WOOD POLES

CONDUCTOR LOADING NOMOGRAPH

VERTICAL, TRANSVERSE AND CONDUCTOR LOADS - LB PER LINEAR FT OF CONDUCTOR

CONNECT V AND W WITH STRAIGHT EDGE AND READ T

Chart 1A.—Conductor loading nomograph, vertical, transverse, and conductor loads—pounds per linear foot of conductor
 (Enlarged from fig. 16 of Discussion Handbook H39, NESC, part 2)

Note.—This device provides a sufficiently precise graphic method of determining "conductor loading" values, except for certain conductors when used in the light-loading district. However, in determining permissible sags and tensions in such a district, the variations found between the values obtained by this chart and values computed in accordance with rule 251, part 2, NESC (H32) are of little importance, since one of the unloaded tension limits of rule 261,F,4 will control, except for unusually long spans.

F = TOTAL CON

TICAL LOAD -

[See note on opposite side.]

BENDING MOMENT DUE TO WIND PRESSURE ON POLE

K = $2T + G$ WHERE T = CIRCUMFERENCE AT POLE TOP, IN INCHES
 AND G = CIRCUMFERENCE AT GROUND LINE, IN INCHES.

H = HEIGHT OF POLE ABOVE GROUND LINE, IN FEET.

M₁ = MOMENT AT GROUND LINE FOR HEAVY AND MEDIUM LOADING, IN POUND- FEET.

M₂ = MOMENT AT GROUND LINE FOR LIGHT LOADING, IN POUND -FEET.

LAY STRAIGHTEDGE ACROSS CHART FROM K TO H AND READ BENDING MOMENT AT M₁ OR M₂

Chart 2A.—*Bending moment due to wind pressure on pole*
