of the MRTD on background temperatures from the measured data with the predicted values given in ASHRAE Standards 101-83 are also included. The dependence of background temperatures for absolute temperature measurements are presented, as well as comparison of measured data and data given by the manufacturer. Horizontal on-axis magnification factors of the geometric transfer function of two systems are also established to calibrate the horizontal axis for the measured line spread function to obtain the modulation transfer function. The variation of the uniformity for horizontal display of these two sensors are also observed. Included are detailed descriptions of laboratory design, equipment setup, and evaluation procedures of each test.

Keywords: *Buildings, *Electric appliances, Standardization, Tests, Furnaces, Water heaters, *Energy efficiency standards, Energy consumption, Consumption rate, Energy efficiency.

The Energy Policy and Conservation Act (EPCA) as amended by the National Energy Conservation Policy Act (NECPA) requires the development of test procedures, labeling rules, and energy efficiency standards for consumer appliances. The purpose of this report is to re-evaluate selective parametric values through analysis of current data, and provide comment and recommendations. The parameters reviewed are: For water heaters - inlet water temperature, outlet water temperature, ambient air temperature, and hot water usage: for furnaces - outdoor design temperature and average annual heating hours; for room and central air conditioners - yearly hours of use. Each parameter reviewed is documented in an independent section in this report and indicates the current value, the historical basis for the current value, the approach used to review and update the value, the results and conclusions, and recommendations. The recommendations generally propose a new value for the parameter studied based upon the information analyzed.

Experimental-Technique for Testing Thermosyphon Solar Hot Water Systems. Final rept...

A. H. Fanney. 1984, 8p Sponsored by Department of Energy, Washington, DC. Pub. in Jnl. of Solar Energy Engineering-Transactions of the ASME (American Society of Mechanical Engineers) 106, 4 p457-464 1984.

Keywords: *Performance tests, Evaluation, Ratings, Reprints, *Solar water heating, *Thermosyphon effect, Solar collectors.

An experimental technique for testing thermosyphon solar hot water systems is described which allows testing of the system indoors under nonirradiated conditions. The technique described is applicable to thermosyphon systems which utilize flat-plate solar collectors. Energy normally absorbed by the irradiated solar collectors is supplied by electric strip heaters attached to the back side of the absorber plates. Analytical expressions are developed which allow the power input to the strip heaters to be calculated for various environmental conditions. A description of the experimental apparatus and test procedure is given. Results are presented which show that the performance of a thermosyphon system tested indoors using the electric strip heater technique closely duplicates system perform-ance under outdoor irradiated conditions.

Keywords: *District heating, *Thermal measurement, Standards, Two-phase flow, *District cooling, Energy conservation.

A workshop on thermal metering (i.e., the flow of steam or of hot or chilled water) was convened in Gaithersburg, MD, May 21-22, 1984 to discuss and prioritize flow rate measurement problems and research programs which could lead to improved energy conservation through the development, acceptance, and use of district heating and cooling systems. The workshop brought together 60 attendees whose expertise spanned a broad range of interests. Included were flowmeter manufacturers, meter users, standards personnel, academicians, and consultants. Attendees listed current problem areas and measurement needs in thermal metering, discussed appropriate responses to these needs, and prioritized these according to their perceived potential for impacting thermal metering practices. Leading this list are: 'paper' standards with special emphasis on 'meter installation requirements', research on two-phase flow and its measurement, two-phase flow technology transfer and information dissemination.

A building emulator can be used to test energy management and control systems (EMCS). The emulator uses a computer program to simulate the responses of a building including the equipment, building space, and building envelope to EMCS commands. Building model software for the emulator has been developed at the National Bureau of Standards (NBS) in an effort to assist the United States Naval Civil Engineering Labo-

MECHANICAL, INDUSTRIAL, CIVIL, AND MARINE ENGINEERING—Field 13 Air Conditioning, Heating, Lighting, and Ventilating—Group 13A

ratory (NCEL), which is developing a sophisticated building emulator. The concept of the building emulator and the building emulator computer program are described in this report. The program includes the weather, the air handling unit, the zone, and the comfort model. In addition, the energy compilation routine is also included. The models presented here are simplified models. With these abridged models, a single zone building with exterior walls and a single deck handling unit are simulated. A complete FORTRAN source code of the building emulator computer program is appended.

Indoor Air Quality Modeling Workshop Report,
P. E. McNall. May 85, 16p NBSIR-85/3150

Sponsored by Environmental Monitoring Systems
Lab., Research Triangle Park, NC.

*Air pollution control, *Mathematical models, *Regulations, Absorption, Air circulation, Na-

tional government, *Indoor air pollution, *Air quality.

Comprehensive modeling of emission, absorption, movement, and controls of indoor air contaminants is essential for developing national policy for IAQ assessment and controls. This report describes several topics discussed in a workshop on indoor air quality, which was held on February 11, 1985 at the National Bureau of Standards. Researchers on IAQ modeling were invited to state their current activities, identify future research needs and recommend specific parameters and contaminants to be included in the IAQ models. The input thus obtained in this workshop will be incorporated in an advanced simulation model for IAQ, to be developed by NBS under a contract with EPA.

Paratransit Advanced Routing and Scheduling System Documentation: Routing and Scheduling

Dial-A-Ride Subsystem, H. K. Hung, W. G. Hall, and R. E. Chapman. Jul 85, 146p NBSIR-85/3178

Sponsored by Urban Mass Transportation Administration, Washington, DC.

Keywords: Routing, Scheduling, Algorthms, Fortran, *Paratransit, *Dial a ride systems, Computer software, Advanced Routing and Scheduling System.

Advanced Routing and Scheduling System (ARSS) is a software system designed to route and schedule patrons in a dial-a-ride environment. The system consists of three subsystems: CONENV, a preprocessor which constructs physical and policy environments; RSDAR, which routes and schedules patrons; and GREPOR, which generates hard copy of all necessary reports. This report provides a description of RSDAR. The RSDAR is a heuristic algorithm. It assigns patrons to form subtours in time intervals, and these subtours are linked to become a tour. Patrons are chosen to be included in a subtour on the basis of the best remaining time of the base trip. Subtours are selected to be included in a tour on the basis of the best productivity measure. The model is written in FORTRAN and complies with the American National Standards Institute X3.9-1978 standard for that language.

Statistical Aspects of Designs for Studying Sources of Contamination.

Final rept.

W. Liggett. 1985, 19p Pub. in American Society for Testing and Materials, Special Technical Publication 867, p22-40 1985.

Keywords: *Statistical analysis, *Environmental sur-*Ground water, *Waste management,

waste disposal, Sources, Design criteria, Sampling, Sites, Experimental design, Water pollution, Assessments, Reprints, *Pollution monitoring, *Waste processing plants.

A design for studying sources of environmental contamination must start with a basis for distinguishing the contamination of interest from the background. As part of this basis, the design should provide a method for assessing the sampling and measurement error. Because of problems with reports of none detected, the design should also include a plan for analyzing intermediate laboratory results in addition to the reported values. This paper discusses these aspects of design in the context of monitoring the groundwater around a waste management facility. A design appropriate for spatially and temporally varying backgrounds is proposed and illustrated with monitoring results from Alabama and Florida. To assess the sampling error, the proposed design specifies resampling each well after a period of a few days. Experiments to check this procedure are suggested. The proposed design incorporates and supplements the Environmental Protection Agency laboratory method for total organic halide. In addition, this paper illustrates some difficult design problems that involve nonnormality and nonlinear measurement methods.

Evaluating the Risks of Solid Waste Management

Programs: A Suggested Approach. Final rept.,

R. E. Chapman, and H. Yakowitz. 1984, 18p Pub. in Resour. Conserv. 11, n2 p77-94 Nov 84.

Keywords: *Waste management, *Mathematical models, Substitutes, Risks, Monte Carlo method, Cost analysis, Capitalized costs, Assessments, Reprints, *Solid wastes, *Resource recovery facilities.

The focus of the paper is on how the Resource Recovery Planning Model (RRPLAN) can be used to evaluate the risks associated with alternative solid waste management programs. The paper first discusses how RRPLAN uses a detailed cost accounting framework to weigh the consequences of decisions affecting siting, routing, marketing and financing. A case study of the tri-county area surrounding Jackson, Mississip pi, where two waste-to-energy facilities are compared to an all landfill option, is then introduced. The case study shows how a coordinated sensitivity analysis can be used to develop a cost estimating relationship between the discounted cost per ton of processing at a waste-to-energy facility and three explanatory variables: (1) the capital cost of the facility; (2) the volume of waste processed; and (3) revenues from the sale of recoverables and any associated tipping fees. A Monte Carlo experiment is then performed to show how variations about the expected values for the three explanatory variables affect the risk of the program. The probability that the discounted cost per ton of the waste-to-energy facility exceeds that of the all landfill option is used as a risk assessment mechanism.

Validation of Models for Predicting Formaldehyde Concentrations in Residences Due to Pressed Wood Products. Phase 1,

R. A. Grot, S. Silberstein, and K. Ishiguro. Sep 85, 148p NBSIR-85/3255

Sponsored by Consumer Product Safety Commission, Washington, DC.

Keywords: *Formaldehyde, *Mathematical models, *Residential buildings, *Wood products, Safety, Houses, Air pollution, Temperature, Humidity, Assessments, Concentration(Composition), *Indoor air pollution, *Air quality, *Consumer products.

The interim report describes procedures and presents results of the first phase of a laboratory project undertaken at the National Bureau of Standards for the Consumer Product Safety Commission (CPSC). The purpose of the ongoing project is to assess the accuracy of emission and indoor air quality models to be used by CPSC in predicting formaldehyde (HCHO) concentrations in residences due to pressed-wood products made with urea-formaldehyde bonding resins, namely particleboard underlayment, hardwood-plywood pan-eling and medium-density fiberboard (MDF). In phase

I, these products were characterized in 'medium-size' dynamic measuring chambers by measuring their HCHO surface emission rates over a range of HCHO concentrations, at 23C and 50% RH. They were then installed in a two-room prototype house and the equilibrium HCHO concentrations were monitored as a function of air exchange rate. Excellent agreement was obtained between measured HCHO concentrations and those predicted by a mass-balance indoor air quality model. In the next phase, the study will be re-peated at various different temperatures and relative humidities so that models predicting HCHO emission rate as a function of temperature and humiditv can be tested.

Criteria and Design Guidelines for Reduced-Size Vents for One and Two Story Housing Units. Final rept.,

R. Wyly, and L. S. Galowin. 1985, 26p Sponsored by Department of Defense, Washington, DC., and Department of Housing and Urban Development, Washington, DC

Pub. in ASPE Jnl. of Engineered Plumbing 1, n2 p97-

Keywords: *Residential buildings, *Plumbing, *Vents, Hydraulic test units, Measurement, Ventilation, Re-

The report describes hydraulic tests of drain-wastevent systems with reduced-size vents installed in single-family housing units at Andrews Air Force Base Camp Springs, Maryland. The vent systems of six field units were sized according to a procedure based on findings in prior laboratory investigations. The tests reported were conducted on three of the units before oc-cupancy. Principal measurements made were trapseal reduction and pneumatic pressure excursions in selected vents, using test procedures developed in the laboratory and adapted to field conditions. Results of the preoccupancy tests showed adequate performance with the reduced-size vents. A procedure for the design of reduced-size vent systems is presented that should be of interest to plumbing designers and groups engaged in updating plumbing codes.

Keywords: *Ventilation, *Air pollution, Contaminants, Energy, Air flow, Circulation, Models, *Indoor air pollution, Computer applications.

Development of infiltration and interroom airflow calculation methods, driven by a concern for indoor air quality have led to a computer simulation of interroom contaminant movement. The model, which assumes fully

501,022 111

Field 13—MECHANICAL, INDUSTRIAL, CIVIL, AND MARINE ENGINEERING **Group 13B—Civil Engineering**

mixed room air, shows that open doorways provide rapid mixing between rooms in buildings using forced air heating. It also confirms that it is most energy efficient to remove the contaminant nearest its source. Detailed modeling of the variations in contaminant concentration within a room is not presently feasible. The concept of ventilation effectiveness should provide sufficient accuracy and reasonable computing speed to be added to some existing energy analysis programs. Current energy analysis programs with long timesteps tend to run into convergence problems when solving the system performance and interroom airflows simultaneously. Short timestep simulation may be required. The need for computer modeling is dem onstrated by the subtle behavior of a very simple system which removes contaminants by forced ventilation.

Maturity Method: Theory and Application. Final rept.,

N. J. Carino, 1984, 13p

Pub. in Cement, Concrete and Aggregates 6, n2 p61-73 1984.

Keywords: *Concretes, *Strength, Hardening(Materials), Theories, Mortars(Materials), Predictions, Thermodynamic properties, Temperature, Time, Reprints, *Maturity method, Arrhenius equation, Aging(Materials).

The maturity method may be used to predict the inplace strength of hardening concrete based on its thermal history. This paper presents a theoretical basis for the maturity method. The general form of the time-temperature function is found to be the time integral of the rate constant. For the case of linear dependence between temperature and the rate constant, the timetemperature function becomes the traditional maturity function. The Arrhenius equation is shown to be an ac-curate representation of the temperature dependence of the rate constant, and the concept of equivalent age is explained for practical application of the Arrhenius equation. It is explained how the accuracy of strength prediction by the traditional maturity method can be improved by using the proper datum temperature. Results illustrate that the appropriate value of apparent activation energy or datum temperature for concrete may be obtained from strength-gain data of isothermally-cured, mortar specimens.

Upgrading Plumbing Vent Systems in Rehab Buildinas.

L. S. Galowin, and F. Winter. Dec 84, 5p Pub. in Heating/Piping/Air Conditioning 56, n12 p113-

Keywords: *Venting, *Buildings, *Plumbing, Circulation, Vents, Performance evaluation, Drains, Traps, Wastes, Reprints, *Retrofitting.

Rehabilitation, modernization, or renovation of existing buildings, as a resource to be conserved or recycled and reused, frequently imposes increased loads on the plumbing water supply and drainage system. An experimental laboratory investigation of 'circulation loop' modification to the drain-waste-vent (DWV) system to relieve the marginal performance of existing installations is reported. The experimental evaluations of the performance of the modified system and a conventional system were undertaken for a variety of wastewater load simulated conditions with various plumbing fix-tures and multistory soil stack loads. The performance parameters considered were evaluation of trap seal failures and siphonic action of the water closets. Also, the dynamic responses to pressure excursions and air flow rate distributions in the branches were measured. Both systems were tested to the limiting condition for single-stack performance over a range of air flow variations into the soil and vent stack.

Urea-Formaldehyde Foam Insulations: A Review of

Their Properties and Performance.

Technical note (Final), W. J. Rossiter, and R. G. Mathey. Mar 85, 74p NBS/

Sponsored by Department of Energy, Washington, DC. Also available from Supt. of Docs as SN003-003-02641-7.

Keywords: *Thermal insulation, *Urea formaldehyde resins, Performance, Buildings, Standards, Cellular plastics, Properties, Energy conservation, Retrofitting, Indoor air pollution.

This report presents a review of the properties and performance of urea-formaldehyde foams pertinent to their use as thermal insulation for buildings. The review is based primarily on existing published literature. The factors affecting the performance of these insulations are listed and discussed. Included among these factors are durability, effect on energy conservation, effect on other building materials, fungus resistance, shrinkage, and temperature and humidity effects on foam. A key issue involving the use of urea-formaldehyde foam insulation is its release of formaldehyde, other gases, and particulates into the air of residences. Information concerning the release of these agents is summarized.

Not available NTIS National Bureau of Standards, Gaithersburg, MD. Effects of Maximum Void Size and Aggregate Characteristics on the Strength of Mortar. Final rept.,

L. I. Knab, J. R. Clifton, and J. B. Ings. 1983, 8p Pub. in Cement and Concrete Research 13, n3 p383-390 May 83.

Keywords: *Mortars(Materials), Voids, Aggregates, Flexural strength, Reprints.

The effects of the maximum void size and aggregate surface roughness and shape on the flexural strength of mortar were investigated. Substantial reductions in the maximum void size and air content of high strength quartz aggregate mortars resulted in flexural strength increases. However, these increases were lower than predicted by the Griffith theory, thus indicating that the maximum void size did not act as the critical flaw controlling the flexural strength. Rather, factors relating to the cement-aggregate bond, including aggregate roughness and surface area, appeared to affect the flexural strength more than the maximum void size.

Alkali-Silica Reaction in Concrete. Final rept. Nov 83-Jan 85, L. J. Struble. Mar 85, 38p NBSIR-85/3116 Grant NSF-CEE82-10791

Keywords: *Concretes, *Alkalies, *Silicon dioxide, cements, Aggregates, Cracks. Mortars (Material), Tests, Chemical reactions.

Reaction in concrete between alkalies from the reaction in concrete between alkalies from the cement and reactive silica in the aggregate may cause expansion and cracking, and occasionally may cause significant weakening of the structure. The objective of this program is to determine whether there is any influence of the alkali mineralogy in the cement on the expansion of mortar due to alkali-silica reaction. The ex-perimental approach consisted of determining the dis-tribution of alkalies within a group of commercial port-land cements with a variety of alkali mineralogies, and measuring expansion of mortar bars prepared using these cements and various reactive aggregates. In some cases, differences were observed in both level and rate of expansion for cements differing in alkali mineralogy. The differences were substantial with cements high in alkali and with opal as the reactive constituent. The results support the authors hypothesis that the specific alkali mineralogy of the cement af-fects the expansion due to alkali-silica reaction.

Assessment of Needs for New Thermal Reference

B. Rennex. May 85, 92p NBSIR-85/3146 Sponsored by Department of Energy, Washington, DC.

Keywords: *Calibrating, *Thermal measuring instru-ments, *Thermal insulation, Construction materials, Thermal measurements, Heat transfer, Thermal conductivity, Thermal resistance, Temperature.

Thermal insulation specimens are required by users to calibrate their heat transfer apparatuses. This report assesses the need for additional calibration specimens to cover a wider range of test conditions and materials. It examines two major sources of measurement error related to the use of calibration specimens. The first is due to the lack of uniformity over a specimen area and the second is due to systematic apparatus errors which vary with the values of specimen mean temperature and thermal conductivity. Possible solutions to these problems are given, based on information obtained from users in universities, industry, and government laboratories. These include recommendations to provide calibration specimens over a wide range of values of specimen temperature and thermal conductivity.

Fracture Toughness of Polymer Concrete Materials Using Various Chevron-Notched Configura-

Final rept., R. F. Krause, and E. R. Fuller. 1984, 16p Sponsored by Department of Energy, Washington, DC.

MECHANICAL, INDUSTRIAL, CIVIL, AND MARINE ENGINEERING—Field 13

Construction Equipment Materials, and Supplies—Group 13C

Pub. in American Society for Testing and Materials, Special Technical Publication 855, p309-323 1984.

Keywords: *Fracture strength, Acrylonitriles, Notch tests, Crack propagation, Reprints, *Polymer concretes, Stress intensity factors.

The fracture toughness of two similar polymer concrete materials was determined using several fracture mechanics configurations to show any influence of crack geometry on resistance to fracture in these materials. The testing configurations included a conventional straight-through notch in a flexure bar and various chevron-notched geometries in both flexure-bar and short-rod specimens. The materials were polymerized mixtures of monomers, anhydrous Type III portland cement, and silica sand. In one composition the monomers were styrene and trimethylolpropane-trimethacrylate; whereas, in the other composition, acrylonitrile was added as well. The fracture toughness was calculated from published stress-intensity coefficients for the straight-through notch which were adapted for use with a chevron notch by assuming that the derivative of the compliance with respect to crack length was the same for both notch types. Effects of varying chevron-notched angle, chevron-vertex posi-tion, and width of specimen in the crack plane were examined.

Sponsored by Air Force Engineering and Services Center, Tyndall AFB, FL. Prepared in cooperation with Naval Civil Engineering Lab., Port Hueneme, CA.

Keywords: *Roofing, *Siding, *Maintenance, Coatings.

Recommendations and guidelines are presented for condition assessment and maintenance of the exterior surfaces of factory coated metal siding and roofing. The metal siding and roofing products commonly en-countered on Air Force installations are addressed. The types of deterioration of metal buildings and appropriate methods of repair and maintenance procedures are related to the materials and construction practices used. The results of field observations of the condition of many types of coatings on metal siding and roofing in varying states of deterioration are re-ported. A quantitative condition assessment procedure was developed for exterior surfaces of metal buildings and consists of two parts. First, the condition of the siding and roofing of the building is evaluated using inspection forms, visual standards, and descriptions of levels of deterioration. In the second part, recommended maintenance procedures are determined using the evaluation data and analytical procedures which were developed. Visual standards and detailed coating failure descriptions were developed in order to identify and categorize the condition of the metal siding and roofing of buildings.

Behavior of Furniture Frames during Fire.

Rept. for 1 Oct 83-30 Sep 84, G. S. Springer. May 85, 58p NBS/GCR-85/494 Grant NB83-NADA-4019

Keywords: *Fires, *Furniture, Frames, Evaluation, Behavior, Tests, Wood products, Mathematical models, Mechanical properties, Strength, Fasteners, Failure, Temperature, Time measurement, Residential buildings, Construction materials, Fire tests, Computer ap-

The objective of the investigation is to evaluate the behavior of furniture frames during fire. Tests were performed measuring the strengths and deflections of wooden (southern pine) bends and joints exposed to elevated temperatures. The times to failure were also determined. A model was developed describing the strengths of wooden bends. Building on this model, a computer code was written which can be used to calculate the strengths of bends at room temperature. The code will serve as a basis for calculating the changes in strengths at elevated temperatures and for predicting the failure time.

Final rept.,

J. Pommersheim, and J. R. Clifton, 1985, 10p. Pub. in Materiaux et Constructions 18, n103 p21-30

Keywords: *Concrete, *Life(Durability), *Mathematical models, *Accelerated tests, *Degradation, *Service life, Scale(Corrosion), Corrosion, Reprints.

The paper discusses development of accelerated tests and mathematical models for predicting the durability of concrete. Durability, service life, and degradation factors are defined and accelerated test methods are contrasted to conventional comparative methods. Factors and mechanisms of concrete degradation are reviewed, as are efforts to quantify these phenomena. Deterministic and stochastic models are discussed. Procedures for developing accelerated tests are pre-sented and applied to a hypothetical example involving freeze-thaw damage. Advantages and disadvantages of accelerated testing and mathematical modeling are discussed in terms of the degradation mechanisms affecting concrete. Examples given of the modeling approach and service life prediction include the prediction of the strength and maturity of concrete, acid attack on cement, sulphate attack, and the effect of scaling and corrosion on load-bearing capacity of concrete.

Pub. in Conservation of Historic Stone Buildings and Monuments, p287-311 1982.

Keywords: *Consolidation, *Building stones, Performance evaluation, Service life, Construction materials, Field tests, Laboratory equipment, Reprints

Mechanisms by which stone consolidants function are outlined. Evaluation of stone consolidants usually requires both laboratory and field tests to determine their initial and long-term performances. ASTM Standard E 632, Recommended Practice for Development of Accelerated Short-Term Tests for Prediction of the Service Life of Building Materials and Components, can be used to provide guidance on the test program. Materials which have been investigated as stone consolidants are reviewed. They fall into four main groups: inorganic materials, alkoxysilanes, synthetic organic polymers, and waxes. A universal stone consolidant does not exist, but epoxies, acrylics, and alkoxysilanes are the most commonly used consolidants.

Specifications for masonry and other construction materials are expected to move gradually over the next several years toward the adoption of probability-based limit states criteria for design. The paper illustrates how such criteria might be developed for brick and concrete masonry construction using, as an example, masonry walls loaded in combinations of axial compression and our-of-plane flexure. The paper shows the type of data that are necessary and how that data can be manipulated within the probabilistic framework to develop probability-based resistance criteria.

Fitness-for-Service Criteria for Pipeline Girth-Weld Quality.

Final rept

R. P. Reed, M. B. Kasen, H. I. McHenry, C. M. Fortunko, and D. T. Read. Jul 84, 80p See also PB84-165448. Sponsored by Department of Transportation, Washington, DC. Office of Pipeline Safety Regulation.

Pub. in Proceedings of Welding Research Council Bulletin No. 296, 80p Jul 84.

Keywords: *Welded joints, *Pipelines, Weld defects, Quality assurance, Criteria, Nondestructive tests, Ultrasonic tests, Crack initiation, Fatigue(Materials), Inspection, Acceptability, Weldments, Reprints.

Criteria have been developed for applying fitness-forservice analyses to flaws in girth welds. A critical crack-opening-displacement elastic-plastic fracture mechanics model was developed and experimentally verified. Procedures for constructing flaw acceptance curves based on this model are provided. A significantly improved ultrasonic method for detecting and dimensioning significant weld flaws was developed. The probability of crack initiation from blunt flaws was shown to be very low under severe low-cycle fatigue. Suggestions are offered for technical implementation of field inspection procedures and for practical implementation of the flaw acceptance criteria.

T. V. Galambos, T. A. Reinhold, and B. Ellingwood. 1982, 13p

Pub. in Jnl. of the Structural Division, American Society of Civil Engineers 108, n12 p2668-2680 Dec 82.

Keywords: *Service life, *Joints(Junctions), Mechanical properties, Probability theory, Statistical analysis, Bolted joints, Limits, Design criteria, Resistance, Steels, Reprints, *Slip.

The serviceability limit state for slip of bolted steel joints is the slip-resistance. The statistical properties of the parameters which define this resistance are presented and discussed. Based on these properties and using First-Order Second-Moment probabilistic analysis, limit-states design criteria are developed for friction-grip bolted joints.

Nonmetallic Composites in Space Dewars.

M. B. Kasen. 1984, 9p Pub. in Proceedings of 1983 Space Helium Dewar Conf., Huntsville, AL., August 24-26, 1984, p171-179.

Keywords: *Dewar flasks, *Composite materials, Pressure vessels, Epoxy matrix composites.

A review of past and present usage of nonmetallic composites in cryogenic dewars and pressure vessels is presented. Particular attention is paid to the extent to which advances in cryogenic composite technology offer new approaches to fabricating thermally efficient systems. It is concluded that more efficient dewar support members can be fabricated by correct utilization of materials in particular temperature ranges. It is further concluded that fabrication of improved cryogenic container vessels is possible utilizing current knowledge of the factors influencing cryogenic performance under thermal and mechanical cyclic loading.

Monocrystal Elastic Constants in the Ultrasonic Study of Welds. Final rept.,

H. M. Ledbetter. Jan 85, 5p

Sponsored by National Science Foundation, Washington, DC.

Pub. in Ultrasonics 23, p9-13 Jan 85.

Keywords: *Welded joints, *Ultrasonic tests, Elastic properties, Reprints.

For studying welds ultrasonically, the importance of knowing the material's single-crystal elastic constants, the C sub ijs, is explained. Where these constants are not known, some guidelines are given for estimating them from polycrystalline elastic constants such as Young's modulus and the shear modulus. The important case of (001) fiber texture is considered. Being transversely isotropic, the case exhibits five macroscopic elastic constants, which are related to the three cubic elastic constants: Csub 11, Csub 12, Csub 44. From the five constants the angular variations of Young's modulus, the torsional modulus, and the sound velocities can be computed. For the same (001) fiber texture, results are given for a standard well-characterized material--copper, where the C sub ijb are well

Ductile-to-Brittle Transition in Steel Weldments for Arctic Structures,
F. Zia-Ebrahimi. Apr 85, 66p NBSIR-85/3020
Sponsored by Minerals Management Service, Reston,

Keywords: *Weldments, *Welded joints, Fracture properties, Steels, Ductile brittle transition, Cold weather construction, Microstructure, Crack initiation.

The report summarizes the work performed in support of the development of fracture criteria for steel weldments in arctic structures. The ductile-to-brittle transition behavior of a shielded metal-arc weld, typical of steel weldments in arctic structures, has been studied. Fracture toughness, Charpy V-notch impact energy, and tensile properties have been measured as a function of temperature throughout the ductile-to-brittle transition range. The effect of geometric dimensions on fracture toughness has been studied for three geometries of single-edge-notch-bend (SENB) specimens. The fracture surfaces of broken specimens have been characterized by scanning electron microscopy (SEM). The microstructure of the multiple-pass weldment has been studied by optical microscopy. The mechanical properties of the steel weldment have been compared to the base metal, an ABS grade EH36 steel in normalized condition.

Experimental Results for Fitness-for-Service Assessment of HY130 Weidments.

Final rept. Oct 81-Sep 82, D. T. Read. Mar 84, 95p NBSIR-84/1699 Sponsored by Naval Sea Systems Command, Wash-

Keywords: *Weldments, *Quality assurance, Assessments, Welded joints, Steels, Cracks, Residual stress, Steel HY130, Fracture(Mechanics), J integrals.

Applied J-integral values for through and surface cracks in HY130 weldments and for surface cracks in HY130 base metal have been measured using a previously developed technique. The applied J-integral is taken as a measure of the crack driving force. The results confirmed previous conclusions, namely, the strong effect of deformation pattern on applied J-integral values, the utility of the J-integral estimation curve for fitness-for-service assessment in cases of gross section yielding (crack size less than 1 percent of load-bearing cross-section), and the need to consider ligament yielding behind surface cracks.

Keywords: Fracture properties, *Pipelines, *Welded joints, Mechanical properties, Cracking(Fracturing), Failure, Defects, Reprints, *Fracture(Mechanics).

Fracture mechanics methods have been used to proracture mechanics methods have been used to provide a basis for assessing the significance of defects in pipeline girth welds. Analytical models based on fracture mechanics technology are developed to establish predicted critical defect sizes for sharp, circumferential defects in pressurized pipe. The general problem considered here is that of a surface defect in a plate, i.e. they use the flat plate analogy for a pipeline. Failure is considered to occur when the ligament runtures and considered to occur when the ligament ruptures and provides a leakage path. The fracture mechanics model used, called the collapsed ligament model, is based on the work of Erdogan and Bakioglu which is in turn based on the Dugdale model. The collapsed liga-

Mapping Principles for the Standards Interface for Computer Alded Design,
L. A. Lopez, and S. L. Elam. Feb 85, 40p NBSIR-85/3115

Keywords: *Building codes, *Design standards, Mapping, Construction, Data processing, *Computer aided design, Analysis, Data bases.

Integrated computed aided design has great potential for increasing the quality and efficiency of the design process. However, building designs are subject to requirements expressed in standards (including project-specific cnteria, specified national standards and build-Ing codes). Standards must be incorporated correctly and efficiently in the computer aided design process in order that the process be correct and efficient. Standards must be programmed for data processing, checked for consistency with the project and legal rechanged or updated when these requirements are changed or updated. Programs for standards, applications programs for design, and project data bases should be distinct, but integrable, to permit each to be developed independently, but then to be widely applicable in association with other programs. Techniques developed for standards analysis, systhesis and expression (SASE) are extended to allow SASE representations. pression (SASE) are extended to allow SASE representations of standards to serve as programs expressing the standards for use in computer aided design. Mapping principles are derived to define the data interface requirements between SASE representations of standards and applications programs.

Keywords: *Reviews, *Production control, Manufacturing, Automation, Robots, Industrial plants, Production engineering, *Flexible manufacturing systems, Computer aided manufacturing.

The paper presents a survey of the existing literature on machine scheduling from the perspective flexible manufacturing systems. It is the first of a series of papers planned to document research in scheduling for the Automated Manufacturing Research Facility (AMRF) at the National Bureau of Standards. An overview of the hierarchical production planning process is given. The paper covers deterministic, non-preemptive scheduling of open shops, since a typical flexible manufacturing system (FMS) operates under these conditions. Both due-date based and flow-time based objections. tives are addressed for single stage single machine, single stage parallel machines, flow shops and job shops. Research in assembly line balancing is similarly covered since it is possible to treat an FMS as a transfer line for repetitive discrete manufacture. The analytical approaches to these problems have focussed primarily on the objectives of maximizing production rate, minimizing in-process inventory, and maximizing machine utilization.

Simulation Model for the Automated Manufactur-

ing Research Facility,
N. Raman. Aug 85, 55p NBS/GCR-85/498
Sponsored by National Bureau of Standards, Gaithersburg, MD.

Keywords: *Industrial plants, *Manufacturing, Mathematical models, Automation, Robots, Production control, *Computer aided manufacturing, Microcomputers, Discrete event system, SIMAN programming lanquage.

The paper presents a simulation model for investigating and validating the operating policies of the Automated Manufacturing Research Facility (AMRF) at the National Bureau of Standards for the June 1985 configuration. The model is written in SIMAN, and runs on any microcomputer which can be run under the MS-DOS operating system. The model represents the AMRF as a discrete-event system and consists of two segments. The values of the system parameters are presented in the Experimental Frame segment. The output includes pertinent statistics such as utilization of each workstation, number of jobs waiting at each workstation, average flow time and average tardiness of jobs of each part type. Procedures for interfacing the simulation output with the LOTUS 1-2-3 graphics package are also included. The impact of different operating policies and scheduling rules can be studied by making relatively minor changes in the Block Diagram. Alternatively, the effect of altering the values of the system parameters can be investigated by making suitable changes in the Experimental Frame.

Virtual Manufacturing Cell. Final rept.

C. R. McLean, H. M. Bloom, and T. H. Hopp. 1983,

Pub. in Proceedings of the IFAC/IFIP Symposium on Information Control Problems in Manufacturing Tech-nology 1982 (4th), Gaithersburg, MD., October 26-28, 1982, p207-215 1983.

Keywords: *Production control, *Manufacturing, Automation, Routing, Scheduling, Artifical intelligence, Machining, *Computer aided control systems, Computer files, National Bureau of Standards.

A virtual manufacturing cell is being developed at the National Bureau of Standards as part of the control software for the Automated Manufacturing Research Facility (AMRF) project. The traditional group technology cell has evolved from the need to provide the flexibility to manufacture a family of parts while maintaining the efficiency associated with a single process flow line. Group technology cells normally require a fixed physical grouping of machining workstations for each class of parts. A shop based upon virtual manufacturing cells provides greater flexibility than existing shop configurations through the time sharing of machining workstations. Virtual cells are not identifiable as fixed physical groupings of machinery, but as data files and processes in the control computer. Given this structure, the shop level control system must now schedule the activation of job cells and the allocation of workstations to these cells. In this configuration, a workstation will always be under the control of a particular virtual cell or a pool cell (that is composed of idle, untasked workstations). Functions that the virtual cell will perform include analysis, reporting, routing, scheduling, dispatching, and monitoring.

Carver. 1981, 29p Pub. in Proceedings of Annual Seminar on Microelectronics Measurement Technology (3rd), San Jose, CA., March 17-18, 1981, v6 p1-29

Keywords: *Microelectronics, *Test equipment, Electronics industry, Integrated circuits, Measurement, Materials, Production control, Control equipment, Performance evaluation, Reprints.

The trend toward smaller devices in larger integrated circuits makes assurance of product functionality in-creasingly difficult. The results of measurements from specially designed microelectronic test structures can be a critical ingredient in process characterization and control, two of the primary factors affecting circuit functionality. Test structures can be used to evaluate

IC materials, to evaluate and control process uniformity, to measure and control device and circuit parameters, to quantify the occurrence of process-related random faults, and to evaluate processing equipment performance. Electrical test structures and test methodologies reviewed here have been developed for rapid automated measurement of a variety of parameters. Simple, fast, visual correlations of the parameters in the form of wafer maps provide information about yield-reducing variations in parameters. Examples of such correlations are discussed.

Interface Depth Resolution of Auger Sputter Profiled Ni/Cr Interfaces: Dependence on Ion Bombardment Parameters.

Final rept.,
J. Fine, P. A. Lindfors, M. E. Gorman, R. L. Gerlach, and B. Navinsek. 1985, 5p
Pub. in Jnl. of Vacuum Science and Technology A3, n3 p1413-1417 May/Jun 85.

Keywords: *Sputtering, *Interfaces, Thin films, Depth, Width, Nickel, Chromium, Ion beams, Reprints, Auger spectroscopy.

Interface broadening which often results as a consequence of sputter profiling can make it difficult to assess the structure of an original interface. There are a number of factors involved in this broadening which are associated with the parameters of the ion bom-bardment and which have not previously been evaluat-ed. Sputter profile measurements obtained on a set of similarly fabricated Ni/Cr multilayered thin-film strucexamine this interface broadening dependence on ion beam energy, ion current density, and angle of incidence, all as a function of sputtered depth. Results are presented of such a set of Auger sputter depth profile measurements and indicate that there can be dramatic changes in sputtered interface widths depending on the ion bombardment parameters used.

J. A. Simpson. 1983, 5p Pub. in Proceedings of IFAC/IFIP Symposium (4th) on Information Control Problems in Manufacturing Tech-nology, Gaithersburg, MD., October 26-28, 1982, p9-13 1983.

Keywords: *Standards, *Industrial plants, Automation, Machine tools, Process control, *Flexible manufacturing systems, *Research facilities, Computer aided manufacturing.

The program focuses on two problems lying close to the core mission of the National Bureau of Standards. First, how will the automated factory ensure that its products are dimensionally compatible with national standards. Second, what new national standards must be developed by the private sector to permit the increased productivity promised by automation to be re-alized in a free market economy. To explore these problems, an extremely flexible manufacturing re-search facility, with hierarchical, highly modular control architecture is being installed. This facility is designed to be capable of emulating a wide variety of manufacturing cells typical of a small machine shop.

EMAT (Electromagnetic-Acoustic Transducer) Synthetic Aperture Approach to Thick-Weld Inspection.

R. E. Schramm, and J. C. Moulder. 1985, 8p Sponsored by Naval Sea Systems Command, Wash-

Pub. in Review of Progress in Quantitative Nondestructive Evaluation, v4A p225-232 1985.

Keywords: *Nondestructive tests, *Ultrasonic tests, Inspection, Weldments, Transducers, Ultrasonic frequencies, Signal to noise ratio, Computer applications.

The paper describes developments in a system based on electromagnetic-acoustic transducers (EMATs) as an approach to automated nondestructive evaluation of thick weldments. Good signal-to-noise ratios, were possible through careful design of the transducers and associated electronic circuits and the use of signal averaging. At 454 kHz, the transducers produce shearhonzontal waves of approximately 7-mm wavelength in steel. The long wavelength permits determination of through-thickness flaw depth from the amplitudes of scattered ultrasonic waves. A minicomputer controlled transducer positioning and acquired the digitized ultra-sonic waveforms for synthetic aperture processing. The synthetic aperture technique further improved signal quality and yielded flaw localization through the weld thickness.

N. G. Dagalakis. 1983, 23p Sponsored by Robotics International, Dearborn, MI.

Pub. in Proceedings of International Symposium on Industrial Robots and Robots 7 (13th), Chicago, IL., April 17-21, 1983, Applications Worldwide, v1 p 7.73-7.95.

Keywords: *Robots, Performance, Detection, Defects.

The use of two techniques for the detection of the presence of defects in robot arms was investigated. Two different types of defects were simulated on a PUMA 600 robot. A defect on the operation of the robot wrist joint controller and loosening of the robot end effector. Both techniques were able to detect the presence of the defects. Ways are suggested for de-termining the seriousness of each defect. At least in the case of the end effector loosening, the nature and seriousness of the defect seem to be easy to determine.

Pub. in Proceedings of SPIE Technical Symposium East 82, 336 p142-153 1982.

Keywords: Robots, Cameras, *Robot vision, Six degrees of freedom.

There are six degrees of freedom that define the position and orientation of any object relative to a robot gripper. All six need to be determined for the robot to grasp the object in a uniquely specified manner. A robot vision system under development at the National Bureau of Standards is designed to measure all six of these degrees of freedom using two frames of video data taken sequentially from the same camera posi-tion. The system employs structured light techniques; in the first frame, the scene is illuminated by two parallel planes of light, and in the second frame by a point source of light.

Keywords: *Control equipment, *Robots, Detectors, Control theory, *Interactive control, Real time, Hierarchies.

A hierarchical architecture is described for a robot integrated into a real-time sensory interactive factory control system. In this architecture, high level goals are decomposed through a succession of levels, each producing strings of simpler commands to the next lower level. The bottom level generates the drive signals to the robot actuators. Each control level is a separate process with a limited scope of responsibility. Each performs the generic control function of sampling its input and generating appropriate outputs. The input is characterized by three types of data - a command from the next higher level, processed sensory data, and status feedback from the next lower level. The outputs are of three types - a command to the next lower level, a request for sensory information to the processing module at the same level, and a status feedback to the next higher level. This paper describes this generic control structure and its implementation in a real-time sensory-interactive control system for a manufacturing

Concepts for a Real-Time Sensory-Interactive Control System Architecture. Final rept

A. J. Barbera, M. L. Fitzgerald, and J. S. Albus. 1982,

Sponsored by Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Electrical Engineering, and Computer Society (IEEE), Los Alamitos, CA.

Pub. in Proceedings of Annual Southeastern Symposium on System Theory (14th), Blacksburg, VA., April 15-16, 1982, p121-126.

Keywords: *Control equipment, *Feedback control, Robots, Real time, *Interactive control, Hierarchies.

The paper describes concepts used in defining an architecture for a real-time sensory-interactive control system. These concepts were arrived at from testing and evaluating different control system strategies at the National Bureau of Standards. A hierarchical task decomposition architecture has been used to structure the complex information processing for real-time sensory interactive robot control in a manageable form This structure consists of a number of generic control levels. The task of a generic control level is to sample its input state and generate an appropriate response output state which results in a partial decomposition of its task command. Sensory feedback is provided by a processing structure of modules that are coupled with the appropriate control levels. The requirement that the system must be designed for ease of human com-prehension has led to an implementation using a statetable processing structure. Real-time response results from a multiple processor implementation using synchronized communications through a common memory.

Adjustment of Robot Joint Gears Using Encoder Velocity and Position Information.

Final rept.,

N. G. Dagalakis, and D. R. Myers. 1985, 6p Pub. in International Jnl. of Robotic Systems 2, n2 p229-234, 1985.

Keywords: *Robots, Gears, Setting(Adjusting), Algorithms, Linkages, Systems engineering, Reprints.

A new technique for the adjustment of joint gears in industrial robots is presented. Band-limited random excitation signals were injected into the drive system of the joint under test, and both the actuator shaft velocity and position were monitored. The coherence func-tions between the voltage at the terminals of the electric actuator and the position and velocity signals were determined. The change in the coherence functions was studied for various joint gear settings. An algorithm is proposed for determining the gear setting which results in the most linear operation of the joint drive system. This algorithm was tested on the adjustment of the gears of the wrist rotation joint of a PUMA 560 robot arm.

Adjustment of Robot Joint Gear Backlash Using

the Robot Joint Test Excitation Technique.

Final rept., N. G. Dagalakis, and D. R. Myers. 1985, 15p Contract N00014-83-K-0236

Sponsored by Office of Naval Research, Arlington, VA Pub. in International Jnl. Robotics Research 4, n2 p65-79, 1985.

Keywords: *Robots, *Gears, Joints(Junctions), Adjusting, Backlash, Reprints, *Robotics, System identifica-

A technique has been developed for the precise adjustment of gear backlash of the joints of an industrial robot. Band limited random excitation signals were injected into the drive system of the joint under test, and the output response of the joint link was monitored using an accelerometer. The coherence function was measured and used to adjust the joint gear backlash in order to minimize the effect of the backlash nonlinearity on the joint drive system. Tests were performed while the joint was both loaded and unloaded and for several different steady state positions. The test results indicate that this technique can be used for both the adjustment of the joint gears and the periodic automatic inspection of their condition.

Visual Feedback for Robot Control.

Final rept.,

M. Shneier, S. Nagalia, J. Albus, and R. Haar. 1982,

Sponsored by Institute of Electrical and Electronics Engineers, Inc., New York.

Pub. in Proceedings of 1982 Workshop Industrial Applications of Machine Vision, Research Triangle Park, NC., May 3-5, 1982, p232-236.

Keywords: *Robots, *Feedback control, Visual perception, Positioning, Rangefinding, Sensory perception.

The roles of three kinds of visual information in robot control are discussed. Range information, obtained from a plane-of-light triangulation system is used in conjunction with floodlighting to find the three dimensional positions and orientations of parts and to calculate their shape properties. Information obtained from successive frames is used in a simple manner to provide feedback in approaching and acquiring a part. The three kinds of information, acting together, provide for fast and reliable object acquisition.

In February 1980, an interagency work group undertook a study of at-sea incineration and the alternatives available to the Federal Government for encouraging the design, construction, and operation of U.S.-flag incinerator ships. The group examined previous incineration operations, various federal assistance programs, safety and control measures, incinerator ship conceptual designs, environmental impacts, and waterfront facilities. This paper presents the findings of the work group and the work program which the Interagency Review Board has initiated. Important ship design factors, such as the regulatory requirements, incinerator technologies, and incinerator system research recommendations, are explained. Details of a conceptual dual-mission ship design, that can incinerate both liquid wastes and solid wastes, are given. Anticipated operating permits, environmental monitoring, and wastes. operating permits, environmental monitoring, and waterfront facilities are discussed.

This Government owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of patent available Commissioner of Patents, Washington, DC 20231 \$1.00.

Keywords: *Valves, *Patents, Safety devices, Instruments, Pressure control, PAT-CL-137-496.

A typical embodiment of the invention provides a means for protecting delicate instruments from damage. A flexible membrane separates two chambers in which, during ordinary operation, the fluid pressures are the same. One of the two chambers also serves as a fluid conduit in the system. Pressure loss in the system causes the higher pressure chamber to flex the membrane which closes a port in the fluid conduit chamber, thereby preventing further system pressure

loss and consequent equipment damage. The membrane, moreover, can have a small bleed to permit gradual, dampened fluid pressure release.

Preliminary Study of the Vertical Stack to Horizontal Drain Entry Condition as an Extension to the Modeling of Unsteady Partially Filled Pipe Flow,
J. A. Swaffield, and L. S. Galowin. Feb 85, 54p
NBSIR-8674306 NBSIR-85/3108

Prepared in cooperation with Brunel Univ., Uxbridge (England).

Keywords: *Plumbing, *Drains, *Pipe flow, Design, Pipes(Tubes), Drainage, Vents, Mathematical models, Finite difference theory, Graphs(Charts), Discharge, Buildings.

The finite difference based method of characteristics model for unsteady partially filled pipe flow was ex-tended to include the stack to horizontal drain entry boundary condition. The conditions at drain entry are defined in terms of the energy of the terminal annular flow velocity in the stack, together with an appropriate loss coefficient as the entry function. The hydraulic solutions link the branch drains, fittings, vertical soil stack and building drain. The analysis permits any combination of drainage load patterns from simultaneous, overlapping or sequence of discharge events. Preliminary simulations utilizing this model indicates that the modeling technique extends the existing horizontal network analysis program to a simulation of multistory building drainage systems. The sizing procedure deter-mines the hydraulic capacity of drains for specified pipe sizes, pipe pitch and well roughness factors.

Development of a Fire Evaluation System for Detention and Correctional Occupancies,

H. E. Nelson, and A. J. Shibe. Dec 84, 123p NBSIR-84/2976

Sponsored by Department of Justice, Washington, DC.

Keywords: *Fire safety, *Evaluation, Safety devices, Buildings, Sprinkler systems, Fire protection, Facilities, Requirements, Design, *Correctional institutions, Evacuation egress, Fire codes.

A Fire Safety Evaluation System for Detention and Correctional Occupancies has been developed. It can be used for determining if a facility has fire safety equivalent to that obtained by meeting the requirement of a given code. The system was calibrated for use with proposed chapters for detention and correctional occupancies of the Life Safety Code (1985). There are separate sets of requirements for each of four use conditions; one for zoned egress, one for zoned impeded egress, one for impeded egress, and one for contained. Within each set, there are two levels of evaluation: one for partially sprinklered and non-sprinklered buildings, and one for totally sprinklered buildings.

Grant NB83-NADA-4047

Keywords: *Enclosures, *Fires, Fluid flow, Buoyancy, Penetration, Smoke, Thermal measurements, Velocity measurement, Air flow, Fire hazards, Flow rate, Compartment fires, Room fires.

An experimental investigation of the nature of the velocity and thermal fields in negatively buoyant flows generated in enclosure fires is carried out. The flow configuration considered is that of a negatively buoyant two-dimensional jet discharged adjacent to a vertical surface, as well as that discharged away from the boundaries of the region. Such flows are frequently encountered in enclosures due to the downward turning of the flow induced by the fire plume, at the corners of the ceiling. Similarly, wall flows generated in the upper stably stratified region in room fires penetrate into the cooler, lower region. In these cases, the buoyancy force is upward while the flow is downward, resulting in a negatively buoyant circumstance. An experimental system is developed to study the downward penetration of such jets in which the buoyancy force opposes the flow. The penetration distance is measured and re-lated to the inflow conditions, particularly the tempera-ture and velocity at the discharge location. 501,088 PB85-179729 PB85-179729 PC A03/MF A01 National Bureau of Standards (NEL), Gaithersburg, MD. Keywords: *Buildings, *Evacuating(Transportation), Fire safety, Networks, Mathematical models, EVAC-NET computer program, Computer applications, Means of egress.

This report summarizes the efforts of the third and final year of a project to develop EVACNET+, a user friendly computer program that models building evacuations. When the evacuation of a building involves the flow of people through well defined passageways, it is natural to consider the evacuation problem to be a network flow problem. EVACNET+ is a user friendly interactive computer program that accepts a user defined network model of a building, converts that model to a time expanded dynamic 'transshipment' network, and solves the dynamic network problem using a capacitated minimum cost network flow algorithm. The solution obtained gives a time-dependent plan to evacuate the building in a minimum time, and identifies building evacuation bottlenecks. In the first year of the grant, EVACNET+ was developed to the point of preliminary testing. During the second year, the coding of EVAC-NET+ was completed and a user's manual was written. This final year of the grant concentrated on research related to extensions of the EVACNET+ concept. Areas of research included investigating: Timevarying extensions of EVACNET+; A model controlled adjustment option; Integration of EVACNET+ with other models; New solution procedures for EVAC-NET+; Expanded model input and editing functions; A result data base analysis system. A microcomputer version of EVACNET+ was also developed for the IBM PC or equivalent.

Literature Survey on Drop Size Data, Measuring Equipment and Discussion of the Significance of Drop Size in Fire Extinguishment,

W. D. Hayes. Jan 85, 31p NBSIR-85/3100 Sponsored by Federal Emergency Management Agency, Washington, DC.

Keywords: *Drops(Liquids), *Fire extinguishing agents, Size determination, Measuring instruments, Spraying, Water, Nozzles, Fire fighting.

The literature was searched for information and data on the size of water droplets from fire fighting equipment, on instrumentation and techniques for measuring droplet size in dense sprays, and on the signifi-cance of droplet size in water sprays used for fire extinguishment. Included is a discussion of droplet size information on an impinging jet type fire hose nozzle. Droplet size analyzers that use shadowgraphic technique are likely to be best suited for measuring sprays from fire hose nozzles. The effects of droplet size in water sprays used for extinguishment in confined and unconfined spaces and with and without counterflowing air currents is discussed.

Included in Research and Innovation in the Building Regulatory Process: Proceedings of the NBS/NCSBCS Joint Conference (6th), Technical Seminar on Streamlined Administrative Procedures, Computers in Construction, and Fire Safety Technology held at Denver, Colorado on September 11, 1984, p117-130 Apr 85.

Keywords: *Fire resistance, *Buildings, Fire safety, Fires, *Evacuation, *Compartmentalization.

Compartmented fire resistive buildings are used for hotels, motels, apartments, condominiums, dormitories, hospitals, and other health care facilities. Several fires in compartmented fire resistive buildings were reviewed. Not all of those that were reviewed were used in this study, only those where reasonably accurate conclusions could be drawn as to whether the victims had evacuated or not.

Telephone Connected Early Warning and Communication System.

W. M. Smith. Apr 85, 5p Sponsored by National Bureau of Standards (NEL), Gaithersburg, MD. Center for Building Technology, and National Conference of States on Building Codes and Standards, Inc., Herndon, VA.

Included in Research and Innovation in the Building Regulatory Process: Proceedings of the NBS/NCSBCS Joint Conference (6th), Technical Seminar on Streamlined Administrative Procedures, Computers in Construction, and Fire Safety Technology held at Denver, Colorado on September 11, 1984, p131-135

Keywords: *Warning systems, *Telephone equipment, *Communication equipment, Buildings, Fire fighting, Fire safety, Smoke detectors.

This paper describes a new development in telephone engineering that provides two vital fire fighting functions - annunciation of smoke detectors by individual location, and one way voice communication to remote sections of buildings by zone or all-call using existing standard telephone equipment. This development creates an opportunity for advanced fire systems features to be put in place quickly and at low cost since most structures already have complete telephone system

Buoyant Plume-Driven Adiabatic Ceiling Tempera-

ture Revisited, L. Y. Cooper, and A. Woodhouse. Apr 85, 32p NBSIR-85/3134

Keywords: *Heat transfer, *Convection, *Fires, *Buildings, Coilings(Architecture), Plumes, Mathematical models, Walls, Adiabatic conditions, Temperature distribution, Research.

In previous works, the convective heat transfer from buoyant plume-driven ceiling jets to unconfined ceilings has been estimated using a formula for the temperature distribution below an adiabatic ceiling, Tad, obtained from experimental data. The present study re-evaluates this data, and develops an independent estimate for Tad. The analysis takes account of the estimate for rad. The analysis takes account of the effect of ceiling surface re-radiation, and use is made of the previously established similarity between plume/ceiling- and jet/wall-driven heat transfer phenomena. The latter similarity is the basis of a correlation of recently reported free jet-wall jet 'recovery temperature' data into a normalized Tad distribution. All of the analysis leads to new formulae for estimating the convective heat transfer to ceilings during enclosure

Analysis of Smoldering Fires in Closed Compartments and Their Hazard Due to Carbon Monoxide. Final rept.,

J. G. Quintiere, M. M. Birky, F. Macdonald, and G.

Smith. 1982, 2p See also PB82-257684.

Pub. in Fire and Materials 6, n3-4, p99-110 Sep-Dec

Keywords: *Buildings, *Fire hazards, *Carbon monoxide, Fire tests, Lethal dosage, Mathematical models, Risk, Reprints, *Room fires, *Smoldering fires, Computer applications.

A review was made of smoldering fire experiments conducted in closed rooms and buildings. The results were summarized by tabulating maximum levels of CO, the time integral of CO concentration ('dose'), CO2, temperature rise and oxygen consumption. A hazard time based on the attainment of a CO dose equal to 4.5% CO-minutes and the time for transition to flaming were also tabulated. The chance of reaching a critical CO condition during smoldering seems to be comparable to the chance of having transition to flaming occur. A theoretical model, requiring inputs of CO production rate and energy release rate, was executed and cornpared with available data. The theoretical results for CO concentration as a function of time were in good agreement with the experimental data. The model offers a means of extrapolating test data to compartments of various size in order to assess the general hazard of CO due to smoldering.

Design as a Function of Responses to Fire Cues. Final rept...

B. M. Levin. 1985, 6p

Pub. in Proceedings of Research and Design '85: Architectural Applications of Design and Technology Research, Los Angeles, CA., March 14-18, 1985, p289-

Keywords: *Buildings, *Design, *Fire safety, *Human behavior, Safety engineering, Architecture, Evacuation, Means of egress.

Studies of the actions of building occupants in fire emergencies show that people often do not initiate an evacuation immediately upon hearing an alarm or smelling smoke. Unless the size, location and danger of the fire is obvious, investigation is a likely action. In addition, ignoring the first signs of a fire is not a rare event. Once an evacuation is initiated, people often attempt to leave by the most familiar rather than most direct route and they often do not or cannot see and follow exit signs. The paper provides current state of the art guidance on how people respond in fire emer-gencies and how the architect can modify total designs (including alarms, public address systems, location of and approaches to emergency exits, etc.) to take advantage of the anticipated response of the occupants in danger. The information will aid the architect in developing designs that increase the likelihood that build-ing occupants will use the emergency evacuation system as the architect intended. 501.100

Calculations of the Heat Release Rate by Oxygen Consumption for Various Applications, Septem-

ber-October 1984.

Final rept., W. J. Parker. Oct 84, 6p See also PB82-192956.

Pub. in Jnl. of Fire Sciences 2, n5 p380-395 Sep/Oct

Keywords: *Fire tests, *Heat measurement, Computation, Calorimeters, Oxygen consumption, Formulas(Mathematics), Reprints, *Heat release rate, consumption, Room fires.

The calculation of heat release rate by oxygen consumption is based on the assumption that all materials release approximately the same amount of heat per unit mass of oxygen consumed. The technique is now being employed to determine the heat release rate of materials in various heat release rate calorimeters. Other uses include the heat release rate of assemblies other uses include the near release rate of assembles in the fire endurance furnaces and the total heat release rate in room fire tests. Various assumptions about CO levels in the exhaust duct and vitiation and humidity in the incoming air are made. General formulas for the heat release rate by oxygen consumption are developed in the paper from which the formulas for specific applications can easily be derived.

Economics of Fast-Response Residential Sprinkler Systems.

Final rept.,

R. T. Ruegg, and S. K. Fuller. 1985, 10p Pub. in Fire Jnl. 79, n3 p18-22/115-118 May 85.

Keywords: *Sprinkler systems, *Fire protection, Economic analysis, Decision making, Reprints, *Residential buildings, Life-cycle cost, Risk analysis, Benefits.

The article presents in brief, illustrates and discusses a model for assessing the economic feasibility of fast-response sprinkler systems for houses. The model calculates expected net present value benefits as they would accrue to the owner of a system, as well as break-even values for key decision variables. Nine hy-pothetical cases are based on the application of a specified system in a new, single-family dwelling, 'average' levels of fire risk as indicated by recent aggregate U.S. fire loss statistics, and sprinkler system performance based on the results of laboratory and field tests of system effectiveness. The results have implications of interest to the research and building com-munities concerned with the economics of home fire protection.

Literature Survey on Drop Size Data, Measuring
Equipment, and a Discussion of the Significance of Drop Size in Fire Extinguishment, W. D. Hayes. Jul 85, 31p NBSIR-85/3100/1 Sponsored by Federal Emergency Management

Agency, Washington, DC.

Keywords: *Fire extinguishing agents, *Drops(Liquids), Fire extinguishers, Fire fighting, Spraying, Water, Measurement, Fire hoses, Spray noz-

The literature was searched for information on the size of water droplets from fire fighting equipment, on in-strumentation and techniques for measuring droplet size in dense sprays, and on the significane of droplet size in water sprays used for fire extinguishment. From the information on drop size analyzers gathered, it is likely that analyzers using a shadowgraphic method to measure drop size are best suited for drop size measurements in water sprays from fire hose nozzles. The effects of droplet size in water sprays used for extinguishment is confined and unconfined spaces and with and without counterflowing air currents are discussed. The report supersedes the January 1985 edition (NBSIR 85-3100).

Jet Diffusion Flame Suppression Using Water

Sprays, Final Report,
B. J. McCaffrey. Jul 85, 58p NBSIR-84/2812-1
Supersedes PB84-159052. Sponsored by Minerals Management Service, Washington, DC.

Keywords: *Offshore drilling, *Fire protection, *Blowouts, Water, Spraying, Gas wells, Oil wells, Fire extinguishing agents, Nozzles, Thermodynamic equilibrium, Diffusion flames, Temperature, Fires, Retarding, Water spray.

The feasibility of using water sprays for the control of offshore oil/gas well blowout fires has been addressed. Considering the sheer scale of the problem, knowledge from a fundamental viewpoint is going to be required in order to extrapolate laboratory-sized flame studies up to full scale. Available data and ap-propriate literature concerned with the application of water sprays as a jet diffusion flame suppression/extinguishment agent have been reviewed. Small pneumatic atomizing nozzles using H2 gas, both as the flame source as well as the atomizing driver, have been used to scale high momentum jet flames and to study the effect of water on the flame. Thermodynamic equilibrium was shown to be an effective guide in interpreting the results. The effect of flame temperature reduction due to water sprays has been observed to cor-relate with a single spray parameter - the median drop

Applied Model Validation,
A. D. Davies. Jul 85, 32p NBSIR-85/3154/1

Keywords: *Fires, *Smoke, Temperature, Computation, *Fire models, *Toxic gases, Fire spread, Fire tests, Computer applications.

The progress report is about an applied model validation case study. The subject model is 'Transport of Fire, Smoke and Toxic Gases (FAST)' by W. W. Jones of the National Bureau of Standards, Center for Fire Research. Products from a fire in a 'burn room' exit through a connected corridor to outdoors. Cooler counterflow air in a lower layer feeds the fire. The model predicts corridor layer temperatures and thicknesses vs. time, given enclosure, fire and ambient specifications. Data have been collected from 38 tests using several fire sizes, but have not been reduced. Corresponding model results, and model and test documentation are yet to come. Considerable modeling and calculation is needed to convert instrument readings to test results comparable with model outputs so that residual differences may be determined. Test results as well as model results must be validated, and test result uncertainties estimated so that they are not unfairly attributed to the model.

Application of Models to the Assessment of Fire Hazard from Consumer Products.

Final rept.,

R. W. Bukowski. Aug 85, 32p NBSIR-85/3219 Sponsored by Consumer Product Safety Commission, Washington, DC.

Keywords: *Fire hazard, Mathematical models, Evaluation, Risk, Furniture, Bedding equipment, Toxicity, Combustion.

The differences among models of fire, fire hazard, and fire risk are described. The use of field, zone, and network models for fire hazard assessment is discussed. A number of available single and multiple compartment models are described. Key considerations with respect to the use of the current models by the Consumer Product Safety Commission for hazard assessment from upholstered furniture and mattress fires is presented. Modifications riecessary to improve the capability of these models for hazard assessment are identified. Model validation, output presentation, and data sources are discussed. Recommendations on specific models for the sponsor to consider for further study and use are provided.

Methods to Calculate the Response Time of Heat and Smoke Detectors Installed Below Large Unob-

structed Ceilings, D. D. Evans, and D. W. Stroup. Jul 85, 50p NBSIR-85/3167

Sponsored by Nuclear Regulatory Commission, Washington, DC.

Keywords: *Early warning systems, Safety devices, Computer programs, Heat measurement, Heat transmission, Detection, Reaction time, Feedback control, Fortran, *Smoke detectors.

Recently developed methods to calculate the time required for ceiling mounted heat and smoke detectors to respond to growing fires are reviewed. A computer program, that calculates activation times for both fixed temperatures and rate of rise heat detectors in response to fires that increase in heat release rate proportionally with the square of time from ignition, is given. This program produces equivalent results to the tables published in Appendix C, Guide for Automatic Fire Detector Spacing, (NFPA 72E, 1984). A separate method and corresponding program are provided to calculate response time for fires having arbitrary heat release rate histories. This method is based on quasisteady ceiling layer gas flow assumptions. Assuming a constant proportionality between smoke and heat release from burning materials, a method is described to calculate smoke detector response time modeling the smoke detector as a low temperature heat detector in either of the two response time models.

tion Systems,
J. R. Lawson. May 85, 165p NBSIR-85/3158
Errata sheet inserted. Sponsored by Veterans Administration, Washington, DC.

Keywords: *Fire tests, Steel structures, Fire resistance, Tests, Graphs(Charts), Structural members.

Two unique walk-on deck construction systems were exposed to the standard NFPA 251 time-temperature fire exposure for periods up to two hours in order to evaluate their fire performance. A large scale steel structure was used in the test program to simulate construction systems found in the field. The structure consisted of two large functional floors separated by an interstitial space in which a walk-on deck was suspended from the top functional floor. One of the walkon deck systems was constructed from lightweight concrete, and the second was built with poured gypsum. Critical components evaluated were the top functional floor, unprotected steel work in the interstitial space, the walk-on deck system, and protection for a heavy steel column located in the center of each test

bay. Test data were compared with the fire endurance test requirements of NFPA 251. Computer predictions also were made using the FIRES-T3 model to determine its ability to accurately predict the construction systems performance.

The paper gives an overview of the Harvard Computer Fire Code. Some background on mathematical fire modeling in general is given and then some of the assumptions and approximations made in the Harvard Mark 5 model are outlined. The capabilities of the model are then discussed, as well as the two variants, Mark 5.3 and Mark 6. The validity and reliability of the model are considered, and its weakest features noted. The requirements in terms of machine size, CPU time, and data are considered, as well as the input/output for (from) the program. Finally, how the program can be modified, plus plans for its future development, are outlined.

PB85-186906 PC A11/MF A01 Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Mechanical Engineering. Thermal Performance Testing and Mathematically

Modeling of Integral Collector Storage Solar Hot Water Systems.

Final rept., W. C. Thomas. Feb 85, 234p VPI-E-85-5, NBS/GCR-85/490

Grant NB82-NADA-3018

Sponsored by Department of Energy, Washington, DC. Office of Solar Heat Technologies.

Keywords: *Thermal measurements, Test equipment, Performance tests, Mathematical models, Efficiency, Irradiance, Temperature, Predictions, *Solar water heating, *Solar collectors.

An investigation was carried out to evaluate a possible alternative test method for integral collector storage solar hot water systems. The new test method is an alternative to the established consensus standard method which requires that integral collector storage systems be tested using a solar irradiance simulator. The concept behind the alternative method is to characterize the thermal performance of the solar collection elements in the integral system using standard test methods for conventional solar collectors. After measuring the efficiency and incident angle response, the integral collector storage hot water system would be tested using an electrical heat source to simulate the absorbed solar energy. The research included both experimental and analytical investigations on the col-

lector elements and on the complete system. All-day tests were performed on two commercial integral col-lector storage solar domestic hot water systems. Tests were performed under a variety of ambient conditions and irradiance levels. An analytical model was developed to predict the thermal performance of one of the systems. Predicted performance was compared with experimental results.

Acoustoelastic Evaluation of Arbitrary Plane Residual Stress States in Nonhomogeneous, Anisotropic Plates.

R. B. King, and C. M. Fortunko. Nov 83, 3p Pub. in Ultrasonics 21, n6 p256-258 Nov 83.

Keywords: *Residual stress, Theories, Normal stress, Velocity measurement, Nondestructive tests, Determination of stress, Evaluation, Homogenity, Secondary waves, Reprints, *Anisotropic plates, *Ultrasonic tests.

In this paper, it is shown that relative ultrasonic velocity measurements can be used to determine the difference of normal stress components in non-homogeneous, anisotropic plates containing arbitrary residual stress states. Previously the theory relating the veloci-ty of Shear-waves to stress and material anisotropy was limited to the case where the principal directions of stress are parallel to the axes of material symmetry. In this paper, the authors remove this restriction by extending the theory. They also suggest possible experimental procedures for validating the new theory.

Final rept., E. Simiu. 1982, 9p See also PB82-118084.

Pub. in Engineering Structures 4, n2 p66-74 1982.

Keywords: *Wind pressure, *Structural engineering, Stacks(Exhaust), Chimneys, Mathematical models, Dynamic response, Measurement, Aeroelasticity, Fluid flow, Vortices, Reprints.

The paper presents a review of fundamental research on the across-flow response of cylindrical structures immersed in a steaming fluid, and of practical procedures for the estimation of the across-wind response of vertical structures such as chimneys and stacks with circular cross-sections. The results obtained by using the procedures reviewed in the paper are compared with reported measurements of the response of a fullscale tapered chimney. This comparison shows that improvements are needed in the modeling of the across-wind response of chimneys and stacks.

In December 1981, the National Bureau of Standards investigated structural vibrations induced in the first floor of the 'D' wing of the main building of the Bureau of Engraving and Printing. In January 1985, additional measurements were performed to check whether there are any changes in the response characteristics of the floor systems which might indicate structural degradation. The results of these measurements are presented.

Keywords: *Building codes, *Standards, Classifications, Regulations, Variability, *Format, Data bases, Computer software.

Current research at the NBS Center for Building Technology (CBT) supports development of a common format for the model building codes. This study demonstrates an application of advanced techniques for standards analysis, synthesis and expression (SASE to code format development. Specifically, the SASÉ techniques allow model code provisions to be stored in specialized databases, classified for easy access, and displayed in conjunction with any candidate code format. By 'mapping' the technical contents of existing model codes onto various candidate formats, each candidate may be evaluated as to the extent to which it adequately contains and provides access to code provisions. Moreover, the mapping technique permits an-alysts to determine whether or not the provisions of any individual code have been properly or logically classified. Results of CBT's research will facilitate the more rational development of a common format for model building codes.

Keywords: *Safety, *Structures, *Construction, Loads(Forces), Reinforced concrete, Buildings, Shor-*Construction,

A technique is proposed which can be used with reasonable accuracy to determine the effects construction loads have on the structure capacity of a rein-forced concrete building. The technique accounts for different types of slab construction, variations in concrete strength throughout the structure, and the nature of different shoring and reshoring systems. The technique uses the equivalent frame method to determine moments and shear forces produced in the structure by the imposed construction loads, and compares these resultants to the shear and moment capacity of the structure at various stages of construction.

Included in Research and Innovation in the Building Regulatory Process: Proceedings of the NBS/ NCSBCS Joint Conference (6th), Technical Seminar on Streamlined Administrative Procedures, Computers in Construction, and Fire Safety Technology held at Denver, Colorado on September 11, 1984, p71-82 Apr

Keywords: *Beams(Supports), *Reinforced concrete, *Building codes, Automation, Regulations, Design, *Compliance.

Building regulations in their various forms are an important part of the construction industry because they establish standards of quality which are intended to assure at least minimal levels of performance and safety. Automated constraint processing, i.e., checking the characteristics of a given design against the minimum characteristics required by regulation via computer, permits extensive and complex regulations to be more comprehensively and accurately utilized.

D. Hammerman. Apr 85, 4p Sponsored by National Bureau of Standards (NEL), Gaithersburg, MD. Center for Building Technology, and National Conference of States on Building Codes and Standards, Inc., Herndon, VA.

Included in Research and Innovation in the Building Regulatory Process: Proceedings of the NBS/ NCSBCS Joint Conference (6th), Technical Seminar on Streamlined Administrative Procedures, Computers in Construction, and Fire Safety Technology held at Denver, Colorado on September 11, 1984, p113-116 Apr 85.

Keywords: *Fire protection, *Building codes, Fire safety, Design, Buildings, Construction, Regulations.

Building codes and fire codes have placed a great deal of emphasis on fire safety design criteria. Fire safety criteria in the codes are the accumulation of provisions based upon the role of judgment and gathering of historical and scientific data. And this approach has not been without considerable gain in the prevention of fires and reduction in the loss of life in buildings. Recognizing the lack of sophisticated fire data of years ago, it is apparent that the entire subject of building construction classifications and building size limitations must be studied to produce more scientificallybased results.

PB85-200087 PC A04/MF A01 National Bureau of Standards (NEL), Gaithersburg, MD. Center for Building Technology. influence of Block and Mortar Strength on Shear Resistance of Concrete Block Masonry Walls, K. Woodward, and F. Rankin. Apr 85, 74p NBSIR-85/3143

Keywords: *Masonry, *Concrete blocks, *Walls, Failure, Tests, Mortars(Materials), Shear strength, Axial stress.

Data from seventeen masonry wall panel tests are presented. All of the walls are ungrouted, unreinforced, and constructed with hollow concrete block. The primary variables in the test series are block and mortar strength, but the applied vertical compressive stress strength, but the applied vertical compressive stress and wall aspect ratio are also varied. The walls are built with either a 'high' strength block or a 'low' strength block having gross area unit strengths of approximately 1800 psi and 1300 psi, respectively. The mortar is either a Type S or Type N mortar and, for convenience, is identified as high and low strength mortar, respectively. Thirteen of the wall panels have nominal dimensions of 64 in. long x 64 in. high x 8 in. thick, but two of the walls are 96 in. long and the remaining two walls are 48 in. long. The applied net area maining two walls are 48 in. long. The applied net area vertical compressive stress is constant for a given test, but varies between 100 psi and 400 psi for tests in the series reported herein. The walls are tested in the NBS Tri-directional Test Facility using fixed-ended boundary conditions at the top and bottom of the walls. A vertical compressive stress is applied and maintained while inplane lateral displacements are imposed at the top of the wall.

Final rept., E. Simiu. 1984, 6p

Pub. in Jnl. of Archit. Plan. Res. 1, n3 p175-180 1984.

Keywords: *Structural engineering, Earthquakes, Urban development, Wind pressure, Buildings, Developing countries, Reprints, *Earthquake engineering, Earthquakes, Low cost housing.

It is shown in this note that incremental expansion schemes pose special and delicate structural design problems that arise from the evolutionary nature of the building process in sites and services projects. A first type of problems arises if an initial but incomplete shelter core is provided on the site. In that case efficient ways must be found to ensure the structural integrity of the initial construction. A second type of problem is due to the difficulty of tying successive incremental portions of the dwelling both to the initial construction and among themselves in such a manner as to create systems that are structurally sound at all times. Without due attention to such problems the resulting construction can be unnecessarily uneconomical as well as constituting a serious hazard to life and property in case of earthquake or tropical cyclone. The purpose of this note is to illustrate these two types of problems by using examples of shelter construction in actual sites and services projects.

Application of the Performance Concept to Fire

Safety in Health Care Facilities.

Final rept.,

R. E. Chapman, and W. G. Hall. 1982, 11p Sponsored by Department of Health and Human Serv-

ices, Washington, DC.

Pub. in Proceedings of ASTM/CIB/RILEM Symposium (3rd), Lisbon, Portugal, March 29-April 2, 1982, on Performance Concept in Building: Advances in the Development of the Concept and Its Application in Rehabilitation, v1 p481-491.

Keywords: *Fire safety, *Hospitals, Economic analysis, Mathematical programming, Building codes, *Health facilities, Nursing homes.

The identification of cost-effective levels of fire safety in health care facilities is a major concern to hospital administrators, fire safety engineers and public policy makers. The prohibitive costs of strict compliance to the prescriptive provisions of the National Fire Protection Association's Life Safety Code (NFPA 101) in hospitals and nursing homes has led to the development of an equivalency methodology, the Fire Safety Eval-uation System. Three topics are described briefly in this paper. They are: (1) The Fire Safety Evaluation System; (2) a mathematical programming procedure which identifies least-cost compliance strategies; and (3) an indication of the cost-saving potential of the Fire Safety Evaluation System.

Treatment of Accidental Loads and Progressive

Failures In Design Standards.

B. Ellingwood. 1981, 17p Pub. in Structural Safety and Reliability, p649-665

Keywords: *Structural design, Loads(Forces), Structural engineering, Building codes, *Structural failure, Structural reliability.

Accidental loads not presently considered in the design of most structures may have catastrophic con-sequences if they occur. If the structure is not properly designed and detailed, a local failure resulting from the accidental load may initiate a chain reaction of failures throughout a major portion of the structure. The development and implementation of design procedures to control the effects of accidental loads and progressive failures is discussed in the paper. The probability of the initiating event and the probability of a structural failure when the event occurs are both considered. Loading criteria are given for the loads that the damaged structure must carry in order to prevent a progressive failure from initiating from a zone of local damage.

Removing Regulatory Constraints to Building Rehabilitation.

Final rept.,

J. H. Pielert, and C. J. Dinezio. 1982, 11p Sponsored by American Society for Testing and Materials, Philadelphia, PA.

Pub. in Proceedings of ASTM/CIB/RILEM Symposium (3rd) on Performance Concept in Building: Advances in the Development of the Concept and Its Application in Rehabilitation, Lisbon, Portugal, March 29-April 2, 1982, v1 p469-479.

Keywords: *Buildings, *Renovating, *Regulations, Building codes, Requirements, Massachusetts.

The paper reports on the formulation of a regulatory concept for the rehabilitation of existing buildings by the National Bureau of Standards in consultation with other representations of the U.S. building community and its implementation by the State of Massachusetts. The proposed regulatory concept discussed in this paper allows rehabilitation of existing buildings without necessarily meeting all new construction code requirements. Recognizing that their statewide building code was a constraint to rehabilitation. Massachusetts dewas a constraint to rehabilitation, Massachusetts developed new code provisions for existing buildings based on this concept. The resulting Article 22 of the State Building Code utilizes a performance approach which allows compliance alternatives in lieu of strict compliance with the prescriptive provisions of the code for new construction. The impact of Article 22 is discussed along with a case study illustration.

Predictive Service Life Testing of Structural and

Building Components.

Final rept., L. W. Masters. 1982, 11p Pub. in Structural Use of Wood in Adverse Environ-ments, p425-435 1982.

Keywords: *Structural analysis, *Service life, *Structural members, Forecasting, Depreciation, Aging tests(Materials), Buildings, Wooden structures, Evaluation, Reprints, Accelerated life tests.

The paper describes the methodology by which service life data can be obtained and the problems encountered in predicting service life from short-term(or predictive service life) tests. A systematic approach aimed at reducing the problems encountered in predictive testing is described. The approach provides guide-lines for evaluating existing predictive service life tests and for developing new, more reliable tests as they are needed. Application of the systematic approach to many components is limited, at present, because of the lack of knowledge regarding exposure conditions and mechanisms of degradation. Despite these limitations, however, the approach is useful in (1) identifying the data needed to develop more definitive tests, (2) ensuring the best possible test is developed, and (3) providing a uniform approach to service life prediction and the reporting of the results.

Cost Impact of the NEHRP (National Earthquake

Hazards Reduction Program) Recommended Provisions on the Design and Construction of Bulldings.

Final rept.,

S. F. Weber. 1985, 19p Sponsored by Federal Emergency Management Agency, Washington, DC. Pub. in Societal Implications: Selected Readings, p1-1

- 1-19 1985.

Keywords: *Building codes, *Construction costs, *Cost analysis, Design standards, Regulations, Safety factor, Earthquake resistant structures, Reprints.

The paper provides some information on the approximate cost impacts resulting from implementation of the NEHRP (National Earthquake Hazards Reduction Program) Recommended Provisions (Building Seismic Safety Council 1984 a) and proposes research to obtain improved estimates of cost impacts. The information is derived from the 52 case studies of the Building Seismic Safety Council (BSSC) trial design program conducted in 1983-84 and based on an amended version of the Applied Technology Council's Tentative Provisions for the Development of Seismic Regulations for Buildings (ATC Tentative Provisions).

Economic Considerations in Insulating Masonry and Wood-Frame Walls of Single-Family Housing. Final rept.,

S. R. Petersen. 1979, 19p Sponsored by American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc., Atlanta, GA., and Department of Energy, Washington, DC.

Pub. in Proceedings of the American Society of Heating, Refrigerating and Air-Conditioning Engineers/Department of Energy-Oak Ridge National Laboratory Conference on Thermal Performance of the Exterior Envelopes of Buildings, Kissimmee, Florida, December 3-5, 1979, p522-540 1981.

(eywords: *Residential buildings, *Economic analysis, Walls, Insulation, Masonry, Evaluation.

Maximum economic levels of insulation in masonry walls are expected to be lower than those for woodframe walls in many parts of the United States for two distinct reasons: (1) insulation costs are significantly higher for masonry walls, and (2) energy savings are somewhat lower because of differences in the dynamic thermal performance of the two wall types. The report examines the impact of both of these factors in determining economically optimal insulation levels for several types of wall construction used in single-family housing, over a wide range of geographic locations.

Roof Management Programs,
W. J. Rossiter, W. C. Cullen, and R. G. Mathey. Nov 85, 61p NBSIR-85/3239

Prepared in cooperation with Cullen (William C.) Associates, Potomac, MD. Sponsored by Postal Service, Washington, DC.

Keywords: *Roofs, *Construction management, Roofing, Design, Maintenance.

Roof management programs are used by private and public sector organizations in the United States to help assure that low-sloped roofing systems will perform as intended over their intended service lives. This report reviews those programs. Three general types of roof management programs are identified and discussed. The three types of roof management program currently conducted are: (1) total roof management which treats the design, construction, and maintenance of new and existing roofing; (2) new construction management dealing with design and installation; and (3) maintenance management which considers the maintenance and repair of existing roofs. Four elements are considered essential to an acceptable roof management program: (1) the roof system criterion; (2) quality assurance; (3) quality control; and (4) responsibility. In addition to the roof management programs that have been developed in the private and public sectors, several companies have organized to provide owners with total or partial roof management services.

Benefit-Cost Analysis, Life-Cycle Costing and

Value Engineering.

Final rept.,
H. E. Marshall. 1984, 9p
Pub. in Proceedings of International Symposium on Building Economics (3rd), Ottawa, Canada, July 18-20, 1984, p15-23.

Keywords: *Benefit cost analysis, Cost analysis, Value engineering, Evaluation, Buildings, Economic analysis.

The common theme that ties together benefit-cost (BC), life-cycle (LCC), and value engineering (VE) analyses is that each is concerned with improving the allo-cation of resources. This overview of Session A de-fines some of the common types of economic analysis approaches used in building evaluations, discusses both how they are alike and different, identifies prob-lem areas, and describes current research to overcome those problems. The overview is intended to provide some perspective of how the different types of analyses are related. Papers in Session A are cited to illustrate the points made in the overview.

censing and, possibly, for foreign licensing. Copy of patent available Commissioner of Patents, Washington, DC 20231 \$1.00.

Keywords: *Test equipment, *Patents, *Bonding, Laminates, Substrates, PAT-CL-73-150.

An apparatus for measuring the strength of a bond between a lamina and its substrate, or the like is shown and described. Air, or some other fluid under pressure, causes a gasket to protrude from a piston to seal the atmosphere from a chamber within the piston and the adjacent exposed lamina surface. The fluid also pressurizes this chamber to pull a loading fixture and a portion of the lamina attached thereto away from the substrate. The force required to pull the lamina from the substrate is equal to the strength of the bond.

Systems for Monitoring Changes in Elastic Stiffness in Composite Materials.

R. D. Kriz. Filed 22 Jul 82, patented 19 Feb 85, 6p PB85-176550, PAT-APPL-6-400 571 Supersedes PB83-108779.

This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of patent available Commissioner of Patents, Washington, DC 20231 \$1.00.

Keywords: *Patents, *Ultrasonic tests, *Fiber composites, Monitoring, Elastic properties, Stiffness, Degradation, PAT-CL-73-599.

Traversing energy flux transmitted into a fiber/matrix composite structure is propagated through the structure in directions which vary depending upon the elastic stiffness condition of the composite. Degradation in elastic stiffness of the composite, from any cause, will result in variations in the direction of travel of the flux through the composite. By determining the direction of flux propagation in the composite, or the portion of the composite structure from which the flux is detected as it exists the structure, the condition of the composite structure, independent of the source of degradation, can be determined. In preferred embodiments the can be determined. In preferred embodiments the energy flux is ultra-sound energy, while in preferred testing devices a single transmitting transducer is directed towards at least two receiving transducers, for example, one located at a position to receive some flux in the total absence of stiffness degradation, and a second located at a position to receive some flux second located at a position to receive some flux which would have traveled through a stiffness degraded structure.

Keywords: *Silicon, *Calibrating, Electrical resistivity, Single crystals, Electrical measurement, *Standard reference materials, *Spreading resistance, *Semiconductors, Chips(Electronics), Uncertainty.

This Special Publication describes the material selection, characterization, data analysis, and measurement resistance measurements on semiconductor silicon. Each of the four comprises a single combination of silicon conductivity-type and crystallographic orientation and contains 16 rectangular silicon chips which are certified for resistivity value based on four-probe resistivity measurements on the slices from which they were cut. The resistivity values of the chips in each set range from about 0.001 ohm-cms to about 100 ohm-cms. The uncertainty of the certified resistivity, as it applies to any individual chip, depends both on the uniformity of the starting slice and on the inherent measurement and the contraction of the starting slice and on the inherent measurement. urement process uncertainty. The procedure for determining this uncertainty, which is specifically evaluated and tabulated on the certificate for each SRM set, is

Automated Coupled-Column Liquid Chromatography System for Measuring Aqueous Solubilities of

Hydrophobic Solutes, J. W. Owens, H. DeVoe, T. J. Buckley, and S. P. Wasik. 11 Oct 84, 8p

Prepared in cooperation with Maryland Univ., College

Park. Dept. of Chemistry. Included in Jnl. of Research of the National Bureau of Standards, v90 n1 p41-48 Jan-Feb 85.

Keywords: *Solubility, *Automation, *Laboratory equipment, Solutes, Temperatures, *Coupled column liquid chromatography, Benzene/ethyl, Computer applications, High performance liquid chromatography. plications, High performance liquid chromatography.

An automated apparatus is described for measuring the aqueous solubility of a sparingly soluble organic compound at many different temperatures. Water is pumped through a generator column packed with a chromatographic support coated with the organic compound, producing a saturated solution. The solute in a measured volume of this solution is extracted with an extractor column and analyzed by high performance liquid chromatography (HPLC). The temperature of the thermostat bath and the operation of the valves and the HPLC are under the control of a microcomputer. Solubility measurements of ethylbenzene obtained with this apparatus have a standard deviation at any one temperature of about 3% of the mean.

Automatic AC/DC Thermal Voltage Converter and AC Voltage Calibration System. Final rept.,

K. J. Lentner, D. R. Flach, and B. A. Bell. Nov 84,

46p NBSIR-84/2973 Sponsored by Department of Defense Calibration Coordination Group, Redstone Arsenal, AL.

Keywords: *Calibrating, *Electrical measurement, Electric potential, Automation, Alternating current, Thermal voltage converters.

An automatic ac/dc difference calibration system is described which uses direct measurement of thermoelement emfs. In addition to ac/dc difference testing, the system can be used to measure some important characteristics of thermoelements, as well as to calibrate ac voltage calibrators and precision voltmeters. The system operates over a frequency range from 20 Hz to 100 kHz, covering the voltage range from 0.5 V to 1 kV. For all voltages the total measurement uncertainties expected (including the uncertainty of the specific reference thermal converters used) were 50 parts per million (ppm) at frequencies from 20 Hz to 20 kHz, inclusive, and 100 ppm at higher frequencies up to 100 kHz. The results of initial intercomparisons between the new system and the manual NBS calibration system, using single-range, coaxial-type, thermal voltage converters as transfer standards, are reported. The results show that the agreement between the two systems is better than the uncertainties originally expected, since the intercomparison of ac/dc differences differed by no more than 15 ppm.

G. V. Blessing, and D. G. Eitzen. 1982, 4p

Sponsored by American Society for Nondestructive

Testing, Columbus, OH.
Pub. in Proceedings of ASNT National Conference (Spring), Boston, MA., March 22-25, 1982, and (Fall), Pittsburgh, PA., October 4-7, 1982, p9-12 1982.

Keywords: *Ultrasonic tests, *Standards, *Reference blocks.

Flat-bottom-hole ultrasonic reference blocks have been used as reference standards in nondestructive testing for many years. A significant document for their application to aluminum is the ASTM standard recommended practice 'Fabricating and Checking Aluminum Alloy Ultrasonic Standard Reference Blocks.' While much effort has been expended to improve this practice, the block echo amplitude tolerances have in fact gradually increased from the original plus or minus 1 dB criteria in 1958 to their present level of plus 2 and minus 3 dB. This interim report will address the principal system variables which have led to these relaxed requirements, and discuss them quantitatively. Experimental results on a particularly unusual reference block set will be presented as an extremum case of block variability due to material properties.

Requirements for 'traceability to national standards can be found in a variety of regulations and standards. Since the agencies requiring traceability do not necessarily define or interpret these requirements uniformly, confusion concerning compliance with such requirements is not uncommon. This paper and a companion paper on Standard Reference Materials discuss the traceability issue from the perspective of the National Bureau of Standards (NBS). Traceability is only one aspect of a total quality assurance program. Statistical quality control techniques developed originally for industrial production processes can be employed to ensure accurate measurements on a continuing basis, using either standard reference materials or calibration services, where they are available from NBS or others.

National Bureau of Standards, Gaithersburg, MD. Performance of the Ohio State University Rate of Heat Release Apparatus Using Polymethylmethacrylate and Gaseous Fuels.

Final rept.,
V. Babrauskas. 1982, 12p
Pub. in Fire Safety Jnl. 5, n1 p9-20 1982.

Keywords: *Polymethyl methacrylate, *Laboratory equipment, *Fire tests, *Calorimeters, Performance evaluation, Plastics, Burning rate, Heat of combustion,

Tests with several gases and with horizontal specimens of polymethylmethacrylate (PMMA) plastic were performed in the Ohio State University (OSU) apparatus using two different techniques: (1) standard com-pensated thermopile measurement and (2) oxygen consumption. Results indicate that the combustion enthalpy is measured substantially completely with the oxygen consumption technique but that for the materials tested a varying 20 to 30 percent loss is seen with the standard method when the calibration is based on methane. Theoretical analysis and diagnostic irradiance and temperature measurements show this to be attributable to the fact that specimen flames impinge upon and heat up portions of the apparatus.

State weights and measures laboratories are custodians of measurement standards at the State level that serve as the basis for assuring equity in the marketplace and as reference standards for calibration services for indigenous industry. As part of its program to encourage a high degree of technical and professional competence in such activities, the National Bureau of Standards (NBS) has developed performance standards and formalized procedures for the following two purposes: 1. certification of competence for the production of reliable metrological measurements (principally mass, volume, and length), and 2. authorization to conduct initial evaluation of weighing and measuring devices/systems before their use in commerce. Part I of this Handbook describes the procedures followed by NBS in certifying State weights and measures lab-oratories for competence. A certified laboratory must satisfy general and specific requirements for each competence area in which certification is desired. Part II of this Handbook describes the procedures followed in authorizing certified State weights and measures laboratories to conduct evaluation of weighing and measuring devices and systems under the National Type Evaluation Program (NTEP).

Final rept.

G. Birnbaum, and D. G. Eitzen. 1982, 6p Pub. in Proceedings of the World Conference on Non-Destructive Testing (10th), Moscow, USSR, August 23-27, 1982, p267-272.

Keywords: *Ultrasonic tests, Standards, Calibrating.

The purpose of this report is to examine the current status and future requirements for ultrasonic NDE standards and calibrations. Considerations along this line have been discussed previously (1) but much of the emphasis was on an analysis of the subject; here the authors attempt to emphasize the progress on ultrasonic NDE standards and consider three aspects of the subject. (a) The authors review improvements of accepted standards such as those proposed by ASTM, those traceable to NBS, and those widely used in practice. Improvements in these standards, in the underlying theory and in their relation to practice will have significant impact on future systems. (b) The authors consider proposed methods which are new rather than improvements to those considered in (a). (c) Finally, the authors consider standards and calibration needs for evolving and future ultrasonic NDE methods.

Pub. in Jnl. of Applied Physics 54, n3 p1198-1201 Mar

Keywords: *Temperature measuring instruments, Fiber optics, Single crystals, Sapphire, Gases, Gas turbines, Bandwidth, Reprints, *Thermometers, Optical fibers, High temperature.

A high temperature optical fiber thermometer made from single crystal sapphire has been developed for use from 600 to approximately 2000C. The device consists of a small blackbody cavity which is sputtered on the end of a thin (0.25 mm to 1.25 mm diameter, 0.05 to 0.30 mm long) sapphire fiber, a connecting low temperature fiber and a conventional optical detector. The radiance from the cavity is used to measure its temperature. The present instrument is calibrated at a single temperature and uses the fundamental radiation laws to interpolate to other temperatures. It is accurate and has a high sensitivity and rapid temporal response. There appear to be a number of applications of the device in both science and industry.

Pub. in X-Ray Spectrometry 10, n2 p91-96 1981.

Keywords: *X ray spectrometers, *Semiconductor devices, *Standards, Efficiency, Reprints, Standard reference materials.

A standard technique for measuring window absorption and other efficiency losses in semiconductor x-ray spectrometers is described. This technique is in the process of being adopted as an IEEE and IEC standard. A NBS Standard Reference Material Glass, SRM-477, has been developed to promote broad availability for the standard and method throughout the user community. Measurements are reported which have been made to establish limits on the geometry of the technique and to determine the effectiveness of the method.

Use of LEDs (Light Emitting Diodes) as YAG Laser Simulators.

Final rept.,
M. Young. 1981, 8p
Sponsored by Aeronautical Systems Div., Wright-Patterson AFB, Ohio.

Pub. in Proceedings of Electro-Optics/Laser '81, Anaheim, CA, November 17-19, 1981, p222-229.

Keywords: *Laser beams, *Simulators, Feasibility, *YAG lasers, *Light emitting diodes.

There is wide interest in using light emitting diodes (LEDs) for calibrating and testing detectors designed to measure weak, diffuse YAG laser beams. Differences of coherence and possible other differences have given rise to the question, is such use of an LED either practically or theoretically justifiable. The purpose of this paper is to examine the problem in some detail and to determine, if possible, the conditions under which suitably filtered LED radiation will adequately simulate a laser beam. The author concludes that, although there are certain areas that require special care, use of an LED as a laser simulator is entirely feasible.

PB85-187466 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Description and Verification of the Silicon Photodiode Self-Calibrating Procedure. Final rept..

Zalewski. 1980, 4p

Pub. in Proceedings of Technical Program Electro-Optical Laser Conf. Expo., Boston, MA, November 19-21, 1980, p208-211.

Keywords: *Photodiodes, *Calibrating, Photodetectors, Radiometry, Silicon, Quantum efficiency, Comparison, Power measurement, Self calibration.

The silicon photodiode self-calibration technique is unlike all other high accuracy absolute radiant power measurements in that it is simple to perform and does not require expensive and elaborate equipment. The steps in the self-calibration procedure for measuring the major quantum efficiency losses are described. Two intercomparisons with electrically calibrated cavity radiometers are presented. These were radiant power measurements in the 1 to 3 mW range at 568 and 633 nm. The agreement in each case was better than 0.1% between these two independent measurement techniques.

501,183 PB85-187482 Not available NTIS National Bureau of Standards, Gaithersburg, MD. SQUID Applications to Geophysics. Final rept.,

J. E. Zimmerman, H. Weinstock, and W. C. Overton. 1981. 4p

Sponsored by Office of Naval Research, Arlington, VA. Pub. in Proceedings of the SQUID Applications to Geophysics Workshop, Los Alamos, New Mexico, June 2-4, 1980, p81-84, 1981.

Keywords: *Magnetometers, Superconductors, Refrigerators, Cryogenics, *SQUID devices, *Cryocoolers.

No alternatives to liquid-helium cryostats for SQUID geomagnetic measurements are presently available, but micro-miniature Joule-Thomson and low-power non-magnetic Stirling cryocoolers are being developed for this and similar purposes. With increasing interest and experimental work on the subject during the past year or two, it is likely that demonstrations of feasibility will occur in the moderately near future, and perhaps even a suitable commercial cryocooler in the next few years.

PB85-187763 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Quality Assurance of Chemical Measurements. Final rept.,

J. K. Taylor. 1981, 9p See also PB85-140671.

Pub. in Analytical Chemistry 53, n14 p1588A-1596A

Keywords: *Quality assurance, *Chemical analysis, Sampling, Tables(Data), Quality control, Reviews, Standards, Reprints, Standard reference materials.

This paper presents an overview of the practices that are considered to be essential for quality assurance of analytical chemical data. Proper attention must be given to planning the work, sampling, and the selection of the methodology, as well as the actual measurement process. Quality control and the development and use of control charts are discussed. The need for data review and adequate documentation are stressed. The role of SRM's for quality assurance is discussed.

Optical Techniques for On-Line Measurement of
Surface Topography.

Final rept.,

T. V. Vorburger, and E. C. Teague. 1981, 23p Contract NASA-L-4718B Pub. in Precision Engineering 3, n2 p61-83 Apr 81.

Keywords: *Surface roughness, *Optical measurement, *Nondestructive tests, Polarimetry, Optical interferometers, Reprints, Ellipsometry, Laser applications, Speckle, State of the art, On line systems.

Optical techniques offer great potential for non-destructive and on-line measurements of surface roughness during manufacturing. The current state of the art is reviewed for a number of optical techniques including specular reflectance, total integrated scatter, diffuseness, angular scattering distributions, speckle, ellipsometry, and interferometry. The paper draws the distinction between the more quantitative but slower profiling techniques and less quantitative parametric techniques, which are faster and hence more useful for high-speed monitoring of surfaces. In their present state of the art these parametric techniques are suitable as comparators rather than as true metrological tools. Speckle techniques hold perhaps the greatest potential as accurate, high-speed metrological tools.

Final rept., G. A. Candela, and D. Chandler-Horowitz. 1984, 7p Pub. in SPIE 480--Integrated Circuit Metrology 2, p2-8 1984.

Keywords: *Ellipsometers, *Polarimetry, *Thin films, Metrology, Design, Performance, Calibrating, Dimensional measurement, Thickness, Reprints, Reference standards, Refractive index, Computer applications, Semiconductors, Laser applications.

A computer-controlled spectroscopic ellipsometer of high accuracy has been designed and constructed. A theta-two-theta goniometer unit and optical rail system allows various ellipsometric methods to be used to measure the parameters delta and psi. Three important methods under study for accuracy, precision, and speed of measurement are the conventional null method, the rotating analyzer method, and the principal angle method. All the goniometer angles, including the angle of incidence, can be measured to an accuracy of 0.001 deg. The present light sources are two lasers with fixed wavelengths, 632.8 nm and 441.6 nm, in addition to a monochromator that can be used to in addition to a monochromator that can be used to scan the wavelength range from 190 to 2600 nm. A unique sample alignment system which uses two quadrant detectors has been developed and a simple but very effective nulling scheme is used. This instru-ment is primarily used for the metrology of semiconductor materials and for the calibration of reference standards for thin film thickness and refractive index.

Also available from Supt. of Docs as SN003-003-02645-0.

Keywords: *Force, *Calibrating, Detectors, Load cells, Comparison.

A comparison of force calibrations performed by the National Bureau of Standards and 27 other laboratories located in the United States is reported. Force sensors of four different capacities were calibrated in both tension and compression, repeatedly by NBS with deadweight and one time each by the other participating laboratories. The force sensor capacities were 0.5, 5, 20, and 100 klbf (2.2, 22, 89, and 445 kN). Deadweight machines (with and without force multiplication) and force sensor transfer standards (used in a testing machine or a loading frame) were the force standards represented in the study. The force calibration procedure used was Method E74-74 of the American Society for Testing and Materials.

Keywords: *Spectral emittance, *Solutions, *Spectro-photometers, Measurement, Visible spectrum, Design criteria, Performance evaluation, Wavelengths, *Hol-

The work describes the methods and procedures used to determine the wavelengths of minimum transmittance of holmium oxide in perchloric acid solution. Measurements of spectral transmittance of the solutions were made by means of a high precision spectrophotometer over the wavelength range 200 nm to 680 nm. The wavelength scale accuracy of this instrument was verified by extensive measurements of mercury and deuterium emission lines. The measurements of spectral transmittance of the holmium oxide solutions were made as a function of temperature, purity, concentration, and spectral bandwidth. Analysis of the uncertainties associated with these parameters and the uncertainties associated with the calibration of the instrument wavelength scale and the data analysis have resulted in an estimated uncertainty of + or - 0.1 nm for the determination of the wavelengths of minimum transmittance of the holmium oxide solution.

Standards, v90 n2 p127-139 Mar-Apr 85.

Keywords: *Fugacity, *Measuring instruments, *Hydrogen, Mixtures, Membranes, Methane, Propane, Partial pressure, Temperature, Gas chromatography,

An apparatus has been designed and constructed to allow measurements of fugacities in gaseous mixtures containing hydrogen. The apparatus makes use of a semipermeable membrane to allow a direct measurement of the partial pressure of a permeating component (in this case, hydrogen) in a mixture with a non-permeating component. In this study, measurements were made on mixtures of hydrogen/methane and hydrogen/methane and hydrogen/methane and hydrogen/methane. drogen/propane. Using measured values of the mix-ture pressure, hydrogen partial pressure and mixture mole fraction at a given temperature, fugacity coefficients were determined using the virial equation. The measured values are compared with some previous data and general trends are discussed.

investigation of the Uncertainties of the NBS (National Bureau of Standards) Thermal Voltage and **Current Converters.**

Final rept.,

F. L. Hermach. Apr 85, 124p NBSIR-84/2903

Keywords: *Standards, *Electrical measurement, Accuracy, Calibrating, Thermoelectric generators, Converters, Transfer standards.

The uncertainties of the NBS reference and working standards for ac-dc current and voltage transfer measurements have been redetermined, to 50 and 100 kHz, respectively, by means of a set of multijunction thermal converters (MJTCs), an improved emf comparator, and extensive series of intercomparisons. Numerous supporting investigations have also been performed. As a result of this work the accuracy of the NBS standards and the output of its calibration service for ac-dc current and voltage transfer are considered to be on a much firmer and better documented basis than heretofore. Improvement by factors of two to five in the calibration accuracy for high-quality, single-range thermoelements and thermal voltage converters is possible for certain ranges of current, voltage, and frequency. For very special tests, such as international comparisons, accuracies approaching 1 ppm are within reach.

Heterochromatic Stray Light in UV Absorption Heterochromatic Stray Light in UV Spectrometry: A New Test Method. Final rept.

K. D. Mielenz, V. R. Weidner, and R. W. Burke. 1982,

Pub. in Applied Optics 21, n18 p3354-3356, 15 Sep 82.

Keywords: *Spectrophotometers, *Ultraviolet spectrophotometers, Estimating, Reprints, Stray light, Test methods

A new method of estimating the amount of heterochromatic stray light in UV spectrophotometers is described. The method uses the same solution filters with sharp UV absorption edges as ASTM Test Method E387, but one measures the apparent absorbance of a 10-mm pathlength cell in the sample beam relative to a 5-mm cell in the reference beam. Scanning towards shorter wavelengths, one records an apparent absorbance maximum which is a direct measure of the stray light. This method was found to be in satisfactory agreement with the ASTM method in comparative tests of several spectrophotometers at different wavelengths between 200 and 390 nm, using KCl, KI, Nal, acetone, and NaNO2 solution filters. The new method proved to be simpler, the main advantage being that the apparent absorbance maximum occurs at considerably lower scale values than the corresponding absorbance plateau measured by the ASTM method. This reduces the need for successive attenuations of the reference beam every time the spectrophotometer runs off scale. In many instances the new method required no attenuation at all.

Effect of Multiregion Crack Growth on Proof Test-

Final rept.,
S. M. Wiederhorn, S. W. Freiman, E. R. Fuller, and
H. Richter. 1984, 22p

Sponsored by Office of Naval Research, Arlington, VA. Pub. in American Society for Testing and Materials, Special Technical Publication 844, p95-116 1984.

Keywords: *Tests, Crack propagation, Cracks, Glass, Strength, Weibull density functions, Reprints, Fracture(Mechanics).

The effect of subcritical crack growth on proof testing is examined. Crack velocity curves obtained by fracture mechanics techniques are used to predict theoretical strength distributions for specimens that survive proof testing. These theoretical distributions are compared with experimental distributions obtained on soda lime silica glass slides. The comparison reveals a surprising sensitivity of the proof test results to the exact position and shape of the crack growth curve. Minor changes in the crack growth curve results in major shifts in position and shape of the strength distribution curves after proof testing. The importance of crack geometry and specimen configuration to crack growth behavior, and hence, to the strength distribution is em-

Pressure and Temperature Measurements in the

Annulus Between the Piston and Cylinder of a Simple Dead-Weight Piston Gauge. Final rept.,

Pub. in Review of Scientific Instruments 55, n12 p1901-1909 Dec 84.

Keywords: *Pressure measurement, *Temperature measurement, *Measuring instruments, Pistons, Cylinders, Metrology, Fluid flow, Pressure gradients, Temperature gradients, Accuracy, Reprints.

Precise and fundamental pressure measurements are obtained using piston gages. Elastic distortion of the piston and cylinder is the leading cause of inaccuracy in measurement of higher pressures. The equation used for calculating the distortion contains the ratio of the pressure in the annulus between the piston and the cylinder to the pressure under the piston. As the proper value of this ratio or a method to determine it were unknown, the practice has been to assume a value of 0.5. In this work, the pressure and temperature of the fluid in the annulus has been measured along the working length of the piston and the cylinder. The model for the pressure ratio proposed by Bass on the basis of dimensional metrology is an excellent agreement with the pressure measurements.

New Spectrograph with a Multichannel Optical Detector for the Raman Characterization of Microparticies. Final rept.

F. J. Purcell, and E. S. Etz. 1982, 6p Sponsored by Microbeam Analysis Society, Bethesda,

Pub. in Proceedings of Annual Conference of the Microbeam Analysis Society (17th), Washington, DC., August 9-13, 1982, p301-306.

Keywords: *Raman spectroscopy, *Optical equipment, *Spectrographs, Laboratory equipment, Particles, Performance evaluation, Design criteria, *Laser spectroscopy, Air pollution detection, State of the art.

A new triple spectrograph, developed by a U.S. optical instrumentation firm, has been evaluated in a prototype instrument configuration for low light level Raman scattering experiments from single microparticles. In conjunction with an argon ion laser as a Raman excitation source, an advanced fore-optical microsampling system designed around a microscope, and a state-ofthe-art optical multichannel analyzer utilizing a linear diode array detector, the system represents a new type of Raman microprobe. The basic configuration of the system is described with emphasis on the new spectroscopic advances embodied in the prototype instrument. The important performance characteristics are compared to currently used micro-Raman instru-mentation employing monochannel, scanning systems. The spectral multiple advantage in the acquisition of micro-Raman spectra is demonstrated with examples from the measurement of laser radiation sensitive microparticles. Highlighted are the advantages of fast data acquisition under conditions of broad spectral coverage. Preliminary results are presented from the analysis of 'real-world' microsamples (e.g., power plant stack particulates). These are placed in the perspective of the current state of the field of micro-Raman spectroscopy.

PB85-202091 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Upholstered Furniture Heat Release Rates: Measurements and Estimating. Final rept.,

V. Babrauskas. 1983, 24p Pub. in Jnl. of Fire Sci. 1, n1 p9-32 Jan-Feb 83.

Keywords: *Flammability testing, *Calorimeters, *Burning rate, *Upholstery, Textiles, Design criteria, Comparison, Oxygen consumption, Cotton fabrics, Polyurethane, Foam, Reprints.

A new instrument, termed a furniture calorimeter, has been constructed and placed into operation for measuring furniture heat release rates based on oxygen consumption. Using the furniture calorimeter, burning rate information has been obtained on a series of 13 chairs, loveseats, and sofas, most of them specially built to permit direct comparisons of construction features. A quantitative assessment is made of the effect of fabric types, filling types (cotton batting, ordinary polyurethane foam, and California-requirements foam), and frame types. The advantages of furniture calorimeter testing over normal room fire testing are discussed. Based on these measurements, an estimating rule is presented for determining the heat release rate. Finally, implications for achieving both good flaming ignition behavior and good cigarette ignition resistance are discussed.

PB85-202109 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Automated NBS (National Bureau of Standards) 1-Omega Measurement System.

Final rept..

K. R. Baker, and R. F. Dziuba. 1983, 5p Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Instrumentation and Measurement 32, n1 p154-158 1983.

Keywords: *Electric measuring instruments, Calibrating, Resistors, Microcomputers, Comparators, Reprints, Computer applications.

A microcomputer controlled measurement system has been developed for calibrating stable, 1-ohm standard resistors. It consists of a direct current comparator potentiometer, a self-balancing detector circuit, and spe-cial switching networks. The measurement system is capable of comparing resistors to a precision of better than 0.01 ppm.

Development of a Personal Exposure Monitor for Two Sizes of Inhalable Particulates. Final rept.

R. L. McKenzie, D. S. Bright, R. A. Fletcher, and J.

A. Hodgeson. 1982, 5p Pub. in Environment International 8, n1-6 p229-233

Keywords: *Monitors, *Particles, *Public health, *Air pollution, Exposure, Sampling, Nitrogen dioxide, Concentration(Composition), Wind tunnels, Reprints, *Indoor air pollution, *Air pollution sampling.

Measurement of personal exposure to ambient level particulate concentrations is often extremely difficult because of a lack of personal exposure monitors capable of collecting measurable quantities within a meaningful sampling period. A new personal exposure monitor for two fractions of inhalable particulates (i.e., the 3-15 micrometers aerodynamic diameter and the <3 micrometers or respirable fraction) has been developed and characterized. This monitor is capable of collecting a sample of each fraction that is quantifiable with ambient concentrations of inhalable/respirable particulates as low as 25 micrograms/cu m in a 24-h sampling period. Wind tunnel tests have been made on the particulate personal exposure monitor to determine sampling efficiency as a function of relative wind speed and orientation with respect to the sampler.

Optimum Applied Field for Magnetic Particle Inspection Using Direct Current. Final rept.

C. L. Oehl, and L. J. Swartzendruber. 1982, 12p Pub. in Jnl. of Nondestructive Evaluation 3, n3 p125-136 Sep 82.

Keywords: *Nondestructive tests, *Magnetic particle tests, Leakage flux, Inspection, Reprints.

Experimental measurements of leakage fields from cylindrical defects were obtained in a geometry which permitted simultaneous measurement of the magnetic induction of the material. The results obtained are compared with calculations using a nonlinear finite difference method. Both the experiments and the calculations indicate that the magnitude of the leakage field continues to grow nearlyin proportion with the applied field well into the saturation region of the magnetic material. The implications for magnetic particle inspection are discussed.

501,209 PB85-202851 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Performance Characteristics of a Continuum-Source Echelie Wavelength Modulated Atomic Absorption Spectrometer.

Final rept., J. D. Messman, M. S. Epstein, T. C. Rains, and T. C. O'Haver, 1983, 4p

Pub. in Analytical Chemistry 55, n7 p1055-1058 1983.

Keywords: *Chemical analysis, Standards, Laboratory equipment, Design criteria, Performance evaluation, Continuum mechanics, Spectral lines, Reprints, *Atomic absorption spectrometers, Standard reference materials.

The operational features of a single-channel atomic absorption spectrometer based on a continuum source and an echelle monochromator modified for wavelength modulation (CEWM-AA) are described. Characteristic concentrations, detection limits, and upper concentration limits of approximately 100 spectral lines for 32 elements were experimentally determined by CEWM-AA using air-acetylene and nitrous oxide-acetylene flames. Detection limits of CEWM-AA are generally within an order of magnitude of line-source atomic absorption (AAL) detection limits for when using optimal lines for CEWM-AA, only Zn, Te, Sb, Cd, and Pd of the 32 elements investigated have detection limits which are inferior to AAL detection limits by more than an order of magnitude. Analyses of several NBS Standard Reference Materials (SRMs) using either flame or graphite electrothermal atomizers demonstrated comparable analytical performance between CEWM-AA and the AAL system operated in the background correction mode (AAL-BC).

Keywords: *Units of measurement, *Metric system, Measurement, Reviews.

The article reviews the history of measurements and the evolution of measurement systems. The develop-ment of the metric system is traced from the beginnings to the present International System of Units. The history of measurements in the United States is discussed with attention to the consideration of the metric system and its utilization. The relationship of English and the United States measurement units is described and tables give customary units. The International System of Units is also described and extensive tables are included.

PB85-203545 Not available NTIS National Bureau of Standards (NEL), Gaithersburg, MD. Semiconductor Materials and Processes Div. Effects of instrumental Artifacts on the Quantitative Determination of Oxygen in Silicon by FTIR (Fourier Transform infrared). Final rept..

A. Baghdadi. 1984, 15p
Pub. in American Society for Testing and Materials,
Special Technical Publication 850, p343-357 1984.

Keywords: *Chemical analysis, *Oxygen, *Infrared spectroscopy, Silicon, Reprints, *Fourier transform spectroscopy.

The evolution of silicon processing technologies to-wards greater reliance on internal gettering by oxygen precipitates has led to the need for greater precision in the measurement of the interstitial oxygen content of silicon slices. This measurement is presently being carried out with the use of Fourier Transform Infrared (FTIR) spectrophotometers. This paper concerns the investigation of the effects of changing the apodization function and beam geometry on the quantitative determination of oxygen in silicon by FTIR. The apodization functions used include the boxcar, cosine, Happ-Genzel, and triangular functions. The beam geometry is varied by placing apertures between the interferometer and the silicon specimen. The effects of beam polarization and detector nonlinearity were also investigated.

METHODS AND EQUIPMENT—Field 14

Laboratories, Test Facilities, and Test Equipment—Group 14B

Keywords: *Quality assurance, *Plastics, *Tests, Standards, Production methods, Reprints.

A program for assuring the quality of products made from plastics is only as valid as the test methodology that supports it. Test methods can be characterized as to their repeatability and reproducibility. Both of these measures describe the level of precision, or agreement among test results, obtained when a test method is used to characterize a product, be it raw material or a finished part. ASTM requires that each test method in the ASTM Book of Standards be provided with a statement of precision and accuracy. This paper describes some recent efforts within Committee D20 on Plastics to assess the precision of two test methods. The results are analyzed using ASTM Practice for Conducting an Interlaboratory Test Program to Determine the Precision of a Test Methods (E691). The implications of the measured precision of the test methods for their use in quality assurance activities are described.

R. L. Watters. 1983, 10p

Pub. in American Laboratory 15, n3 p16-25 1983.

Keywords: *Chemical analysis, *Calibrating, Performance evaluation, Emission spectroscopy, Reprints, *Inductively coupled plasma spectroscopy.

Quantitative analysis using the Inductively Coupled Plasma (ICP) technique involves a series of measurement procedures. In order to evaluate the overall precision of the technique, non-random errors must be eliminated and the random error of each step in the measurement process must be considered. Calibration functions, spectral overlap corrections, blank correc-tions, and other factors are often treated as nonvaria-ble quantities. Approaches to including the error asso-ciated with these steps are presented. Using these approaches will enable the analyst to construct realistic confidence limits on the final ICP results.

Multilayer Analysis Using a Multiflux

Method, S. O. Sari. Apr 85, 4p Included in OM85: Basic Properties of Optical Materials. Summaries of Papers, p154-157 Apr 85.

Keywords: *Optical materials, *Optical coatings, *Coatings, Light scattering, Maxwells eauations.

The use of uniform material layers to form multilayer films forms the basis for an extensive coating technology. The transmissive and reflective properties of such structures are dominated by optical interference occurring among the layers. Comparatively less attention seems to have been given to treating stratified media consisting of random rather than uniform material layers. Within such structures, the optical scattering properties of each sublayer dominate the optical properties. Some previous work on diffuse coatings has been concerned with investigations of surface-roughened layers and the form of diffuse scattering from one or more roughened interfaces. Such analytical investigations have been based on lowest-order solutions to Maxwell's equations at a perturbed roughened interface, a calculational procedure which has been carried out by several different authors in recent years. The present objective is to point toward a possible alternative method for treating diffuse scattering. Examples would include aggregate suspensions, artificial dielectrics, solids containing scattering defects, paint layers or inhomogeneous recording materials. This analysis may have applications to optical material studies such as ensemble microparticle drop sizing or other related topics of current interest. It may serve as an adjunct to scattering models based on direct solutions to Maxwell's equations for various scattering geometries.

Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Power Apparatus and Systems PAS-104, n4 p971-976 Apr 85.

Keywords: *Space charge, Measurement, Filteration, Air flow, Density(Number/volume), Reprints

The efficiency of a high efficiency particulate air (HEPA) or absolute filter for removing charge from an air stream has been measured for a variety of space charge and air flow conditions. Ion densities ranged from 100,000 to 1,000,000/cu cm and were for positive and negative space charge as well as mixtures. The space charge was made up predominantly of ions with mobilities greater than 0.000001 sq m/Vs. For all conditions studied, the transmission of the filter was less than 0.1%. For space charge consisting of ions of one polarity, space charge density measurements made using HEPA filters and ion counters may be compared directly. The filter is well suited for accurate measurements of net space charge density.

Measurement of a Piezoelectric delta Constant for Poly(Vinyildene Fluoride) Transducers Using Pressure Pulses.

Final rept.,

A. J. Bur, and S. C. Roth. 1 Jan 85, 6p.

Sponsored by Air Force Armament Lab., Eglin AFB.

Pub. in Jnl. of Applied Physics 57, n1 p113-118, 1 Jan 85.

Keywords: *Transducers, Piezoelectricity, Measurement, Vinylidene chloride resins, Reprints.

The hydrostatic piezoelectric coefficient d sub h has been measured for biaxially-oriented poly(vinyiidene fluoride) transducers using pressure pulses having peak values of 1.8 X 10 to the 7th power Pa (2600 psi) and a pulse width of approximately 10 ms. For these measurements, the sample was placed in an oil pressure chamber at room temperature and the pressure pulse was initiated by dropping a 16-kg mass onto a plunger in the chamber. Since adiabatic compressional heating accompanies the pressure pulse, temperature compensation of the transducer was necessary. This was achieved by incorporating a thermocou-ple in the bilaminate configuration of the transducer and by amplifying the thermocouple signal appropriately to account for the pyroelectric response due to adiabatic heating, which was approximately 15% of the transducer signal. The calculation of d sub h shows that the response of the bilaminate transducer is linear up to 1.8 X 10 to the 7th power Pa(2600 psi).

Subharmonic Frequency Locking in the Resistive

Josephson Thermometér.

Final rept., M. van Veldhuizen, and H. A. Fowler. 1 May 85, 6p Pub. in Physical Review B 31, n9 p5805-5810, 1 May

Keywords: *Temperature measuring instruments, Josephson junctions, Electrical impedance, Cryogenics, Reprints, *Thermometers, SQUID devices.

Phase-locked oscillatory solutions are examined as a basis for the dc impedance of the resistive superconducting quantum-interference device Josephson thermometer. The calculations are based on the resistively shunted junction model in the limit 2pi(L sub s)(l sub c)/(Phi sub 0) = or > 1, where (L sub s) is the loop inductance and (l sub c) is the junction critical current, and for a junction resistance large compared with the external shunt resistance. An algorithm for representexternal shuft resistance. An algorithm for representing frequency entrainment in (kappa, omega) space (drive amplitude, frequency) leads to zones with rotation number p/q having the form of leaf-shaped regions joined and overlapping at their tips. High-resonance zones are very thin and locally similar. No character between the model can simulate the province of t otic behavior has been observed. The model can simulate the 'rising' curves of dc impedance as a function of drive amplitude.

The authors have adapted a commercially available xray diffractometer normally used for structure determinations on single crystals to operate as a very flexible device for performing x-ray pole figure determinations and related studies on polymeric materials. Descriptions of crystallite orientations, as provided by pole fig-ures, are useful in studying many aspects of the behav-ior of products made from semicrystalline polymers. The paper describes the software that they have written for their pole figure facility. Except for some vendor-provided routines to drive the hardware interface all of their software is written in FORTRAN. Menu driven operation is provided to maximize user convenience.

Software for Liquid Size Exclusion Chromatogra-phy Data Collection and Analysis.

Final rept..

J. D. Barnes, B. Dickens, and F. L. McCrackin. 1985,

Pub. in Proceedings of the ACS (American Chemical Society) Division of Polymeric Materials: Science and Engineering, Miami Beach, Florida, v52 p291-298 Apr

Keywords: *Chromatographic analysis, *Operating systems(Computers), *Data processing, Fortran, Molecular weights, Automation, Laboratories, *Liquid size exclusion chromatography, *Computer software, *Applications programs(Computers), *Computer aided analysis, Computer applications.

The paper describes software that is used for data collection and analysis from a size-exclusion liquid chromatograph. The chromatograph is a commercially available instrument that provides on board micro-processor control of the specimen injection functions. The authors use a commercially available microcom-puter as a passive listener connected to the chromatograph output to collect, store, and analyze the data. The data collection and analysis software is written in FORTRAN. Maximum use is made of graphical displays to aid the user's judgement in interpreting the data. All operations are menu driven, so that the user does not need to be familiar with the computer's operating system. Data archiving functions are built in to facilitate after-the-fact retrieval of the data.

Deconvolution by Design - An Approach to the Inverse Problem of Ultrasonic Testing. Final rept.,

D. Eitzen, N. Hsu, A. Carasso, and T. Proctor. 1985, Pub. in the Review of Progress in Quantitative Nondestructive Evaluation, v4A p179-188 1985.

Keywords: *Nondestructive tests, *Ultrasonic tests,

*Deconvolution, Inverse problems.

In the paper the authors present some preliminary results on a new approach to the problem of characterizing flaws using ultrasonics. The approach takes advantage of the characterization of the char tage of the fact that they have control over the time waveform of the probing pulse in an ultrasonic test. It also takes advantage of some special properties of the inverse Gaussian function and an effective, stable, continuous deconvolution procedure which is based on the special function. The procedure also has the special feature that the error in the resultant of the deconvolution, which contains all available information about the flaw-scatterer, can be estimated in a powerful way. First they present the problem formulation and

Laboratories, Test Facilities, and Test Equipment—Group 14B

the analytical reasoning. They then discuss the inverse Gaussian function, the deconvolution procedure based on the probe function, and point out some of the special features of the probe function and the procedure. They also present some numerical tests and results using the procedure, demonstrate that the tools necessary to implement the procedure are within grasp, and present some preliminary experimental re-

Optical Linewidth Measurement on Patterned Metai Layers.

Final rept., D. Nyyssonen. 1984, 7p Pub. in SPIE 480, p65-70 1984.

Keywords: *Line width, Optical measurement, Lithography, Integrated circuits, Wafers, Reprints.

In a previous paper, a waveguide model was developed for the imaging of micrometer-sized lines patterned in thick layers of dielectric materials (silicon dioxide) with application to linewidth measurement on integrated-circuit wafers. The paper describes the extension of this work to metals characterized by their complex index of refraction, $\mathbf{n}+\mathrm{i}\mathbf{K}$, as well as the inclusion of a sublayer such as a silicon dioxide insulating layer. This extension allows the modeling of optical imaging and linewidth measurement on metal-on-silicon (MOS) structures. It is shown that the image structure for metals at and near focus is different from that for dielectrics. Thick and thin layer (less than 200 nm) imaging is compared. Experimental image profiles of metal lines at and near focus are also shown. The experimental data were obtained from a bright-field microscope using a laser source (530 nm) and controlled spatial coherence.

Pub. in Proceedings of the Scientific Apparatus
Makers Association, The Future of Optical Technologies in the Semiconductor Industry, Sunnyvale, California, May 23, 1983, p1-7 Mar 84.

Keywords: *Line width, *Measurement, Optical measurement, Calibrating, Standard reference materials.

The manuscript is a summary of a talk covering current NBS activities in linewidth measurement including re-search, calibration of standard reference materials (SRMs), development of calibration procedures and test methods, and technology transfer. The current status of photomask linewidth SRMs is discussed (anti-reflective 'gold' chromium SRMs 474 and 475, bright chromium SRM 476, and the 3X reticle SRM 1830). Wafer linewidth measurements are divided into two categories, thin layers (less than approximately 200 nm) and thick layers. The design of the linewidth standard for thick layers. The design of the linewidth standard for thin layers is described. Research problems remaining for thick layers are described along with current NBS waveguide modeling. Instrumentation used for both photomask and wafer calibrations is also described. NBS plans for development of SEM/e-beam instrumentation and SRMs are also included.

Frequency Measurements from the Microwave to the Visible, the Speed of Light, and the Redefinition of the Meter.

Final rept.,
K. M. Evenson. 1983, 28p
Pub. in Proceedings of the North Atlantic Treaty Organization Advanced Study Institute on Quantum Metrology and Fundamental Physical Constants, Erice, Italy, November 16-28, 1981, NATO ASI Series B: Physics, v98 p181-207 1983.

Keywords: *Frequency measurement, *Length, *Metrology, *Standards, *Light speed, *Meter, Laser radi-

The techniques of laser frequency measurement, especially those leading to the measurements of the frequency of visible light, are described. The use of these techniques has led to much higher accuracy in spectral measurements, a hundred-fold increase in the accuracy of the value of the speed of light, and to a proposed redefinition of the meter, fixing the value of the speed of light. The use of stabilized lasers in these measurements, some of the characteristics of the metal-insulator-metal diode used in high speed detection, and the realization of the meter with the proposed new definition are described.

Pub. in Proceedings of the Symposium on Interaction
of Non-Nuclear Munitions with Structures (2nd),
Panama City, Florida, April 15-18, 1985, p291-295.

Keywords: *Pressure gages, Thin films, Polyvinyl fluoride, Pressure sensors

The pressure sensing element of this transducer is a thin film of polyvinylidene fluoride. The transducer is designed to measure dynamic pressures in the presence of thermal pulses which are produced by adiabatic compressional heating of the PVDF and its surroundings. Adiabatic heating of the PVDF will reduce its charge output by a constant 8%. Adiabatic heating of the surroundings will vary with each environment. Two approaches to compensating for environmental compressional heating are used.

This short note describes an apparatus that has been designed and constructed to allow assessment of the extent of chemical decomposition of fluids and fluid mixtures under high temperature, high pressure condi-tions. The apparatus is used to screen fluid systems

prior to PVT (pressure-volume-temperature) or VLE (vapor-liquid equilibrium) experiments under severe conditions. For a predetermined residence time, the fluids are maintained at the temperature and pressure at which the PVT or VLE experiment will be conducted. The residence time in the reactor is comparable to the expected residence time in the PVT or VLE apparatus. Samples of fluid are withdrawn directly at regular intervals for analysis by gas chromatography, or collected in a sampling vessel for more extensive analysis.

Siz. ng of Polystyrene Spheres Produced in Micro-

gravity, G. Mulholland, G. Hembree, and A. Hartman. Jul 85,

Keywords: *Latex, *Polystyrene, *Spheres, *Size determination, Standard deviation, Weightlessness, *Space manufacturing, Space shuttles, Transmission electron microscopy.

26p NBSIR-84/2914

The standard deviation of the size distribution was determined for a polystyrene latex produced in a space shuttle experiment and in an earth-bound control experiment. Values determined from direct measurement of transmission electron micrographs, corrected for magnification distortion, were 0.035 micrometer for the space grown material and 0.15 micrometer for the control. The standard deviations obtained from an aerodynamic particle sizer were only slightly greater than those obtained by TEM; 0.042 micrometer and 0.20 micrometer for the shuttle and ground material respectively. However these values were produced in a few hours versus the several weeks it took for the electron microscopy. Both of the techniques used here resulted in measured standard deviations significantly smaller than those previously reported for this material.

Response Behavior of Hot-Wires and Films to Flows of Different Gases,
W. M. Pitts, and B. J. McCaffrey. Jul 85, 124p
NBSIR-85/3203

Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC.

Keywords: *Flow measurement, Hot wire anemometers, Gas flow, Velocity measurement, Reynolds number, Nusselt number, Heat transfer, Correlations, Cylindrical bodies, Convection, Vortices, Calibrating, Hot-film anemometers, Accommodation coefficient.

Measurements of the voltage output for hot-wire and film anemometers placed in flows of nine different gases have been made as a function of flow velocity. In order to obtain these correlations it has been necessary to consider and correct for the effects of probe end conduction losses, temperature dependencies of gas molecular properties, flow slip at the probe surfaces, and gas accommodation. The importance of the nature of the flow over the cylindrical devices to the heat transfer behavior is described. A previously unre-ported hysteresis in the heat transfer behavior for RE 44 has been characterized and attributed to the pres-ence or absence of eddy shedding from the heated cylinder.

Feasibility Study for the Development of Standards Using Differential Scanning Calorimetry.

Final rept., J. E. Callanan, S. A. Sullivan, and D. F. Vecchia. Aug

85, 59p NBS/SP-260/99
Also available from Supt. of Docs as SN003-003-02675-1. Library of Congress catalog card no. 85-

Keywords: Feasibility, Standards, Calibrating, Materials tests, Temperature, Heat flow, Enthalpy, *Standard reference materials, *Differential scanning calorimetry.

The tremendous increase in the use of differential scanning calorimetry, coupled with the decrease in the capability for conventional precision calorimetry, has created a need for more and better thermal standards for use with scanning calorimeters and other thermal instruments currently available, such as thermome-chanical analyzers. The development of these standards by methods such as adiabatic or drop calorimetry is impractical because of the number and variety of standards required, the associated expense, and the lack of facilities and personnel to do the certification. A two-part study was designed to evaluate the capability of a differential scanning calorimeter for developing temperature and enthalpy of fusion standards. Part I evaluated the variability of the differential scanning calorimeter (DSC) and factors which affected it; Part II applied American Society of Testing Materials (ASTM) procedures for the temperature and heat flow calibra-tion. The study shows that fusion standards can be developed with a differential scanning calorimeter.

Assessment of the NBS (National Bureau of Standards) 1-Meter Guarded-Hot-Plate Limits.

Final rept., B. G. Rennex. Aug 85, 98p NBSIR-85/3221 Contract DE-AI05-85OR21513

Sponsored by Department of Energy, Washington, DC. Office of Buildings Energy R and D.

Keywords: *Thermal insulation, Thermal resistance, Thermal conductivity, Performance evaluation, Calibrating, *Guarded hot plates, *Building materials.

Accurate measurement of the thermal resistance of insolution and building materials is a matter of national interest. A viable national calibration program must consist of accurate apparatuses, appropriate test methods, and calibration specimens available over the needed ranges of test and material parameters, such as temperature and apparent thermal conductivity. The apparatuses are operated according to the test methods to provide these calibration specimens. It is necessary to know the apparatus accuracy over the entirety of the operating ranges over which the calibration specimens are measured. The objective of this report is to evaluate the operating capability of the NBS 1-m Guarded-Hot-Plate apparatus according to three kinds of limiting factors. The first kind is the limits of temperature over which the various apparatus components can be used without suffering damage. The second kind is the limits of plate temperatures, specimen thickness, atmospheric pressure, and relative humidity that can be achieved with the existing control systems. The third kind is any limits on the values of apparent thermal conductivity, thermal resistance, or specimen thickness due to measurement error considerations.

Humidity Sensors for HVAC (Heating, Ventilation and Air-Conditioning) Applications.

C. W. Hurley, and S. Hasegawa. May 85, 18p Sponsored by Civil Engineering Lab. (Navy), Port Hueneme, CA.

Pub. in Proceedings of International Symposium on Recent Advances in Control and Operation of Building HVAC Systems, Trondheim, Norway, May 22-23, 1985, p173-190.

Keywords: *Moisture content, *Environmental engineering, *Psychrometers, *Dew point, *Buildings, Hygrometers, Heating equipment, Ventilation, Air conditioning, Cost analysis, Ideal gas law.

The monitoring and control of the moisture content of the air within a building is required to operate the heating, ventilation and air-conditioning (HVAC) equipment in the most efficient manner to meet the demands of the people and equipment working in the building. The ideal gas equation can be used for this purpose since only negligible errors will result. Seven types of relative humidity sensors are discussed. The basic principles of operation, cost ranges, expected accuracies, linearities, operating limits, etc. are given. A section is devoted to methods of avoiding the high limits of relative humidity sensors. Finally, a discussion of the principles of operation, cost, operating limits, etc. is presented on dew-point hygrometers and their applications in HVAC 501,252

Characteristics of Backscattered Electron Detectors for Scanning Electron Microscopy.

Final rept..

D. E. Newbury. 1981, 8p

Pub. in Proceedings of Annual Conference on Microbeam Analysis Society (16th), Vail, CO., July 13-17, 1981, p1-8.

Keywords: Electron scattering, Backscattering, Scintillation counters, Solid state counters, *Scanning electron microscopy, *Electron detection, *Electron counters.

The backscattered electron signal in the scanning electron microscope carries useful contrast information on atomic number differences, topography, crystallography, and magnetism in a sample. Detectors for backscattered electrons fall into four categories (1) scintillators; (2) backscattered to secondary conversion with detection with a scintillator; (3) solid state diodes; and (4) specimen current. Important detector properties include: (1) solid angle of collection; (2) take-off (emergence) angle; (3) energy-response; (4) frequency response; and (5) sensitivity to electron trajectory effects. These properties are compared for the various detectors.

Factors Affecting the Reversed-Phase Liquid Chromatographic Separation of Polycyclic Aromatic Hydrocarbon Isomers.

Final rept.,

S. A. Wise, and L. C. Sander. May 85, 8p

Pub. in Jnl. of High Resolution Chromatography and Chromatography Communications 8, p248-255 May

Keywords: *Aromatic polycyclic hydrocarbons, *Chemical analysis, *Chromatographic analysis, Separation, Mathematical models, Polymers, Reprints, *Reversed phase liquid chromatography, Monmers.

Reversed-phase liquid chromatography (LC) on C18 stationary phases provides excellent selectivity for the separation of polycyclic aromatic hydrocarbons (PAH). Recent studies have shown that several factors affect selectivity for the LC separation of PAH including phase type (monomeric or polymeric), pore diameter and surface area of the silica substrate, and surface density of the C18 ligands. In this paper the separation of eleven PAH isomers of molecular weight 278 is used to further illustrate the effect of stationary phase characteristics and shape of the solute (length-tobreadth ratio, L/B) on retention and selectivity. Based on these studies, a model is proposed to describe the retention of PAH on polymeric C18 phases.

Final rept.

S. D. Rasberry. 1983, 6p Sponsored by American Society for Quality Control, Inc., Milwaukée, WI.

Pub. in Proceedings of Annual American Society Quality Control Transactions (37th), Boston, MA., May 24-26, 1983, p343-348.

Keywords: *Quality assurance, Quality control, Measurement, Accuracy, *Standard reference materials, Traceability.

Requirements for 'traceability to NBS' can be found in a variety of regulations and standards. As the agencies requiring traceability do not necessarily define or interpret these requirements uniformly, confusion concerning compliance with such requirements is not uncommon. This paper and a companion paper on NBS Calibration Services discusses the traceability issue from NBS' perspective. Statistical quality control techniques developed originally for industrial production processes can be employed to ensure accurate measure-ments on a continuing basis using either Standard Ref-erence Materials or calibration services where they are available from NBS.

Orbiting Standards Package: A Recalibratable Satellite Instrument Assembly for Measuring Large Earth Station Antennas.

Final rept., A. J. Estin, and R. C. Baird. 1982, 12p Pub. in Proceedings of the Antenna Measurements Symposium, Las Cruces, New Mexico, October 5-7, 1982, p5-1 - 5-12.

Keywords: *Antennas, Artifical satellites, Measuring instruments, Electromagnetic radiation, Microwave communication, *Orbiting Standards Package, Earth terminals, Electromagnetic measurement.

The concept of an Orbiting Standards Package (OSP) has been discussed as a means of making direct measurements of fields, patterns, and polarization states of signals radiated from large earth station antennas. It would also have the capability of producing test fields of known intensitites and arbitrary but welldefined polarization states, thereby enabling the determination of such parameters as G/T and Effective Receiving Area of earth stations. Recent developments in microwave six-port networks and in standard antennas would permit the all-electronic generation and detection of these signals. Moreover, it appears possible to recalibrate the satellite standards package to laboratory state-of-the-art accuracy following launch.

Analytical Optogalvanic Spectroscopy in Flames. Final rept.,

Pub. in Analytical Laser Spectroscopy, p213-233 1985.

Keywords: *Chemical analysis, *Ionization, Excitation, Design criteria, Performance evaluation, Reprints, *Laser spectroscopy, *Optogalvanic spectroscopy, *Laser enhanced ionization, Flame spectroscopy.

Optogalvanic spectroscopy is based on changes in the impedance of a weakly ionized plasma in response to the optical excitation of an atomic or molecular species in the plasma. Though rooted in research of over five decades ago, optogalvanic spectroscopy has fluorished with the advent of tunable lasers. Optogalvanic spectroscopy in flames, or laser enhanced ionization, has been extensively developed as a flame spectrophotometric analytical method. This paper reviews the research into the theory and practice of laser enhanced ionization since the inception of the method in 1976. The mechanisms of ion production, ion transport, and signal generation are treated theoretically, and supported by experimental studies. The develop-ment of analytical LEI is presented, with discussions of instrumentation, sensitivity, and accuracy.

Thermal Testing of Passive/Hybrid Solar Components.

Final rept.

M. E. McCabe. 1982, 6p Sponsored by Department of Energy, Washington, DC. Passive and Hybrid Solar Energy Div.

Pub. in Proceedings of Passive and Hybrid Solar Energy Update, Washington, DC., September 15-17, 1982, p251-256.

Keywords: *Test facilities, *Solar heating, Buildings, *Passive solar heating systems, Solar space heating.

Studies of thermal performance of passive solar buildings have indicated a need for precise field measurement of solar heat gain and thermal heat loss or gain for modular passive/hybrid solar components. A scription of the conceptual design and the major assemblies and subsystems for a new calorimetric test facility is presented. The facility is designed for field testing of passive solar components at the National Bureau of Standards in Gaithersburg, MD. The test facility metering chamber can accommodate test articles having nominal dimensions up to 1.26 x 2.09 m corresponding to a standard sliding door, with thicknesses up to 0.41 m (16 in). The test articles are installed in the buildings envelope and can be oriented either to the vertical-south, or to the horizontal-upward facing direction. The metering chamber is designed to simulate an ideal indoor thermal environment by absorbing all the solar energy transmitted by the test article and by maintaining the indoor air and surface temperatures controlled values between 15.6 and 26.7C (60 and 80F). A description of the passive/hybrid solar components proposed for testing in the calorimeter during the winter season of 1982-1983 is provided.

The authors have constructed a 30-40 GHz test apparatus which allows us to measure the noise temperatures of SIS mixers with an accuracy of better than + or - 1 K. This is a factor of six improvement over earlier measurements. In addition, SIS mixers employing arrays of N=1, 5, 10, 25, and 50 tunnel junctions in series have been tested. The input power required to saturate the array mixers was found to increase as Nsquared, and the gain and noise temperature of the array mixers were independent of N.

Characterization of NBS (National Bureau of Standards) Standard Reference Material 2135 for Sputter Depth Profile Analysis.

Final rept.,

J. Fine, and B. Navinsek. 1985, 5p Pub. in Jnl. of Vacuum Science and Technology A3, n3 p1408-1412 May/Jun 85.

Keywords: *Sputtering, Ion beams, Calibrating, Interfaces, Resolution, Thin films, Nickel, Chromium, Reprints, *Standard reference materials, Auger spectrosсору.

A Ni/Cr multilayered thin-film standard reference material (SRM) for sputter depth profile calibration has been developed jointly by the National Bureau of Standards, the Jozef Stefan Institute, and the American Society for Testing and Materials (ASTM) Committee E-42 on Surface Analysis. This perodically modulated structure can be effectively used to calibrate sputter erosion rates and depth of erosion scales in surface analysis as well as to monitor ion beam stability and to optimize sputtering conditions so as to achieve maximum interface resolution. Characterization results obtained on this first SRM for surface analysis to be issued by NBS indicate that the accuracy of its structure is known to better than 6% and that its sputter profiles are well defined and reproducible. Results of the calibration and compositional analysis of this SRM are presented regarding uniformity and periodicity of thin film layers, absolute film thickness, sputtered interface depth resolution, and relative Ni/Cr sputtering rates and yields. Measurement methods used to characterize this thin-film structure include EN(E) Auger sputter depth profiling, Rutherford backscattering spectrometry, and neutron activation analy-

Calibration Methods for Eddy Current Measure-

ment Systems.

Final rept.,

J. C. Moulder, J. C. Gerlitz, B. A. Auld, M. Riaziat, and S. Jeffries. 1985, 10p
Pub. in Proceedings of Review of Progress in Quantitative Nondestructive Evaluation, San Diego, CA., July 8-13, 1984, v4A p411-420 1985.

Keywords: *Eddy currents, Calibrating, Nondestructive tests, Measurement.

Quantitative inversion of eddy current signals to obtain flaw sizes from actual measurements requires methods for calibrating eddy current measurement sys-tems. In performing flaw-signal inversion it is not suffi-cient to know the phase of the flaw signal relative to liftoff: rather, the absolute phase of Delta Z is required. The authors explore three possible approaches to this problem: absolute electrical calibration of the measurement system, measurements of probe liftoff signals, and measurements on actual or simulated flaws. Air core, circular coils of rectangular cross-section are used to facilitate comparisons of theory and observation. Results of liftoff measurements are found to agree with analytical solutions obtained by Dodd and Deeds. Flaw signals for rectangular-shaped, surface-breaking flaws agree with the predictions of the nonuniform-probe-field theory of Muennemann and Auld.

Ultra-High Resolution Frequency Meter.

Final rept.,
J. J. Snyder. 1981, 6p
Pub. in Proceedings of Annual Frequency Control
Symposium (35th), Philadelphia, PA., May 27-29,
1981, p464-469.

Keywords: *Frequency meters, Frequency measurement, Random noise, Signal to noise ratio.

The authors have recently developed a novel instrument for measuring the frequency of a periodic signal contaminated by random phase noise. This frequency meter averages overlapping time intervals using a simple algorithm implemented with standard logic circuits. Because of the signal-to-noise improvement inherent in the averaging process, the standard devi-ation of a single measurement contaminated by, e.g., white phase noise is proportional to tau to the minus 1.5 power, tau is the time for the measurement. In contrast, the uncertainty in the measurement of the frequency of a noisy signal using a standard frequency counter is proportional to 1/tau. For many potential applications of the frequency meter, the measurement uncertainty due to contaminating noise may thereby be reduced by several orders of magnitude in comparison with a measurement over the same time interval using presently available instruments.

Final rept., H. S. Peiser. 1985, 6p Pub. in Analytical Chemistry 57, n511A 1985.

Keywords: *Chemical elements, *Standards, Isotopes, Samples, Reprints, *Natural emissions, *Atomic weights.

The tables of atomic weights of the chemical elements as they are found in natural terrestrial sources are reviewed regularly and published by the International Union of Pure and Applied Chemistry. After a recent major revision of these tables, the author discusses the improvement and limitations in the reliability of these data as they affect analytical chemists. The uncertainty of these data are implied in the precision of the tabulated numerical values. Taken into account are both experimental uncertainties and natural variability of isotopic abundances. The 20 elements that have only one stable nuclide have atomic weights reliable to about 1 part in 10,000,000. An equal number of elements have experimental uncertainties of more than 1.5 parts in .0001 with no significant variability. Their atomic-weight determination remains a challenge to experimenters. About 11 elements are so variable that atomic weights of given samples can be measured more accurately than the atomic weight values have been tabulated. Radioactive decay affects appreciably only the atomic weights of daughter elements in some abnormal sources.

Effect of Ion Current in the Collisionless Theory of Floating AC Probe Measurements. Final Report, E. R. Mosburg. 1981, 5p See also PB82-118357.

Pub. in Review of Scientific Instruments 52, n8 p1182-1186 Aug 81.

Keywords: *Langmuir probes, Electron energy, Plasma diagnostics, Reprints, *Electron temperature.

Previous treatment of the theory of floating ac probes has considered only the electron current voltage dependence. In the paper the effect of including the voltage dependence of the ion current is examined, and equations are derived which allow the use of the calculations by Laframboise of the ion current to cylindrical probes having arbitrary ratios of probe diameter to Debye length. The error in electron temperature meas-urements introduced by neglecting the ion current variation, and the range of usefulness of the technique, is discussed. For example, in the normally expected range of floating potential, a measurement of the electron temperature could be in error by as much as about 13% if the voltage dependence of ion current is ignored.

Raman Microprobe Spectroscopic Analysis.

Final rept., J. J. Blaha. 1981, 41p Pub. in Vibrational Spectra and Structure: A Series of Advances, v10 p227-267 1981.

Keywords: *Raman spectroscopy, *Microanalysis. *Molecular vibration, Particles, Sampling, Laboratory equipment, Forecasting, Molecular structure, Chemical analysis, Reprints.

Raman microprobe and microscopes have extended vibrational spectroscopy to the analysis of microparti-cles whose dimensions are on the order of micrometers. These techniques have been applied to the analysis of a wide variety of materials in a broad range of fields. Many of these investigations have been demonstrations of potential while others have yielded information that can not be obtained by any other technique. Raman spectra obtained from microparticles are directly related to that from both samples. In contrast to the measurement of macroscopic crystals, all of the Raman active modes of a sample are usually observed in a single spectrum when microparticles are examined. In this review, a general summary of the Raman microprobe technique, instrumentation and applications will be made to demonstrate the versatility of the technique to a wide range of problems. In addition some information is presented on possible future developments in applications and improvements in instrumentation.

Reference Materials: Their Production, Certification and Use in Compatible Measurement Networks.

Final rept.

Pub. in Proceedings of Euroanalysis III, Reviews in Analytical Chemistry, p153-172 1979.

Keywords: *Measurements, *Chemical analysis, Laboratory equipment, *Reference materials, Certified reference materials, Standard reference materials.

In a world becoming increasingly interdependent in terms of trade, environmental protection, safeguarding of nuclear materials, and world health, among others, the importance of being able to make dependable and reliable measurements is self-evident. Measurement compatible networks are designed and their work implemented in a manner that assures that measurement results from one laboratory to another agree within predetermined uncertainties useful for some stated end-purpose. Networks that accomplish accurate measurements, (measurements free of systematic error and precise), produce results that are compatible. One important mode for achieving accurate measurements, especially useful for the determination of chemical composition, is based on the use of reference materials in the measurement process. The production and certification of reference materials (RM's) is a complex, time-consuming, and costly process requiring measurement resources of the highest order in terms of skilled manpower and sophisticated equipment. To describe and illustrate these, the author uses as his model the RM program of the U.S. National Bureau of Stan dards, a program now approaching its 80th anniversary. Of great importance, is the scientific integrity and credibility of the finished product. The three measurement modes used at NBS to arrive at certifiable values for its RM's are described in some detail. General principles involved in RM production are also discussed.

Review of Materials for pH Sensing for Nuclear Waste Containment, T. Dietz, and K. G. Kreider. Sep 85, 62p NBSIR/85-

Sponsored by Nuclear Regulatory Commission, Washington, DC.

Keywords: *pH meters, *Radioactive wastes, Reviews, Corrosion, Design criteria, Performance evalua-tion, Electrochemistry, Electrodes, Glass, Thin films, Platinum oxides, Stability, Transition metals, Yttrium compounds, *Radioactive waste disposal, *Radioactive waste storage, NRC, Chemical reaction mechanisms, Metal oxides, Palladium hydride, Iridium oxide.

The report defines the performance criteria of the needed pH sensors and reviews the performance of a number of elevated temperature pH sensing technologies with respect to these criteria. The criteria of electrode performance were developed to predict the utility of various pH electrodes in these simulated environments. The classes of pH electrodes reviewed are the glass electrode, yttria stabilized zirconia, palladium hy-dride and a variety of metal oxides. The report focuses on a relatively new solid state electrode material, reactively sputter deposited iridium oxide. The performance of this thin film material is of particular interest because its low electrical resistivity and high corrosion resistance eliminate some of the shortcomings of the glass and ceramic materials. The reactive sputtering technology permits these films to be deposited and pattern defined on a wide variety of substrate materials. Low electrical resistivity, which simplifies electrical contacts, and a flexible deposition technology make this material a prime candidate for micro pH sensors.

Superconductor-Insulator-Superconductor Quasi-

particle Junctions as Microwave Photon Detec-

Final rept.

P. L. Richards, T. M. Shen, R. E. Harris, and F. L.

Lloyd. 1980, 3p Sponsored by Office of Naval Research, Arlington, VA. Pub. in Applied Physics Letters 36, n6 p480-482, 15

Keywords: Microwave equipment, Electron tunneling, Superconductors, Detectors, Reprints, *Microwave sensors, Quasiparticles.

The strong nonlinearity of the quasiparticle tunneling current in superconductor-insulator-superconductor junctions near the full-gap voltage 2 delta/e can be used for direct detection of microwave signals. Measurements at 36 GHz yielded a current responsivity of 3500 A/W, which is within a factor of 2 of the quantumlimited value e/(h bar)omega. The measured NEP of 2.6 + or - 0.8x10 to the -16th power W/(Hz sup 1/2) is the lowest value reported to date and can probably be improved significantly. The experimental results are compared with both the standard classical analysis and photon-assisted tunneling theory.

Nonparametric Calibration.

Final rept., G. Knafl, J. Sacks, C. Spiegelman, and D. Ylvisaker. 1984, 9p Pub. in Technometrics 26, n3 p233-241 Aug 84.

Keywords: *Calibrating, Mathematical models, Reprints, Systematic errors.

The paper deals with calibration when a linear model may not hold exactly. Usually, a calibration curve f is assumed to follow a linear model, e.g., f(x) = a + bx or f(x) = a + bx + c(x squared). As such calibration curves only approximate reality, there is a discrepancy between the assumed linear model and the true curve. This discrepancy produces systematic errors in the measurements obtained from the fitted calibration curve. The new procedures recommended here cope directly with such systematic errors, whereas the more traditional linear model approach cannot.

Wear Testing and Standardization.

Final rept., P. J. Blau. 1985, 3p

Pub. in ASTM (American Society for Testing and Materials) Standardization News, p34-36 Oct 85.

Keywords: *Wear tests, Standardization, Wear, Fric-

Wear exacts a high cost in our economy. Its many forms affect most technological disciplines. To improve control and reduction of wear, research and development programs need to use wear testing methods of many kinds. Standardization to only a few basic tests may not be possible due to the diversity of wear modes. Use of simple, linear wear constants from lab-oratory tests may lead to unrealistic representations of actual component behavior. More advanced, multi-mode wear tests and analytical models for wear mechanisms need to be developed to improve relating laboratory testing data to field performance. ASTM can serve an important role by promoting multimode wear testing procedure development, improvements in standard terminology, and methods for reporting data.

Microindentation Hardness Testing.

Final rept.,
P. J. Blau, and T. R. Shives. 1985, 5p
Pub. in ASTM (American Society for Testing and Materials) Standardization News 13, n1 p47-51 Jan 85.

Keywords: *Hardness tests, Metals, Microhardness, Microstructure, Failure.

The paper briefly reviews two common micro-indentation hardness testing methods for metals, highlighting sources of measurement errors, the need to understand the significance of microhardness numbers, and both traditional and more unique applications of such testing. Examples of studies from several applied fields are used to illustrate the points in the discussion: failure analysis, microstructural characterization, fracture mechanism research, and tribology. The trend to-wards automating hardness test methods is discussed.

Simple Gas Sampling and Injection Apparatus.

Final rept.,
T. J. Bruno. 1985, 3p
Sponsored by Gas Research Inst., Chicago, IL.
Pub. in Jnl. of Chromatographic Science 23, p325-327 Jul 85.

Keywords: *Gas chromatography, *Samplers, Injection, Laboratory equipment, Design criteria, Performance evaluation, Reprints.

The short paper describes a simple apparatus used for gas sampling and injection in gas chromatographic analysis. It can be constructed easily from commercially available equipment, and provides results which rival those obtainable from less conventional sampling systems. The main features of the sampler/injector are a variable volume sample reservoir and a standard tenport sampling valve equipped with an evacuable sample loop of fixed volume. The variable volume of the sample reservoir allows control of the sample pressure inside the loop. Evacuation of the sample loop prior to filling has been found to give a considerable increase in precision of replicate area count measurements. The sampler/injector is especially useful for sit-uations in which a very limited amount of gaseous sample is available for analysis.

Dioxide.

Final rept., B. C. Cadoff, and J. Hodgeson. 1983, 3p Pub. in Analytical Chemistry 55, n13 p2083-2085 1983.

Keywords: *Nitrogen dioxide, *Monitors, *Air pollution, Sampling, Concentration(Composition), Laboratory equipment, Chemical analysis, Reprints, *Air pollution sampling, *Air pollution detection, *Passive monitors.

A precise, high-rate passive sampler for NO2 is described. It can be assembled from a commerciallyavailable device, and can be used to reliably sample low ambient levels of NO2. Triethanolamine is used to collect the NO2, and the analysis method follows the traditional Saltzman procedure. The device is diffusion controlled and samples at a rate of approximately 110 mL/min. It has been evaluated at two levels of relative humidity and exhibits no interference in the presence of a large excess of NO. Sampling has been conducted at 2 concentrations between 61 and 335 ppb.

Interlaboratory Comparison of Source Apportionment Procedures - Results for Simulated Data

Final rept.,

L. A. Currie, R. W. Gerlach, C. W. Lewis, W. D. Balfour, and J. A. Cooper. 1984, 21p

Pub. in Atmospheric Environment 18, n8 p1517-1537

1984.

Keywords: *Air pollution, *Aerosols, *Particles, Assessments, Sampling, Meteorology, Least square methods, Comparison, Sources, Reprints, State of the art, Intercomparison, Procedures.

Three sets of simulated compositional data for aerosol samples were prepared in order to (a) assess the current state of the art of source apportionment procedures, and (b) to provide initial sets of test data to aid in method development. The data sets were generated from reported source profile information, together with real meteorological data (St. Louis, 1976) and two constructed city plans. Following plume dispersion by means of the RAM model, forty 'samples' were generated having known source contributions and error structure. Deconvolution of the simulated data sets was undertaken by seven laboratories using numerical methods based primarily on least squares (Chemical Mass Balance) and multivariate (Factor Analysis and Multiple Linear Regression) techniques. Comparison of the interlaboratory results and estimated uncertainties with the known source contributions indicated consistency within about a factor of two (average about + or - 30%), and uncertainty estimates which ranged from much too conservative (broad) to much too small. No unique choice of method evolved from this exercise; the alternative methods appeared complementary and capable of resolving up to about 6-9 different sources. As a result of the intercomparison, suggestions are given for improving the simulation process per se, as well as the various methods of treating the data--especially with respect to the issue of estimated uncertainties.

PB86-133634 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Many Dimensions of Detection in Chemical-Analysis.

Final rept.,

L. A. Currie. 1983, 1p Pub. in Abstracts of Papers of the American Chemical Society 185, p63 Mar 83.

Keywords: *Chemical analysis, Chromatographic analysis, Spectrochemical analysis, Mathematical models, Error analysis, Sampling, Calibrating, Reprints.

Simple detection decisions generally involve the comparison of scalar quantities (gross signal, blank). Conventional chromatography and spectrometry, on the other hand, involve one-dimensional variables (time, mass, wavelength, energy) where signal and baseline traces may be examined to decide whether a peak is present at a given location. Linked techniques, such as

501,301 141

Group 14B-Laboratories, Test Facilities, and Test Equipment

GC-MS or two-parameter nuclear spectroscopy, raise the question of detection in two dimensions. Finally, problems wherein a set of samples is characterized by many independent chemical and physical observa-tions raise the issue of multidimensional detection. All such problems have a common theoretical base in the such problems have a common theoretical base in the statistical theory of hypothesis testing. Following a brief review of underlying assumptions and techniques for applying the theory to detection decisions and detection limits, primary attention is given to a one-dimensional (reduced from two) problem involving the calibration curve of the pesticide Fernvalerate. Other topics addressed include information-loss through faulty reporting (at trace levels) and its impact on regulatory issues, and chemometric quality assurance through standard interlaboratory test data sets.

Neutron Depth Profiling at the National Bureau of Standards.

Final rept.,

R. G. Downing, R. F. Fleming, J. K. Langland, and D. H. Vincent. 1983, 5p

Pub. in Nuclear Instruments and Methods in Physics Research 218, n1-3 p47-51, 15 Dec 83.

Keywords: *Neutrons, Nuclear reactions, Silicon, Helium 3, *Depth dose distributions, Semiconductors, Lithium 6, Boron 10, Sodium 22.

The National Bureau of Standards has established a dedicated neutron depth profiling (NDP) facility at its 10 MW research reactor in Gaithersburg, MD. The goal of the program is to provide real-time concentration or the program is to provide real-time concentration profiles with the quality necessary to address scientific and technological problems. The depth profiles are obtained by deconvolution of energy spectra measured as monoenergetic charged particles are released by exoergic neutron reactions. The energy the particle relations upon leaving the sample surface is primarily detains upon leaving the sample surface is primarily de-pendent on the depth at which the reaction took place. Initially He-3, Li-6, B-10, and Na-22 are being studied because of their large thermal neutron cross sections and the importance of the nondestructive analysis of these elements in many matrices.

PB86-136850 Not available NTIS National Bureau of Standards, Gaithersburg, MD. High Frequency Optical Heterodyne Spectrosco-

py. Final rept.,

M. Ducloy, and J. J. Snyder. 1983, 4p
Pub. in Proceedings of the Society of Photo-Optical Instrumentation Engineers Laser-Based Ultrasensitive Spectroscopy and Detection, San Diego, CA., August 23-24, 1983, v426, p87-90.

Keywords: *Doppler effect, *Noise reduction, Performance evaluation, *Laser spectroscopy, *Optical heterodyne spectroscopy.

The progress over the last few years in the field of sub-Doppler saturated absorption spectroscopy has been greatly assisted by the development of new techniques for increasing sensitivity. For many laboratory situations it is now routinely possible to achieve signal-to-noise ratios and sensitivities very near the quantum limit imposed by the fundamental statistical fluctua-

tions (shot noise) of the probe laser beam. It has been known for some time that the sensitivity of shot-noise limited saturation spectroscopy is exceedingly high. Until recently however, the sensitivity achieved in practice was more often several orders of magnitude worse than the predicted shot-noise limit. The reason for the reduced sensitivity is due to a number of non-funda-mental or 'technical' sources, including common prob-lems such as electronic interference and ground loops as well as amplifier noise, unstable laser feedback interference, and excessive laser amplitude noise. In this discussion the authors shall assume that the elecity, low-noise amplifiers are in use. Their objective will be to show how the effects of laser feedback and laser amplitude noise may be reduced to the level of shot noise or below.

(Order as PB86-137627, PC A04/MF A01) National Bureau of Standards, Gaithersburg, MD. Recalibration of the U.S. National Prototype Kllo-

gram, R. S. Davis. 14 Jun 85, 19p Included in Jnl. of Research of the National Bureau of Standards, v90 n4 p263-283 Jul-Aug 85.

Keywords: *Mass, *Standards, *Units of measurement, *International prototype kilogram, *Kilogram.

The U.S. national prototype kilogram, K20, and its check standard, K4, were recalibrated at the Bureau International des Poids et Mesures (BIPM). Both these kilograms are made of platinum-iridium alloy. Two additional kilograms, made of different alloys of stainless steel, were also included in the calibrations. The mass of K20 in 1889 was certified as being 1 kg-0.039 mg. Prior to the work reported below, K20 was most recently recalibrated at the BIPM in 1948 and certified as having a mass of 1 kg-0.019 mg. K4 had never been recalibrated. Its initial certification in 1889 stated its mass as 1 kg-0.075 mg. The work reported below establishes the new mass value of K20 as 1 kg-0.022 mg and that of K4 as 1 kg-0.106 mg. The new results are discussed in detail and an attempt is made to assess the long-term stability of the standards involved with a view toward assigning a realistic uncertainty to the measurement.

The paper describes the present status of NBS thermal conductivity Standard Reference Materials (SRM's) and Calibrated Transfer Specimens (CTS's). Included are the metal SRM's, tungsten, electrolytic iron, and austenitic stainless steel. Also discussed is graphite, a soon-to-be-established SRM and candidate SRM's, such as black quartz. Finally, a description is given of the insulation SRM's and CTS's.

501,314 PB86-139821 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Laboratory Evaluation Process of the National Voluntary Laboratory Accreditation Program.

M. V. Federline. 1983, 9p Proceedings of Symposium on Evaluation and Accreditation of Inspection and Test Activities, ASTM STP 814, p96-104 1983.

Keywords: *Test facilities, *Quality assurance, Laboratories, *Accreditation, National Voluntary Laboratory Accreditation Program, NVLAP program.

At least 70 laboratory accreditation systems exist in the United States today, many of which are directed at a single discipline or narrow spectrum of products. The increase in the number of these systems in response to a growing need for laboratory testing services indicates the viability of the laboratory accreditation concept. The National Voluntary Laboratory Accreditation Program (NVLAP) was established by the Department of Commerce to provide a national, multidisciplinary laboratory evaluation scheme. NVLAP evaluation is based upon compliance with criteria which reflect the latest technology in laboratory operation and manage-ment. These criteria are sufficiently flexible to accommodate such diverse testing areas as thermal insula-tion, carpet, and concrete. The evaluation of laborato-ries, conducted by the National Bureau of Standards uses a peer review. It combines elements of questionnaire, laboratory on-site survey, and testing of proficiency samples in a comprehensive examination to determine a laboratory's capability to perform specific tests. NVLAP, an interactive system between laboratory and accreditor, provides a mechanism for overall laboratory improvement. 501,315 PB86-139912 Not available NTIS National Bureau of Standards (NEL), Boulder, CO. Efficient Calibration Strategy for Linear, Time Invariant Systems.

Final rept. G. N. Stenbakken, T. M. Souders, and J. A. Lechner.

1984, 1p
Pub. in Proceedings of Conference on Precision Electromagnetic Measurements, Delft, The Netherlands, August 20-24, 1984, p215.

Keywords: *Frequency response, *Calibrating, Linear systems, Regression analysis, Optimization, Tests, Time invariant systems.

An efficient strategy for accurately characterizing the frequency response of linear, time invariant (LTI) systems is presented. The approach, based on circuit modeling, design-of-experiments theory, and nonlinear regression analysis, optimizes calibration confidence with respect to test effort. The analytical tools and methodology needed for designing the strategy will be included, together with experimental results. The approach can be particularly beneficial in volume testing of instruments such as oscilloscopes, precision ac voltmeters, waveform recorders, and wideband wattmeters.

Final rept.

F. L. Walls, and J. J. Gagnepain. 1984, 10p Pub. in Precision Frequency Control, v2 ch15 p287-296 1984.

Keywords: *Quartz resonators, *Frequency measurement, Microbalances, Monitors, Deposition, Pressure sensors, Temperature measuring instruments, Accelerometers, Vibration meters.

The high resolution achievable with frequency metrology often makes it attractive to connect the measurement of physical parameters to a frequency measurement via a suitable transducer. Quartz crystal resonators are sensitive to mass loading and via nonlinear effects, to temperature and stress. The sensitivities are generally low; however, the excellent short-term stability of precision quartz resonators makes high-resolution measurements of temperature, pressure, vibration, acceleration, film thickness, some gas-phase chemical rates, and absorption feasible.

Keywords: *Standards, *Surfaces, *Optical tests, Scratches, *Scratch standards, Cosmetic standards, MIL standards.

The scratch standard (MIL-O-13830A) is a cosmetic standard that is effected by a visual comparison with a set of submasters that is in turn evaluated by comparison with a set of master standards. Both manufacture and certification of the submasters are somewhat unreliable. In the paper, the authors show that the submasters can be classified according to the relative power scattered at a relatively small angle. They have designed etched gratings with which to replace the submasters; these gratings have the appearance of scratches but diffract a broad peak between 5 and 10 degrees off the axis of the incident beam. They have classified some prototypes both by comparison with the master standards and by a photoelectric measure-ment; agreement between the two methods is good. The authors suggest that such gratings be used as the submasters and possibly that they be classified by a photoelectric rather than visual measurement.

Comparison of Sputtered Ni/Cr Interface Depth Resolution as Obtained by the Quartz Crystal Mio-crobalance Mass-Loss Method and Auger Spectroscopy. Final rept.

B. Navinsek, P. Panjan, A. Zabkar, and J. Fine. 1985,

Pub. in Jnl. of Vacuum Science and Technology A3, n3 p671-673 May/Jun 85,

Keywords: *Interfaces, *Depth finding, Nickel, Chromium, Microbalances, Quartz, Sputtering, Metal films, Thin films, Comparison, Reprints, Auger electron spectroscopy.

Sputter depth profiles of interfaces have been obtained by monitoring the change in sputtering rate as a function of sputtered depth. One very sensitive technique which we use to measure sputtering rates is the quartz crystal microbalance mass-loss method; it has been used to characterize Ni/Cr interfaces sputtered with a mass-analyzed 6 to 12 keV argon ion beam. Interface widths or interface depth resolution (90 to 10% points) obtained from the mass-loss depth profile data are compared to Auger sputter depth profile widths (1 to 4.5 keV argon ions) obtained on similar Ni/ Cr thin-film materials. The somewhat narrower widths found with the mass-loss method indicate that this found with the mass-loss method indicate that this type of depth profiling can be used to characterize interface structures and to estimate the abruptness of an original, unsputtered interface.

D. Nyyssonen. 1985, 7p Pub. in SPIE Optical Microlithography IV 538, p172-178 1985.

Keywords: *Line width, *Optical measurement, *Dimensional measurement, *Lithography, Optical microscopes, Focusing, Wafers, Micrometers, Reprints, Edge detection.

Lack of precision and accuracy of in-process critical dimension (CD) measurements of linewidth continues to be a serious problem at micrometer and submicrometer dimensions. The paper proposes a new dualthreshold method for edge detection and focusing, based on image theory, which can be adapted to most optical microscope-based measurement systems. It does not require knowledge of the phase difference at the line edge. The accuracy of this criterion is compared to two more widely used criteria, (1) the minimum and (2) 50% threshold, and it is concluded that, when the phase difference is unknown and varies with normal processing, the new dual-threshold method is the superior method.

Measurement Technology for Automation in Construction and Large Scale Assembly,
J. M. Evans. Aug 85, 67p NBSIR-85/3310
Proceedings of a workshop held at Washington, DC.
on February 5-6, 1985. Sponsored by Transitions Repearch Corp. Hartford CT. search Corp., Hartford, CT.

Keywords: *Metrology, Automation, Construction, Robots, Assembling, Technology, Numerical control.

The workshop, sponsored by the National Bureau of Standards and Transitions Research Corporation, concluded that: New technology achievable in the near term would have a major benefit in the construc-tion and large scale assembly industries. The key to this benefit is the application of computers to data management and process control both off-site for design and planning and on-site for inventory manage-ment, production control and creation of an as-built data base. The achievement of this new technology requires research carried out on the integration of systems for measurement and automated control of onsite construction and assembly tasks.

Keywords: *Chemical analysis, *Calibrating, Laboratory equipment, Correlation techniques, *Kalman filtering, *Chemometrics, Computer applications, Proce-

Different chemometric methods to improve calibrations are described. A Kalman filter is applied for processing and predicting slowly varying parameters of a linear calibration graph. The results are used for the evaluation of unknown samples, and for deciding whether to calibrate again or to analyze the next unknown sample. Another approach of the calibration problem, particularly in chromatography, is the use of correlation techniques. The noise reduction property of correlation chromatography is used to extend the calibration graph to very low concentrations. Further-more, an experimental technique to determine a calibration curve and the unknown sample simultaneously under exactly the same conditions is described.

Keywords: *Experimental design, *Chemical analysis, Optimization, Mathematical models, Screening.

Most research and development projects require the optimization of a system response as a function of several experimental factors. Familiar chemical examples are the maximization of product yield as a function of reaction time and temperature; the maximization of analytical sensitivity of a wet chemical method as a function of reactant concentration, pH, and detector wavelength; and the minimization of undesirable impurities in a pharmaceutical preparation as a function of numerous process variables. The 'classical' approach to research and development involves answering the following three questions in sequence: What are the important factors (Screening), in what way to these important factors affect the system, (Modeling), What are the optimum levels of the important factors. As R. M. Driver has pointed out, when the goal of research and development is optimization, an alternative strategy is often more efficient: What is the optimum combination of all factors levels, (Optimization), In what way do these factors affect the system, (Modeling in the region of the optimum), What are the important factors. The key to this alternative approach is the use of an The key to this alternative approach is the use of an efficient experimental design strategy that can optimize a relatively large number of factors in a small number of experiments. The theory of these techniques and applications to real situations will be dis-

Finline Diode Six-Port: Fundamentals and Design

Information, M. Weidman. Dec 85, 43p NBS/TN-1090 Also available from Supt. of Docs as SN003-003-

Keywords: Network analyzers, Millimeter waves, Integrated circuits, Planar devices, Design, *Six ports

The preliminary design and testing of a planar circuit six-port with diode detectors is described. The planar circuit medium was chosen to be finline, and all preliminary work was done in WR-42 waveguide (18-26.5 GHz). The finline substrate was alumina, and initially commercial beam-lead diodes were bonded to the finline metalization. The goal is to design an integrated circuit which could be fabricated on one chip (with diode detectors) and used as part of a six-port network analyzer in the waveguide bands above 18 GHz. Initial designs proved to be unsatisfactory because of high losses and reflections. Most of the problems have been solved, and a usable integrated finline circuit is a good possibility for a millimeter wave six-port.

Standards, v90 n5 p331-339 Sep-Oct 85.

The NBS-2 balance was designed and built at NBS and transferred to the BIPM in 1972. It is presently used for the comparison of national prototype kilograms with international standards. Excellent environmental conditions at the BIPM have resulted in a longterm standard deviation of 1 microgram (1 x 10 to the 9th power) for a comparison of two 1-kilogram standards. With this remarkable precision, one has begun to observe and quantify systematic biases of less than 5 micrograms. The nature of these biases is presented as well as the remedy adopted to eliminate their influ-ence on both the final measurement results and the variance assigned to those results.

PB86-166816 (Order as PB86-166782, PC A04/MF A01) National Bureau of Standards, Gaithersburg, MD. SRM 1970: Succinonitrile Triple-Point Standard - A Temperature Reference Standard Near 58.08C, B. W. Mangum, and S. El-Sabban. 8 Aug 85, 12p Prepared in cooperation with National Inst. for Standards, Cairo (Egypt).
Included in Jnl. of Research of the National Bureau of Standards, v90 n5 p359-370 Sep-Oct 85.

Keywords: *Succinonitrile, *Thermometers, Temperature measurement, Standards, Calibrating, *Standard reference materials.

Triple-point-of-succinonitrile cells have been tested and established as Standard Reference Material (SRM) 1970. Of the 115 cells tested, 109 were accepted as SRM 1970. Five of the 115 cells had triple-point temperatures lower than 58.0785C (the low-temperature limit established for SRM 1970) and, consequentlv. were rejected. One of the 115 cells broke during tests on it. The mean value of the triple-point temperatures (obtained by freezing) of the 109 cells is 58.0796 + or -0.0015C, where the uncertainty is the total estimated uncertainty relative to the International Practical Temperature Scale of 1968, Amended Edition of 1975. The standard deviation of the triple-point temperatures is 0.48 mK. The purity of the succinonitrile of the SRM 1970 cells is estimated to range from 99.999.97% to 99.999.84%. The preparation of the cells, the various tests performed on them, and the procedure recommended for their use are described.

Use of Power Transfer Matrices in Predicting System Loss: Theory and Experiment. Final rept.

J. M. Maisonneuve, and R. L. Gallawa. 1984, 6p Sponsored by Centre de Documentation de l'Arme-ment, Paris (France). Direction des Recherches, Etudes et Techniques.

Pub. in Proceedings of SPIE, Fiber Optics: Short-Haul and Long-Haul Measurements and Applications II, San Diego, CA., August 21-22, 1984, v500, p88-93.

Keywords: Attenuation, *Local area networks, *Fiber optics transmission lines, Ray theory, Power transfer.

The phase space diagram for parabolic and step index fibers leads to a graphic representation of the bound, leaky, and refracted rays of ray theory. This concept is used to predict the attenuation of typical components of local area networks. The technique uses power transfer matrices to track the evolution of power distribution in ray packets. In particular, we predict and then measure the power transfer of two ray packets for a step index fiber. The comparison is encouraging.

A local area computer network (LAN) measurement center has been implemented at the National Bureau of Standards, Institute for Computer Sciences and Technology (ICST) for the performance investigation of NBSNET, one of the largest operational local broadcast networks. The measurement center is a facility for characterizing NBSNET traffic and for performing research experiments with artificially generated traffic. The center consists of four components: a monitoring system for collecting measurements about both artificial and normal network traffic, an artificial traffic generator for emulating various loads on the network, analysis software for summarizing the measurement information into performance reports, and a development system for generating hardware and software support of the entire measurement center. A taxonomy of audiences interested in local network traffic characterization is presented.

PB85-221919 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Performance Analysis of NBSNET. Final rept.,

R. E. Toense. 1983, 10p Pub. in Jnl. Telecommun. Networks 2, n2 p177-186

Keywords: *Computer networks, *Telecommunication, Carriers, Performance evaluation, Utilization, Channel stabilization, Reprints, *Communications networks, *Local area network, NBSNET, NBS network, Broadcasting.

The performance of NBSNET, a broadcast, packet switched, carrier sense multiple access with collision detection (CSMA/CD) local area network, is analyzed in terms of utilization, stability, delay and fairness. Traffic generators transmit packets of known arrival rate and packet length distributions on an isolated network segment. The packets are recorded and time-stamped segment. The packets are recorded and time-stamped for analysis. Analysis of the empirical laboratory data

shows that (1) utilization of the network under heavy and overloaded conditions approaches the theoretical limit and is predictable, (2) the network remains stable under the conditions observed, (3) the mean delay introduced by the network is predictable as a hyperbolic function of the observed channel utilization, (4) the network is fair with uniformly distributed individual node utilizations.

Computer Based Message Systems (CBMS), once excomputer Based Message Systems (CBMS), once exclusive tools of programmers and researchers, are rapidly finding their way into commercial and governmental offices. The first CBMSs were designed as closed systems, allowing messages to be exchanged only between the users of the same CBMS. The proliferation of CBMSs has been accompanied by a growing eration of CBMSs has been accompanied by a growing desire by users for communication between different systems. Standards and protocols provide common systems. Standards and protocols provide common ground for the interconnection of dissimilar systems. The paper discusses the design and rationale of a draft CBMS message format standard being developed by Bolt Beranek and Newman under contract to the U.S. National Bureau of Standards. The draft standard provides a machine-readable format for the representation of CBMS messages as they are sent or exceived by computer based mails systems. It also not received by computer based mail systems. It also provides a set of standard message fields which may be used to convey specific information often found in CBMS messages.

Transparent Metrology of Signal to Noise Ratios of Noisy Band-Limited Digital Signals,

D. Halford. Jun 85, 32p NBS/TN-1077

Also available from Supt. of Docs SN003-003-02658-

Keywords: *Signal to noise ratio, *Pulse communication, Metrology, Noise(Sound), Measurement, Monitors, Real time operations, Signals, Synchronism.

The author propose the use of a template method for quantitative, correct, and transparent measurement of signal power to additive noise power ratios (SNR) of digital signals and systems under full operating conditions. The author discusses the significance of transparent metrology, the measurement of various SNR's by the template method, and the general applicability of the template method for measurements on any noisy digital signal. The template method can provide transparent metrology procedures for other basic measurands, e.g., intersymbol interference, multiplicative noises, and synchronization.

Global Positioning System for Accurate Time and Frequency Transfer and for Cost-Effective Civilian Navigation.

Final rept.,

J. L. Jespersen, M. Weiss, D. D. Davis, and D. W.

Allan. 1980, 1p

Pub. in Proceedings of IEEE Plans 80, Position Location and Navigation Symposium, Atlantic City, New Jersey, December 8-11 1980, p468.

Keywords: *Navigation, Position(Location), Time, Frequencies, Atomic clocks, *Global positioning system.

The paper described some alternative applications of Global Positioning System (GPS) including a method for very accurate time transfer and for civilian position location much less expensively than the designed De-partment of Defense method. The first part of the paper discusses several time transfer techniques with emphasis on what we call the 'common-view' ap-proach, and the second part considers the system for position location. Both applications depend on the fact that accurate ephemerides are available for GPS and that GPS time is based on atomic clocks.

in alloy or oxide form, often leads to marked compositional changes at the surface as a consequence of ion implantation, preferential sputtering, and atomic cascade mixing. For fixed energy ions, these mechanisms produce a composition profile which is dependent upon the incident angle of the ions. Research in the area of ion-bombardment-induced composition changes has almost exclusively dealt with mono-directional ion beams. Most applications of ion bombardment are concerned with well-collimated beams. In the case of the first wall of a fusion reactor, however, the impinging ions are not restricted to any particular angle. The Monte Carlo code EVOLVE, which models the ion bombardment of surfaces, has been used to correlate the composition changes due to a multidirectional to be been to those of more directional to the composition. tional ion beam to those of mono-directional beams. Calculations are presented for a multi-directional Xe beam of 1.5 keV containing equal portions of ions with incident angles of 0 degrees and 70 degrees.

The report contains results of a research program to produce material property data that will facilitate design and development of cryogenic structures for the superconducting magnets of magnetic fusion energy power plants and prototypes. The program was developed jointly by the staffs of the National Bureau of Standards and the Office of Fusion Energy of the Department of Energy; it is managed by NBS and sponsored by DOE. Research is conducted at NBS and at various other laboratories through subcontracts with NBS. Research results for 1984 are summarized in an Initial 'Highlights of Results' section and reported in detail in the technical section and reported in detail in the technical papers that form the main body of this report. The technical papers are present-ed under four headings reflecting the main program areas: Welding, Nonmetallics, Structural Alloys, and Technology Transfer. Objectives, approaches, and achievements are summarized in an introduction to each program area.

Calibration for Measurements with Background
Correction Applied to Uranium-235 Enrichment.

Final rept., W. Liggett. 1983, 16p

Pub. in Nuclear Instruments and Methods in Physics Research 216, n3 p455-570 1 Nov 83.

Keywords: *Uranium 235, *Enrichment, *Calibrating, *Gamma ray spectroscopy, Reprints.

In enrichment measurement by gamma spectroscopy, two activity levels are observed: One is the sum of the response to the enrichment and a background level, and the second is another background level. Calibration consists of determining not only the relation be-tween the response and the enrichment but also the relation between the two background levels. A calibration procedure with this property is developed under the assumption that the random errors have constant variance and the assumption that the two background levels are proportional. This procedure provides a consistent estimator for the calibration curve and interval estimates for the unknowns measured after calibration. The calibration procedure is applied to enrichment measurements made with the SAM-2 enrichment meter. With these measurements as illustrations, tech-

The resin bead sample loading technique in thermal ionization mass spectrometry has been evaluated for the accurate and precise measurement of uranium and plutonium isotopic ratios by means of an interlaboratory analysis program (round robin) sponsored by the National Bureau of Standards (NBS). Nanogram size samples, including both standards and unknowns, were loaded onto anion exchange resin beads and transported to participating laboratories for measure-ment. Six laboratories or 40 percent of the laboratories identified as having the requisite high sensitivity instrumentation have participated in all phases of the round robin to date. Isotopic fractionation is concluded to be a major source of imprecision and calibration of isotopic fractionation the major source of inaccuracy.

National Bureau of Standards Health Physics Radioactive Material Shipment Survey, Packaging, and Labelling Program Under ICAO/IATA and DOT Regulations.

Final rept.,

D. R. Sharp, and L. A. Slaback. Feb 84, 5p Pub. in Proceedings of the Health Physics Society Mid-year Topical Symposium (17th), Pasco, Washington, February 5-9, 1984, p7.87-7.91.

Keywords: *Packaging, *Marking, Regulations, Transportation, *Radioisotopes, BASIC computer program, US NBS.

NBS routinely ships, both domestically and internationally, many isotopes in small to moderate activities. These shipments are divided about evenly between Limited Quantity and Type-A shipments, with many containing mixtures of isotopes in a variety of combinations. The ICAO/IATA shipping regulations (and the new DoT regulations on their model) specify individual shipping parameters for every isotope, with limited quantity limits that are additionally a function of physical state. The resulting parametric permutations have become so complex that quality control in the shipment of these radioactive packages has become diffi-cult to maintain. The authors have developed a computer program that will guide a person with minimal training in transportation regulations through package surveys and give exact packaging and labelling instructions. The program is a 27K-byte, user-friendly, BASIC program that runs on the Epson-HX20 notebook computer with microcassette drive and 16K memory expansion unit. This small computer is more manageable than the regulation books for which it will be substituted and will be used in our routine radioactive shipments.

A. F. Clark, M. W. Cromar, and F. R. Fickett. 1984,

Pub. in Proceedings of Int. Cryogenic Engineering Conf. (10th), Helsinki, Finland, July 31-August 3, 1984, n365-368

Keywords: Magnetometers, Supe *Squid(Detectors), *Magnetic monopoles. Superconductors,

Several different configurations of magnetic monopole detectors have been built and operated at the National Bureau of Standards. These have been designed based on the following objectives: (1) Study of the noise characteristics; (2) Simplicity and ease of changing configurations; (3) Operation in relatively large magnetic fields; and (4) Optimum detector area. Satisfina those objectives have recentled in covered corrections. fying these objectives has resulted in several compromises, but also a flexible and useful apparatus for studying the behavior of the SQUID-detector loop combination with particular emphasis on noise sources that can simulate a monopole signal. Several sources of noise and techniques for their elimination are discussed. Data from the spectral analysis of the noise signals are presented.

Dose Conversion Factors and W sub n Values for InfinitesImal Infinite Tissue-Equivalent Ion Chambers in Monoenergetic Neutron Fields from Thermal to 20 MeV.

Final rept.,
B. R. L. Siebert, and J. J. Coyne. 1984, 4p
Pub. in Radiation Protection Dosimetry 9, n3 p215-218

Keywords: *Ionization chambers, *Dosimetry, Thermal neutrons, Fast neutrons, Reprints, *Neutron dosimetry, *Tissue-equivalent detectors, Tissue-equivalent materials.

In neutron dosimetry it is common practice to use tissue-equivalent (TE) plastic as a wall material and methane based TE filling gas in constructing ionization chambers and proportional counters. As the materials differ in their elemental composition, Fano's theorem cannot be applied, and therefore it is to be expected that the cavity size has an effect on the response of the instrument. In consequence, the dose conversion factor (i.e. ratio of dose in wall to dose in gas) and the (W sub n) value (i.e. ratio of specific energy deposited in the gas to the specific number of ion pairs created) also depend on the size. The paper gives these ratios for infinitesimal and infinite cavities as a function of neutron energy from thermal to 20 MeV. The relevance of the results to microdosimetric measurements is discussed. Formulas are given which relate the quantities to the primary spectra of charged parti-cles produced by neutrons in materials of interest.

Measurement of High Doses Near Metal and Ceramic Interfaces.

Final rept.,
W. L. McLaughlin, J. C. Humphreys, M. Farahani,

Pub. in Proceedings of the International Symposium on High-Dose Dosimetry, Vienna, Austria, October 8-10, 1984, p109-133 1985.

Keywords: *Dosimetry, Calcium fluorides, Sodium chloride, Lithium fluorides, Polymeric films, Electron beams, Gamma rays, Alkali halides.

Radiochromic dosimeters consisting of leuco dyes dissolved and cast in very thin (5 to 100 micrometer) plastic films have been shown to be accurate and reproducible dosimeters for measuring absorbed doses in the range 1,000 to 1,000,000 Gy. There are also thin, optical-quality ceramic crystals (e.g. LiF, NaCl and CaF2) having thicknesses about 0.1 to 2 mm that can provide precise absorbed dose readings in the range 100 to 1 billion Gy by spectrophotometric readings of a series of radiation-induced color-center absorption bands. Besides their relatively broad response ranges, these dosimeters have the advantages of being useful in both photon and electron radiation fields, without great losses in accuracy due to rate or temperature great losses in accuracy due to rate or temperature dependence. The plastic films are particularly useful for mapping high-resolution dose distributions, such as depth-dose or isodose contours in thin layers, tubing and wire insulation. It has been shown that, by suitable selection of these plastic and crystalline systems, a fairly wide assortment of materials can be simulated in terms of radiation absorption properties over wide photon and electron spectral ranges (0.01 to 10 MeV).

Callbration of the NBS (National Bureau of Standards) Black Neutron Detector at 2.3 MeV Using the Time-Correlated Associated-Particle Method. Final rept.

K. C. Duvall, A. D. Carlson, and O. A. Wasson. 1985,

3p Pub. in Nuclear Instruments and Methods in Physics Research B10/11, n9 p931-933 1985.

Keywords: *Calibrating, Neutron sources, *Neutron detectors, MeV range 01-10.

A time-correlated associated-particle measurement capability using the D(d,n)(3)He source reaction has been developed at the National Bureau of Standards 3-MV positive-ion Van de Graaff Accelerator Laboratory. The facility has been used to measure the efficiency of the NBS Black Neutron Detector at a neutron energy of 2.3 MeV. The associated (3)He particles are detected at an angle of 45 degrees with respect to the beam axis which is a more forward angle than conventionally employed. The kinematically more energetic (3)He particles detected at the forward angle are readily separated from scattered deuterons at an incident beam energy of 250 keV. The time-correlated coincidence requirement on events detected in the Black Neutron and associated-particle detectors virtually eliminates the need for background corrections to the Black Neutron Detector rate. A result for the efficiency of the Black Neutron Detector at 2.3 MeV has been obtained with an accuracy of about + or - 1% and agrees well with a Monte Carlo calculated value. The measurement extends the usefulness of the Black Neutron Detector as an absolute neutron flux monitor to the higher energy region.

501.369 PC A04/MF A01 PB85-242196 National Bureau of Standards, Gaithersburg, MD. Heat Release Rate Characteristics of Some Combustible Fuei Sources in Nuclear Power Plants,

B. T. Lee. Jul 85, 53p NBSIR-85/3195 Sponsored by Nuclear Regulatory Commission, Washington, DC.

Keywords: *Fire hazards, *Nuclear power plants, Fuels, Fire safety, Fires, Cables(Power lines), Trays, Flammability, Flammable liquids, Ignition, Wood, Fire tests, Refuse, *Heat release rate.

A major risk to a nuclear power plant is the possibility of serious fire. There is a need to know the heat release rate behavior of combustible fuels in the plant in order to help reduce the fire threat to the facilities. Heat release rate characteristics of cable tray fires and some of the associated potential external ignition sources are discussed. Existing correlations are given for determining the time to ignition and the subsequent heat release rate of spills and pools of flammable liquids. Approximate correlations are developed for heat release rate for trash fires as a function of fire size and for one particular cable tray array arrangement as a function of the type of cable. In addition, a scheme is given for calculating the heat release rate from wood fuel fires.

Uranium-235 Measurement in Waste Material by Resonance Neutron Radiography.

Final rept.,

R. A. Schrack. Nov 84, 7p

Sponsored by Nuclear Regulatory Commission, Wash-

Pub. in Nuclear Technology 67, p326-332 Nov 84.

Keywords: *Radioactive wastes, *Uranium 235, Neutron radiography, Measurement, Reprints.

The use of resonance neutron radiography as a means of monitoring the amount of (235)U in waste material is investigated. A matrix material simulating incinerator ash is inoculated with (235)U in concentrations ranging from 0.00048 to 0.0046 g/cc. The observed uncertainty agrees well with an analytical model and ranges from 16% for the lowest concentration to 2.5% for the highest concentration. The effect of inhomogeneity of matrix and sample is determined and found to be in agreement with analytical models. The technique is demonstrated on sample sizes ranging from 2-I bottles to 55-gal drums.

In August 1979, the Department of Energy (DOE) invited the National Bureau of Standards (NBS) to consider establishment of a technical program that would contribute to the measurement standards foundation required for disposal of nuclear waste. A group of NBS scientists was asked by the management of NBS to examine the needs for measurement standards in nuclear waste management and, if desirable, to recommend a technical program. This talk is an interim report on the progress of their study and states their tentative conclusions and recommendations for an NBS technical program.

Pub. in Nuclear Materials Management 13, n1 p16-27 1984.

Keywords: *Nuclear materials management, *Tanks(Containers), *Volume, *Calibrating, Accountability, Water, Reprints, *Safeguards.

An algorithm has been developed to enable inference of the volume of process mixture in a tank, such as a nuclear materials accountability tank, at temperature T from measurements of differential pressure and temperature and values of other parameters. The differential pressure is converted to that corresponding to water at the reference temperature, 25C, by the use of a derived equation. This differential pressure is then used in a water calibration equation to calculate the volume of water at 25C. This volume is equal to the volume of process mixture at 25C at the same level in the tank, the desired result.

Analytical Approach to Acoustic Emission Signal
Processing: Problems and Progress. Final rept.,

N. N. Hsu, and D. G. Eitzen. Oct 84, 9p Pub. in Proceedings of Int. Acoustic Emission Symposium (7th), Progress in Acoustic Emission 2, Zao, Japan, October 23-26, 1984, p326-334.

Keywords: *Signal processing, Greens function, *Acoustic emissions.

The detected AE voltage waveform is considered as the convolution of (1) the source waveform, (2) the Green's function of the structure and (3) the transduction function of the detector. The authors have demonstrated, both in concept and in controlled experiment, that knowing two of the three functions the remaining unknown function can be determined. However, to solve any of the three the other two must be precisely solve any of the three the other two must be precisely determined. Many problems remain to be solved. The authors have made some progress in the understanding of these problems. Specifically they will report on the: 1. Design and characterization of simulated transient AE sources. 2. Development of techniques for experimental determination of Green's functions. 3. Development of a new test configuration for AE source thereacterization for material studies. Finally, the authorization for the source of the sector of of characterization for material studies. Finally the authors make some remarks on the comparison of the various approaches to AE waveform analysis.

S. J. Norton, and M. Linzer. 1982, 33p Pub. in Ultrason. Imag. 4, n3 p201-233 1982.

Keywords: *Ultrasonic radiation, *Refraction, *Acoustic refraction, Acoustic velocity, Perturbation theory, Correction, Reprints, *Tomography, Acoustic attenuates

In velocity and attenuation tomography, ray refraction leads to errors in time-of-arrival, as well as to errors in attenuation due to phase cancellation and lateral beam displacement. Some authors have proposed iterative techniques based on ray tracing to correct for these effects. In this paper, the authors consider an alternative approach using a perturbation analysis of refraction. This approach requires neither iteration nor ray tracing. In both two and three dimensions, the perturbation approach is much simpler computationally than ray tracing methods. Computer simulated reconstructions are presented which clearly show the improvement that can be achieved with the second-order time delay correction.

Scattering of Sound Waves by Inhomogeneities:
Time Domain Analysis.

R. D. Mountain, and G. Birnbaum. 1984, 7p
Pub. in Nondestructive Testing Communications 1, p219-225 1984.

Keywords: *Acoustic scattering, *Nondestructive tests, Acoustic measurement, Ultrasonic tests, Solids, Reprints, Born approximation.

The scattering of sound waves by isolated inhomogeneities in an otherwise uniform solid is analyzed using the Born approximation in the time domain. The volume and shape of the scatterer is related to time moments of the amplitude of the scattered signal. The matching of the incident pulse shape to the size of the scatterer is found to be essential if this type of measurement is to yield useful results.

Traceabllity of Acoustical Instrument Calibration
to the National Bureau of Standards.

Final rept.,

V. Nedzelnitsky. 1980, 4p Pub. in Proceedings of International Conference on Noise Control Eng. Noise Control for the 80's, Miami, FL., December 8-10, 1980, Inter-Noise 80, v2 p1043-

Keywords: *Acoustic measurement, *Calibrating, *Microphones, Electroacoustic transducers, Metrolo-

The necessity for the National Bureau of Standards (NBS) to provide absolute, reciprocity-based pressure and free-field calibrations of measuring microphones sufficiently accurate for the most critical needs creates a hierarchy of instrument calibration establishing direct or implied chains of 'traceability' to the NBS. Different users have differing needs so that 'traceability' is not the same concept for all users. In analyzing various definitions of traceability, Belanger ('Traceability: An Evolving Concept, ASTM Standardization News, Jan. 1980, pp. 22-27) described two contrasting views. Each of these views is shown in the present paper to represent the primary concern of a group of users of the NBS acoustic calibration services. Whichever view is employed, the value of a given system for realizing traceability depends on that system's capacity to ensure measurements of adequate accuracy.

Transport In a Disordered One-Dimensional System: A Fractal View.

Final rept..

R. J. Rubin. Sep 84, 10p

Pub. in. Jnl. of Statistical Physics 36, n5/6 p615-624 Sep 84.

Keywords: *Crystal defects, Transport properties, Reprints, One dimensional, Fractals.

The author reexamines the calculation of the transmission coefficient of a random array of N isotopic defects in an otherwise perfect, harmónic, one-dimensional crystal lattice. The thermal conductivity of this model system has been studied under steady-state conditions in which there is a kinetic temperature difference across, and an associated energy flux through, the array of defects. An exact expression for the transmission coefficient is obtained in terms of the magnitude of an N th order determinant. Rubin reduced the eval-uation of the determinant to the evaluation of a sequence of N-1 nonlinear transformations drawn from a set of transformations parametrized by the nearestneighbor spacing of the isotopic defects. These transformations are self-inverse and provide an example of what Mandelbrot has termed a self-inverse fractal. The variety of limiting distributions of values obtained under these transformations will be illustrated.

Advanced Multi-Chamber System for Preparation of Amorphous Thin Films by Coevaporation and Their Subsequent Characterization by AES (Auger Electron Spectroscopy), ESCA (Electron Spectros-copy for Chemical Analysis), SIMS (Secondary Ion Mass Spectroscopy, and ISS (Ion Scattering Spectroscopy) Methods. Final rent.

M. Sanders, E. N. Farabaugh, W. S. Hurst, and W. K. Haller. 1981, 3p

Pub. in Jnl. of Vacuum Science and Technology 18, n3 p1308-1310 Apr 81.

Keywords: *Thin films, Electron beams, Silicon dioxide, Magnesium oxides, Preparation, Reprints, *Amorphous materials, *Coevaporation.

Vacuum deposition is one means of producing amorphous structures from compositions which do not nor-mally form glasses. Aluminum oxide, for instance, is always polycrystalline when solidified from the melt, but frequently has highly disordered structures when produced by vacuum evaporation. Preparation of com-plex multicomponent thin films by single source vacuum evaporation is normally limited by the large differences in vapor pressures of the components. One approach which overcomes this difficulty involves codeposition from multiple sources operated at appropriate temperatures to produce the desired individual deposition rates. In this paper, the authors describe a facility which has been designed and constructed for the production of thin films by multiple source evaporation and subsequent analysis by Auger Electron Spec-troscopy (AES), Electron Spectroscopy for Chemical Analysis (ESCA), Secondary Ion Mass Spectroscopy (SIMS) and Ion Scattering Spectroscopy (ISS). The authors then present initial results obtained on the system MgO-SiO2 showing the functional relationship between the concentration of the second component (in this case SiO2) and the crystallinity of the film.

Powder-Pattern: A System of Programs for Processing and interpreting Powder Diffraction Data. Final rept.,

N. P. Pyrros, and C. R. Hubbard. 1983, 10p Sponsored by JCPDS-International Centre for Diffraction Data, Swarthmore, PA.

Pub. in Advances in X-Ray Analysis 26, p63-72 1983.

Keywords: *X ray diffraction, *Crystal structure, Data processing, Spectrum analysis, Fortran, Reprints, *Powder patterns, POWDER-PATTERN system, Computer applications.

POWDER-PATTERN is a general system for processing powder diffraction data. The system has been designed and developed specifically for the processing of high quality standard x-ray diffraction powder pat-terns. POWDER-PATTERN is an interactive system that consists of a number of independent modules (programs) that have been designed so that they allow recycling in the execution of the modules. The modules are linked through the use of a common file named PKS that serves as an input to the modules and as a depository of the data generated by the different modules and by the user. An editing program allows for the manipulation of the PKS file. Modules locate the peaks, refine the parameters with profile refinement, correct the observed peak positions for external and internal calibration, and perform a least squares cell refinement. Interactive plotting programs allow the user to intervene at various stages of the processing, or to simply check the results. The profile refinement module using flexible rational profiles with a relatively small number of parameters can give accurate peak positions and can help in the interpretation of complicated bands with overlapping profiles.

Pub. in Proceedings of Int. Conf. Fast Ionic Transport in Solids, Gatlinburg, TN., May 18-22, 1981, Solid State Ionics 5, p323-326 Oct 81.

Keywords: *Crystal structure, Neutron diffraction, *Lithium rhenates, *Lithium iron vanadates.

The authors have determined the crystal structures of LiReO3, Li2ReO3 and Li2FeV3O8, obtained by Li insertion of ReO3 and FeV3O8, by neutron diffraction powder profile analysis. The ReO3 host lattice is exclusively corner shared and undergoes significant twisting on Li insertion. The FeV3O8 host lattice is extensively edge shared and changes little on Li insertion. The Li is accommodated in 6 coordinate sites in the rhenates and 5 coordinate sites in the iron vanadate.

Effect of Anisotropic Crystal-Melt Surface Tension on Grain Boundary Groove Morphology. Final rept.

P. W. Voorhees, S. R. Coriell, G. B. McFadden, and R. F. Sekerka. 1984, 17p Pub. in Jnl. of Crystal Growth 67, n3 p425-440 Aug 84.

Keywords: *Interfacial tension, *Grain boundaries, Crystal growth, Interfaces, Anisotropy, Reprints.

The shape of a stationary solid-liquid interface in a temperature gradient near a grain boundary in a pure material is calculated for anisotropic crystal-melt surface tension and equal thermal conductivities of crystal and melt. Results are compared with those for the well-known problem of the two-dimensional equilibrium shape of a crystal. For small anisotropy, the resultinterface shapes have continuously turning tangents but differ in detail from the grain boundary groove shapes that have been calculated for isotropic surface tension. For larger anisotropy, the interface shapes have discontinuities in slope as a result of missing orientations; these missing orientations are the same as those that would be missing on the corre-sponding equilibrium interface shape. In cases where a normal to the grain boundary or to the macroscopic interface is in the range of missing orientations on the corresponding equilibrium shape, the groove shape may contain some of these orientations as well as having varifold surfaces. Detailed numerical results are presented for a surface tension with fourfold symme-

R. A. Forman, and S. Mayo. 1985, 5p Pub. in Jnl. of Applied Crystallography 18, p106-109

Keywords: *Alignment, X ray diffraction, Gallium arsenides, Silicon, Reprints, *X ray topography, Semiconductors.

A simple method for in situ alignment of samples in a double crystal x-ray topography system is described. The method permits a specific crystallographic axis to be made conincident with the sample rotation axis used to set the Bragg angle. Surface reflections from approximately orthogonal crystallographic planes are required, and tables of such planes suitable for alignment of cubic crystals are given. The procedure allows rapid setup for the other accessible surface reflection or transmission topographs.

Phase Transition and Compression of LiNbO3 Under Static High Pressure.

Final rept., J. A. H. da Jornada, S. Block, F. A. Mauer, and G. J. Piermarini. 1985, 4p

Sponsored by Conselho Nacional de Pesquisas, Rio de Janeiro (Brazil), and Universidade Federal do Rio Grande do Sul, Porto Alegre (Brazil). Inst. de Fisica. Pub. in Jnl. of Applied Physics 57, n3 p842-844, 1 Feb

Crystallography—Group 20B

Keywords: *Lattice parameters, X ray diffraction, Phase transformations, Compressive properties, Reprints, *Lithium niobates, High pressure, Pressure dependence, Cubic lattices.

Lattice parameters of LiNbO3 were measured at room temperature over the pressure range 0-35 GPa by x-ray diffraction using the diamond anvil cell. In the region below 13 GPa (where a hydrostatic pressure was maintained) the pressure dependence of the volume can be well described by the Birch-Murnaghan equation of state, yielding B(o) = 134 + or - 3 GPa for the zero-pressure bulk modulus and B'(0) = 2.9 + or -0.5 for its pressure derivative. A phase transformation was detected at 30 + or - 3 GPa both by x-ray diffraction and by optical observation of the change from a transparent to an opaque state. The pattern of the high-pressure phase was tentatively indexed on the basis of a cubic cell with a = 6.78 A.

Analysis of Angular Dependent XPS (X-ray Photoelectron) Peak Intensities.

Final rept., R. A. Armstrong, and W. F. Egelhoff. 1985, 8p Pub. in Surface Science 154, pL225-L232 1985.

Keywords: *Epitary, Nickel, Copper, Cobalt, Metal films, Substrates, Surfaces, Reprints, *X-ray photoelectron spectroscopy.

Angle resolved X-ray photoelectron (XPS) studies of clean Ni(100) and of epitaxial Cu and Co films on Ni(100) have been interpreted with the aid of single scattering cluster calculations. It is found that for atoms in the top few atomic layers, photoelectron forward scattering by overlying atoms in the lattice causes XPS peak intensities to be enhanced at angles corresponding to nearest neighbor and next-nearest neighbor internuclear axes. Angle resolved XPS should thus be an excellent approach for gaining structural information on, for example, epitaxial overlayers or surface reconstructions.

Final rept., F. A. Mauer, S. Block, G. J. Piermarini, and R. Munro. 1982, 3p See also AD-A116 900.

Pub. in AIRAPT Conference on High Pressure in Research and Industry (8th), Uppsala, Sweden, August 17-22, 1981, Assoc. Int. pour l'Avancement de la Recherche et de la Technologie aux Hautes Pressions 2, p537-539 1982.

Keywords: *Ice, *Crystal structure, Raman spectroscopy, X ray diffraction, High pressure.

Ice VII has been studied in a diamond anvil cell at room temperature by Raman spectroscopy to 30.0 GPa and energy dispersive x-ray diffraction to 36.0 GPa. Both the O-O distance and the Raman O-H frequency decrease with pressure and they are linear relative to each other within experimental error. The decrease in the Raman frequency is related to the increase in length of the O-H bond towards a symmetrical O.H..O hydrogen bond. Generally the lattice parameter at each pressure is based on the (110), (200), and (211) reflections. The largest portion of the error is due to the uncertainty of the pressure in the highest ranges arising from the nonhydrostatic character. The pressure range measured by the ruby fluorescence method in a sample approximately 0.2 mm in diameter by 0.1 mm thick ranged from 23.7 GPa to 26.2 GPa. In addition to the ice results, the advantages of the double-slit energy dispersive x-ray diffraction system is briefly described.

Two-Dimensional X-ray Scattering.

Final rept., S. Brennan. 1985, 9p

Sponsored by Department of Energy, Washington, DC., National Science Foundation, Washington, DC., and National Institutes of Health, Bethesda, MD. Pub. in Surface Science 152/153, p1-9 1985

Keywords: *Surfaces, X ray diffraction, Metal films, Lead(Metal), Copper, Epitaxy, Substrates, Reprints, *X ray scattering, *Grazing incidence scattering, Two dimensional.

A discussion of Grazing Incidence Scattering (GIS) is presented, with an emphasis on applications of the technique. This paper is an overview of what can and has been done in this new area of surface structural science. The method is contrasted to some of the currently available techniques to show why it offers unique advantages for certain classes of problems such as the crystallography of ordered overlayers, clean reconstructed surfaces and the thermodynamics of two-dimensional melting. Some recent data for Pb layers on Cu(110) are presented to indicate the type of information that this new method can obtain. Also discussed is the application of the technique to the interfacial structure of epitaxial layers focusing on in-plane strain, lattice mismatch and the abruptness of the substrate-epitaxial interface.

Displacement Field of a Dislocation Distribution.

Final rept., R. de Wit. 1981, 6p

Pub. in Proceedings of International Conference on Dislocation Modelling of Physical Systems, Gaines-ville, FL., June 22-27, 1980, p304-309 1981.

Keywords: Elastic properties, Anisotropy, Displacement, *Dislocations, Burgers vector.

Burgers' formula gives the displacement field due to a discrete dislocation line of arbitrary shape in an isotropic, linearly-elastic, infinitely extended, homogeneous body. The paper derives the analogous expression for a continuous distribution of dislocations in an anisotropic body. Special cases give the displacement due to a discrete dislocation line in anisotropic elasticity and due to a continuous dislocation distribution in isotropic elasticity. These expressions all represent generalization of Burgers' original formula.

Dislocation Concepts Applied to Material Model-

ling. Final rept., R. de Wit. 1985, 16p

Sponsored by American Society for Metals, Metals Park, OH., and Army Research Office, Arlington, VA. Pub. in Proceedings of International Symposium on Mechanics of Dislocation, Houghton, Mí., August 28-30, 1983, p111-126 1985.

Keywords: Plastic deformation, Microstructure, Work hardening, Homotrapy theory, Differential geometry, Liquid crystals, Reviews, *Dislocations, Amorphous

A selective survey is given of several research areas where dislocation concepts have made useful contributions to our understanding of the physical world. The value of dislocation theory for interpreting plastic de-formation and work hardening is discussed. Disloca-tion concepts have led to elegant continuum theories which are closely related to differential geometry and have analogies in electrodynamics and relativity. Dislo-cation concepts are also useful in fields other than solid crystals, surface crystals, liquid crystals, magnetism, amorphous materilas, and waves. Finally, some speculations are given for the application of dislocations in solid state technology.

Diffraction of Evanescent X-rays: Results from a

Dynamical Theory.

Final rept..

P. L. Cowan. 1985, 3p

Pub. in Physical Review B: Condensed Matter 32, n8 p5437-5439, 15 Oct 85.

Keywords: *X ray diffraction, Surfaces, Interfaces, Crystal structure, Reprints.

Evanescent x rays can be made to diffract from periodic structures parallel to a surface or interface. A dynamical theory of diffraction yields several novel predictions which may be experimentally important. First, x-ray standing-wave fields are generated and can be controlled. This suggests a new technique for unambiguous determination of surface structure. Secondly. evanescent x-ray wave fields may be produced in the incident medium as well as the substrate. Finally, the rocking curve of the diffracted beam is narrow and asymmetric.

Scray Photoelectron and Auger-Electron Forward Scattering: A New Tool for Studying Epitaxial Growth and Core-Level Binding-Energy Shifts.

Final rept.,

W. F. Egelhoff. 1984, 4p Pub. in Physical Review B 30, n2 p1052-1055, 15 Jul

Keywords: Copper, Nickel, Surfaces, Reprints, *Auger electron spectroscopy, *X ray photoelectron spectroscopy, *Epitaxial growth, Binding energy.

Above a few hundred eV kinetic energy, Auger electrons and photoelectrons exhibit strong forward scat-tering by overlying atoms, and this produces intensity peaks at polar and azimuthal angles corresponding to internuclear axes. This provides a new structural probe which is especially useful for studying epitaxy, surface alloying, and surface segregation. It also provides a new approach to measuring core-level binding-energy shifts by permitting selective enhancement of bulk versus surface signals.

New Tool for Studying Epitaxy and Interfaces: The XPS (X-ray Photoelectron Spectroscopy) Searchlight Effect.

Final rept.,
W. F. Egelhoff. 1985, 3p
Pub. in Jnl. of Vacuum Science and Technology A3, n3
p1511-1513 May/Jun 85.

Keywords: Copper, Nickel, Substrates, Interfaces, Reprints, *X ray photoelectron spectroscopy, Epitaxial growth.

Very recently, a phenomenon long known in angle-re-solved x-ray photoelectron spectroscopy (XPS) has been reinterpreted. The new interpretation is that XPS peak intensities are enhanced at angles correspond-ing to axes connecting the photoemitting atom to its immediate neighboring atoms. These enhanced intensities thus identify the bond axes present near the surface. In the paper, examples are presented of the great power of this 'XPS searchlight' effect as a new tool for studying epitaxy and interfaces.

Measurement of Time-Dependent Sputter-Induced

Silver Segregation at the Surface of a Ni-Ag Ion Beam Mixed Solld.

Final rept., J. Fine, T. D. Andreadis, and F. Davarya. 1983, 10p Pub. in Proceedings of International Conference on lon Beam Modification of Materials (3rd), Grenoble, France, September 6-10, 1982, Nuclear Instruments and Methods in Physics Research, v209-210, pt 1 p521-530 1983.

Keywords: Ion beams, Diffusion, Separation, Nickel, Silver, Interfaces, Surfaces, *Ion bombardment, *Physical radiation effects, Argon ions.

Sputter depth profiling of alloys and interfaces using low energy ion beams can cause in-depth compositional changes to occur. One possible mechanism responsible for such changes is enhanced diffusion oc-curing along point defects generated by the ion bombardment in the near surface region. Sputter profiling of a Ni/Ag interface produces a mixed Ni-Ag surface region and the authors have found that in such a region, bombarded with 1 to 4 keV argon ions at 20C, that the Ag will segregate to the surface. The segrega-tion can be observed to occur in real time after the ion bombardment has been stopped. Auger spectroscopy was used to obtain a unique set of measurements of the kinetics of surface segregation due to bombard-ment enhanced near-surface diffusion. The kinetics of the segregation is examined and its influence on sputter depth profiling demonstrated.

NBS*LATTICE - A Program to Analyze Lattice Relationships. Version of Summer, 1985. Final rept.,

V. L. Himes, and A. D. Mighell. Dec 85, 84p NBS/ TN-1214

Also available from Supt. of Docs as SN003-003-02713-8.

Keywords: *Crystal structure, *Crystal lattices, Computer programming, Crystal symmetry, Fortran, NBS star LATTICE computer program, Matrix inversion.

A FORTRAN program to analyze lattice relationships has been written and is available for distribution by the NBS Crystal Data Center. The present version of NBS LATTICE performs several functions including: (1) the characterization and identification of unknown materials using lattice-formula matching techniques; (2) the calculation of the reduced cell of the lattice, and the calculation and reduction of specified derivative supercells and/or subcells (i.e., this program function calculates the standard cells which are useful in the determination of metric lattice symmetry, in finding a matrix relating two unit cells, etc.); (3) unit cell transforma-tions; and (4) matrix inversions. It is planned to incorporate additional functions in forthcoming versions of this program. Among others, these functions will include a matrix method to determine metric lattice symmetry and a technique to find a transformation matrix relating any two unit cells.

Correction to the Formula for the London Moment of a Rotating Superconductor.

R. M. Brady. 1982, 18p Sponsored by Trinity Coll., Cambridge (England)., and Science Research Council, London (England). Pub. in Jnl. of Low Temperature Physics 49, n1-2 p1-17 1982.

Keywords: *Superconductors, *Rotation, Magnetic fields, Reprints, London equation, Order parameters, Quantum mechanics.

This paper gives full quantum-mechanical analysis of the magnetic field (first discussed by London) which appears spontaneously when a sample of superconductor is set into rotation. It shows that, for slow rotation velocities and using certain approximations, the field B threading a cavity within a superconductor which rotates at angular velocity omega, is given by eB 2(m sub 0) - W/(c squared) omega, where -e is the charge on the electron, (m sub 0) is the free electron mass, W is the work-function of the superconductor, and c is the velocity of light. In the calculation effects which are second-order in the rotation velocity have been ignored, and the result is only strictly valid at the zero of temperature. The application of this result to experiments using practical, non-ideal apparatus is then illustrated for a simple geometry.

R. J. Van Brunt, and M. Misakian. 1982, 15p Sponsored by Department of Energy, Washington, DC. Div. of Electric Energy Systems.

Pub. in Proceedings of Conference on Electr. Insul.

and Dielectr. Phenom., Symposium on Corona and Non-Spark Discharges, October 26-28, 1981, IEEE Trans. Electr. Insul. 17, n2 p106-120 Apr 82.

Keywords: *Sulfur hexafluoride, *Electric corona, Avalanche breakdown, Ionization, Measurement.

Using a pulse counting technique, inceptions of positive and negative point-plane corona in SF6 under dc and 60-Hz ac conditions were measured. Effects of gas pressure, uv-radiation, and point electrode size on differences between ac and dc, and between positive and negative inceptions were investigated. Inceptions were also calculated using the streamer criterion.

Agreement was obtained with measured negative inceptions for both ac and dc conditions, but not with positive inceptions. The growth in the active-electron initiation volume with applied voltage was calculated and used to explain the observed polarity effect. The magnitude of the polarity effect is predictably reduced either by irradiating the gap or by increasing the diameter of the point electrode.

Role of Photodetachment In Initiation of Electric Discharges in SF6 and O2.

Final rept., R. J. Van Brunt, and M. Misakian. 1983, 6p Sponsored by Department of Energy, Washington, DC. Pub. in Jnl. of Applied Physics 54, n6 p3074-3079 Jun Keywords: *Electric discharges, *Sulfur hexafluoride, Oxygen, Avalanche breakdown, Reprints, Photode-

The role of photodetachment in the initiation of electron avalanches near a positive point electrode was investigated using radiation between 295 and 630 nm from a chopped, tunable cw laser or filtered Hg-discharge lamp for a gap in which the negative ion was controlled by uv-irradiation of the cathode. Consistent with estimates based on known cross sections, photodetachment for light beams up to 500 mW was found to make a negligible contribution to avalanche initiation in SF6 and O2 at pressures from 50 to 500 The conditions under which photodetachment might be observed are discussed, and it is shown that for the conditions considered here, the expected dominant electron release mechanism in the gap is through collisional detachment of stable negative ions. Previously reported enhancements in avalanche rates resulting from irradiation of a positive point can be explained as arising from increases in negative ion densities due to attachment of photoelectrons ejected by scattered radiation.

Keywords: *Superconductors, Critical field, Niobium, Tantalum, Tin, Reprints, Critical current.

Data are presented on the strain dependence of the critical current and critical field of Nb-Ta/Sn superconductors fabricated by the liquid Sn infiltration process. The results show that liquid infiltrated Nb-Ta/Sn superconductors have several significant advantages over bronze-process Nb/Sn super conductors: an overall (J sub c) that is 3-10 times higher for magnetic fields in the range 13-20 T, an irreversible (damage) strain limit twice as large, and a (J sub c) elastic-strain sensitivity less than half as large at fields above about 16 T These improved properties are attributed to several unique characteristics of the liquid infiltration process: a tough Nb-Ta matrix, fine equiaxial A15 grains, and a uniform stoichiometric Sn concentration.

Sponsored by Air Force Office of Scientific Research,

Bolling AFB, DC.

Pub. in Jol. of Applied Physics 57, n1 p3809-3811, 15

Pub. in Jnl. of Applied Physics 57, n1 p3809-3811, 15 Apr 85.

Keywords: *Superconductors, *Magnetic hysteresis, Hysteresis, Magnetization, Niobium, Titanium, Losses,

When subjected to transient magnetic fields, super-conductors exhibit losses. At low frequencies, most of the dissipation is hysteretic. Magnetization was measured in an axial field for eight multifilamentary Nb-Ti superconducting wires with different filament sizes and different ratios of copper to superconductor. The fullpenetration field H(p) was estimated from the high-field ends of the hysteresis loops. The estimate of H(p) provides a method to assess the critical current density Jc. There was good agreement between measured losses and those predicted from H(p) and the peak applied field.

Possible Estimation Methodologies for Electromagnetic Field distributions in Complex Environments.

Technical note

M. Kanda, J. Randa, and N. S. Nahman. Mar 85, 52p NBS/TN-1081

Keywords: *Electromagnetic fields, Distribution, Estimating, Environmments, Hazards, Scanning, Statistical analysis.

The problem of measuring and characterizing complicated multiple-source, multiple-frequency electromagnetic environments is becoming more important and more difficult as electrical devices proliferate. The paper outlines three general approaches to the problem which are currently under investigation at the National Bureau of Standards. The three approaches are: (1) a statistical treatment of the spatial distribution of electromagnetic field intensities; (2) a numerical computation using a finite-difference (or lattice) form of the electromagnetic action functional; and (3) use of a directional probe to scan a volume. All three methods are still in the development stage, but each appears promising.

B. Robertson. Mar 84, 3p

Pub. in Jnl. of Fluids Engineering 106, p18-20 Mar 84.

Keywords: *Flow measurement, *Elastic waves, Sound transmission, Velocity, Pipes(Tubes), Temperature, Frequencies, Reprints.

An expansion in powers of V/c is derived for the wave number of the fundamental sound mode in a flow conduit, where V is the velocity of fluid in the conduit and c is the local sound speed. Both V and c are assumed to be independent of the longitudinal coordinates and of the time, but may have arbitrary profiles. The calculation applies to frequencies well below the cutoff frequency of the conduit, which may have an arbitrary cross-sectional shape. To lowest order, the wave number depends only on the average of the longitudi-nal component of V and is independent of its profile.

A previous numerical study by Davis and Moore of vortex shedding from rectangles in infinite domains is extended to include the effects of confining walls. The major changes to the numerical modeling are the addition of a direct solver for the pressure equation and the use of an infinite-to-finite mapping downstream from the rectangle. The parameters in the problem are now Reynolds number, rectangle aspect ratio, blockage ratio, and upstream velocity profile. As each of these is varied, the effects upon the forces acting on the rectangle and the structure of the wake are discussed. Streakline plots composed of multishaped passive marker particles provide a clear visualization of the vortices. These plots are compared with smoke-wire photographs taken from a wind tunnel test. Strouhal numbers obtained both computationally and experimentally are compared for two values of the blockage ratio. Moving recirculation zones which appear between the wake and the walls are discussed.

H. Baum, M. Ciment, R. W. Davis, and E. F. Moore.

1981, 485p

Pub. in Proceedings of International Conference on Numerical Methods in Fluid Dynamics (7th), Lecture Notes in Physics Series 141, 485p 1981.

Keywords: *Axisymmetric flow, Viscous flow, Unsteady flow, Incompressible flow, Reynolds number, Swirling, Mathematical models, Numerical analysis, Fluid dynamics, *Shear layers, Cylindrical coordinates.

This paper presents both a new model problem for unsteady, incompressible viscous flow and a new numerical method for modeling flows in cylindrical geometries. The model problem is an exact solution to the fully three-dimensional axisymmetric Navier-Stokes equations and is shown to represent a moving shear layer of rotating fluid whose thickness depends on Reynolds number. An asymptotic steady-state is reached which consists of a potential vortex with a viscous core. The new numerical method is a fundamental solution technique for cylindrical coordinates similar in derivation to the El-Mistikawy-Werle scheme (AIAA J., 16, p. 749, 1978) for cartesian coordinates. This

method is implemented in the context of the operator compact implicit (OCI) format. The new scheme and several others are tested on the model problem over a range of Reynolds numbers.

The paper presents a numerical simulation of two-dimensional unsteady flow around squares in infinite do-mains with uniform upstream velocity profiles. Variations in the behavior of lift and drag with Reynolds number are discussed. Passive marker particles are used to visualize the onset and subsequent development of vortex shedding at a Reynolds number of 1000. The finite difference scheme employed in this simulation utilizes third-order accurate upwind differencing for convection and a Leith-type of temporal differencing. Variations in convective differencing near the corners of the square and at the out-flow boundary of the mesh are described.

Drag on a Sphere Moving Horlzontally Through a Stratlfled Liquid.

K. E. B. Lofquist, and L. P. Purtell. 1984, 14p Sponsored by Office of Naval Research, Arlington, VA. Pub. in Jnl. of Fluid Mechanics 148, p271-284 Nov 84.

Keywords: *Drag, *Spheres, Salt water, Wakes, Reprints, Stratified flow, Stratified fluids.

The drag on a sphere moving horizontally through stably stratified salt water is measured in laboratory experiments. The increment in drag coefficient due to the stratification, delta (C sub D), is obtained as function of a stratification parameter, kappa (eq. 5) and, in princi-ple, the usual Reynolds number, R. In these experi-ments, where R ranges from 150 to 5,000, delta (C sub D) is insensitive to R. But as function of kappa, delta (C sub D) has both positive and negative values. A positive peak in delta (C sub D)(kappa), about as large as the unstratified (C sub D), is identified as a resonance maximum in the lee-wave drag. Negative values of delta (C sub D)(kappa), as large as 15% of (C sub D), are interpreted as a reduced rate of generation of heat within the wake due to inhibition of vertical turbulent motions and vertical spreading of the wake by the stable stratification.

Finite Difference Methods for Fluid Flow.

R. W. Davis. 1984, 19p
Pub. in Proceedings of 1983 International Conference
on Computational Techniques and Applications:
CTAC-83, University of Sydney, Australia, August 28-31, 1983, p51-69 1984.

Keywords: *Navier-Stokes equations, *Finite difference theory, Unsteady flow, Computerized simulation, *Computational fluid dynamics, Separated flow.

The purpose of the paper is to describe how finite difference methods can be employed to solve the incom-pressible Navier-Stokes and continuity equations of fluid flow. The differencing of the various terms in these equations is considered in detail, and a solution procedure is presented which gives reasonable results for two complex flow problems. These problems involve unsteady viscous separated flows in the wake of a rectangular obstacle inside a two-dimensional channel and in an axisymmetric mixing layer. The impor-tance of a priori testing of the numerical methods on appropriate simple model problems is stressed and a useful example is given. Also stressed is the importance of computational flow visualization and data analysis in order to make sense of a flow calculation.

Contract DE-AC02-ER10797

Pub. in Jnl. of the Optical Society of America B 1, n2 p150-154 Apr 84.

Keywords: *Light pulses, Correlations, Intensity, Reprints, Dye lasers, Pulsed lasers, Hole burning, Multimode.

Statistical cross correlations between mode intensities in individual pulses from a multimode dye laser have been studied using a Fizeau interferometer and a high resolution linear photodiode array. It was found that positive intensity cross correlations develop between modes separated by certain characteristic frequen-cies. This appears to be a result of spatial hole burning in the standing-wave cavity. The gain competition between certain modes is minimized due to the spatial inhomogeneity of the mode intensity distributions in the gain medium.

Rare earth ion doped LiYF4 crystals are well-known laser active materials; they produce the laser emissions in the range of 0.8-2.1 micrometer wavelength. LiYF4 host structure, a scheelite model, is a bodycentre tetragonal with a = 5.175A and c = 10.74A. The polarized fluorescence and absorption, excitation spectra, life-time, etc. of the crystal doped with Nd(3+) have been studied in detail and the crystalfield parameters have also been reported, but only a few works about its vibrational properties have been presented so far. The optical phonon spectra are rather important for development of tunable solid state lasers; for this reason the authors carried out the study of Raman spectra of this material, analyzed its optical mode vibrations, and finally compared with that of the sample doped with Nd(3+).

Surface Erosion Induced by Electronic Transi-

R. F. Haglund, and N. H. Tolk. Apr 85, 4p Included in OM85: Basic Properties of Optical Materials. Summaries of Papers, p184-187 Apr 85.

Keywords: *Ultraviolet optical materials, *Radiation damage, Synchrotron radiation, Electron inrradiation, Surfaces, Erosion, Sodium chloride, Lithium fluorides.

The problem of damage to ultraviolet optical materials has been and continues to be a major source of concern in the design and operation of high-power lasers. Little fundamental understanding exists of the atomiclevel mechanisms which operate to produce this damage. However, recent experiments have shown that irradiation of optical materials by electrons and photons at energies characteristic of high-power and high-energy laser systems is an efficient cause of surface erosion. The experiments described here are intended to illuminate the basic mechanisms associated with energy absorption, distribution and localization leading to electronically induced desorption, and to determine the role of defects in these processes.

Efficient Single Mode Operation of a CW Ring Dye Laser with a Mach-Zehnder Interferometer.

Final rept.,

J. C. Bergquist, and L. Burkins. Jul 84, 7p Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC., and Office of Naval Research, Arlington, VA. Pub. in Optics Communications 50, n6 p379-385, 15 Jul 84.

Keywords: Reprints, *Dye lasers, *Ring lasers, Continuous wave lasers, Mach-Zehnder interferometers.

Stable single mode operation of a ring dye laser is ob-

tained with the combination of a Mach-Zehnder inter-ferometer (MZI), three plate birefringent filter, a single thin etalon, and a undirectional diode. The MZI eliminates the fractional insertion loss due to beam walk-off and distortion which an intracavity etalon must introduce in order to select single frequency operation. The authors experimentally demonstrate the low insertion loss, single mode stability, and frequency tuning of a ring dye laser using a specially designed, compact MZI. Finally, the authors propose MZIs with no coatings, which should permit extremely low loss broadband operation.

The spectral irradiance of an incandescent lamp was measured with a grating spectroradiometer that was calibrated at 632.8 nm with a HeNe laser and an absolute detector. The absolute detector was a silicon photodiode whose response was determined by the predictable quantum efficiency (also known as self-calibration technique). These results were compared to the spectral irradiance values obtained by calibrating the lamp relative to a black-body source traceable to the freezing point of gold. The ratio of the black-body based irradiance to detector based irradiance was found to be 1.0075 within a combined uncertainty of + or - 1.12%.

Redefining the Scratch Standards

M. Young, and E. G. Johnson. Feb 85, 28p NBS/TN-1080

Sponsored by Army Armament Research and Development Command, Dover, NJ. Also available from Supt. of Docs as SN003-003-02635-2.

Keywords: *Optical measurement, *Standards, *Surfaces, Diffraction, Gratings(Spectra), Surface properties, *Scratch standards, MIL standards.

The scratch standard (MIL-0-13830A) is a cosmetic standard that is effected by a visual comparison with a

set of submasters that are in turn evaluated by comparison with a set of master standards. Both manufacture and certification of the submasters are somewhat unreliable. In this paper, the authors show that the sub-masters can be classified according to the relative power scattered at a relatively small angle. They have designed etched gratings with which to replace the submasters; these gratings have the appearance of scratches but diffract a broad peak between 5 and 10 degrees off the axis of the incident beam. The authors have classified some prototypes both by comparison with the master standards and by a photoelectric measurement; agreement between the two methods is good. The authors suggest that such gratings be used as the submasters and possibly that they be classified by a photoelectric rather than visual measurement.

501,455 PB85-195303 PC A03/MF A01 National Bureau of Standards, Gaithersburg, MD. Self-Study Manual on Optical Radiation Measurements. Part 1. Concepts. Chapter 12. Blackbodies, Blackbody Radiation, and Temperature Scales. Technical rept.

See also PB84-218346. Also available from Supt. of Docs as SN003-003-02647-6.

Keywords: *Optical measurement, *Radiometry, *Blackbody radiation, *Temperature, *Thermal radiation, Temperature measurement, Manuals, Fundamental constants, Thermodynamics, Plancks constants, Stefan-Boltzmann equation.

This is the eighth in a series of Technical Notes (910-) entitled 'Self-Study Manual on Optical Radiation Measurements'. It contains Chapter 12 of Part I of this Manual. Additional chapters will continue to be published, similarly, as they are completed. The Manual is a comprehensive tutorial treatment of the measurement of optical radiation that is complete enough for self-instruction. Detailed chapter summaries make it also a convenient authoritative reference source. In this chapter, the authors review the radiometric treatment, and the significance for radiometric measure-ments, of blackbodies, blackbody radiation, and temperature scales. Many important and interesting aspects are not treated because the authors primary interest is in radiometry and radiometric measurements. The emphasis is on ideal blackbodies and laboratory simulators; thermal radiation from other real sources will be treated in a chapter on Thermal Radiation Properties of Materials.

501.456 PB85-195923 Not available NTIS National Bureau of Standards, Gaithersburg, MD. What is Dynamic Dispersion.

Final rept.,

J. Reader, 1981, 2p

Pub. in Applied Optics 20, n13 p2171-2172, 1 Jul 81.

Keywords: *Optical dispersion, Gratings(Spectra), Reprints, *Dynamic dispersion, *Dispersion.

It is shown that the quantity dynamic dispersion, intro-duced by Lockwood in 1973, does not differ from ordinary dispersion.

501 457 PB85-195980 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Radiometry Using Synchrotron Radiation. Final rept.

E. B. Saloman, S. C. Ebner, and L. R. Hughey. 1981,

Sponsored by SPIE-The International Society for Optical Engineering, Bellingham, WA.
Pub. in Proceedings of the SPIE 279, Washington, DC., April 21-22, 1981, p76-83.

Keywords: *Synchrotron radiation, *Ultraviolet radiation, *Radiometry, *Calibrating, X rays, Storage rings, Uncertainty.

Synchrotron radiation is a source of continuum radiation ranging from the x-ray or soft x-ray region (depending on machine energy) to beyond the visible region. The amount of radiation emitted is a calculable function of machine operating parameters. This makes it possible to use synchrotron radiation from electron synchrotron radiation from electron synchrotrons and electron storage rings as an absolute source particularly in the VUV and soft x-ray regions where other standards are difficult to find. At the National Bureau of Standards (NBS) an electron stor-

age ring (SURF-II) has been used to calibrate spectrometers and photometers used in solar and aeronomy research and in fusion plasma diagnostics. A large chamber has recently been completed to facilitate such calibrations. The radiation incident on these spectrometers can be calculated to uncertainties of 3%. A technique to exactly determine the number of electrons orbiting in the ring is currently being developed to reduce this uncertainty.

Optical Bistability Experiments and Mean Field Theories.

Final rept.

W. J. Sandle, R. J. Ballagh, and A. Gallagher. 1981,

16p Pub. in Proceedings of International Conference on Optical Bistability, Ashville, NC., June 3-5, 1980, p93-108 1981

Keywords: *Optical bistability, Laser radiation.

Theories of optical bistability have largely been concerned with idealized two-state absorbers in optical cavities, but experiments must contend with the properties of real atoms. The main purpose of this paper is to present experimental evidence for optical bistability taken under conditions where real atomic behavior can be closely represented by the two-state model, so that tests of mean field theories of OB are possible. An important feature of the work is the use of high optical intensities obtained with a near-concentric focussing cavity.

Transient Analysis of Electromagnetic Reflection from Dispersive Materials,
A. G. Lieberman. Mar 85, 73p NBS/TN-1202

Also available from Supt. of Docs as SN003-003-02651-4.

Keywords: *Light pulses, Plane waves, Polarization(Waves), Greens function, Surfaces, Electromagnetic wave reflections, Laser radiation, Drude model, Transients, Dispersion, Femtosecond

Theoretical expressions are presented describing the transient and steady-state temporal evolution of an impulsive, TE-polarized, plane wave reflected into vacuum from any of a variety of frequency-dispersive material surfaces. Polar dielectrics, non-polar dielectrics, metals and plasmas are treated using, respectively, the Debye, Lorentz, and Drude material models to investigate the effects of dispersion upon dimensional measurements performed with optical pulses of extremely short duration. The more general problem, concerning the reflection of an optical pulse of any specified waveform, is resolved by performing a con-volution of the incident wave at the material surface with the previously determined reflection of an impulsive wave.

Effect of Atmospheric Attenuation on Temperature Measurements Made Using Infrared Scanning Systems.

T. P. Sheahen. 1983, 8p Pub. in Applied Optics 22, n7 p1070-1077, 1 Apr 83.

Keywords: *Atmospheric attenuation, *Infrared radiation, *Temperature measurement, Carbon dioxide, Water vapor, Reprints, *Atmospheric transmissivity, *Thermography, Remote sensing.

The atmosphere attenuates infrared radiation in the frequency range 3 - 5 micrometers even at distances as short as one meter. In order to do precise quantitative infrared thermography, it is necessary to correct the received signal for this attenuation. This paper develops a simple model and presents numerical calculations of the attenuation expected at a few meters distons of the attendation expected at a few meters distance, for one typical thermographic imaging system. (The extension to other equipment could easily be done by substituting different numerical data for the detector response.) The attenuation factors due to CO2 and due to H2O are 6% and 8%, respectively, at 10 meters range. A wide variety of target temperatures and ambient humidity conditions were examined; representative curves selected from this output are pre-sented. Because of the importance of precise infrared measurements for industrial applications, the effect of varying CO2 concentration was also studied.

Keywords: *Microstructure, *Spectrophotometry, Optical properties, Spectroellipsometry.

That microstructure can profoundly influence optical properties of materials has been known essentially from the first investigations of the electromagnetic response of macroscopic media. 'Microstructure' is used here in the standard materials science sense, referring to spatial inhomogeneities on the scale of about 1 to 25 nm. These are inhomogeneities large enough so that the separate regions possess their own dielectric identity, yet small compared to the wavelength of light. The present summary deals primarily with the modeling problem, and will cover topics that, in the opinion of the author, have not been adequately discussed elsewhere.

Included in OM85: Basic Properties of Optical Materials. Summaries of Papers, p11-16 Apr 85.

Keywords: *Light scattering, *Optical measurement.

The generalized Lorenz/Mie formalism can be used to calculate the elastic scattering (e.g., extinction and scattering cross sections) and the internal electromagnetic field distributions of axisymmetric micro-objects (e.g., cylinders, spheres, and spheroids) with complex refractive index (n tilde = n + ik) and characteristic size a. The electromagnetic fields inside and on the surface of the microparticles can be enhanced at specific values of the size parameter x = 2(pi)/lambda (where lambda in the patiel wavelength). For dielecting the size parameter x = 2(pi)/lambda(where lambda is the optical wavelength). For dielectric microparticles, even with x < 1, localized surface plasmon resonances can occur at several wavelengths with vastly different electromagnetic field enhancement factors and spectral linewidths. Recent experimental interests have been directed toward the exploitation of the enhanced electromagnetic field intensity of these resonances. For dielectric microparticles in particular, morphology-dependent resonances have been applied to the determination of the following properties of individual droplets flowing in a linear stream: (a) evaporation and condensation rates; (b) interfacial surface tension and bulk viscosity; and (c) nonlinear optical properties such as lasing and coherent Raman processes. For metallic microparticles, localized surface plasmon resonances have been applied to the species determination of molecular adsorbates via the surface enhanced Raman scattering. In this presentation, research results from collaboratorive work at Yale, Cornell, and Clarkson Universities will be briefly reviewed.

Characterization of Optical Materials and Surfaces
Using Time-Domain Reflectometry,

A. G. Lieberman. Apr 85, 4p Included in OM85: Basic Properties of Optical Materials. Summaries of Papers, p17-20 Apr 85.

Keywords: *Optical materials, Optical measurement, Light pulses, Surfaces, *Time domain reflectometry, Laser radiation, Femtosecond pulses.

The generation of femtosecond duration laser pulses containing only a few oscillations of coherent light has recently been achieved using pulse compression techniques. Such ultrashort pulses have broad spectral bandwidths which may encompass the material and structural resonances of a reflecting medium. The effects of these resonances of a reflecting medium. The effects of these resonances upon the reflected waveform could provide a novel method for characterizing the optical properties of a material or evaluating the surface finish of a manufactured object. The purpose of this paper is to explore the features of time-dependent optical pulse scattering from dispersive materials having smooth surfaces, from perfect conductors having randomly rough surfaces, and from materials exhibiting both dispersion and surface roughness.

Surface Plasmons, H. J. Simon. Apr 85, 5p Included in OM85: Basic Properties of Optical Materials. Summaries of Papers, p60-64 Apr 85.

Keywords: *Optical properties, Metal films, Metals, Dielectrics, Interfaces, *Second harmonic generation, *Plasmons.

The recent prediction of the properties of a new long range surface plasmon (LRSP) mode on the two surfaces of a thin metal film bounded by index-matched dielectrics has stimulated theoretical and experimental interest in this new mode. When the fundamental mode of this plasmon is excited on both surfaces of a thin silver film bounded by a nonlinear quartz crystal and an index-matched liquid, the second harmonic generation is over two orders of magnitude larger than that due to the single-boundary surface plasmon. In conclusion, the highly resonant and localized nature of the LRSP mode will make this mode a useful new probe for studying linear and nonlinear optical properties of metal-dielectric interfaces.

Relationship of Microstructure to Optical Properties of Thin Films,

H. A. Macleod. Apr 85, 6p Included in OM85: Basic Properties of Optical Materials. Summaries of Papers, p74-79 Apr 85.

Keywords: *Dielectric films, *Optical properties, *Microstructure, *Thin films, Titanium oxides, Zirconium oxides

Although the properties of materials in thin-film form are broadly similar to those of bulk materials, there are often significant differences. Frequently the level of performance that can be achieved with thin films is inferior to that predicted from simple bulk properties. Great progress has been made in closing the gap between real thin-film properties and bulk properties but a gap still remains and much of it is a direct consequence of the effects of microstructure on the optical, mechanical and chemical properties of thin films. Here we are concerned solely with the optical properties and we limit the discussion to dielectric films.

Simple Model of Inhomogeneity in Optical Thin Films,

G. Deniau, F. Flory, and E. Pelletier. Apr 85, 2p Included in OM85: Basic Properties of Optical Materials. Summaries of Papers, p84-85 Apr 85.

Keywords: *Optical coatings, *Thin films, Titanium dioxides, Homogeneity, Models, Inhomogeneity.

Most materials used in thin-film optical coatings exhibit optical inhomogeneity that is frequently so large that it cannot be neglected. The inhomogeneity is directly related to the layer microstructure that can be observed in electron micrographs. This leads directly to the consideration of a layer model that can be used to represent this homogeneity and can be used in calculations. Its usefulness decreases with its complexity and it should therefore be as simple as possible but nevertheless it should also reflect the real behavior of the films. The unprecedented precision with which multilayer deposition can now be controlled coupled with the possibility of accurate in situ property measurement makes the time ripe for a reexamination of this problem.

Woollam. Apr 85, 3p
Prepared in cooperation with Universal Energy Systems, Dayton, OH.
Included in OM85: Basic Properties of Optical Materian als. Summaries of Papers, p86-88 Apr 85.

Keywords: *Optical coatings, *Carbon, Optical properties, Semiconductors(Materials), Substrates, Films, Diamonds, Ellipsometry, Refractive index, Extinction coefficients.

Diamondlike carbon (DLC) films have been described by various authors as being hard, resistant to various chemicals, highly insulating, and adherent to a wide variety of materials. The authors have recently been investigating the usefulness of these materials in various applications including dielectrics for integrated circuits and coatings for optical (especially infrared) materials. The purpose of the present paper is to describe the optical properties of DLC films deposited on several technologically important semiconductors. Specifically, the authors have used spectroscopic ellipsometry and absorption spectroscopy to determine the index of refraction and extinction coefficient over the wavelength range from 220 nm to 3.39 micrometers. Substrate materials include flat, polished, oriented single crystals of silicon, indium phosphide, cadmium telluride, mercury cadmium telluride, germanium, and quartz.

Keywords: *Metal films, *Platinum, *Optical coatings, *Transparence, Indium phosphides.

Highly transparent metal films are of potential interest in a number of areas of science and technology including light detection, photovoltaic energy conversion, catalysis, and photoelectrochemistry. In studies of light-activated hydrogen evolution on platinized semiconducting photocathodes, it was discovered that the quantum yield of hydrogen-evolving semiconducting electrodes did not decline significantly with increasing platinum coverages, even for metric thicknesses as much as 50 nm where 99.9% of the transmitted light should have been absorbed. The observation of this anomalous transparency stimulated further investiga-tion, and in a recent preliminary report the authors described the preparation and characterization of the first substantially transparent supported metal films of sig-

nificant thicknesses. They found that the essential characteristics giving rise to substantial transparency in metal films were porosity and microstructure, and that by controlling these properties, absorption and reflection losses could almost be eliminated. Here, the authors discuss in more detail the physical principles involved and present further results on Pt film/p-InP

The recent developments in preparation of thin amorphous films of the arsenic chalcogenides by spin-coating from solution have led to renewed interest in these materials for applications in the field of integrated optics as waveguides, couplers, or storage media. As part of our theoretical investigation of the electronic structure of these materials, we have undertaken to calculate the molecular structure for some of their existing molecules, namely As4S4, As4Se4, As4S6 and As4Se6. In the present paper we report on our calculations for the first two molecules.

als. Summaries of Papers, p106-109 Apr 85.

Keywords: Silver sulfides, *Infrared optical materials, *Electrolytic cells, Thin films, Transmittance, Reflectance, Refractive index, Extinction coefficients.

Ag2S undergoes a crystallographic phase transition at a temperature Tc = 180C. The electrical conductivity of the high temperature phase, alpha-Ag2S, is three orders of magnitude greater than the low temperature phase, beta-Ag2S. As a result, beta-Ag2S transmits through much of the mid-infrared region, whereas alpha-Ag2S exhibits a distinct plasma absorption edge. Studies of the influence of the electron concentration on the electrical and optical properties of bulk Ag2S have been reported. Investigations of these properties were achieved by incorporating an AgS sample in a galvanic cell structure. The structure of these bulk material galvanic cells is given by: Ag electrode/Agl/Ag2S/Pt electrode. In a similar manner a thin film galvanic cell, with a design analogous to the bulk cell, has been made and used to vary the electron concentration in the silver sulfide film of the cell. Several thin film silver sulfide galvanic cells were pre-pared. The transmittance and reflectance data are shown. The corresponding refractive index and extinction coefficient computed from the best fit parameters are shown. Also given is a plot of electron concentration as a function of cell potential.

Keywords: *Infrared materials. optical *Synthesis(Chemistry), X ray diffraction, Selenides, Sulfides, *Cadmium phosphide sulfides, Cadmium phosphide selenide sulfides.

CdPS3 is optically transparent from 4000/cm to 500/ cm (2.5-20 micrometers) with a fundamental absorption edge close to 454/cm (22 micrometers). Initial studies of CdPS3 suggested that the material could be useful as an infrared transmitting material provided that the material strength could be increased. CdPS3 has been synthesized with stoichiometry much closer to the theoretical value previously reported. The present X-ray data for the CdPS3 system, although reproducible from sample to sample, is not consistent with the C2/m structure assigned to this compound by Brec et al. However, the presently reported data are consistent with a layer structure in which cadmium might be in a different environment or in more than one environment. If cadmium is in a second environment then it must be, as the (113)Cd NMR shows, only one Cd(II) site. Furthermore, as seen by the EPR data of Mn-doped CdPS3 this cadmium site whether it be in-terstitial or defect cannot be substituted by Mn(II). Such structural differences could also explain the different intercalation chemistries of the cadmium and nickel MPS3 compounds.

B. Edgerton, and D. Shortt. Apr 85, 4p Included in OM85: Basic Properties of Optical Materials. Summaries of Papers, p115-118 Apr 85.

Keywords: *Semiconducting films, Thin films, Glass, Transparence, Substrates, Amorphous silicon, Refractive index, Extinction coefficients.

Uniform homogenous layers of material deposited on a substrate can be described optically by a thickness and a complex index of refraction, n(lambda) ik(lambda). Alternately one can describe the absorption coefficient, alpha(E), as a function of the photon energy. If the complex index of refraction and the thickness are known for both the film and the substrate, then electromagnetic theory provides a basis for calculating the reflectance and transmittance spectra of the film. The challenge is to work this problem backwards. Given the two spectra, can one find a unique description of the dispersion in the optical properties as well as a thickness which satisfy the data. The first step in our process is to choose a parameterized model to describe the optical properties. The second part of the process determines the values of the optical properties without recourse to a particular choice of parameterized model for describing the shape of the dispersion. The film used to illustrate this technique is a glow discharge deposition of amorphous silicon hydrogen alloy on Corning 7059 glass. The measured spectra appear in Fig. 1.

Densification of Zirconia Films by Coevaporation

A. Feldman, and E. N. Farabaugh. Apr 85, 4p Included in OM85: Basic Properties of Optical Materials. Summaries of Papers, p122-125 Apr 85.

Keywords: *Optical coatings, *Zirconium oxides, *Silicon dioxide, Electron beams, Substrates, Films, Coevaporation, Refractive index.

Optical films of zirconia have been receiving considerable attention because of their potential use as the high-index layer in multilayer optical coatings for the

Group 20F—Optics

ultraviolet portion of the spectrum. Several problems are associated with electron-beam deposited zirconia films and these include index instability and index inhomogeneity. The index instability is caused by the adsorption and the desorption of water in the porous columnar structure of the zirconia films. Index inhomogeneity is due to the inhomogeneous structure in the films. Recent work has shown that the first several tens of nonometers of a film possess a cubic structure whereas the outmost layers possess a monoclinic structure. One approach for producing bulk-like zir-zonia films that is receiving considerable attention at present is ion-assisted electron-beam deposition. This is because the method has successfully produced zirconia films having bulk-like densities and refractive indices that show insignificant sensitivity to water adsorption. In this paper we demonstrate a similar effect when mixed zirconia:silica films are produced by coevaporation from independent electron-beam sources, and, in particular, we show that the admixture of a small amount of silica with the zirconia produces a film possessing a higher refractive index than a pure zirconia film.

Keywords: *Infrared optical materials, Optical properties, Crystal defects, Impurities, *Calcium lanthanum sulfides, *Aluminum zinc sulfides, Electron spin resonance.

Calcium lanthanum sulfide (nominally CaLa2S4) and zinc aluminum sulfide (ZnAl2S4) are potentially useful as infrared-transmitting ceramics. In an attempt to cor-relate optical properties with the presence of impurities and defects, the authors have been studying the electron paramagnetic resonance (EPR) spectra of pow-dered samples. EPR spectroscopy has established that CaS is an impurity phase in CaLa2S4 and has been used to identify transition metal impurities, paramagnetic defects and photochemical processes in these materials. Both Mn(2+) and a paramagnetic center with coupling to several (27)Al nuclei were observed in preparation of ZnAl2S4. These spectra may be useful in evaluating the quality of ZnAl2S4 preparations and in the identification of impurity phases that are present.

Status of Optical Constants of Solids from X-ray to

MM-Wave Region,
E. D. Palik. Apr 85, 6p
Included in OM85: Basic Properties of Optical Materials. Summaries of Papers, p171-176 Apr 85.

Keywords: X rays, Ultraviolet radiation, Light(Visible radiation), Infrared radiation, Millimeter waves, Thin films, *Refractive index, *Extinction coefficients.

As editor of the Handbook of Optical Constants of Solids (1) the author has obtained a bird's-eye view of th quantity and quality of optical constants for 37 solids th quantity and quality of optical constants for 37 solids of technological and physics interest. These include 11 metals - Al, Cu, Au, Ir, Mo, Ni, Os, Pt, Rh, Ag, W; 14 semiconductors - CdTe, GaAs, GaP, Ge, InAs, InSb, InP, PbSe, PbS, PbTe, Si, a-Si, ZnS; 12 insulators - As2Se3, As2S3 C(diamond), LiF, LiNbO3, KCI, SiO2, SiO, Si3N4, NaCl, TiO2. Twenty one critiquers have examined the existing literature for these materials and panel tabulated a single set of refrective index a and have tabulated a single set of refractive index n and extinction coefficient k for as wide a spectral region as possible. Examples of a metal Ag, a semiconductor Si and an insulator a-SiO2 (silica) are given in Fig. 1. Some effort is made to discuss the measurement techniques and the quality of the data. The problems encountered here with measurements and data are representative. The problems encountered here with measurements and data are representative of all the solids studied. The Handbook also contains 11 chapters on how to determine n and k in various spectral regions.

Vacuum Ultraviolet Loss In Magnesium Fluoride Films, O. R. Wood, P. J. Maloney, H. G. Craighead, and J.

E. Sweeney. Apr 85, 3p Included in OM85: Basic Properties of Optical Materials. Summaries of Papers, p181-183 Apr 85.

Keywords: *Optical costs, *Magnesium fluoride, *Far ultraviolet radiation, *Ultraviolet optical materials, Light scattering, Losses, Thin films.

Because MgF2 is transparent to wavelengths as short as 1100 A in the VUV, it finds extensive use for lenses and windows in this region. Major applications can be found in UV lasers, spectroscopy and space astronomy. Another important use of MgF2 is as an evaporated coating onto aluminum, where it greatly increases the VUV reflectance and also retards oxidation. The authors have investigated the excess loss in evaporated films and found that it is due to scattering from inhomogeneities and absorption from the low energy tail of an excitation band. Both of these mechanisms were found to be strongly dependent on the degree of crystallinity of the film, which is largely determined by the substrate temperature during deposition. The study has allowed the authors to produce films with extinction coefficients as low as 0.005, several times better than previously reported.

Micro-Raman Study of Laser-Induced Damage, P. M. Fauchet, I. H. Campbell, and F. Adar. Apr 85, 4p

Prepared in cooperation with Instruments S.A., Inc.,

Metuchen, NJ. Included in OM85: Basic Properties of Optical Materials. Summaries of Papers, p198-201 Apr 85.

Keywords: *Radiation damage, *Raman spectroscopy, Optical materials, *Laser radiation, Neodymium lasers.

In most laser systems, damage to optical components is the major factor that limits scaling towards higher energy density. Although laser-induced damage in solids has been an active field of research for many years the authors do not have a satisfactory under-standing of the physics involved in these processes. This situation is in part due to the lack of nondestructive, quantitative probes that can be used in situ. In this paper, the authors show that Raman scattering is such a probe and can be used successfully in a wide range of practical situations.

Ics of Photorefractive Gratings in LINbO3 Crystals, J. K. Tyminski, R. C. Powell, H. C. Chow, and M. J. Kleiwer. Apr 85, 3p

Included in OM85: Basic Properties of Optical Materials. Summaries of Papers, p229-231 Apr 85.

Keywords: *Gratings(Spectra), Laser beams, Single crystals, Holography, Crystal defects, Light scattering, *Lithium niobates, *Photorefractive effect.

One technique for studying the photorefractive effect (PRE) in crystals is to establish and probe holographic gratings with crossed laser beams. Generally the gratings are assumed to have a sinusoidal shape and the measurement which is made is the scattering efficiency of the probe beam at the Bragg condition. The authors repoort the development of a new technique for studying the PRE based on the analysis of small angle scattering patterns. This technique allows for the inclusion of multiple fourier components in the geometric shape of the grating in analysis to LiNbO3 crystals with several different types of defect properties show that the measured scattering patterns are extremely sensitive to the microscopic properties of the grating.

R. W. Hellwarth. Apr 85, 2p
Included in OM85: Basic Properties of Optical Materi-

als. Summaries of Papers, p232-233 Apr 85.

Keywords: Barium titanates, *Phase conjugation, Four wave mixing, Photorefractive effect, Bismuth silicates, Semiconductors.

In the simplest class of phase--conjunction experiments the two beams E and G interfere to create intensity variations (moving or stationary) which in turn cause a variation in the refractive index seen by beam H. This variation is often called an index 'grating'. The H beam scatters from this grating to generate the F beam. This may be called the (tensor) volume holographic process for phase-conjugation. The beams can be on simultaneously or in various time se-quences. The authors will describe how this singlegrating process has been used to obtain the most accurate measurements of impurity density, conduction band diffusion lengths, and trap excitation cross-sections in photorefractive bismuth silicate and barium titante. Results for electron-hole pairs in semiconduc-tors will also be described. This process gives often the simplest and most accurate method of measuring thermal conductivities of slightly absorbing transparent media. It is also the basis for another coherent Raman spectroscopic technique (Raman-induced phase con-

501.509

jugation) which has advantages and disadvantages relative to coherent anti-Stokes Raman spectroscopy and other well-known laser spectroscopic techniques.

Bismuth Silicon Oxide: Sample Variability Studied with Thermally Stimulated Conductivity and Thermoluminescence,

B. W. Holmes, and J. E. Ludman. Apr 85, 4p Prepared in cooperation with Rome Air Development Center, Hanscom AFB, MA.

Included in OM85: Basic Properties of Optical Materials. Summaries of Papers, p242-245 Apr 85.

Keywords: *Thermoluminescence, Variability, Electron traps, Holography, *Bismuth silicon oxides, Photore-fractive effect, Phase conjugation.

Bismuth silicon oxide (BSO) is widely used in optical data processing, reversible, real-time holography, and optical phase conjugation. The optical characteristics (such as wavefront reflectivity) vary significantly, even for identically prepared crystals. The manufacture of uniform and improved BSO crystals may well depend on a better understanding of the fundamental processes responsible for its photosensitivity. The authors studied electron trapping in BSO using thermally stimulated conductivity (TSC) and thermoluminescence (TL). In this study, the authors surveyed at a number of different BSO crystals, in order to assess sample variability as revealed in TSC and TL.

Materials Regulrements for Optical Logic and Bistable Devices,

N. Peyghambarian, and H. M. Gibbs. Apr 85, 3p Included in OM85: Basic Properties of Optical Materials. Summaries of Papers, p246-248 Apr 85.

Keywords: Gates(Circuits), Zinc sulfides, Zinc selenides, Gallium arsenides, *Optical bistability, *Logic devices, Nonlinear optics, Refractive index, Aluminum gallium arsenides, Copper chlorides, Semiconductors.

Optical bistability, which is referred to as the existence of two stable output intensities for the same input intensity, has been realized in many semiconductors. Examples include the GaAs and GaAs-AlGaAs multiple-quantum-well superlattices, CuCl, and ZnSe. In this talk, the authors focus their attention on these materials because of their greater potential to be used as practical devices.

Mirrorless Optical Bistability in CdS,
J. W. Haus, C. C. Sung, C. M. Bowden, and J. M.
Cook. Apr 85, 2p

Prepared in cooperation with Alabama Univ. in Huntsville. Dept. of Physics, Army Missile Command, Redstone Arsenal, AL., and Middle Tennessee State Univ.,

Included in OM85: Basic Properties of Optical Materials. Summaries of Papers, p249-250 Apr 85.

Keywords: *Cadmium sulfides, *Optical bistability, Logic devices.

Recently, Dagenais and Sharfin have reported wholebeam optically bistable behavior in uncoated platelets of CdS. This phenomenon was observed at milliwatt power levels when the incident laser frequency was tuned just below the resonance of the I(2) bound-exciton. Using a qualitative model, the authors successfully correlated the temperature dependence of the absorption with the observed bistable behavior. The authors research extends their qualitative model by eliminating several unnessessary assumptions. It is shown how such devices can be used as multiplexers and as composite optical logic elements and for use in optical computing and optical communications. The role of the temperature-induced absorption in CdS which leads to bistable output intensities is explained.

als. Summaries of Papers, p251-254 Apr 85.

Keywords: *Liquid crystals, Birefringence, Nonlinear ontics

Liquid crystals are birefringent materials with fluidity comparable to water. Device potential arises from the influence of electric, magnetic or optic fields on the optic axis oreintation. The response time is viscous limited. However, the more viscous smetic phases have storage properties. The birefringence is directly related to the order parameter of the fluid and its therefore sensitive to temperature, particularly near a phase ttransition. As the nematic to isotropic phase transition, the refractive index (n) discontinuity approximates 0.1. This is a weak first order transition with latent heat approximately 1 J/cc. These properties make the nematic phase an interesting solvent in a thermal dye cell. The thermal response is not viscous limited. It can be shown that when submillisecond response is demanded the thermal process is more efficient than the viscous limited orientation response. Experiments were performed with 5CB doped with L-dye D81 (EM Chemicals).

Study of Second Harmonic Generation Coefficlents and Ultraviolet Absorption Edge of Barlum

Borate Crystal,
J. K. Zhu, B. Zhang, and S. H. Liu. Apr 85, 1p
Included in OM85: Basic Properties of Optical Materials. Summaries of Papers, p255 Apr 85.

Keywords: Ultraviolet radiation, Wave functions, *Barium borates, *Second harmonic generation, Nonlinear optics.

Barium borate (beta-BaB2O4) is a new type of nonlinear optical crystal. In this paper the authors report one-electron energies and wave functions of barium borate by use of EHMO theory. Both the calculated values of SHG coefficient and ultraviolet absorption edge for barium borate crystal are in quantitative agreement with the experimental results. The comparison between EHMO, CNDO/S and experimental values is shown.

Verdet Constant of Optical Glasses, H. J. Hoffmann, W. W. Jochs, and G. Przybilla. Apr

Included in OM85: Basic Properties of Optical Materials. Summaries of Papers, p266-269 Apr 85.

Keywords: *Optical glass, *Glass, *Faraday effect, *Magnetooptics, *Verdet constants, Polarized light.

A relation for the Verdet constant as a function of wavelength was first derived by Becquerel. Unfortunately Becquerel's equation cannot generally be justified on the basis of quantum mechanics. L. Rosenfeld calculated a quantum mechanical expression of the Faraday rotation angle for the monoatomic case. A thorough discussion of the limitations is given by Van Vleck. In order to avoid these difficulties, the authors developed recently a simple new dispersion formula. To test this equation, they determined experimentally the Verdet constant of different glasses in the visible spectral region by measuring the rotation angle induced by a magnetic field.

Optical Characterization of Devitrification for Cr(+3)-Doped Zr-Ba-La-Al Fluoride Glass, W. J. Miniscalco, L. J. Andrews, B. T. Hall, and D. E. Guenther. Apr 85, 4p Included in OM85: Basic Properties of Optical Materi-

als. Summaries of Papers, p274-277 Apr 85.

Keywords: *Devitrified glass, *Optical glass, *Fluorides, Infrared optical materials, Atomic energy levels, Emission spectroscopy, Photoluminescence, Chromi-um, Stability, Crystal field, Doped materials, Heavy metals.

The past decade has seen an enormous increase in activity in the area of heavy metal fluoride glasses. These glasses contain no oxygen and are distinguished from the fluoroberyllates by the absence of beryllium. In addition to their scientific interest as a largely unexplored glass-forming system, heavy metal fluoride glasses are of technological interest because they have high optical transmission from the UV to the mid-IR (= or > 7 micrometers). One potential application is as optical fiber for both communications and energy transmission in the mid-IR. Since these glasses can be doped with transition metal and rare earth ions, other promising applications are as solid state laser hosts and magneto-optic devices. An important consideration in all applications is the relatively poor stability of these glasses compared to oxide glasses as indi-cated by their extremely narrow working ranges. Even for the best compositions the crystallization tempera-ture is seldom more than 100 degrees C hier than the glass transition temperature. To further understand the stability of heavy metal fluoride glasses, the authors have undertaken an investigation of crystallization using primarily optical techniques. The work has concentrated on a Zr-Ba-La-Al fluorozirconate glass (ZBLA) which has been doped with probe ions whose optical spectra are sensitive to their local environment.

Optical Study of Ge-P-Te and Ge-Se-Te Chalco-

genide Glasses,
L. Boehm, A. Bornstein, and S. Arie. Apr 85, 4p
Included in OM85: Basic Properties of Optical Materials. Summaries of Papers, p278-281 Apr 85.

Keywords: *Infrared optical materials, *Fiber optics, Group 6A compounds, Chemical analysis, X ray analysis, Chemical composition, Optical properties, *Germanium phosphoride tellurides, *Germanium selenide tellurides, *Optical fibers.

Chalcogenide glasses have been thoroughly investigated, especially in connection with their electronic properties and their promise as IR windows in the 8-12 micrometers region. For the purpose of the present study, the major attraction of chalcogenides lies in their promise as IR materials for infrared optical fibers. Such fibers are needed in applications using highpower CO2 laser for surgery as well as in cutting and heat treatment of metals. These fibers will also play an important role in the development of many infrared devices in the field of image relaying and remote sensing. In this study, the authors present the preparation and optical characterization of two glass systems containing relatively high amounts of Te. Such glasses are expected to be transparent up to 20 micrometer and may serve as preforms for drawing IR fibers.

Precision Measurements by Optical Heterodyne Techniques.

Final rept.,

L. Hollberg, M. Long-Sheng, M. Hohenstatt, and J. L. Hall. 1984, 8p Contract NSF-PHY82-00805

Pub. in Proceedings of SPIE - The International Society for Optical Engineering, San Diego, CA., August 23-24, 1983, p91-98 1984.

Keywords: *Optical measurement, *Heterodyning, lodine, Line spectra, Erbium, Absorption spectra, Spectroscopy, Four wave mixing.

Optical heterodyne techniques are described that are generally applicable to spectroscopy and precision measurements. Phase modulation is used at high fre-

quencies in order to suppress laser amplitude noise which is dominantly at low frequencies. The high sensitivity of these techniques is demonstrated in the detection of non-linear optical resonances in molecular iodine. Optical heterodyne saturated absorption and four-wave-mixing spectra taken with a dye laser are shown of the 612 nm I2 line which is of importance for optical frequency standards. Also shown are optical heterodyne detected saturated absorption spectra of Erbium taken in a hollow cathode discharge. An improvement in signal-to-noise ratio of 1000 is found for the optical heterodyne method relative to optogalvanic signals detected in the same discharge. Advantages and disadvantages of the various methods are discussed as are some ideas for improvement. A list of thirty references is given.

Keywords: *Frequency measurement, *Electron transitions, lodine, Reprints, Visible radiation, State of the

In order to measure the super narrow spectral features of cooled atoms and ions, in the optical region, optical frequency synthesis (OFS) techniques rather than wavelength techniques must be used. It is anticipated that many of these resonances will be in the optical region of the spectrum, and this paper addresses the state-of-the-art of the measurements of frequencies in that region. Two recent optical frequency measurements of iodine transitions in the visible are described, as well as recent improvements in fabricating the point-contact diode used in these measurements.

Attenuation of Multimode Fused Silica Optical Fibers Cooled to Liquid Hellum Temperature. Final rept.,

A. Engelsrath, D. R. Larson, D. L. Franzen, and R. J. Phelan. 1984, 7p

Pub. in Proceedings of SPIE -- Fiber Optics: Short-Haul and Long-Haul Measurements and Applications II, n500 p124-130 1984.

Keywords: Fiber optics, Attenuation, Near infrared radiation, Detectors, Silicon dioxide, Cryogenics, *Optical fibers, Visible radiation, Multimode.

The feasibility of bringing an optical signal through an optical fiber to a detection and processing system at liquid helium temperature was examined. The attenuation of three multimode optical fibers, from two different manufacturers with different buffer coatings, was measured under different cooling conditions. It was found that the attenuation depends on the cooling found that the attenuation depends on the cooling condition and has hysteresis effects. Independent of the wavelength tested (0.4 - 1.65 micrometers) the attenuation stayed below 0.1 dB/m under controlled slow cooling and under 0.5 dB/m with very fast cooling. Therefore, optical fibers can be used to bring optical signals into a liquid belium cooled Dewar for detections. cal signals into a liquid helium cooled Dewar for detection and processing

Theory of Resonant Degenerate Mixing with Broad-Bandwidth Lasers.

Final rept., G. Alber, J. Cooper, and P. Ewart. 1985, 1p Grant NSF-PHY82-00805

Pub. in Physical Review A 31, n4 p2344-2352 Apr 85.

Keywords: Laser beams, Band width, Reprints, *Four wave mixing, *Degenerate four wave mixing, Nonlinear optics.

The effects of finite laser bandwidth on resonant degenerate four-wave mixing (DFWM) are calculated with use of a model in which the intense, counterpropagating pump beams are characterized by a chaotic field, the probe beam is weak and monochromatic, and the medium consists of a gas of two-level atoms. authors present a steady-state solution in the limit where the pump-laser bandwidth exceeds all other atomic relaxation rates. Although the mean intensity due to the fluctuating fields is spatially independent (no steady-state standing-wave pattern is established), the analytic results indicate that, for intensities above the saturation intensity I(sat), spatially periodic saturation effects are important. Increasing bandwidth is shown to lead to an increase in the effective saturation intensity resulting in lower phase-conjugate reflectivity for I<I(sat) than for coherent pump fields, in contrast to the results for narrow-bandwidth chaotic fields. The resonant DFWM line shape is also calculated and compared to the coherent result. The authors comment on the application of the model to other fourwave-mixing processes employing broad-bandwidth lasers.

Grazing-incidence High-Resolution Spectrograph with Two Optical Elements. Final rept.,

A. M. Malvezzi, L. Garifo, and G. Tondello. 1981, 6p Pub. in Applied Optics 20, n14 p2560-2565, 15 Jul 81.

Keywords: *Ultraviolet spectrometers, *Spectrographs, Reprints, *Ultraviolet telescopes, *Solar spectrometers.

Using two optical toroidal elements, a mirror and a grating, both working at grazing incidence, a spectrometer can be built that is stigmatic in the XUV region at one wavelength. Good compensation of the aberra-tions is achieved when the intermediate sagittal image is nearly at infinity. By varying the angle of incidence on the grating with simple movements, a given couple of optical elements could cover stigmatically a rather extended spectral range. If coupled with bidimensional array detectors, such a spectrograph could find appli-cations in planned solar XUV telescopes.

Direct Measurement of the Electric Field of a Laser Pulse - Theory.

Technical note,

E. G. Johnson. Aug 85, 60p NBS/TN-1084 Also available from Supt. of Docs as SN003-003-

Keywords: *Laser beams, *Electric fields, Light pulses, Measurement, Fiber optics, Optical filters, Beam pro-

The author considers realizing an electric field measuring apparatus by using optical processing, tapered optical fibers, and a pair of detectors at the end of each optical fiber. Using an appropriate computer-generated optical filter, the author shows it is possible to dis-criminate among a set of orthonormal modes used to represent the spatial features of the electric field with a signal-to-noise ratio of at least 100 to 1. If the positioning accuracies for various parts of the apparatus are properly set up, it is expected that the signal-to-noise ratio could be about 1000. The purpose of the tapered and graded-index fiber is to select the fundamental propagating mode in a fiber and to attenuate the other modes. The existence of this fiber allows the precise determination of the strength of each of the orthonormal modes being used as the spatial basis of the electric field before the optical processing. The paper presents the conflicts in the design and gives a solution. The complete evaluation requires assembly of the proposed apparatus to assess final accuracy.

Determination of Fringe Order in the Channel

Spectra of Thin-Films.

Final rept

A. Feldman. 1984, 4p

Pub. in Applied Optics 23, n8 p1193-1196 1984.

Keywords: *Optical interference, *Thin films, Optical coatings, Thickness, Reprints, Refractive index, Dis-

The fringe orders in the channel spectrum of a thin film can be determined unambiguously provided it is known that the film thickness is less than a critical value. The value is equal to minus one half the reciprocal dispersion of the material at the wavelength of minimum dispersion within the wavelength range of measurement. Values of critical thickness are given, as a function of wavelength, for 33 optical materials. The data indicate that the critical thickness is at least 10 micrometers in all of the materials at wavelengths within the operating range of commercial spectrophotometers.

Visual Clarity with a Black-and-White Scene.

Final rept.

J. A. Worthey. 1985, 5p See also AD-A141 498.

Pub. in Jnl. of the Illuminating Engineering Society 14, n2 p634-647 Apr 85.

Keywords: *Visual perception, Color vision, Experiments, Recognition, Resolution, Visual acuity, Re-

Visual clarity experiments are usually done with colorful test objects, and it is generally concluded that the results of such experiments are related to the colorrendering properties of the illuminants involved. Nonetheless, it has been observed that a clarity difference between illuminants may be seen, even with black-and-white objects. An experiment was performed to measure differences of perceived clarity using only black-and-white fabric and black yarn as test objects. (The word 'clarity' was not used in the instructions to subjects. They were asked questions concerning 'preferences' and 'blackness'.) The differences measured seem to indicate a role for color in black-and-white vision, but not a pure clarity effect independent of illuminant solor. minant color.

Limitations of Color Constancy.

Final rept.,

J. A. Worthey. 1985, 13p Pub. in Jnl. of the Optical Society of America A2, n7 p1014-1026 Jul 85.

Keywords: *Color, *Adaptation, Visual perception, Chroma, Illuminance, Reprints.

Theories of adaptation, such as those based on the proportionality law of von Kries, provide detailed predictions concerning perception of object colors when illuminant spectral power distribution is changed. Since these predictions depart from the simple ideal of color constancy, a question arises of the relationships among data, theories, and the ideal of constancy. Pro-jecting the data of a constancy experiment into an op-ponent-color system indicates that constancy tends to hold well for illuminant shifts in the blue-yellow direction but less well for shifts in the red-green direction. This observation is consistent with a theory based on von Kries adaptation.

Bandwidth of a Multimode Fiber Chain.

Final rept., P. M. Rodhe. Feb 85, 10p

Pub. in Jnl. of Lightwave Technology LT-3, n1 p145-154, 1 Feb 85.

Keywords: *Fiber optics, *Bandwidth, Transfer functions, Optical measurement, Reprints, *Optical fibers, Multimode.

The author proposes a new method for evaluating the baseband transmission in a multimode fiber chain. Carnevale and Paek stated that errors in the tiber manufacturing process will randomly distort a desired index profile, presumably of power-law type. The author extends their discussion to the band-widths of concatenated fibers, by considering Gaussian approxima-tions to actual transfer functions. The bandwidth can thus be separated into two parts, one of which is due to the over- and undercompensation of individual, idealized power-law profiles, and the other of which refers to random profile distortions as well as possible mode coupling within mode groups.

Electromagnetic Technology Div. Intramodal Part of the Transfer Function for an Optical Fiber.

Final rept.

P. M. Rodhe. Feb 85, 5p

Pub. in Jnl. of Lightwave Technology LT-3, n1 p154-158, 1 Feb 85.

Keywords: *Fiber optics, *Transfer functions, *Bandwidth, Optical measurement, Reprints, *Optical fibers.

Intramodal contributions in measurements of opticalfiber bandwidth are investigated theoretically and experimentally in the quasimonochromatic case. A relation is established between the intramodal transfer function and a possibly non-Gaussian source spectrum, which may also vary with modulation frequency. By considering the latter variation in particular, we are able to predict the intramodal length dependence and show how it may deviate from that of a conventional approach.

PB85-203503 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Cascade Effects in Mass-Dependent Preferential Recoil implantation.

Final rept., M. L. Roush, F. Davarya, O. F. Goktepe, and T. D.

Andreadis. 1983, 12p
Pub. in Nuclear Instruments and Methods in Physics
Research 209, p67-78 May 83.

Keywords: Computerized simulation, Reprints, *lon bombardment, Ion implantation, Recoils.

Under some circumstances, ion bombardment induces preferential recoil implantation of one species of an initially homogeneous binary target. The atomic masses of the target components play a central role in the segregation produced by the ion bombardment if all binding energies are the same. The process of component segregation does not generally take place by single recoil implantation events in which atoms are driven from the surface region inward to the enriched portion. Rather, the motion is one of migration in which a great deal of motion takes place due to atomic mixing and there is a slight directional preference which favors the inward movement of the heavy element. To facilitate a study of their role in recoil implantation, this computer simulation involves grouping of the components of the recoil cascade according to the number of collisions preceding their generation. The authors observe that the recoils of the lighter target species have greater total path lengths but their direction of travel is more random. The heavy species is preferentially implanted due to its retention of the inward-directed momentum.

Possible interpretation of a New Resonance at 8.3 GeV. Final rept.

K. Lane, S. Meshkov, and F. Wilczek. 29 Oct 84, 3p Contract EY-76-C-02-1545, Grant NSF-PHY77-27084 Sponsored by National Aeronautics and Space Admin-

istration, Washington, DC. Pub. in Physical Review Letters 53, n18 p1718-1720,

29 Oct 84.

Keywords: Reprints, *Pseudoscalers, Nuclear resonance, Tau particles, Gauge theory.

It is discussed whether the recently discovered resonance at 8.3 GeV can be interpreted as a weakly coupled fundamental pseudoscalar. Such a particle is readily incorporated in an SU(2) xU(1) gauge theory framework. The importance of mixing with (eta sub B), (eta prime sub B) for the phenomenology of such a particle is emphasized, and critical tests of their identification are proposed.

New Atomic Mechanism for Positron Production in Heavy-Ion Collisions. Final rept.,

W. Lichten, and A. Robatino. Feb 85, 5p

Pub. in Physical Review Letters 54, n8 p781-784, 25 Feb 85

Keywords: Reprints, *Positron sources, Heavy ion reactions.

The Letter gives a newly considered mechanism for positron production which consists of filling of longlived, supercritical, multiple-vacancy states via higherorder perturbations, with interference terms of the same order of magnitude as in the case of the previously considered single vacancies. The mechanism could be relevant to the structure in positron energy spectra observed at Gesellschaft fur Schwerionenfors-chung in heavy-ion collisions. A possible directional anisotropy of positron emission is discussed.

Transplutonium (sigma sub nf) Systematics in the MeV Range.

Final rept.,

J. W. Behrens, J. Trochon, and J. Jary. Jun 85, 3p Pub. in Transactions of the American Nuclear Society 49, p196-198 Jun 85.

Keywords: *Fission cross sections, *Actinide series, Reprints.

In addition to obtaining nuclear data from measurement and theory, one may also rely on nuclear data phenomenology, the study of systematic trends in nu-clear parameters which are accurately known to infer these parameters for nuclides which are not accurately known, often because they are difficult to measure. One such study deals with the systematics of neutron-induced fission cross sections over the incident-neutron energy range from 1 to 20 MeV. Results for a total of over 40 isotopes of the uraniums, neptuniums, and plutoniums have now been completed. Extension of these trends to the transplutoniums, however, yields inferred values which significantly overpredict the fission cross section. This overprediction is primarily caused by the change in the systematics of the inner fission barrier height, near compound nucleus neutron number 146, as will be shown.

Pub. in Proceedings of the International School of Nuclear Physics Nuclear and Subnuclear Degrees of Freedom and Lepton Nucleus Scattering, Erice, Italy, April 8-20, 1984, Progress in Particle and Nuclear Physics 13, p237-242 1985.

Keywords: *Research, Electron scattering, Photonuclear reactions, Reviews, Electrodisintegration, Racetrack microtrons

Electronuclear Physics has a long history at NBS, extending back to the pioneering photonuclear experiments of Fuller and Hayward in the 1950's. Since 1967 the authors have carried out an experimental program in electron scattering, electrodisintegration, and photon scattering using their 140 MeV linac. Although there are still some experiments in progress using the linac, it is approaching the end of its useful life for nuclear physics. The authors are now building a 200 MeV CW racetrack microtron (RTM) and designing apparatus for use in a program of primarily coincidence experiments when the RTM is completed. In the report, the authors summarize the current status of these efforts, as well as experiments being carried out at other laboratories, and a small but active theory program.

Virtual Photons in Theory and Experiment.

Final rept.

W. R. Dodge. 1985, 9p Pub. in Nuclear Instruments and Methods in Physics Research B10/11, p423-431 1985.

Keywords: Reprints, *Virtual photons, Virtual particles, Electrodisintegration, Zirconium 90, Isobaric analogs.

Before the last decade nuclear electrodisintegration experiments in the region of the giant dipole resonance were carried out primarily as an expedient experimental alternative to photodisintegration experiments. Lack of an adequate treatment of Coulomb distortion of the incident and scattered electron's wavefunction in heavy nuclei and recoil in light nuclei when the momentum of the scattered electron was not much smaller than the momentum of the recoiling residual nucleus limited the establishment of the correspondence between photo- and electrodisintegration to roughly s-d shell nuclei. Distorted-wave Born approximation calculations have solved the former problem in virtual photon analysis of (e,X) total cross-section measurements and the effects of recoil on PWBA virtual photons have been recently investigated. In principle, an inclusive (e,X) experiment completely determines the (gamma,X) cross-section. Besides those matrix elements present in the photodisintegration cross-section that are associated with the transverse form factor as q->omega, other terms associated with the Coulomb, interference, and polarization terms of the (e,e'x) cross-section appear in the (e,X) cross-section. Inclusive (e,X) experiments done at NBS to test the limitations of E1 virtual photon theory are described. The proliferation of (e,e'X) experiments will intensify interest in (e,e'X) theory aexperiments, with the X arm singles serving as an important check on the internal consistency of the (e,e'X) results. 501,547

Cold Fragmentation Measurements Using a Very-High-Energy-Resolution Ionization Chamber.

Final rept.,

J. Trochon, G. Simon, J. W. Behrens, and F. Brisard.

1985, 1p Pub. in Transactions of the American Nuclear Society 49, p199 Jun 85.

Keywords: *Nuclear fission, *Nuclear models, Thermal neutrons, Reprints, *Fission fragments, Uranium 235.

The evolution of a fissioning nucleus from saddle point to scission is perhaps the least known stage of nuclear fission at low energy. In a recent 'microscopic analysis of collective dynamics in low energy fission' using a density dependent Hartree-Fock-Bogolyubov approach with an effective force, Berger et al. interpreted the phenomenon as a passage of the nucleus from an elongation valley to a fusion valley. For small elongation, this passage occurs through a striction barrier, which disappears for more elongated configurations. This fission mode is named 'cold configuration' or 'cold fragmentation' because the scission leaves the two fragments in states close to their ground state. In the present measurements, the authors investigated cold fragmentation in the thermal neutron-induced fission of (235)U, i.e., (236)U*, to test the fission dynamics calculation and to contribute to the knowledge of the even-odd effect and of the maximum total fragment kinetic energy for a given fragmentation.

Fission Cross-Section Measurements in Reactor

Physics and Dosimetry Benchmarks.

Final rept., J. A. Grundl, and D. M. Gilliam. 1983, 2p

Pub. in Transactions of the American Nuclear Society 44, p533-535 Jun 83.

Keywords: *Fission cross sections, *Uranium 233, *Plutonium 239, *Uranium 235, Californium 252, Fission neutrons, Standards, Reprints, *Plutonium 240, *Plutonium 241, *Thorium 232, *Uranium 238, *Neptunium 237, Benchmarks.

Fission cross sections for eight fissionable isotopes of importance for nuclear technology have been measured in two fission neutron spectra and one fissionneutron-driven standard neutron field. New measurements for (240)Pu, (241)Pu, (233)U, and (232)Th, accompany revised values from earlier determinations for (239)Pu, (235)U, (238)U, and (237)Np. The starting point for all of these measurements is an absolute cross section measurement for (252)Cf fission spectrum neutrons. The absolute cross section is determined from a neutron source strength, a source-to-detector distance, and an absolute fission rate. Errors are given at one standard deviation. These benchmark measurement results are intended to provide integral normalizations and a test of differential neutron cross section data.

Angular Distribution of High Energy Electrons Fol-

lowing Radiation,

L. C. Maximon, and A. Lepretre. Oct 85, 53p NBSIR-84/2854

Prepared in cooperation with CEA Centre d'Etudes Nucleaires de Saclay, Gif-sur-Yvette (France). Service de la Metrologie et de la Physique Neutroniques Fondamentales.

Keywords: *Electron scattering, Bremsstrahlung, Scattering cross sections, Angular distribution, Screening, Small angle scattering.

An expression is derived for the angular distribution of high energy electrons which have undergone scatter-ing andd radiated a photon, integrated over the directions of the emitted photon, in the region of small scattering angles, for which the atomic form factor must be taken into account but the nuclear structure may be neglected. This distribution is analogous to Schiff's high-energy small-angle distribution for photons, inte-grated over the final electron angles. It is shown that the correction to the energy-angle distribution of elec-trons due to atomic screening is identical in form to the correction to the energy-angle distribution of photons. This correction involves an integral over the atomic form factor, and is evaluated in closed form for the Thomas-Fermi-Moliere model. A very simple expression is obtained for the case of complete screening.

Redistribution of Radiation in a Low Density Plasma.

Final rept

G. G. Lombardi, and D. E. Kelleher. 1983, 11p Pub. in Proceedings of Int. Conf. Spectral Line Shapes (6th), Boulder, CO., July 12-16, 1982, v2 p835-845.

Keywords: *Hydrogen, *Fluorescence, Light scattering, Spectral lines, *Plasma, Laser radiation, Balmer

The redistribution of radiation was observed in (H sub alpha), the first Balmer line of hydrogen. A dye laser was tuned to the far wing of (H sub alpha), and the fluorescent radiation was observed in the core as a function of laser detuning. The profile, which was found to be Lorentzian, is principally determined by the natural and resonance broadening of the lower level. The polarization of the fluorescent radiation was measured relative to the incident linear polarization. The polarization of the fluorescence in the absence of collisions was calculated and compared to the measured value. It provides information concerning the rate of depolarizing collisions.

Around-the-World Relativistic Sagnac Experiment.

D. W. Allan, M. A. Weiss, and N. Ashby. Apr 85, 2p Sponsored by Colorado Univ. at Boulder. Dept. of Physics and Astrophysics.

Pub. in Science 228, p69-70, 5 Apr 85.

Keywords: *Atomic clocks, *Relativity, Reprints, *Sagnac effect, Global positioning system.

In 1971 Hafele and Keating carried portable atomic clocks east and then west around the world and verified the Sagnac effect, a special relativity effect attributable to the earth's rotation. In the study reported here, observations of the effect were made by using electromagnetic signals instead of portable clocks to make clock comparisons. Global Positioning System satellites transmit signals that can be viewed simultaneously from remote stations on the earth; thus an around-the-world Sagnac experiment can be per-formed with electromagnetic signals. The effect is larger than that occurring when portable clocks are used. The average error over a 3-month experiment was only 5 nanoseconds.

Mode Coupling from Linear and Nonlinear Kinetic Equations.

Final rept., J. W. Dufty, and R. F. Rodriguez. 1983, 26p Pub. in Jnl. of Statistical Physics 33, n2 p261-286 Nov

Keywords: *Kinetic theory, Boltzmann equation, Spheres, Reprints, Klimontovich equation, Mode coupling.

The calculation of mode coupling contributions to equilibrium time correlation functions from the nonlinear Boltzmann equation is reconsidered. It is suggested that the use of a nonlinear kinetic equation is not appropriate in the context, but instead such calculations should be reinterpreted in terms of the Klimontovich equation for the microscopic phase space density. For hard spheres the Klimontovich equation is formally similar to the nonlinear Boltzmann equation, and the similarity is exploited to explain the successful calcula-tion of mode coupling effects from the latter. The rela-tionship of the Klimontovich formulation to the linear ring approximation is also established.

Space Antenna for Gravitational Wave Astronomy. Final rept., J. E. Faller, P. L. Bender, J. L. Hall, D. Hils, and M.

A. Vincent. 1985, 7p Pub. in Proceedings of Colloquium on Kilometric Opti-cal Arrays in Space, Corsica, France, October 23-25, 1984, p157-163 1985

Keywords: Spacecraft, *Gravitational wave antennas, Gravitational radiation, Gravity waves.

The authors are investigating possible designs for a laser gravitational wave antenna in space using free test masses and heterodyne (interferometric) detection. One possibility is to use baselines about one million km long between three spacecraft in nearly circular one-year orbits about the sun. If the orbit elements are chosen properly, the distances between the spacecraft can be kept constant to roughly 1 part in 1000 without orbit corrections. With milliwatt-transmitted laser power levels and 50 cm diameter optics, a strain sensitivity of 10 to the 19th power/(Hz to the 1/2 power) over at least the period range from 10 to 10,000 seconds appears feasible. The primary goal of the measurements is to observe gravitational radiation associated with present or past interactions of supermassive objects.

501,566 PB86-143906 PC A03/MF A01 National Bureau of Standards (NML), Gaithersburg, MD. Center for Radiation Research. Irreducible Density Matrices, M. Danos. Nov 85, 27p NBSIR-85/3270

Keywords: *Quantum theory, Angular momentum, Tensor analysis, *Density matrix, Polarization, SU-2

An expansion of the density matrix is given into irreducible SU(2) tensors, i.e., into quantities of good angular momentum. These irreducible tensors can be handled by all the powerful tools developed in the context of the handling of angular momentum. As examples, the density matrix of a cryogenically alligned nucleus is derived and the construction of the angular distributions of nuclear reactions in terms of density matrices is demonstrated.

Waves, Microstructures, and Effective-Medium Approximation.

Final rept., S. K. Datta, and H. M. Ledbetter. 1985, 11p Sponsored by Defense Advanced Research Projects Agency, Arlington, VA.
Pub. in Mechanics of Dislocations, p213-223 1985.

Keywords: *Microstructure, *Elastic properties, Phase velocity, Plane waves, Wave propagation, Preferred orientation, Anisotropy, Inclusions, Reprints.

Theoretically and experimentally the authors studied phase velocity of a plane wave propagating in an elastic medium with microstructure. Microstructures studied were either inclusions or fibers, which were either aligned or oriented randomly. Preferred orientation of the microstructure causes anisotropic macroscopic physical properties. Here the authors consider the elastic properties. The theoretical model used a wavescattering approach together with Lax's quasi-crystalline approximation. The model predicts the macro-scopic isotropic elastic constants for the case of random orientation and the macroscopic anisotropic elastic constants caused by preferred orientation.

Review of Generalized Failure Criteria Based on the Plastic Yield Strip Model.

Final rept..

R. de Wit. 1981, 27p

Sponsored by Federal Railroad Administration, Washington, DC. Office of Rail Safety Research.

Pub. in Proceedings of National Symposium on Frac-ture Mechanics (14th), Los Angeles, CA., June 30-July 2, 1981, ASTM STP 791, p1-14-1-50.

Keywords: *Pressure vessels, Fracture properties, Mechanical properties, Cracks, Failure, Collapse, Fracture(Mechanics).

A review is given of the failure criteria developed by Hahn and Sarrate for through-cracked pressure ves-sels, whereby they established three failure categosels, whereby they established three failure categories. This work was based on the Dugdale and Bilby-Cottrell-Swinden (D-BCS) model for the crack-tip opening displacement (CTOD) in an infinite plate. The model was extended in an approximate way by Heald-Spink-Worthington (D-BCS-HSW) to finite geometries and structures by combining the effects of plasticity and geometry as multiplicative factors. In this paper the criteria of Hahn and Sarrate are extended to the D-BCS-HSW model. The three failure categories are relabelled: (1) linear-elastic fracture mechanics (LEFM), (2) elastic-plastic fracture mechanics (EPFM), and (3) plastic collapse (PC).

PB86-138104 Not available NTIS National Bureau of Standards (NEL), Gaithersburg, MD. Mathematical Analysis Div. Fatigue Research: Needs and Opportunities.

Final rept.,

J. T. Fong. 1985, 5p Pub. in ASTM (American Society for Testing and Materials) Standardization News 13, n11 p59-63 1985.

Keywords: *Fatigue(Materials), Mechanical properties, Crack propagation, Fatigue Cracking(Fracturing), Reprints.

The significance of fatigue research in engineering and materials science is stated in simple terms through a look at the goals of research and its benefits to society. An overview of the research progress during the last 30 years is given in a historical perspective dating back to as far as the 1840's. The driving forces for re-search support from the industry and the user commu-nity are introduced to place the concept of 'research needs' in a practical setting. Technical difficulties in moving fatigue toward a more scientific basis are discussed.

Dynamic Green's Functions of an Infinite Plate - A Computer Program, N. N. Hsu. Nov 85, 67p NBSIR-85/3234

Keywords: *Plates(Structural members), *Greens function, *Computer programs, Nondestructive tests, Elastic waves, Waveforms, Fortran, Convolution integrals, *Acoustic emissions.

The report is a FORTRAN program to compute the Green's functions of an infinite plate. The Green's function, G(ij) (xi,x,t), is defined as the ith component of the displacement at x due to a point force of step-

Group 20K—Solid Mechanics

function time dependency acting at xi in the jth direction initiated at t=0. The Green's function is the fundamental solution of the transient elastic wave propagation problem. In general, the displacement field u(xi,x,t)at x due to a point force of arbitrary time dependence acting at xi can be computed by a convolution integra-tion. Displacement produced by a dynamic force dis-tributed over a finite area can also be computed by numerical integration using the Green's function as the kernel of the integral over the finite area. The computer program is made available mainly for its application to calibrate acoustic emission systems and sensors.

This report summarizes all those programs which depend on the NBS reactor. It covers the period from July 1983 through June 1984. The programs range from the use of neutron beams to study the structure and dynamics of materials through nuclear physics and neutron standards to sample irradiations for activation analysis, isotope production, radiation effects studies, neutron radiography, and nondestructive evaluation

501,572 PB85-186997 Not available NTIS National Bureau of Standards (NEL), Gaithersburg, MD. Semiconductor Devices and Circuits Div. Comparison of Theoretical and Empirical Lifetimes for Minority Carriers in Heavily Doped Sillcon.

Final rept., H. S. Bennett. 1984, 5p Pub. in Solid-State Electronics 27, n10 p893-897 1984.

Keywords: *Silicon, Field effect transistors, Semiconductor doping, Reprints, *Minority carriers, *Carrier lifetime, *Semiconductors, Bipolar transistors.

The minority carriers determine essential electrical characteristics of bipolar devices and bipolar-like para-sitic paths in field effect devices. The electrical behavior of such devices is frequently described by detailed device models. Compared to the other input parameters for detailed device models, the minority carrier lifetimes due to traps or defects as functions of doping density have great uncertainty. A major finding in this paper is that the commonly used empirical expressions for the lifetime due to defects may not give correct results when included in detailed models of shallow, heavily doped silicon emitters.

High-Frequency Transient-Resistance Spectroscopy of Deep Levels in Si GaAs.
Final rept.,

A. C. Seabaugh, M. I. Bell, R. D. Larrabee, and J. D. Oliver. 1984, 9p Pub. in Proceedings of Semi-Insulating 3-Materials

Kah-nee-ta 1984, p437-445 1984.

Keywords: *Gallium arsenides, Chromium, Reprints, *Deep level transient spectroscopy, *Photoresistance deep level transient spectroscopy, Doped materials.

A new photoinduced transient-resistance technique is used to characterize deep levels in semi-insulating GaAs. In this technique, termed photoresistance deep-level transient spectroscopy (PR-DLTS), an optical pulse is used to generate excess carriers which are trapped by deep levels in the material. The ac resistance of the specimen is monitored, and the resistance transient which occurs after the illumination ends is signal processed in the same way as the capacitance transient in conventional DLTS. Comparison of this technique with the dc current-transient measurement, photoinduced transient spectroscopy (PITS), shows photoliadiced transient spectroscopy (FITS), shows that it is sensitive to the same trapping/detrapping phenomena. PR-DLTS data for the Cr-related deep level is consistent with published DLTS results. Results are reported for materials grown by the horizontal Bridgman method and by the liquid-encapsulated Czochralski technique, both with and without chromium doping. Nineteen specimens from ten different manufacturers are compared.

Pub. in Proceedings of International Copper Research Association Annual Report 57p 1984

Association Annual Report, 57p 1984.

Keywords: *Superconductors, Copper, Composite materials, Niobium intermetallics, Tin intermetallics, Wire, Reprints, Copper matrix composites.

The report summarized the work performed on four INCRA projects covering a span of about six years. The main goal of the work was to investigate the in-situ superconductors, those produced by the relatively rapid cooling of a melt containing essentially non-mis-cible components. The component with the higher melting point precipitates out as small particles during the cooling. Subsequent drawing of the resulting boule results in fine filaments of this material (the superconductor) in the lower-melting matrix (usually oxygen-free copper or a copper-tin alloy).

PB85-196111 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Interaction Effects in Disordered Landau-Level Systems in Two Dimensions. Final rept..

Pub. in Physical Review B: Condensed Matter 26, n4 p1651-1659, 1 Aug 82.

Keywords: *Electron gas, *Coulomb interactions, Magnetic fields, Reprints, Density of states, Two dimensional.

Interaction effects in the disordered two dimensional electron gas are considered in the regime of high mag-netic field and low temperature. Logarithmic temperature corrections to the density of states and the conductivity are obtained. When Hartree corrections are included, good agreement with the experimental results of Paalanen, et al. is obtained.

501,577 PB85-196228 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Reversible Step Rearrangement and Segregation on Nickel Surface at the Curie Temperature. Final rept..

T. Jach, and J. C. Hamilton. 1982, 8p Pub. in Physical Review B: Condensed Matter 26, n7 p3766-3773, 1 Oct 82.

Keywords: *Ferromagnetic materials, *Nickel, *Surfaces, Phase transformations, Single crystals, Curie temperature, Carbon, Separation, Reprints.

Reversible step period rearrangement and carbon segregation have been observed on clean nickel single-crystal surfaces whose bulk is also relatively free of impurities. The temperature of these transitions which are 35K wide, appears to be the nickel Curie temperature, as determined by simultaneous LEED, Auger, and permeability measurements on nickel stepped and flat (111) surfaces. The observation of segregated carbon in carbidic form (isolated carbon atoms) indicates an unusual bonding state of C to the surface below the Curie temperature. Measured carbon coverages indicate a change greater than 0.2eV per carbon atom in the heat of segregation at the Curie point.

PB85-196236 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Integral Equation Approach to the Inclusion Problem of Elasto-Plasticity.

W. C. Johnson, and J. K. Lee. 1982, 7p Pub. in Jnl. of Applied Mechanics 49, n2 p312-318 Jun

Keywords: *Elastic properties, *Plastic properties, *Integral equations, Deformation, Strains, Stresses, Reprints, Pearson density functions.

An integral equation approach is derived for the calculation of the elasto-plastic strain field associated with a transformed inclusion of constant stress-free transfor-mation strain and for an inhomogeneity when the far stress field remains elastic. The assumptions of a coherent precipitate and the deformation theory of plasticity are employed although any yield condition and flow rule can be chosen. The complexity of the integral equation is such as to necessitate an iterative solution scheme. The technique is applied to a spherical precipitate in a uniform elastic stress field where associated stress and strain fields and plastic zone are calculated. The nature of the plastic relaxation process compares qualitatively with two dimensional plane stress behavior. Extension of this technique to the nonaxisymmetric problem is also examined.

Observation of Spin Waves in Pd(1.5% Fe). Final rept.,

J. W. Lynn, J. J. Rhyne, and J. I. Budnick. 1982, 3p Sponsored by American Inst. of Physics, New York and Institute of Electrical and Electronics Engineers, Inc., New York,

Pub. in Proceedings of Annual Conference on Magnetism and Magnetic Materials (27th), Atlanta, Ga., November 10-13, 1981, Jnl. of Applied Physics 53, n3 pt2 Mar 84.

Keywords: *Ferromagnetic materials, *Palladium alloys, *Iron containing alloys, *Magnons, Neutron scattering, Magnetic moments, Cryogenics, *Spin

Inelastic neutron scattering measurements have been carried out on the 'giant-moment' alloy system Pd(1.5% Fe), which is in the dilute ferromagnetic regime. Below the Curie temperature of 67K relatively well defined spin wave excitations have been observed in the small wavevector region (Q < 0.14/A).

Solid-State Physics—Group 20L

The dispersion of these excitations is consistent with the quadratic relation E = D(Q sup 2) expected for an isotropic ferromagnet, with D = 40 meV-(A sup 2) at a temperature of the 40K. With increasing temperature, the spin waves are found to renormalize in energy, and broaden rapidly both with increasing Q and increasing temperature.

Calorlmetric measurement of weak optical absorption of laser Illumination by solid samples is a well established method. The possibility of applying such methods to the study of deep level impurities has been discussed in the literature (1,2), but little data has been published. In this paper, some of the many difficulties and constraints in applying calorimetry to the study of deep level impurities are discussed. The goal of the present study was to determine the energy of a deep present study was to determine the energy of a deep level with respect to either the valence or conduction band edge. In order to do this it is necessary to measure the photoionization or photoneutralization cross section as a function of photon energy.

Prepared in cooperation with Pennsylvania State Univ., University Park. Materials Research Lab. Included in OM85: Basic Properties of Optical Materials als. Summaries of Papers, p218-221 Apr 85.

Keywords: *Silicon, *Charge carriers, Carrier mobility, Energy bands, Dynamics, Picosecond pulses, Density

The observations suggest that the large density of states in the gap in a-Si provides a fast and easy non-radiative channel for the decay of charge carriers out of the conduction band. This conclusion is derived from the exponential decay in the reflectance which is interpreted as indicating the dominance of monomole-cular non-radiative recombination, with bimolecular ra-diative recombination relatively unimportant in sputtered a-Si at T = 300 K up to 900 ps.

Survey of Chaos in the Rf-Blased Josephson Junc-

tion. Final rept.

R. L. Kautz, and R. Monaco. 1 Feb 85, 15p Pub. in Jnl. of Applied Physics 57, n3 p875-889, 1 Feb

Keywords: *Josephson junctions, Superconductivity, Reprints, *Chaos, Voltage standards.

Chaotic behavior in the rf-biased Josephson junction is studied through digital simulations of the Stewart-McCumber model. Chaotic states are characterized by Poincare sections, Liapunov exponents, and power spectra. Models are presented which explain some features of the chaotic spectra. The parameter range over which chaotic behavior occurs is determined employer which chaotic behavior occurs is determined employer. over which chaotic behavior occurs is determined em-pirically for a broad range of dc bias, rf bias, and the hysteresis parameter for a fixed rf frequency. It is shown that chaos does not occur if either the dc bias or the rf bias is very large. An attempt is made to explain the boundaries of the chaotic region in terms of simple models for chaotic behavior.

Group 20L—Solid-State Physics

Keywords: *Nickel, *Magnetism, *Surfaces, Chemisorption, Oxidation, Reprints, *Electronic structure, Photoelectron spectroscopy.

The d-band holes which give rise to ferromagnetism in Ni can be directly observed by spinpolarized inverse photoelectron spectroscopy (SPIPES). Only incident electrons polarized in the minority spin direction can fall into unfilled minority spin states and radiate a detected photon. On dissociative chemisorption of O2 one observes a reduction in the number of minority spin d holes. It is this change in electronic structure which gives rise to a decrease in magnetization. A background of minority and majority spin states remains essentially unchanged. Further exposure to oxygen causes formation of NiO; the surface magnetization goes to zero, and a completely different SPIPES spectrum is observed. The relative importance of delectrons and s, p electrons in chemisorptive bonding on Ni backboar much discussed. Those data suggests on Ni has been much discussed. These data suggest that the d states interact strongly with the oxygen and that this interaction has a profound influence on the surface magnetism.

Pub. in Proceedings of the Very Large Scale Integration Science and Technology International Symposium (1st), Detroit, MI., October 18-21, 1982, v82-87, p123-129.

Keywords: *Silicon, *Energy gap, Integrated circuits, Energy bands, *Very large scale integration, Density of states

As the dimensions of devices become smaller, the effect of bandgap narrowing, which occurs in silicon as a result of heavy doping, becomes increasingly more important. The diffusion coefficients of dopant ions depend strongly on the ratio of the majority carrier den-sity to the intrinsic carrier density, which increases with decreasing energy gap. The authors have previously developed a model, restricted to donors, which accounts for the bandgap narrowing observed optically at 35 and 300 K. These results have been extended to the case of a donor density of 1.0 x 10 to the 20th power/cc at 1100C, for which our model predicts a bandgap reduction of 123 meV. However, the intrinsic carrier density is increased by only 15 percent because the perturbed bands are nonparabolic. The authors conclude that bandgap narrowing resulting from heavy doping has a much smaller effect on diffusion coefficients than predicted by prior models based on impurity bands.

tum Hall Effect. Final rept.

S. M. Girvin, A. H. MacDonald, and P. M. Platzman.

Feb 85, 3p Pub. in Physical Review Letters 54, n6 p581-583, 11 Feb 85.

Keywords: *Hall effect, Excitation, Reprints, *Fractional quantum Hall effect, *Quantum Hall effect.

The authors present a theory of the collective excitathe authors present a theory of the collective exchanges and the spectrum in the fractional quantum Hall-effect regimes, in analogy with Feynman's theory for helium. The spectrum is in excellent quantitative agreement with the numerical results of Haldane. Within this approximation the authors prove that a finite gap is generic to any liquid state in the extreme quantum limit and that in this property analyses are and that in this single-mode approximation gapless excitations can arise only as Goldstone modes for ground states with broken translation symmetry.

Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions of Magnetics MAG-21, n2 p771-774 Mar 85.

Keywords: *Superconductors, Niobium intermetallics, Tin intermetallics, Reprints, *Niobium tin, Critical cur-

Superior superconducting properties, such as high J(c)'s and T(c)'s, have been obtained from reacted

liquid-infiltrated Nb-Sn composite wires. These excel-lent properties are attributed to the chemistry and structure of the material, which is prepared by a unique solid (Nb) - liquid (Sn) reaction. From heat capacity measurements, sharp bulk superconducting transitions of the A15 phase occur at 17.2-18 K and the weight fraction of A15 in the composite wire is about 23%. Analytical electron microscopy techniques have shown that: the microstructure of these conductors consists of alternating large-grain and small-grain fila-

Effect of Unlaxial Strain on the Critical Current and

Critical Field of Chevrel Phase PbMo6S8 Superconductors.

Final rept.,

J. W. Ekin, T. Yamashita, and K. Hamasaki. 1985, 4p Sponsored by Department of Energy, Washington, DC. Office of Fusion Energy. Pub. in IEEE (Institute of Electrical and Electronics En-

gineers) Transactions on Magnetics MAG-21, n2 p474-477 Mar 85.

Keywords: *Superconductors, *Critical field, Strains, Reprints, *Critical current, *Lead molybdenum sul-

The first measurements of the effect of uniaxial strain on the critical current of a Chevrel phase superconductor, PbMo6S8, have been obtained at 4.2 K in magnetic fields from 2 T to 24 T. The data show there is a very significant reversible effect of elastic strain on the critical current of PbMo6S8, comparable in magnitude to that observed in Nb3Sn. This is because both the peak pinning force and upper critical field are very sensitive to elastic strain. A correlation is noted between the elastic strain effect, radiation sensitivity, and crystal phase.

Generalized Theory of Neutron Scattering from Hydrogen in Metals.

Final rept., R. C. Casella. 1983, 10p

Pub. in Physical Review B: Condensed Matter 28, n6 p2927-2936, 15 Sep 83.

Keywords: *Neutron scattering, *Hydrogen, Metals, Energy bands, Reprints.

A recent analysis by the author of inelastic scattering of neutrons from dilute hydrogen in terms of coherent itinerant-proton energy bands is generalized to include incoherent processes such as the spontaneous decay of the proton from excited-oscillator states to the ground state, as well as incoherent hopping among excited local-oscillator states centered at neighboring interstitial occupancy sites. Similarly, the analysis of Chudley and Elliott of quasielastic neutron scattering and its extension by Rowe, Skold, Flowtow, and Rush are generalized to include coherent hopping (band transport) in the self-correlation function describing motion of the proton among neighboring oscillator ground states (and, when applicable, among excited states). The general formalism developed here encompasses quasielastic and inelastic scattering and allows for the coexistence of coherent and incoherent processes. At each level of complexity, the expressions obtained for the cross sections are shown to reduce to earlier results in the limits when either the coherent or the incoherent contributions to the neutron bandwidths can be ignored.

Numerical Analysis of the Thermal Pulse Experiment (Dielectric Polarization Distributions Meas-

urement). Final rept.

F. I. Mopsik, and A. S. DeReggi. 1980, 9p Pub. in Proceedings of 1980 Annual Report Conference on Electrical Insulation and Dielectric Phenomena, Boston, MA., October 26-29, 1980, p251-259.

Keywords: *Polarization(Charge separation), Thermal radiation, Electrets, Fourier analysis, Computer applications, Transients.

The thermal pulse experiment has been presented as a way of investigating polarization distributions in poled materials. The method involves measuring the electrical response to a thermal pulse applied to one surface of a sample by a light flash. The Fourier analysis that the authors developed for the thermal pulse experiment has been used for the development of a computer program to analyze experimental data. The develop-ment of this program has led to a better understanding of the actual experiment, both as to experimental requirements and the results that are obtainable for the desired polarization distribution. The authors present the requirements on the sample cell, the effect of finite light pulses, and the optimum time sampling. They also show what the best possible result can be for the spatial distribution of polarization and how close one can come to it. Both actual and calculated data will be presented to illustrate their results.

Understanding Materials Reliability - The Mechanisms of Fracture.

Final rept.,
R. M. Thomson. 1980, 8p
Pub. in DARPA/AFML (Defense Advanced Research
Projects Agency/Air Force Materials Lab.) Review of Progress in Quantitative Nondestructive Evaluation, La Jolla, CA., July 8-13, 1979, p159-166 1980.

Keywords: *Fractures(Materials), Fracture properties, Brittleness, Fatigue(Materials), Ductility, Plastic properties, *Fracture(Mechanics), Nondestructive evalua-

For the benefit of the NDE community, a personal view will be given of the current status of our understanding of materials fracture. The discussion will include a gen-eral description of the physical and chemical processes which occur when a solid under load possesses a crack. A physical picture is presented of the role of plasticity. The basic question of ductile vs brittle response of the solid is addressed and recent ideas and progress is reviewed. Time dependence, and its manifestation in materials fatigue are briefly described. The implications for NDE are on two levels: (1) new insight generated by fundamental advances in the science of materials reliability will lead to new NDE tools; and (2) NDE techniques can and should be applied to further the fundamental understanding of reliability.

PB86-128154 Not available NTIS National Bureau of Standards (NEL), Gaithersburg, MD. Semiconductor Materials and Processes Div Band-Gap Narrowing in the Space-Charge Region of Heavily Doped Silicon Diodes.

Final rept.,

J. R. Lowney. 1985, 5p Pub. in Solid-State Electronics 28, n1/2 p187-191

Keywords: *Energy gap, *Silicon, Semiconductor diodes, Space charge, Semiconductor doping, Reprints, Density of states.

The densities of states of the valence and conduction bands have been calculated in the space-charge region of a heavily doped linearly graded p-n junction silicon diode. Both the donor and acceptor densities were chosen to be equal to 6.2 x 10 to the 18th power/ cc. The results showed the emergence of band tails which penetrated deeply into the energy gap and accounted for the band-gap narrowing observed in such a diode by analysis of capacitance vs voltage measurements of the built-in voltage.

Energy and Material Dependence of the inelastic Mean Free Path of Low-Energy Electrons In Solids.

Final rept., C. J. Powell. 1985, 5p Pub. in Jnl. of Vacuum Science and Technology A3, n3 p1338-1342 May/Jun 85.

Keywords: *Electron scattering, *Mean free path, Carbon, Magnesium, Aluminum, Aluminum oxide, Copper, Silver, Gold, Bismuth, Inelastic scattering, Reprints, EV range 100-1000, KeV range 01-10, Energy dependence.

Calculations have been made of the inelastic mean free paths (IMFP's) of 100-2000-eV electrons in C, Mg, Al, Al2O3, Cu, Ag, Au, and Bi. These calculations have been based on experimental optical data and on theory. The optical data gives the dependence of the differential inelastic scattering cross section at zero momentum transfer on electron energy loss; the data used here satisfy optical sum rules closely. Theory is needed to specify the dependence of the differential inelastic scattering cross section on momentum transfer; results for free-electron-like solids were assumed to be applicable to the present materials. The calculated IMFP's show significant deviations from the dependencies on electron energy and material expected from the formulas of Seah and Dench, Szajman et al., and Ashley.

Effect of Wall and Room Surfaces on the Rates of

Heat, Smoke, and Carbon Monoxide Production in a Park Lodging Bedroom Fire, B. T. Lee. Feb 85, 57p NBSIR-85/2998 Sponsored by National Park Service, Washington, DC.

Keywords: *Buildings, *Furnishings, *Fire tests, *Heat flux, Flashover, Burning rate.

A furnishing arrangement representative of those in U.S. Park Service lodging facilities was evaluated for its open burn (free burn) characteristics. The arrange-

ment consisted of a double bed with a wood head-board and one wood night table. The proximity of a wall and the effect of a room on the combustion of the same arrangement were examined. Wall finish materials were gypsum board and plywood. The presence or combustibility of an adjacent wall did not have a significant effect on the burning behavior of the furnishing arrangement. Nor did the effect of a room enclosure for the first few minutes subsequent to ignition. However, after this initial time interval, the effect of a room, er, after this initial time interval, the effect of a room, lined with gypsum board finish, on the burning furnishings was pronounced, with flashover occurring as early as 233 s with heat release rates of over 2 MW. This compared with a peak rate of 1.2 MW for the open burn. Wood paneling in the room increased the peak rate to 7 MW. Mass flow of hot gases, smoke, and carbon monoxide from the room fires were measured. The use of a sprinkler or automatic door closing device activated by a smoke detector was shown to prevent room flashover.

Experimental Study of the Burning of Pure and Fire Retarded Celiulose. Doctoral thesis,

S. S. Tewari. Jan 85, 104p NBS/GCR-85/485 Grant NB83-NADA-4017

Keywords: *Cellulose, *Burning rate, *Fire resistant coatings, *Flammability testing, *Cellular materials, Combustion, Sodium hydroxide, Sodium carbonates, Samples, Pyrolysis, Wood, Surface temperature, Theses, Experimental design, Char, Oxygen, Concentration(Composition).

The burning of charring materials is studied using samples prepared from pure cellulose and the cellulose which has been fire retarded by the addition of Sodium Hydroxide and Sodium Carbonate. The samples which are hemispherically nosed cylinders, are burned in a vertical orientation in a variable oxygen/nitrogen mixture at atmospheric pressure. Ambient oxygen contration has a stronger effect on the change in burncentration has a stronger effect on the change in burn-ing rate and surface temperature than a proportional change in the retardant concentration. This dominant effect of oxygen concentration is also evident in a significant increase in the amount of retardant needed to cause extinction (both stagnation point and flaming) as the ambient oxygen concentration is increased. At sufficiently high oxygen concentration no extinction is found for the maximum retardant concentration used in this study. A practical consequence of these findings is the need to exercise proper caution in using these retardants in cellulosic products in oxygen rich environments.

PROPULSION AND FUELS—Field 21

Combustion and Ignition—Group 21B

Pub. in Proceedings of International Conference on MHD Electrical Power Generation (7th), Cambridge, MA., June 16-20, 1980, v1 p212-219.

Keywords: *Mathematical models, *Slags, *Magneto-hydrodynamics, *Combustion, *Melts, Experimental design, Potassium carbonates, Oxidation, *Quasiche-mistry, *Seed-slag interactions, Phase equilibrium, Aluminum potassium silicates.

Experimental data illustrating KAISiO4/melt interaction as a function of temperature are presented for synthetic channel slags modeling MHD combustion of 'Eastern' and 'Western' coals. The phase equilibrium behavior of the two slags is markedly different. In particular, a wide area of high temperature liquid immisci-bility is found in the iron rich 'Eastern' slag. However the quasichemical model, by choice of appropriate parameters, can be used to fit the two-liquid data for the 'Eastern' slag. The quasichemical model suggests a sensitive relation between oxidation state and melt phase equilibrium behavior. The need for quantitative data on the effect of Fe(+3) on melt polymerization is discussed.

H. G. Semerjian, and J. E. Dove. 1981, 6p Sponsored by Combustion Inst., Bordeaux (France). France Section.

Pub. in Proceedings of Int. Specialists Meeting of the Combustion Institute (1st), Bordeaux, France, July 20-25, 1981, p455-460.

Keywords: *Detonation waves, *Boundary layers, *Combustion, *Reaction kinetics, Pressure, Mathematical models.

Pressure and composition limits, and velocity deficits have been calculated for confined hydrogen-oxygen detonations, and the effect of initial pressure, mixture composition and tube diameter on detonability limits has been investigated. A quasi-one-dimensional Zeldovich-von-Neumann-Doring model is used to represent the reaction zone, and the effect of the viscous boundary layer along the wall is accounted for using a negative displacement thickness. The model predicts all the experimentally observed features of detonation waves; (a) all confined detonation waves travel at a velocity somewhat lower than the C-J velocity, and the velocity deficit is dependent on pressure, gas composition and tube diameter; (b) detonability limits exist and again depend on pressure, composition and tube diameter. Effect of the chemical reaction scheme and multidimensional effects are also discussed.

Calculations of Three Dimensional Buoyant

Piumes in Enclosures.

H. R. Baum, and R. G. Rehm. 1984, 23p Pub. in Jnl. of Combustion Science and Technology 40, n1-4 p55-77 1984.

Keywords: *Plumes, *Combustion, Enclosures, Convection, Fires, Mathematical models, Aerosols, Fluid flow. Eddies, Reprints.

A computational model of the three dimensional buovant convection and aerosol dynamics induced by a weak volumetric source of heat and mass is presented. The hydrodynamics is directly based on the time dependent inviscid Boussinesq equations. No turbulence model or other empirical parameters are introduced. The use of Lagrangian particle tracking together with an exact solution of the Smoluchowski equation allows prediction of smoke aerosol transport and coagulation. The combined calculations represent predictions involving five independent variables. Flow features from three different configurations are illustrated with both Eulerian and Lagrangian displays of information. Sample aerosol coagulation results are compared with data from a wood fire. The computer resources required are discussed and an assessment of the current feasibility of large-eddy simulations in fire research is made.

Workshop on Flame Radiation and Soot. Proceedings: Ad Hoc Mathematical Fire Modeling Working Group.

R. S. Levine. Feb 85, 18p

Pub. in Jnl. of Fire Technology 21, n1 p41-58 Feb 85.

Keywords: *Flame propagation, *Fire extinguishing agents, Soot, Heat transfer, Combustion, Fires, Reprints, Fire models.

From the several research projects on extinguishment, that there are two important extinguishment mechanisms, and both of them can be incorporated into the models: Method 1 requires enough extinguishing agent so that its heat of vaporization is of the order of the heat stored in the ceiling layer plus the thermal output of the fire. It is possible that the stirring caused by a sprinkler in a small room will rapidly carry vaporized extinguishing agent into the lower layer. Method 2 requires only a few percent of the amount of extinguishing agent in method 1, provided it can be efficiently delivered to the fuel surface.

PB85-203487 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Smoke Measurements: An Assessment of Correlations between Laboratory and Full-Scale Experiments.

Final rept..

J. G. Quintiere. 1982, 16p

Pub. in Fire and Materials 6, n3-4, p145-160 Sep-Dec

Keywords: *Smoke, *Fires, Measurement, Correlations, Tests, Light transmission, Visual perception, Visibility, Equations, Reprints.

An extensive review is presented demonstrating the nature of comparison between full-scale fire smoke data and test method results for materials. These correlations are presented in terms of consistent parameters established through a development of the governing equations for smoke concentration and light attenuation. Visibility data pertaining to light transmission through smoke is presented. Recommendations are made for further research to establish a sounder basis for correlations, and a practical strategy is suggested for proceeding in the present.

Wall Flames and implications for Upward Flame Spread.

Final rept.

J. Quintiere, M. Harkleroad, and Y. Hasemi. 1985,

Pub. in Proceedings of AIAA (American Institute of Aeronautics and Astronautics) Aerospace Sciences Meeting (23rd), Reno, Nevada, January 14-17, 1985, AIAA-85-0456, 16p 1985.

Keywords: *Flame propagation, Polyurethane resins, Fires, Aircraft, Foam, Combustion, Heat transfer, Polymethyl methacrylate, Particle boards, Wool, Nylon, Flammability, *Flame spread tests.

The study marks the second phase of a project aimed at developing a predictive and quantitative measurement strategy for flame spread on materials. It deals with the heat transfer processes important to the inception of upward flame spread. In the study, six mateception of upward flame spread. In the study, six materials have been consistently used throughout. They included: polymethymethacrylate (PMMA); Douglas fir particle board; low density rigid polyurethane foam (GM-31); flexible polyurethane foam; wool/nylon carpet and an aircraft interior panel. Vertical sections of the materials, nominaly 28 x 28 cm were irradiated by infrared heaters and burned. Flame height and the heat transfer to a cool (60 degrees C) vertical conner. heat transfer to a cool (60 degrees C) vertical copper plate were dynamically recorded. The results are analyzed in terms of the flame height and the energy release rate of the wall fire.

tions, Buoyancy, Computation, Fires, Stratification, Stability, Reprints.

Finite difference approximations to the set of partial differential equations governing internal waves are investigated. Analytical solutions describing waves in an enclosure in two and three dimensions are obtained. The schemes considered are second order accurate in space and include first order explicit and second order time differencing. The solutions are used to investigate the temporal stability and long term accuracy of all schemes. The mode frequencies and wave shapes obtained from each difference scheme are compared with the solutions both to the corresponding partial differential equations and to equations obtained by dis-cretizing in space only. The solutions have been used by the authors to help develop a finite difference code designed to compute non-linear buoyancy-driven flows of the type that arise in enclosure fires.

Perspective on Compartment Fire Growth.

Final rept.,

J. Quintiere. 1984, 44p

Pub. in Combustion Science and Technology 39, n1-6 p11-54 1984.

Keywords: *Fires, Flame propagation, Combustion, Heat transfer, Fluid mechanics, Reprints, *Compartment fires, *Fire growth.

A review was made of research related to fire growth in compartments. Mention is made of the zone and field model approaches that have been used to describe many aspects of compartment developing fires. Primarily the review is organized by phenomena associated with compartment fires. These include fluid mechanic, heat transfer and combustion processes. Each phenomenon is discussed and work is presented to illustrate predictive techniques. Limitations and deficiencies in the authors understanding are discussed. A previously unavailable analysis of radiative transfer in an enclosure for a two layer participating gas is also presented.

Pub. in Combustion and Flame 51, n3 p357-364 1983.

Keywords: *Molecular structure, *Aromatic polycyclic hydrocarbons, *Ions, *Reaction kinetics, *Flammability testing, *Thermodynamics, High temperature tests, Experimental design, Sampling, Stability, Reprints.

The aim of this work is to determine structures of a series of major hydrocarbon ions found in the burnt gas region of fuel-rich acetylene flames. Both kinetic and thermodynamic arguments are presented to first show that protonated and ionized benzenoid polynuclear aromatics are more stable than any of their nonbenzenoid structural isomers, and then that the ionized forms are expected to predominate in low pressure flames above about 1600 K. The fact that only the protonated forms are detected in flame-sampling experiments is attributed to rapid H-atom addition reactions in a region cooled by the sampling probe. This work demonstrates the utility of thermokinetic estimation methods for determining the most stable ion structures, correcting for sampling effects and finding ion reaction pathways.

Soot Particle Measurements in Diffusion Flames. Final rept.

R. J. Santoro, H. G. Semerjian, and R. A. Dobbins. 1983, 16p Pub. in Combustion and Flame 51, n2 p203-218 1983.

Keywords: *Soot, *Particle size, *Combustion, *Flames, Chemical reactions, Fluorescence, Oxidation, Light scattering, Ethane, Diffusion, Reprints.

The formation and growth of soot particles in a co-annular diffusion flame has been studied using a laser extinction/scattering technique for particle size measurement. Measurements have been obtained with ethene as the fuel for various fuel flow rates. The results reveal that the flame can be broadly divided into two regions. One characterized as a region of growth where soot formation processes dominate and a second in which oxidation processes are dominant. Measurement show that soot is first observed to form low in the flame in an annular region inside the main reaction zone. At higher locations this annular region widens until the entire flame is observed to contain particles. Measurements of depolarized scattered light and fluorescence have also been obtained and indicate a correlation between the species responsible for these processes and soot growth. Results indicate that the particle formation region obeys closely the Burke Schumman analysis for flow rate dependence, where as substantial differences occur in the oxidation region. Measurements have also been obtained using ethane as the fuel as an intial comparison of fuel structure effects.

Bench-Scale Methods for Prediction of Full-Scale

Fire Behavior of Furnishings and Wall Linings.

Final rept.,

V. Babrauskas. 1984, 26p
Pub. in SFPE (Society of Fire Protection Engineers)
Technology Report 84-10, p1-25 1984.

Keywords: *Furniture, *Walls, *Linings, Flammability, Measurement, Flashover, Fires, Heat transfer, Flame propagation, Test equipment, Ignition, Fire resistant materials, Reprints, *Fire tests.

Fire development in a room involves three basic phenomena: ignition, flame spread, and heat release rate. Of these, the heat release rate tends to be more important than the other two in most common fire scenarios. Heat release rates are difficult to determine accurately by direct, sensible-enthalpy measurements. It has recently been used in two test apparatuses developed at the National Bureau of Standards: a furniture calorimeter for conducting full-scale tests, and a cone calorimeter for conducting bench-scale tests. Bench-scale data have now been gathered on upholstered furniture and on wall-lining materials, with corresponding full-scale data available from furniture calorimeter or room fire measurements. In both cases, bench-scale measurements allowed the successful predic-tion of full-scale data for variables of interest, which were the peak rate of heat release and the time to flashover.

PB85-224483 PC A04/MF A01 National Bureau of Standards (NEL), Gaithersburg, MD. Center for Fire Research. Evaluation and Refinement of Test Methods Used for Measuring Fire Hazards of Shipboard Hull Insu-

lations and Mattress Insert Foams,

B. T. Lee. May 85, 57p NBSIR-85/3148 Sponsored by Naval Sea Systems Command, Washington, DC.

Keywords: *Fire tests, *Construction materials, *Insulation, *Ship hulls, *Bedding equipment, Smoke, Carbon monoxide, Foam, Heat transmission, Burning rate, Experimental design, Fire hazards, Laboratory equipment, Polyphosphazene.

A quarter-scale room fire test developed at NBS was used to help develop a preliminary approach for fire hazard assessment of wall-ceiling combinations of hull insulation materials. The quarter-scale test has been refined to include measurement of heat release rate, smoke, and carbon monoxide. In addition, polyphosphazene foam insulations were evaluated with this test. The quarter-scale test was also modified for test-ing mattress insert materials, including polyphospha-zene foam. Existing tests, used for measuring total heat, rate of heat release, and smoke production, were also used to evaluate these materials. Heat release rate measurements with the Ohio State University apparatus and smoke measurements with the ASTM E 662 test, modified for horizontal placement of specimens, gave adequate evaluation of the fire hazards of mattress insert materials.

PROPULSION AND FUELS—Field 21

Combustion and Ignition—Group 21B

Products of Wood Gasification,

T. J. Ohlemiller, T. Kashiwagi, and K. Werner. Apr 85, 115p NBSIR-85/3127

Sponsored by Department of Energy, Washington, DC.

Keywords: *Stoves, *Gasification, *Air pollution, *Py-Wood, Combustion products, Gas chromatogrolysis, *Wood, Combustion products, Gas chromatography, Chromatographic analysis, Heating equipment, Residential buildings, Gas analysis, Thermal degradation, *Wood burning appliances, *Air pollution detection, Path of pollutants, Solid wastes.

The increasing problem of pollution from wood-burning stoves has prompted this examination of the basic gasification process of wood under conditions encompassing those in stoves. Other variables were sample grain orientation, thickness, exposure time and moisture content. Sample weight was followed in some tests; sample temperature (5 thermocouples) was followed in others. In all tests, all evolved products were either monitored (H2O, CO, CO2, total hydrocarbons not condensible at -40C) or trapped and analyzed (condensible organic species) by gas chromatography and mass spectroscopy. Chromatographic fingerprints of the organic condensate indicated that its composition does not vary a great deal for the conditions examined here. The fingerprints from the radiative heating tests bear a strong resemblance to those of the smoke condensate from a wood stove.

Polyesters: A Review of the Literature on Products of Combustion and Toxicity,
E. Braun, and B. C. Levin. Jan 85, 72p NBSIR-85/

Sponsored by Consumer Product Safety Commission, Washington, DC.

Keywords: *Polyester resins, *Combustion products, *Toxicity, *Pyrolysis, *Fire tests, *Thermoplastics, Reviews, Textiles, Construction materials, Fire resistant materials, Air pollution, Plastics, Additives, *Indoor air pollution, Consumer products.

The available literature was reviewed to determine the nature and extent of information available on the thermal decomposition products and the toxicity of the combustion products of polyester materials used in consumer applications such as textiles and construction. The literature review is limited to the publications printed in English through June, 1984. The thermal decomposition products of polyesters are a function of temperature and oxygen content of the atmosphere. In general, as the temperature increases, the quantity of heavier hydrocarbons decreases and the production of CO and CO2 increases. The presence of flame retarded additives, such as bromine and chlorine containing compounds, product halogenated combustion prod ucts. The use of phosphorus and bromine together in the same flame retardant finish increases the concentration of low molecular weight compounds. Thirteen different test protocols have been used to evaluate the toxicity of various types of polyester. In general, the results from large-scale tests are ambiguous because of the presence of other materials in addition to the polyesters.

Experimental Study of Environment and Heat Transfer in a Room Fire. Mixing in Doorway Flows and Entrainment in Fire Plumes.

Rept. for 1982-84, E. E. Zukoski, T. Kubota, and C. S. Lim. May 85, 175p NBS/GCR-85/493

Grant NB82-NADA-3033

Keywords: *Fire tests, *Heat transfer, *Building fires, *Combustion products, Plumes, Experimental design, Doors, Ceilings(Architecture), Gravity, Experimental design, Concentration(Composition), Mixing, Mathematical models. Gas flow.

The report contains a description of an ongoing study of gravity currents for conditions which match those the authors expect to find in unwanted fires in buildings. A review is made of the pertinent literature and a description is given of the flow regimes which can exist for ideal gravity currents when viscous effects, heat transfer, and mixing are ignored. The influence of boundary conditions fixed by the method used to withdraw the fluid displaced by the current is given. Algebraic equations for the thickness of the current and the of the head are derived for these ideal flows. The influences of viscosity and mixing are briefly dis-cussed and the status of salt water and gas modeling experiments is given.

Investigation of Turbulent Fires on Vertical Walls:
Wall Plume Structure,

M. C. Lai, S. M. Jeng, and G. M. Faeth. Feb 85, 74p NBS/GCR-85/486 Grant NB81-NADA-2044

Keywords: *Fires, Air flow, Turbulence, Walls, Flow visualization, Measurement, Combustion, Flames, *Wall flow, Buoyant plume, Fire plume.

A theoretical and experimental study designed to improve understanding of buoyant fires is described. The main objective is to study turbulent fires along surfaces, however, several noncombusting and combusting flow configurations, which offer opportunities to highlight aspects of this problem under simpler circumstances, were considered during the work, e.g., buoyant noncombusting wall plumes, for studies of flow properties; and turbulent round flames, for studies of flame radiation properties. Various phases of the study are reported separately; this report considers results for noncombusting wall plumes.

Pyrolysis of Cellulose, an Introduction to the Liter-

T. Hirata. Aug 85, 36p NBSIR-85/3218

Keywords: *Cellulose, *Pyrolysis, *Bibliographies, *Fire resistant materials, *Biomass, Reaction kinetics, Molecular structure, Mathematical models, Polymerization, Fine structure, Chemical properties, Wood, Anaerobic processes.

Topics related to cellulose pyrolysis are briefly surveyed under several headings. The principal aim is to give the reader some grasp of the issues involved and provide a guide to the relevant literature; 171 references are cited. The headings include: Changes in cellulose fine structure with heating, chemical changes during pyrolytic weight loss and kinetic modeling of pyrolysis. Principal emphasis is on the last area; it is concluded that no current model adequately predicts both the observed changes in degree of polymerization and the weight loss during heating.

Scaling Parameters of Flashover. Final rept.,

A. M. Kanury. Jul 85, 50p NBS/GCR-85/497 Contract NB83-NADA-4018

Sponsored by National Bureau of Standards (NEL), Gaithersburg, MD. Center for Fire Research.

Keywords: *Flashover, *Fires, Combustion, Walls, Flames, Flame propagation, Scaling, Room fires, Fire growth, Compartment fires.

The topic of concern in this project is room fire growth to flashover. The objective is to develop scaling rules for flashover time and to apply these rules to certain existing room fire flashover test data. In this report, the scaling rules are deduced from first principles of energy and mass conservation describing the physics of fire growth. The nondimensional scaling parameters are all obtained in the desirable terms of fundamental combustion properties. Collection, estimation, and deduction of these fundamental properties for the materials involved in the concerned fire tests has to be done in the immediate future to evaluate the scaling parameters for correlating the test data.

Scale Effects on Fire Properties of Materials, A. Tewarson. Feb 85, 52p NBS/GCR-85/488 Grant NB83-NADA-4021

Sponsored by National Bureau of Standards (NEL), Gaithersburg, MD. Center for Fire Research.

Keywords: *Materials tests, *Flammability testing, Experimental design, Plastics, Wood, Pyrolysis, Paper, Cellulose, Carbon monoxide, Furniture, *Indoor air pollution, *Toxic substances.

The objective of this study was to examine the scale effects on fire properties of materials over a range of fire sizes from 10 kW to 5000 kW-scale fires. Experiments were performed for cellulosic materials, alone and in combination with synthetic materials in box-like and crib-like configurations. Experimental results for a pool-like material configuration from our previous study and for enclosure fires of wood cribs reported in the literature were also used. For turbulent fires of various sizes with various geometrical material configurations, a chemical similarity was found for each material for each specified value of the ventilation parameter. The decomposition mode in the combustion of the cellulosic material was found to be very important for CO and particulates, but less important for CO2 and heat.

Two Approaches to the Analysis of Actual Fires.

Final rept.,

J. A. Rockett. 1985, 12p Pub. in Fire Safety Jnl. 9, p17-28 1985.

Keywords: *Fire tests, Reprints, Numerical solution.

Two calculations are described. One used only simple algebra to show the rate of development of a critical aspect of a fire. The other used one of our most elaborate computer based schemes to extend the results of full-scale fire tests to additional, important situations. Both provided useful results. The significance of this is that it is not the complexity of a calculation that is important but its relevance to the problem at hand.

Laser Tomography for Diagnostics in Reacting

Final rept..

H. G. Semerjian, S. R. Ray, and R. J. Santoro. 1982.

Pub. in Proceedings of AIAA/ASME Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference (3rd), St. Louis, MO., June 7-11, 1982, p1-9.

Keywords: *Absorption spectra, *Flames, *Fuel air ratio, Methane, Concentration(Composition), Temperature, *Laser spectroscopy, *Tomography, Hydroxyl radical.

The laser tomography technique has been developed for simultaneous measurement of temperature and species concentration in reacting flows. Laser tomography is a multiangular absorption technique which involves making absorption measurements along M par-allel rays at N equally spaced angles. These MxN measurements are then used to reconstruct the spatially resolved two-dimensional property field. Results of a simulation study are presented for a methane/air diffusion flame. Two techniques, a two-line ratio and a spectral line profile technique, have been used to obtain the temperature and OH concentration and temperature fields can be reconstructed with a resolu-tion of better than 1%. Sensitivity of the technique to the choice of particular spectral lines, and the effect of large temperature gradients are also discussed.

A review of the literature was undertaken to ascertain the current knowledge of the nature of the thermal decomposition products generated from ABS and the toxicity of these evolved products into. The literature review encompasses English language publications available through June 1984. This literature surveyed showed that the principal ABS thermooxidative degradation products of toxicologic importance are carbon monoxide and hydrogen cyanide. The experimental generation of these and other volatile products is principally dependent upon the combustion conditions and the formulation of the plastic. The toxicity of ABS thermal degradation products has been evaluated by five methods. The toxicity of ABS degradation products was found to be comparable to the toxicity of the thermal decomposition products of other common polymeric materials.

Program for the Development of a Benchmark Compartment Fire Model Computer Code, L. Y. Cooper, J. A. Rockett, H. E. Mitler, and D. W. Stroup. Oct 85, 30p NBSIR-85/3252

Keywords: *Fires, *Fire safety, Fire tests, *Compartment fires, Fire models, Fire studies, Computer codes.

With a variety of objectives in mind, many different compartment fire model computer codes have been developed within the fire safety/research community. Yet, no one of these can be described as being a 'benchmark' model in the sense that it is reliable enough to be accepted as a standard of reference for the performance of design-oriented fire models. It is the major objective of the Compartment Fire Modeling Research (CFMR) Group in the Fire Safety Technology Division of the Center for Fire Research (CFR) to develop such a Benchmark Compartment Fire Model (BCFM) computer code. This paper describes the characteristics of this BCFM, and outlines the program which will lead to its development.

501,653 PB86-166659 PC A03/MF A01 National Bureau of Standards (NEL), Gaithersburg, MD. Center for Fire Research. Forced Smolder Propagation and the Transition to Flaming In Cellulosic Insulation.

Final rept. T. J. Ohlemiller. Oct 85, 50p NBSIR-85/3212 Sponsored by Department of Energy, Washington, DC.

Keywords: *Insulation, *Combustion, Cellulose, Fire resistant coatings, Flame propagation, Flammability testing, Smoldering.

It is well known that a smoldering fuel responds to an increased oxygen supply by becoming faster and hotter until, eventually, flames erupt. This sequence is examined quantitatively for thick horizontal layers of a permeable fuel, i.e., cellulosic insulation. Two configurations are possible, forward and reverse smolder; both are investigated experimentally. The influence of combustion retardants is also investigated; these include boric acid, a smolder retardant; and borax, a flaming retardant. Both prevent the transition to flaming in the absence of adjacent flammable material but are less effective in its presence. The overall response of these various fuel mixtures and configurations suggests that both kinetics and oxygen supply rate (not the latter alone) play substantial roles in dictating smolder response to an air flow.

Annual rept. 25 May 84-25 May 85, L. P. Cook, and E. R. Plante. Dec 85, 107p NBSIR-85/3282

Contracts N00014-83-F-0117, N00014-84-F-0204 Sponsored by Office of Naval Research, Arlington, VA.

Keywords: *Liquid metals, *Combustion, Reaction kinetics, Enthalpy, Oxidation, Lithium, Aluminum, Boron, Beryllium, Magnesium, Nitrogen fluorides.

A survey of eight alternative liquid metal stored chemical energy reactions has been made for purposes of

comparison with the lithium-aluminum/water, lithium/ sulfur hexafluoride, and other reaction schemes. The objective of the study was to survey the potential of these eight reactions as alternate stored chemical energy systems and to develop priorities for future study. Experimental data on the products of reaction and kinetics of reaction are presented for: (Li/H2O; H2/O2), (Li/H2O; NaO2/H2O; H2/O2), (MgAI/H2O; H2/O2), and (LiAI/CIO3F). These data have been collected with the control of the contro lected using thermogravimetry and Knudsen effusion mass spectrometry, with x-ray diffraction analysis of experimental products. Among other results, the data show that the aluminum component of the fuels is relatively inert to oxidation up to 650 degrees C. Above this temperature, materials limitations have hampered the collection of experimental data. Thermodynamic analysis has been used to extend the data on each of the eight reaction schemes, and to predict the chemical reaction which best represents the complete oxidation of each fuel by the indicated oxidant at 1100 K. Enthalpies have been calculated for each fuel/oxidant com-bination. Safety considerations are also discussed for

Preliminary Applyeds of Chickens Preliminary Analysis of Oll-Silck Combustion.

I. S. Wichman. Nov 85, 20p NBSIR-85/3266 Sponsored by Minerals Management Service, Reston,

Keywords: *Combustion, Ignition, Oil spills, Burning rate, *Oil slicks.

The preliminary study of oil-slick combustion contains a literature review, a formulation of a physical model of oil-slick burning, and some suggested experiments. The theoretical model is divided into three stages: (1) an ignition and acceleratory-growth stage; (2) a slow-down regime, in which finite slick thickness effects become important; and (3) an extinction cycle. The proposed experiments emphasize the use of the Fire Research Laboratory, located on the NBS grounds.

MARKET: A Model for Anlayzing the Production, Transmission, and Distribution of Natural Gas.
Technical note (Final),
C. Witzgall, and P. B. Saunders. Apr 85, 168p NBS/

TN-1209

Also available from Supt. of Docs as SN003-003-02644-1. Sponsored by Department of Energy, Washington, DC.

Keywords: *Natural gas, *Gas industry, Gas production, Marketing, Gas distribution, Policies, Prices,

Supply(Economics), Demand(Economics), Regulations, Reserves, Mathematical models.

This report describes the MARKET submodel, one of three that combine to form the Gas Analysis Modeling System (GAMS). GAMS was developed for use by the Energy Information Administration of the U.S. Department of Energy. It provides a tool for analyzing the regional effects on the domestic natural gas market of various policies for regulating the price of natural gas at the wellhead. MARKET is concerned with the production of gas reserves and the transmission and dis-tribution of gas to consumers. It solves a network equilibration problem to arrive at estimates of produc-tion quantities and prices.

Application of Perdeuterated Polycyclic Aromatic Hydrocarbons (PAH) as internal Standards for the Liquid Chromatographic Determination of PAH in a Petroleum Crude Oli and Other Complex Mixtures. Final rept.

W. F. Kline, S. A. Wise, and W. E. May. 1985, 15p Sponsored by Department of Energy, Washington, DC. Office of Health and Environmental Research. Pub. in Jnl. of Liquid Chromatography 8, n2 p223-237 1985.

Keywords: *Aromatic polycyclic hydrocarbons, *Chromatographical analysis, *Standards, Chemical analysis, Petroleum products, Crude oil, Reprints, *Liquid chromatography, *Standard reference materials, Air pollution detection.

A sequential liquid chromatographic (LC) procedure for the determination of polycyclic aromatic hydrocarbons (PAH) in a petroleum crude oil and other complex mix-tures is described. The procedure includes normal-phase LC on an animosilane column to isolate fractions containing isomeric PAH and reversed-phase LC on a polymenc C18 column to separate the individual PAH isomers. Appropriate perdeuterated PAH are added to the sample so that each isomeric fraction will contain one internal standard. The perdeuterated PAH are excellent internal standards for this sequential LC procedure. Perdeuterated PAH have normal-phase and reversed-phase LC retention characteristics similar to those of the parent PAH. In the normal-phase LC separation, the perdeuterated PAH elute in the same fraction as the parent PAH. In the reversed-phase LC separation, the perdeuterated PAH elute first and are generally resolved from the parent PAH. The optimized spectrofluorometric detection of each PAH analyte is accomplished by programming appropriate sets of excitation and emission wavelengths to correspond with the elution time of each analyte on the polymeric C18 column. The analytical results obtained from this procedure for the analysis of a shale oil sample (Standard Reference Material (SRM) 1580) and a petroleum crude oil (SRM 1582) are compared to values obtained by gas chromatography-mass spectrometry.

Speciation of inorganic Arsenic and Organoarsenic Compounds in Fossii Fuei Precursors and Products. Final rept.

E. Brinckman, C. S. Weiss, and R. H. Fish. 1983,

Sponsored by American Chemical Society, Washing-

Pub. in Proceedings of the American Chemical Society Meeting Chemical Congress of the North American Continent, Las Vegas, Nevada, August 24, 1980, Chapter 13 in Chemical and Geochemical Aspects of Fossil Energy Extraction, p197-214 1983.

Keywords: *Arsenic inorganic compounds, *Arsenic organic compounds, *Fossil fuels, *Trace elements, Metal containing organic compounds, Chemical analysis, Atomic spectroscopy, Absorption spectra, Shale oil, Oil shale, Chemical reactions, Stability, Catalysts, Chemical reaction mechanisms.

The molecular forms of trace metal(loid)s in fossil deposits are complex, probably consisting of varying proportions of inorganic, metallo-organic, and true organometallic chemical species residing in unspecified sites within the carbonaceous matrix. Modern industrial processing of fossil materials requires a refined understanding of the original form of the selected ele-

ment, its relationship to other matrix elements, and the pathways by which processing can alter the elements original form. From the standpoint of its environmental impact or its ability to poison catalysts used to upgrade crude oils, arsenic is a key element for which an urgent need exists to determine its chemical form(s) and transformations during fossil fuel processing. The underlying analytical requirements for the speciation of trace elements in fossil materials will be discussed along with a review of the present status of trace ele-ment speciation in these materials. Recent work performed in our laboratories on the speciation of arsenic compounds in shale oil, oil shale retort waters and oil shale kerogen is presented in this context.

501,660 PB86-102258 PC A06/MF A01 National Bureau of Standards (NEL), Gaithersburg, MD. Center for Fire Research. Development of a Model for the Heat Release Rate of Wood - A Status Report, W. J. Parker. Jul 85, 107p NBSIR-85/3163 Contract EMW-E-1239

Keywords: *Wood, *Heats of combustion, *Mathematical models, Pyrolysis, Moisture contents, Exposure, Thermal conductivity, Fuels.

The report describes the status of the development of a method for predicting the heat release rate of wood for different thicknesses, moisture contents, and exposure conditions. A computer model has been set up on a microcomputer. Experimental techniques have been devised to obtain the input data required by the model. These include (1) the thermal conductivity as a function of temperature and percent loss, (2) the kinetic constants needed to describe the mass loss rate, (3) the heat of combustion of the volatile pyrolysis products, and (4) the contraction factors due to charring. Sufficient data on these parameters were taken to exercise the model. Heat release rates and effective heats of combustion were measured as a function of external radiant flux on 12.5 mm thick dry vertical specimens of Douglas fir particle board. The calculated and measured peak heat release rate curves are similar in shape and amplitude but differ significantly in time scale. This may be due to the lack of thermal conductivity data on the char in the high temperature range. There is very good agreement between the cal-culated and measured effective heats of combustion. The initial results with the model are promising.

Thermai Conductivity of Coal-Derived Liquids and Petroieum Fractions. Final rept.,

M. E. Baltatu, J. F. Ely, H. J. M. Hanley, M. S. Graboski, and R. A. Perkins. 1985, 8p Sponsored by Gas Research Inst., Chicago, IL., and Department of Energy, Washington, DC. Office of

Basic Energy Sciences.
Pub. in Industrial and Engineering Chemistry Process
Design and Development 24, n2 p325-332 1985.

Keywords: *Petroleum products, *Thermal conductivity, *Coal liquids, Specific heat, Experimental data, Ideal gas, Comparison, Reprints, *Pseudopotential

Thermal conductivity coefficients of coal-derived liquids and petroleum fractions are calculated by an extended corresponding states, conformal solution technique. The method requires as input pseudocritical parameters, molecular weight and acentric factor, and a pseudo-ideal gas heat capacity for each pseudocomponent or fraction. These quantities are estimated here from the mean average boiling point and specific gravity of the fractions using the techniques proposed by Riazi-Daubert, Kesler-Lee, and Winn: the relationship between the estimated conductivity and the choice of the method is noted. Predicted thermal conductivities are compared with data for three coal liquid samples measured at the Colorado School of Mines and with literature data. Agreement between prediction and experiment is generally within 10%, depending on the method used to calculate the input parameters. Some literature petroleum fractions data are also compared with the model. Again, agreement is within 10%.

Internal Friction and Dynamic Young Modulus of a Bituminous Coal.

H. M. Ledbetter, M. W. Austin, and J. E. Callanan.

1985, 7p Pub. in Proceedings of the American Chemical Society On Physical Methods for Fuel Division Symposium on Physical Methods for Fossil Fuels, Miami Beach, FL., April 28, 1985, American Chemical Society, Division of Fuel Chemistry 30, n1 p127-133 1985.

Keywords: *Bituminous coal, *Internal friction, *Modulus of elasticity, Physical properties, Polymers, Specific heat, Thermal expansion, Debye temperature.

Internal friction provides a well-known probe of defects in solids. The companion property--elastic modulus--provides valuable material characterization. This modulus relates in turn to a wide variety of other solid-state physical properties: specific heat, thermal expansivity, Debye temperature. Here the authors report preliminary measurements of these two physical properties between 295 and 76 K. Specimens consisted of square-cross-section rods approximately 5 mm by 30 mm. Apparatus consisted of a Marx oscillator at frequencies near 50 kHz. They found two internal-friction peaks, one centered near 220 K and one below 76 K. The preliminary results support the view that coal exhibits strong polymeric character.

Evaluation of Data on Higher Heating Values Determined during ASTM (American Society for Testing and Materials) Round Robin Testing of RDF-3 (Refuse-Derived-Fuel). Final rept..

E. S. Domalski, and S. Abramowitz. Nov 80, 15p Sponsored by Department of Energy, Washington, DC. Energy from Municipal Waste Div.

Pub. in Proceedings of Mineral Waste Utilization Symposium, Mineral and Mineral Process Waste - Urban Solid Waste - Industrial Waste Recovery - Scrap Metal Recovery, Chicago, IL., October 20-21, 1980, p69-83.

Keywords: *Standards, *Calorific value, Substitutes, Fuels, Chemical properties, Coal, Comparison, Tables(Data), Marketing, Statistical analysis, *Refuse derived fuels, *Round Robin tests, *Waste utilization, Resource recovery facilities.

The potential application of RDF-3 as an alternative or supplemental fuel is dependent upon its acceptance as an article of commerce. ASTM Committee E-38 on Resource Recovery and its Subcommittee on Energy E-38.01 has been actively engaged in the development of concensus standards for this purpose since April 1974. Standard procedures for the characterization of RDF-3 are being developed. These procedures are based on those ASTM methods used in coal analysis. The procedures developed will insure a meaningful purchase - sales relationship between the buyer and seller. A variety of chemical and physical test procedures were studied by as many as 12 laboratories. Currently 20 editorial draft standards have been prepared and are being studied by the committee membership. The National Bureau of Standards in cooperation with ASTM subcommittee E38.01 has undertaken a technical review of a selected group of chemical properties The property of principal interest is the higher heating value. In order to properly characterize this property, critical evaluation of methods to determine total moisture, residual moisture, and ash is also necessary. Intralab and interlab variations in these properties are discussed. A comparison of these results with those on round robin data for coal are also made. The results of this study identify the levels of precision for intralab and interlab agreement.

PB86-119351 Not available NTIS National Bureau of Standards, Gaithersburg, MD. Elimination of the Parallax in Satellite Theory. Final rept., A. Deprit. 1981, 43p Pub. in Celestial Mechanics 24, p111-153 Jun 81.

Keywords: *Orbits, *Parallax, Perturbation theory, Removal, Elimination, Reprints, *Satellite orbits, Lie transformation.

When the perturbation affecting a Keplerian motion is proportional to (r sup -n)(n = or > 3), a canonical transformation of Lie type will convert the system into one in which the perturbation is proportional to (r sup - 2). Because it removes parallactic factors, the transformation is called the elimination of the parallax. In the main problem for the theory of artificial satellites, the elimination of the parallax has been conducted by computer to order 4. The first order in the reduced system may now be integrated in closed form, thereby revealing the fundamental property of the first-order in-termediary orbits in line with Newton's Propositio XLIV. Extension beyond order 1 leads to identify a new class of intermediaries for the main problem in nodal coordinates, namely the radial intermediaries. The technique of smoothing a perturbation prior to normalizing the perturbed Keplerian system, of which the elimination of the parallax is an instance, is applied to derive the intermediaries in nodal coordinates proposed by Sterne, Garfinkel, Cid-Palacios and Aksnes, and to find the canonical diffeomorphisms which relate them to one another and to the radial intermediaries.
