

Iowa

Wetland Management District

Final Comprehensive Conservation Plan

The mission of the U.S. Fish & Wildlife Service is working with others to conserve, protect, and enhance fish and wildlife and their habitats for the continuing benefit of the American people.

The mission of the National Wildlife Refuge System is to administer a national network of lands and waters for the conservation, management and, where appropriate, restoration of the fish, wildlife and plant resources and their habitats within the United States for the benefit of present and future generations of Americans.

Comprehensive Conservation Plans provide long-term guidance for management decisions; set forth goals, objectives and strategies needed to accomplish refuge purposes; and, identify the Fish and Wildlife Service's best estimate of future needs. These plans detail program planning levels that are sometimes substantially above current budget allocations and, as such, are primarily for Service strategic planning and program prioritization purposes. The plans do not constitute a commitment for staffing increases, operational and maintenance increases, or funding for future land acquisition.

Iowa Wetland Management District Final Comprehensive Conservation Plan Executive Summary

Introduction

The Final Comprehensive Conservation Plan (CCP, Plan) for the Iowa Wetland Management District (WMD, district) is now complete. A separate environmental assessment (EA) and Draft CCP documents the National Environmental Policy Act of 1969 (NEPA) process for developing the CCP. In general, scoping revealed issues that drove alternative ways of managing the district. Implementation of each of those alternative management styles (including the no action alternative) had different effects on the physical, biological, and socio-economic environment. Analysis of those effects revealed the “preferred” alternative, which constitutes the CCP. The Plan includes goals, objectives, and strategies for the district to guide overall management for the next 15 years. The document can be viewed and downloaded at <http://www.fws.gov/midwest/planning/iowawetlands/index.html>. A CD or paper copy of the Plan can be requested through:

Iowa Wetland Management District

- E-mail at r3planning@fws.gov (Please include “Iowa WMD CCP” in the subject line); or
- Mail at Union Slough NWR, Attn: Iowa WMD CCP, 1710--360th Street Titonka, Iowa, 50480; or
- Telephone at (515) 928-2523.

The Iowa WMD consists of scattered tracts of habitat (both wetland and upland grassland) known as Waterfowl Production Areas (WPAs). Currently, there are 75 WPAs in 18 counties in north-central Iowa totaling 24,712 acres in fee title primarily managed by the Iowa Department of Natural Resources (DNR). Even though district acquisition has only occurred in 18 counties to date, a larger 35-county boundary is approved. This boundary follows the historic range of the poorly drained Prairie Pothole Region (PPR) in Iowa, an area known for its waterfowl production. The district also includes 575 WPA acres and approximately 434 Farm Service Agency acres in conservation easements on private land. This plan was prepared with the intent that the strong partnership with the Iowa DNR will continue over the next 15 years.

District Vision

Waterfowl and other winged wildlife herald the richness of resilient, productive wetlands and tallgrass prairies, bringing appreciation and satisfaction to visitors, the rewards of enduring commitments across ownerships throughout the Prairie Pothole Region of Iowa.

District Goals

Wildlife: In partnership with the Iowa DNR and others, restore a natural diversity and abundance of waterfowl, migratory birds, and other native fauna within the Iowa WMD.

Habitat: In partnership with the Iowa DNR and others, conserve, restore, and expand grassland and wetland habitat managing for a natural diversity of native flora within the Iowa WMD.

People: In partnership with the Iowa DNR and others, promote understanding, appreciation, and support for the Iowa WMD as well as stewardship and understanding of the southern Prairie Pothole Region and its native ecosystems to visitors and local residents.

Public Involvement

Public Open House Meeting

Initial conversations about comprehensive planning for the district began mid-year of 2009; however, the official kick-off was in December 2011. In addition to identifying information essential to the planning process, district staff also developed a communication plan and a preliminary list of issues to be addressed in the CCP. The public scoping period began on January 30, 2012 and lasted for 30 days. The public was contacted through letters, news releases, and four open house meetings. The open houses gave the public an opportunity to discuss issues with district and Iowa DNR staff and regional planners. The public was also given 30 days to review and comment on the EA and Draft CCP document. This review period began on Monday August 19th, 2013 and was announced through postcards, news releases and two open house meetings.

Issues

Scoping produced ten issues that were addressed when developing alternative ways of managing the district:

- What species group and life cycle is the focus of district management?
- How should the district address the decrease in populations of grassland-dependent birds due to the decline of grassland habitat?
- How can the district improve/maintain upland habitat quality?

- What wetland type is the focus of district management?
- How can the district improve/maintain wetland quality?
- How can the district manage food plot use?
- How will the district address the decreasing purchasing power of existing funds?
- What are the district's priority areas for acquisition?
- How can the district promote awareness and understanding of WPAs as well as educate the public on the importance of their management?
- What public uses can the district allow that are appropriate and compatible with the U.S. Fish and Wildlife Service (FWS, Service) and National Wildlife Refuge System mission and meet the public demand for more recreational opportunities?

Implementation

The following statements will apply to the district over the next 15 years:

- The general management direction in this plan will apply to all district properties in which the Service has acquired an interest across the 35 counties.
- Existing WPAs or other district properties will be inventoried as necessary; any new techniques implemented will be monitored as necessary to allow for adaptive management; and research will be designed when and where it was needed to support and/or guide management.
- Since one of the goals of refuge/district planning is, "to provide a basis for adaptive management by monitoring progress, evaluating plan implementation, and updating refuge plans accordingly" (FWS, 2000), the adaptive management process will be utilized in the district.
- The portions of three WPAs—Jemmerson Slough (Dickinson County), Elk Creek Marsh (Worth County), and Rice Lake (Winnebago and Worth Counties)— currently closed by state regulation as waterfowl refuges will remain closed.
- Within two years of CCP approval, it will be proposed through the federal rulemaking process to implement the following regulation on the Service's fee title property within the Iowa WMD: "You may only use or possess approved nontoxic shot shells while in the field, including shot shells used for hunting wild turkey." This requirement would be in line with current regulations at 50 CFR 32.2(k).
- The district will attempt to reduce its contribution to climate change as well as monitor the effects of climate change in the district.

The following objectives will guide management of the district over the next 15 years:

- Over the 15-year life of the CCP, increase the breeding population of Mallard by 450 pairs and Blue-winged Teal by 450 pairs on protected wetlands (permanent state and federal ownership) in the PPR of Iowa, and develop strategies, as part of the district's Inventory and Monitoring Plan, to set recruitment goals for these species in the PPR of Iowa.

- Over the 15-year life of the CCP, increase native grassland habitat by 7,500 acres with a plant diversity of 100 or more species, and provide more suitable habitat (in terms of vegetative structure as will be defined in the district's Habitat Management Plan) in existing grassland for a wide variety of grassland-dependent birds within the Iowa WMD.
- At the end of the 15-year life of the CCP, perennial grassland, preferably native, is present on at least 97 percent of the uplands of the Iowa WMD.
- At the end of the 15-year life of the CCP a variety of wetland types (75 percent temporary and seasonal, 15 percent semi-permanent, and 10 percent permanent) exist across the Iowa WMD as representative of the pre-Euro-American settlement landscape.
- Over the 15-year life of the CCP, wetlands within the Iowa WMD are restored and managed to provide breeding waterfowl pair densities of at least 0.9 pairs per wetland acre.
- During the 15-year life of the CCP, food plots are present on no greater than three percent of the upland acres within the Iowa WMD.
- Over the 15-year life of the CCP, continue to pursue perpetual protection of wetland and grassland of up to 112,000 acres in the PPR of Iowa in collaboration with county, state, and other federal governments, conservation organizations, private businesses, and concerned citizens. Landscape-level planning tools (i.e., four-square mile survey, restorable wetlands layer, etc.) utilized by Iowa DNR and the Service's Habitat and Population Evaluation Team office will guide partners as to where strategic land acquisition should occur.
- Within 15 years of CCP approval, provide the infrastructure on three WPAs (such as trails, kiosks, pull-offs, etc.) and information (brochure, website, Facebook page, etc.) necessary for visitors to appreciate resources in the Iowa WMD, as defined in the Visitor Services Plan.
- Upon implementation of the CCP, allow uses required by regulation (hunting, recreational fishing, and recreational trapping—all in accordance with state regulations) as well as other public uses deemed appropriate and compatible across the Iowa WMD. Within four years of CCP approval, appropriate and compatible uses will be clearly articulated to the public through uniform signage, brochures, and Iowa DNR and Iowa WMD websites as identified in the Visitor Services Plan.

Chapter 1: Introduction

In this chapter:

[The Process and the Plan](#)
[The District](#)
[Purpose of and Need for the Plan](#)

This chapter provides introductory material that explains the process for developing as well as the purpose and need for the plan and provides background information about the district.

The Process and the Plan

The planning process to develop a Comprehensive Conservation Plan (CCP, Plan) for the Iowa Wetland Management District (WMD, district) includes eight steps (U.S. Fish and Wildlife Service [FWS, Service], 2000):

1. Preplanning: Planning the Plan
2. Initiate Public Involvement and Scoping
3. Review Vision Statement and Goals and Determine Significant Issues
4. Develop and Analyze Alternatives, Including the Proposed Action
5. Prepare Draft Plan and NEPA Document
6. Prepare and Adopt Final Plan
7. Implement Plan, Monitor, and Evaluate
8. Review and Revise Plan

In general, scoping reveals issues that drive alternative ways of managing the district. Implementation of each of those alternative management styles (including the no action alternative) may have different effects on the physical, biological, and socio-economic environment. Analysis of these effects reveals the alternative that best:

- Achieves the district purposes, vision, and goals;
- Fulfills the National Wildlife Refuge System (NWRS, Refuge System) mission;
- Maintains and where appropriate restores ecological integrity of the district and the Refuge System (of which the district is a part);
- Addresses significant issues and mandates; and is
- Consistent with principles of sound fish and wildlife management.

This alternative is preferred and therefore constitutes the CCP. The CCP includes goals, objectives, and strategies for the district to guide overall management for the next 15 years. Monitoring and evaluation of implementing the plan provides a basis for eventual review and revision (as necessary). Public, partner, tribal, and other stakeholder input guides the planning process and, in turn, the long-term management decisions of the district. The plan primarily applies to fee title properties; however, it also applies to all easement types within the district if

legally allowed with the general exception of management direction regarding visitor services. An environmental assessment (EA) was written to document the National Environmental Policy Act of 1969 (NEPA) planning process for developing this CCP.

Per the National Wildlife Refuge System Improvement Act of 1997 (Improvement Act) (Public Law, 1997), the CCP must identify and describe the following:

- Purposes of the district
- Fish, wildlife, and plant populations, their habitats, and the archeological and cultural values found in the district
- Significant problems that may adversely affect wildlife populations and habitats and ways to correct or mitigate those problems
- Areas suitable for administrative sites or visitor facilities
- Opportunities for fish and wildlife-dependent recreation

More specifically per Service Manual direction (FWS, 2000), the CCP includes the following:

- A vision for the district, which is a concise statement of what the district should be, or what it is desired to be, based primarily upon the Refuge System mission and specific district purposes, and other mandates
- Goals, which are broad statements of desired future conditions
- Objectives, which are concise statements of what, how much, when, and where to achieve something and who is responsible for the work
- Strategies, which are specific actions, tools, techniques, etc. to meet the objectives

Finally, the CCP for the Iowa WMD focuses on the following aspects of management:

- Focal species group and life cycle
- Prolonged decline of grassland-dependent bird populations due to the decline of grassland habitat
- Upland habitat quality
- Focal wetland type
- Wetland quality
- Food plot use
- Decreasing purchasing power of existing funds and priority areas for acquisition
- District awareness and understanding
- Appropriate recreational opportunities

The District

The Iowa WMD consists of scattered tracts of habitat (both wetland and upland grassland) known as Waterfowl Production Areas (WPAs). As of 2011, there are 75 WPAs in 18 counties

in north-central Iowa totaling 24,712 acres in fee title and 575 acres in wetland and habitat easements (FWS, 2011a) (figure 1-1). While the federal Duck Stamp funds used to purchase the land are federal, the agency primarily responsible for restoration and management of the habitat is the Iowa Department of Natural Resources (DNR). Even though district acquisition has only occurred in 18 counties to date, a larger 35-county boundary is approved. This boundary follows the historic range of the poorly drained Prairie Pothole Region (PPR) (figure 1-2) in Iowa, an area known for its waterfowl production due to its prime “pothole” wetland habitat. Union Slough National Wildlife Refuge (NWR, refuge) in Titonka, Iowa administers the district, which also includes 18 tracts (434.6 acres) of Farm Service Agency (FSA) conservation easements on private land (figure 1-3). This plan was prepared with the intent that the strong partnership with the Iowa DNR will continue over the next 15 years.

Easements

The district currently inspects 44 wetland easements, one habitat easement, and 18 FSA conservation easements annually. These inspections include a visual search of aerial photography to look for tile drainage, ditches, filling, excavation, dumping, or any other violation. Field evaluations are also completed to make recommendations for habitat improvements and to discuss weed control and other general management issues. Letters are also sent to easement owners reminding them of its provisions and importance for waterfowl production.

Violations are typically addressed by Service law enforcement staff seeking voluntary compliance. Some of the most common easement violations in the district are crop encroachment, rock dumping, and excavation (consolidation drainage). Finally, the Partners for Fish and Wildlife Program biologist at Union Slough NWR prioritizes habitat enhancement projects and works with landowners to repair/replace dikes and other water control structures.

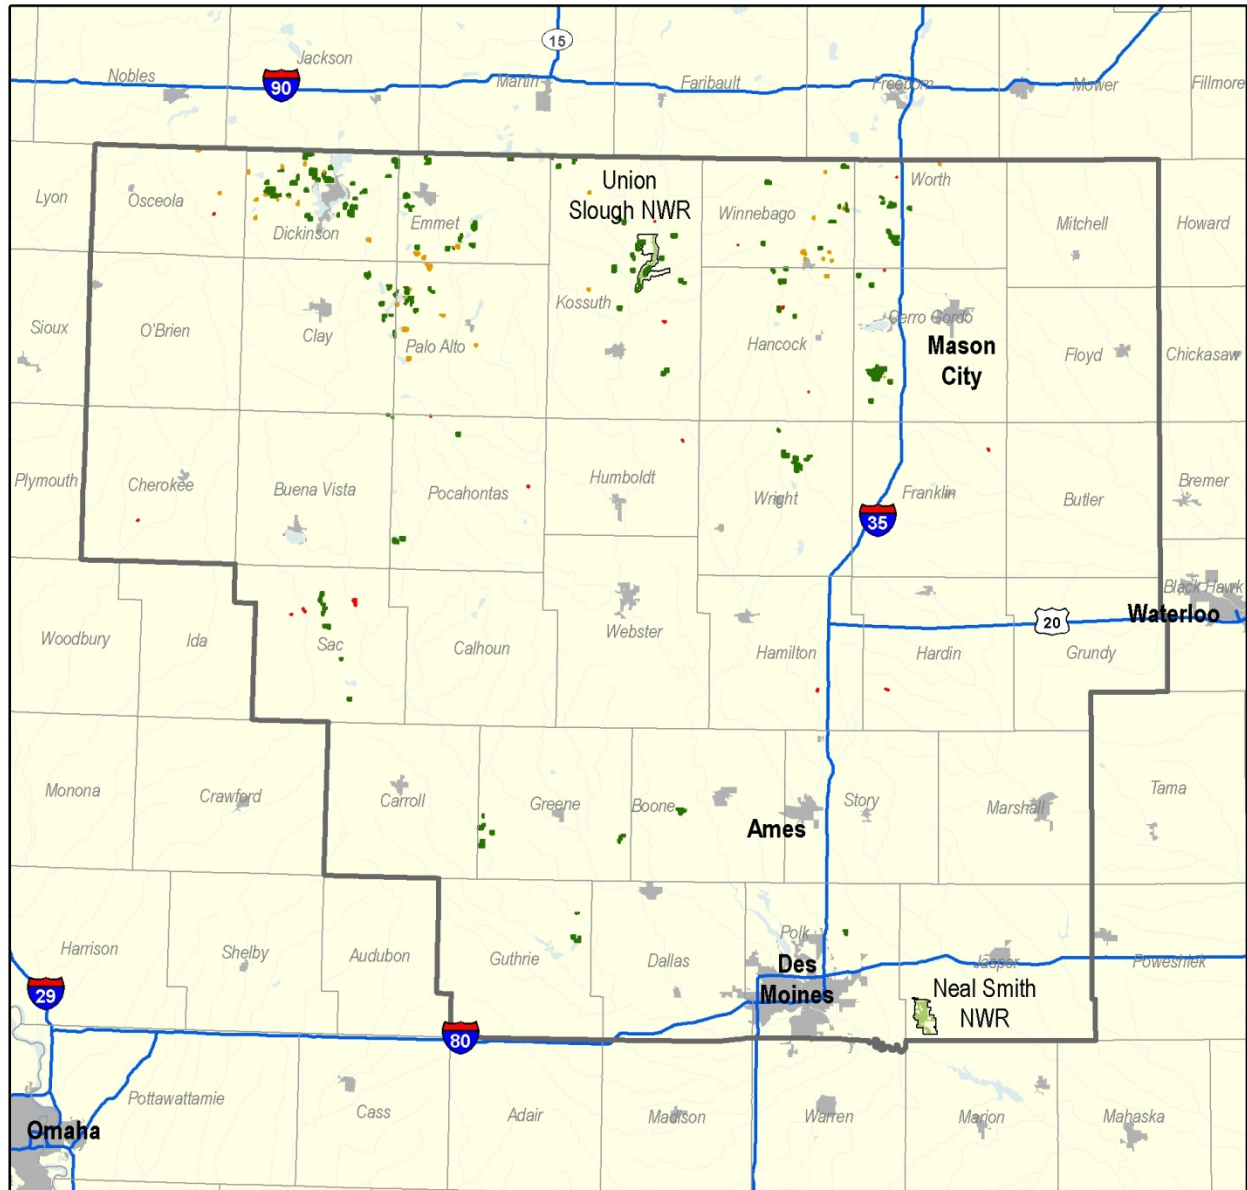

Purpose of and Need for the Plan

The Improvement Act requires the development of a CCP for each refuge/district of the Refuge System. These CCPs are to be completed within 15 years of the Improvement Act (i.e., October 2012). No CCP currently exists for the district, so there is a need to develop one. The purpose then, of the proposed action is to determine the desired future conditions of the Iowa WMD and develop long-range guidance and management direction to achieve the purposes of the district. This management direction will provide for the conservation of fish, wildlife, and plant resources and their related habitats, as well as opportunities for compatible wildlife-dependent recreational uses (FWS, 2000) especially in the face of a changing climate (temperature/moisture changes may alter the entire PPR’s available waterfowl habitat).

Per the Service Manual (FWS, 2000), the CCP for the district will not only describe the desired future conditions and management direction to achieve those conditions but will also:

- Help fulfill the NWRS Mission, which includes WMDs;
- Maintain and where appropriate restore the ecological integrity of the district and the greater Refuge System of which it is a part;
- Help achieve the goals of the National Wilderness Preservation System; and
- Meet other mandates, especially Secretarial Order 3289 Amendment 1: Addressing the Impacts of Climate Change on America’s Water, Land, and Other Natural and Cultural Resources of 2010.

Chapter 2: District Planning Context

In this chapter:

[Refuge System Planning Guidance](#)
[District Management Guidance](#)
[Relationship to Other Conservation Initiatives](#)
[The Planning Process](#)

This chapter describes the organizational, legal, and policy context in regards to planning for and management of the Iowa Wetland Management District (WMD, district). This includes the U.S. Fish and Wildlife Service (FWS, Service) mission, the National Wildlife Refuge System (NWRS, Refuge System) mission, goals, and guiding principles as well as the history of the district and its purpose, vision, and goals.

Refuge System Planning Guidance

The U.S. Fish and Wildlife Service

The Iowa WMD is administered by the U.S. Fish and Wildlife Service, the primary federal agency responsible for conserving, protecting, and enhancing the Nation's fish and wildlife populations and their habitats. The Service oversees the enforcement of federal wildlife laws, management and protection of migratory bird populations, restoration of nationally significant fisheries, administration of the Endangered Species Act, restoration of wildlife habitat such as wetlands, collaboration with international conservation efforts, and the distribution of conservation funding to states, territories, and tribes. Through its conservation work, the Service also provides a healthy environment in which Americans can engage in outdoor activities. Additionally, as one of three land managing agencies in the Department of the Interior (DOI), the Service is responsible for the Nation's Refuge System.

FWS Mission

Working with others to conserve, protect, and enhance fish, wildlife, and plants and their habitats for the continuing benefit of the American people.

The National Wildlife Refuge System

The Refuge System was founded in 1903 when President Theodore Roosevelt designated a three-acre island off the Florida coast, Pelican Island, as a sanctuary for colonial nesting birds. Today, the Refuge System has grown to a network of 560 national wildlife refuges (NWR, refuge), 38 districts, and 49 coordination areas covering over 150 million acres of public lands and waters. Over 50 percent of these lands (over 76 million acres) are contained within Alaska's 16 refuges, with the remainder distributed throughout the other 49 states and U.S. territories. Since 2006, Marine National Monuments have been added to the Refuge System, bringing over 50 million additional acres in the Pacific Ocean under federal protection and conservation management.

The Refuge System is the world's largest collection of lands and waters specifically designated and managed for fish and wildlife. Overall, it provides habitat for more than 700 species of birds, 220 species of mammals, 250 reptile and amphibian species, 200 species of fish, and more

than 280 threatened or endangered plants and animals. As a result of international treaties for migratory bird conservation and related legislation (e.g., Migratory Bird Conservation Act of 1929), many refuges have been established to protect migratory waterfowl and their migration flyways that extend from nesting grounds in the north to wintering areas in the south. Refuges also play a vital role in preserving threatened and endangered species.

Refuges also provide important recreation and education opportunities for visitors. When public uses are deemed appropriate and compatible with wildlife and habitat conservation, they are places where people can enjoy hunting, fishing, wildlife observation, photography, environmental education, environmental interpretation, and other recreational activities. Many refuges have visitor centers, wildlife trails, automobile tours, and environmental education programs. Nationwide, over 41 million people visit national wildlife refuges annually.

NWRS Mission

To administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans.

NWRS Goals

Revised goals for the Refuge System were adopted on July 26, 2006 and incorporated into Part 601, chapter 1, (601 FW1) of the Service Manual (FWS, 2006). The goals are:

- Conserve a diversity of fish, wildlife, and plants and their habitats, including species that are endangered or threatened with becoming endangered;
- Develop and maintain a network of habitats for migratory birds, anadromous and interjurisdictional fish, and marine mammal populations that is strategically distributed and carefully managed to meet important life history needs of these species across their ranges;
- Conserve those ecosystems, plant communities, wetlands of national or international significance, and landscapes and seascapes that are unique, rare, declining, or underrepresented in existing protection efforts;
- Provide and enhance opportunities to participate in compatible wildlife-dependent recreation (hunting, fishing, wildlife observation and photography, and environmental education and interpretation); and
- Foster understanding and instill appreciation of the diversity and interconnectedness of fish, wildlife, and plants and their habitats.

NWRS Guiding Principles

- We are land stewards, guided by Aldo Leopold's teachings that land is a community of life and that love and respect for the land is an extension of ethics. We seek to reflect that land ethic in our stewardship and to instill it in others;
- Wild lands and the perpetuation of diverse and abundant wildlife are essential to the quality of the American life;

- We are public servants. We owe our employers, the American people, hard work, integrity, fairness, and a voice in the protection of their trust resources;
- Management, ranging from preservation to active manipulation of habitats and populations, is necessary to achieve Refuge System and Service missions;
- Wildlife-dependent uses involving hunting, fishing, wildlife observation, photography, interpretation, and education, when compatible, are legitimate and appropriate uses of the Refuge System;
- Partnerships with those who want to help us meet our mission are welcome and indeed essential;
- Employees are our most valuable resource. They are respected and deserve an empowering, mentoring, and caring work environment;
- We respect the rights, beliefs, and opinions of our neighbors; and
- We are a science-based organization. We subscribe to the highest standards of scientific integrity and reflect this commitment in the design, delivery and evaluation of all of our work.

Ecological Integrity

The National Wildlife Refuge System Improvement Act of 1997 directs the Service to ensure that the biological integrity, diversity, and environmental health of the System are maintained for the benefit of present and future generations of Americans. In response to this direction, the Service used a public process to develop policy that provides specific guidance to maintain biological integrity, diversity, and environmental health, collectively referred to as ecological integrity (FWS, 2001). The policy contains a process to evaluate each refuge/district and identify the best management direction to prevent degradation of environmental conditions; and where appropriate and in concert with refuge/district purposes and the Refuge System mission, restore lost or severely degraded components of ecological integrity as compared to those found under historic conditions. The ecological integrity components include the following:

- **Biological Integrity**—Biotic composition, structure, and functioning at genetic, organism, and community levels comparable with historic conditions, including the natural biological processes that shape genomes, organisms, and communities.
- **Biological Diversity**—The variety of life and its processes, including the variety of living organisms, the genetic differences among them, and communities and ecosystems in which they occur.
- **Environmental Health**—Composition, structure, and functioning of soil, water, air, and other abiotic features comparable with historic conditions, including the natural abiotic processes that shape the environment.
- **Historic Conditions**—Composition, structure, and functioning of ecosystems resulting from natural processes that we believe, based on sound professional judgment, were present prior to substantial human-related changes to the landscape.

Maintaining the ecological integrity of a WMD is particularly challenging given that Waterfowl Production Areas (WPAs), although locally large complexes, are rather small and isolated within their larger landscape. For Iowa WMD, like many others, much of the larger landscape is in

heavy agricultural use. Therefore, WPAs are greatly influenced by the movement of sediment, nutrients, and agricultural chemicals from adjacent crop fields. This has led to decreased plant diversity and openings for many invasive plants to become established. These invasive plants often form dense stands and crowd out native vegetation.

Furthermore, water quality in district wetlands has deteriorated due to sedimentation and eutrophication caused by runoff from neighboring farm fields. According to an unpublished report from a 1995 U. S. Geological Survey study at Union Slough NWR, the mean sediment increase in refuge pools from 1938 to 1995 was 2.62 feet, or more than 0.5 inches per year. In addition to sedimentation problems, a contaminant study conducted at Union Slough NWR from 1995 to 1997 found numerous wetland quality issues including nitrate loading, elevated levels of ammonia, low dissolved oxygen levels, limited benthic macroinvertebrate diversity, limited wetland plant diversity, massive phytoplankton blooms, and elevated selenium levels (Coffey, 2000). The source of many of these problems is the effluent of drainage tiles that dump into wetlands. The tile introduces a pathway for excess sediment, nutrients, and pesticides to enter the wetlands. The influence of consolidated water from drainage tile in wetlands can effectively interrupt the important and natural wet/dry cycle of Prairie Pothole Region (PPR) wetlands. The combination of more stable water conditions and the introduction of more sediment, nutrients, and pesticides have contributed to dense cattail stands in shallow water areas and wet meadow zones that are dominated by reed canarygrass. Collaborating with the Iowa Department of Natural Resources (DNR) and others, working within watersheds, and building complexes through acquisition rather than small-scattered tracts all help maintain the ecological integrity of the district within its landscape.

Cooperative Farming

Description of the Farming Program for the Iowa WMD

The use of farming as a land management tool supports the biological purposes and management strategies of the Iowa WMD presented in the EA and Draft CCP and will adhere to all regional and national policies and guidance, such as; Region 3 Pesticide Use Policy (appendix M of the Iowa WMD Final CCP), Region 3 Farm Program Guidance (appendix N of the Iowa WMD Final CCP) and the U.S. Fish and Wildlife Service (FWS, Service)'s Midwest Region Environmental Assessment (EA) for row crop farming and the use of genetically-modified, glyphosate-tolerant (GMGT) corn and soybeans on refuge/district land (FWS, 2011c).

Farming in the Iowa WMD is accomplished primarily through the issuance of a Special Use Permit (SUP) or a Habitat Management Agreement (HMA) to private individuals (cooperative farmers). The SUP/HMA provides direction to the cooperative farmer on: types of crops to be planted, crop shares or cash payments for farming privileges, use of pesticides, use of best management practices, and other special conditions to ensure the farming program is conducted in an appropriate manner and within state, regional, and national Service guidance. The SUP/HMA is completed, issued, and signed by the Iowa WMD project leader or appropriate Iowa Department of Natural Resources (DNR) staff as provided in the Memorandum of Understanding (MOU). These annual agreements are typically written to work with the same cooperator farming the unit for multiple years. Some prescribed farming operations are conducted directly by Iowa DNR staff through provisions of the MOU.

Farming in the Iowa WMD occurs on less than eight percent of the total district acres (updated as of January, 2014) and will occur on only previously disturbed areas, such as previously

farmed land. Farmed tracts vary in size from 5 to 160 acres and are located on terrain described as flat to gently rolling. Crops planted in the Iowa WMD currently include corn, soybeans, sunflower, sorghum, millet, alfalfa, wheat, and barley. Table 2-1 provides farm crop and acreage information for the 2011–2013 farming seasons.

Cooperative farmers utilize conventional farming practices including the use of tractors, plows, disks, planters, spray equipment, and combines. Each site is tilled prior to spring planting, once ground conditions permit the use of heavy equipment without damage to the soil (i.e., rutting). Tilling requires one to two days per site. Some sites may also be treated with a pre-emergent herbicide prior to planting. Crops such as corn and soybeans are planted. Typically, planting is completed in one day or less on any individual site, and planting on all sites typically begins as early as mid-April and is completed as late as early June depending on soil conditions and type of crop planted. Cooperating farmers will be subject to Service policy and regulation regarding use of chemicals and treated seeds. Chemical use is restricted by type and to the minimum necessary amount applied.

Harvest techniques are the same for both no-till and traditional farming practices. Harvest begins in the fall using a self-propelled harvesting implement such as a combine. It usually takes about one day per site and is completed on all sites by late October or early November. Crops cultivated for winter food resources are left standing through the winter and harvested after March 1. Some crops such as winter wheat may be planted in the late summer or early fall. Planting and harvest activities are restricted to minimize disturbance of wildlife species.

All use of genetically-modified crops in the Iowa WMD will occur under the guidance of the Service's Midwest Region EA for row crop farming and the use of GMGT corn and soybeans on refuge/district land (FWS, 2011c). The use of genetically-modified crops will be limited to GMGT corn and soybeans, will be allowed only for the purpose of habitat restoration, and will under regional policy be limited to five years for any individual tract in preparation for habitat restoration. However, the Iowa WMD has a goal of accomplishing habitat restoration projects on individual tracts within just two years, weather permitting.

The Iowa WMD project leader is required to demonstrate that the proposed use of GMGT crops is essential for habitat restoration. If the use of GMGT crops is proposed, the project leader must complete a Standard Eligibility Questionnaire for Genetically Modified Crops on National Wildlife Refuge System Lands (appendix L of the Iowa WMD Final CCP). The Regional Chief of Refuges will review all requests for authorization to use GMGT crops and will approve or deny requests based on the questionnaire. A current farming compatibility determination that addresses the use of GMGT crops for habitat restoration is also required (appendix F of the Iowa WMD Final CCP). The use of GMGT corn and soybeans for restoration purposes has been authorized in the Iowa WMD and has been implemented since the 2012 farming season. The use of GMGT crops is not allowed for any other farming purposes, including habitat management, supplemental food, and attracting wildlife for viewing and photography.

For the past several years, the Service has been reducing the number of acres farmed on National Wildlife Refuge System (NWRS, Refuge System) land as well as the number of acres planted to GMGT crops within the region. This trend is also occurring in the Iowa WMD, especially in the number of acres of GMGT corn planted, as indicated in table 2-1. However, for those refuges/districts involved with land acquisition programs, farming as a land management tool will be necessary on those recently acquired acres. Generally, three to five years of farming is necessary to prepare the soil for native grass/forb seed planting, however the Iowa WMD has a goal of restoring farmed land within two years.

The use of treated crop seeds, particularly those treated with chemicals referred to as neonicotinoids, have been a growing environmental concern due to potential effects on pollinator species. Neonicotinoids are a class of insecticides chemically similar to nicotine. They are marketed and distributed in various forms including sprays, powders, and seed treatments. Trade names containing neonicotinoids may include (but are not limited to) Acceleron®, Acetamiprid®, Actara®, Adage®, Adjust®, Admire®, Advantage®, Alpine®, Arena®, Assail®, Belay®, Calypso®, Celero®, Centric®, Clutch®, Confidor®, Cruiser®, Dinotefuran®, Encore®, Flagship®, Gaucho®, Helix®, Inside®, Intruder®, Legend®, Merit®, Meridian®, Nipsit®, Platinum®, Poncho®, Pravado®, Premise®, Regent®, Safari®, Scorpion®, Titan®, Touchstone®, Tristar®, and Venom®. Active ingredients include: acetamiprid, clothianidin, dinotefuran, imidacloprid, nithiazine, sulfoxaflor, thiacloprid, and thiamethoxam. Due to this concern, the Iowa WMD will implement the following Region 3 guidance on the use of neonicotinoid treated seeds (a refuge/district manager can always be more restrictive than these more general regional guidelines):

- Refuge managers will exhaust all alternatives before allowing the use of neonicotinoid treated seeds on Refuge System land in 2014 and 2015.
- Refuge managers need to eliminate the use of neonicotinoid treated seed on Refuge System land in Region 3. The strategy is to start the transition in calendar year 2014 and be "neonicotinoid seed free" in calendar year 2016. In 2014 and 2015 there will be some flexibility for the transition and take in to account the availability of non-treated seed. During the two transition years, refuge managers need to have an approved Pesticide Use Proposal (PUP) before allowing the planting of neonicotinoid treated seed on Refuge System land under their management. Special attention will be given to the "justification" section of the PUP. The PUP will become part of the official record and should clearly state the need to use treated seed during this transition period. Refuge managers must provide justification to the area supervisor and receive written concurrence prior to initiating a PUP for the use of neonicotinoid treated seeds.
- All crop seeds treated with neonicotinoid chemicals must be planted (incorporated) beneath the soil surface due to their high toxicity to birds. No residue seeds can be left above ground. Any treated seeds that are spilled and/or left above ground at the time of planting must be picked-up and removed or replanted underground immediately. The refuge/district must conduct random field spot checks at the time the treated seeds are planted to ensure they are incorporated beneath the soil surface. To accommodate this process, any Region 3 field station that uses neonicotinoid treated seed must complete a Region 3 Treated Seed Incorporation Monitoring Statement. This Statement will document that all treated seed has been incorporated beneath the soil surface, thus adhering to Service policy. This guidance also applies to fungicide treated seed as indicated in the Region 3 Pesticide Use Policy.
- Seeds treated with neonicotinoid chemicals are listed as toxic to aquatic invertebrates. Therefore, field stations using neonicotinoid treated seeds must develop specific Best Management Practice guidelines to be included in the submitted PUP and implemented in the special use conditions of the SUP.
- Seed treatment chemicals cannot be mixed or applied to the crop seeds on refuge/district land, they must be treated off-site.

Farming, to accomplish habitat restoration objectives, is implemented primarily to prepare a quality seed bed for the establishment of native prairie grass and forb species. Farming may be utilized for one to two years to reduce unacceptable levels of undesirable chemical residue, noxious weeds, or non-native plant species. Newly acquired properties for the Iowa WMD are often land that is currently being farmed. Past prairie restoration efforts, without utilizing farming, have resulted in limited seedling establishment (mainly forb species) and unacceptable levels of invasive vegetation competition, thereby weakening prairie plant development. Furthermore many of the tracts acquired by the Iowa WMD have been extensively farmed for a long period of time, reducing the possibility that simply idling or creating “go back” prairie can be a feasible option. SUPS/HMAs may be utilized to extend the farming program to keep the land free of weeds until funds are available for habitat restoration; however, the Iowa WMD has a goal for the farming of any given tract of no more than two years. Under the SUP/HMA chemical use is restricted to promote a more favorable soil condition for native plant establishment and growth. The last year of farming typically requires the cooperative farmer to plant soybeans, as soybean stubble is a preferred substrate in which to plant native grasses and forbs. Native plant seeds are then broadcast on top of the ground or drilled into the soybean stubble depending on local planting strategies.

Through the Service’s partnership with the Iowa DNR, food plots have been established as an acceptable practice to provide winter food resources and provide wildlife viewing and hunting opportunities. The MOU between the Service and the Iowa DNR states that permanent food plots are permitted at levels identified in the Final CCP, the Iowa WMD Habitat Management Plan (to be written), and the Waterfowl Production Area (WPA) unit plans. Collaborative goals in the North American Waterfowl Management Plan (2012) include the following:

- Goal #2: Wetlands and related habitats sufficient to sustain waterfowl populations at desired levels, while providing places to recreate and ecological services that benefit society
- Goal #3: Growing numbers of waterfowl hunters, other conservationists, and citizens who enjoy and actively support waterfowl and wetlands conservation

The goals in this plan focus on engaging people with nature and growing the number of hunters. Food plots in Iowa are thought of as a positive practice providing excellent viewing and hunting opportunities. Allowing food plots on WPAs within the district, albeit limited, will assist the Iowa DNR (a key Service partner) in providing hunting opportunities that will in turn gain public support for waterfowl and wetland protection.

Currently food plots range in size from three to ten acres; however, they are not necessary on all WPAs within the district. Service managers and Iowa DNR wildlife biologists will determine areas that would be appropriate for food plot placement. Given the waterfowl production/migratory bird purposes of the district, creation of edge, size of habitat patch (Warner et al., 2012), timing of disturbance related to farming practices (Korschgen and Dahlgren, 1992), and herbicide treatments of crops will be considered in the determination. Although some species of both migratory and resident birds have been documented nesting in corn and soybean row crops this may create an ecological trap (Best, 1986). For this reason managers need to be cautious with locations of food plots within the district.

New management plans for individual units will involve evaluating the need for food plots on the tract and potential locations to lessen the impacts of disturbance, edge, chemical use, and soil erosion. Individual unit plans will also ensure that food plots are not located in wetland basins

or remnant prairie sites. Many times food plots may be better situated on adjacent state WMAs, county conservation areas, or private land. Currently, approximately eight percent (updated as of January, 2014) of the district WPA properties are in row crop agriculture, mostly in reconstruction to prairie. It is reasonable to believe that Iowa DNR food plot objectives can be met with three percent of the district's uplands in food plots without materially detracting from the waterfowl production purpose for the district. Three percent of the district uplands equates to approximately 500 acres of food plots across the district WPAs. This rate of food plot use in the district will be evaluated through the early stages of the Final CCP to determine the minimum acceptable level for food plots, especially given the partnership with the Iowa DNR and the district's waterfowl production purpose.

Wildlife food plots generally consist of plantings of corn, soybeans, sunflowers, wheat, barley, oats, rye, buckwheat, millet, milo, and sorghum. Cultivation of these crops is usually accomplished by cooperative farmers through an agreement with the Iowa DNR. Food plots will not be manipulated in any way to constitute baiting of migratory game birds and waterfowl as defined in the Migratory Bird Treaty Act of 1918 (16 U.S.C. 703–712 P.L. 105–312) and 50 CFR 20.11–21. Standard agricultural practices will be used in farming operations with the exception that insecticide use will not be permitted. Crops will be left standing in the field and may be harvested in the early spring each year.

Some food plots that are designed, in particular, for winter survival of Ring-necked Pheasant include planting shelterbelts of conifer trees and shrubs. Because grassland bird research suggests that some birds experience reductions in nest success and higher predation rates in grasslands that have been fragmented by trees (Johnson and Temple, 1990), WPAs would not be locations considered for shelterbelt placement in conjunction with food plots. Wetland vegetation can provide excellent winter cover for resident wildlife, therefore negating the need for shelterbelt plantings on WPAs.

The decision to use cooperative farming for habitat restoration, habitat management, supplemental food, or attracting wildlife for viewing and photography would occur as part of strategies developed under specific program or unit habitat management planning. The use of farming provides a management tool that allows the WMD staff to meet the habitat goals and objectives. Service policy calls for maintaining or restoring WMD habitats to historic conditions if doing so does not conflict with refuge purposes. As practiced at the Iowa WMD, farming—both conventional (for food plots) and with the use of glyphosate-tolerant corn and soybeans (for prairie restoration)—contributes to the achievement of WMDs purposes and the Refuge System mission, because it helps enhance and restore grassland habitat for migratory birds and resident wildlife.

Table 2-1: Acres Farmed on Refuge System Land and Acres Planted to GMGT Crops within the Iowa WMD

Planted by:	2013 (acres)	2012 (acres)	2011 (acres)
Cooperators/contractors to genetically-modified organism (GMO) corn.	370	669	826
Cooperators/contractors to GMO soybeans.	624	746	631
Cooperators/contractors to non-GMO corn.	126	155	79
Cooperators/contractors to non-GMO soybeans.	179	175	132
Cooperators/contractors to other crops as part of a farming rotation.	alfalfa 641, oats 114.5, sunflower 21	alfalfa 589.6, sunflower 18.2, sorghum 6.8	alfalfa 538.6, oats 13.0, sunflower 2.6
Total Acres Farmed by Cooperators/Contractors	2,076	2,360	2,221
FWS (Iowa DNR) employees to GMO corn.	0	0	0
FWS employees to GMO soybeans.	0	0	0
FWS employees to non-GMO corn.	0	0	0
FWS employees to non-GMO soybeans.	0	0	0
FWS employees to other non-native crops as part of a farming rotation or a moist soil management activity.	sorghum 28.4 Iowa DNR	sorghum 34.7 Iowa DNR	sorghum 43.8 Iowa DNR
Total Acres Farmed by FWS Employees	28	35	44

Site-Specific Effects Analysis for the Farming Program in the Iowa WMD

No site-specific effects on the environment, other than what have already been disclosed in other NEPA documents completed by other federal agencies, are expected from the farming program in the district because of the following:

1. *The Animal and Plant Health Inspection Service (APHIS) regulates the cultivation of genetically engineered organisms, not the U.S. Fish and Wildlife Service.*

APHIS regulates the introduction (importation, interstate movement, or release into the environment) of certain genetically engineered organisms and products that may pose a risk to plant or animal health. APHIS exercises its regulatory authority through a system that includes both permits and notifications. A permit is granted for a field trial when APHIS has determined that the conduct of the field trial, under the conditions specified by the applicant or stipulated by APHIS, does not pose a plant pest risk. A researcher or developer may also request that APHIS no longer regulate an organism by submitting a petition for nonregulated status.

Such field trials have been completed for both glyphosate-tolerant soybeans and corn. For soybeans, nine field tests took place between 1991 and 1994 at approximately 54 sites in 19 states (including Iowa). "Field trial reports from these tests show no deleterious effects on plants, nontarget organisms, or the environment as a result of these releases," (U.S.

Department of Agriculture [USDA]-APHIS, 1994).” For corn, field tests occurred between 1993 and 1996 in the major corn growing regions of the United States (20 states, assumed to include Iowa). “This line [MON 802] has been evaluated extensively to confirm that it exhibits the desired agronomic characteristics and does not pose a plant pest risk,” (USDA-APHIS, 1997a).

Given the field trial results, petitions for nonregulated status were also submitted for both soybeans and corn. In 1994 (USDA-APHIS), APHIS completed an environmental assessment and reached a finding of no significant impact on the environment “from the unconfined, agricultural use of glyphosate-tolerant soybean line 40-3-2 and its progeny.” In 1997 (USDA-APHIS, 1997a), a similar environmental assessment was completed with a finding that “MON 802 corn will not have a significant adverse impact on organisms beneficial to plants or agriculture, or other nontarget organisms, and will not affect threatened or endangered species.” APHIS concluded, “There will be no significant impact on the human environment if MON 802 corn and its progeny were no longer considered a regulated article,” (USDA-APHIS, 1997a).

Similar field trials, assessment, and finding were completed later in 1997 for glyphosate-tolerant GA21 corn (USDA-APHIS, 1997b). Other extensions of these original petitions have been submitted in more recent years, and similar trials, assessments, and findings have been completed or are underway for other glyphosate-tolerant corn and soybean crop lines. This documentation, which includes analyses of the effects on humans and the environment from growing genetically engineered crops, can be found at the following website: http://www.aphis.usda.gov/biotechnology/petitions_table_pending.shtml.

Since another federal agency, APHIS, regulates the cultivation of genetically engineered organisms and that agency has completed NEPA documentation including effects analyses of this activity, the Service relies on the findings from that agency when determining the effects of the same activity on refuge system land. APHIS has both the regulatory authority and the necessary technical expertise to assess effects of genetically engineered crops on the environment, while the Service has no regulatory jurisdiction over that activity. Therefore, no other site-specific effects other than what have already been disclosed by APHIS are expected from cultivation of genetically engineered crops by the Service.

2. The U.S. Environmental Protection Agency (EPA) regulates the use of pesticide chemicals, including herbicides, in the environment.

The EPA regulates the use of pesticide chemicals, including herbicides, in the environment. Under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA), EPA has the authority to regulate the testing, sale, distribution, use, storage, and disposal of pesticides. Before a pesticide may be sold, distributed, or used in the United States, it must be registered under FIFRA.

For example, the EPA first issued a registration standard for glyphosate in June of 1986. Because of advances in scientific knowledge, pesticides that were first registered years ago are required by law to be reregistered to make sure that they meet today’s more stringent standards. In evaluating pesticides for reregistration, EPA obtains and reviews a complete set of studies from pesticide producers, describing the human health and environmental effects of each pesticide. Glyphosate was reregistered in 1993 as it was found to “not pose unreasonable risks or adverse effects to humans or the environment.” Furthermore, “EPA determined that the effects of glyphosate on birds, mammals, fish and invertebrates are

minimal,” (EPA, 1993). In 1997, permanent tolerances for residues of glyphosate were established in or on raw agricultural commodities including field corn varieties genetically-modified to be tolerant of glyphosate (EPA, 1997).

The herbicide 2,4-D has been used since the 1940s as a pre-plant or post-emergent herbicide to control broadleaf weeds on a broad range of crop and non-crop sites, including cornfields. The EPA first issued a registration standard for 2,4-D in 1988, and the herbicide was reregistered in 2005. In summary, the EPA stated, “Some ecological risks are of concern on some sites for some species,” (EPA, 2005). They provide mitigation measures “expected to lessen, but not eliminate, the risk of 2,4-D to wildlife and plants,” (EPA, 2005). Currently, 2,4-D is approved for pre-plant and post-emergent application on corn and pre-plant application on soybeans.

Dicamba is widely used in agricultural, industrial, and residential settings for the post emergent control of certain broadleaf weeds and woody plants. It was first registered by the EPA in 1967 and was reregistered in 2006 with amendments in 2008 (EPA, 2009). During the reregistration, the EPA determines whether the pesticide meets the “no unreasonable adverse effects” criteria of FIFRA. As a result of the reregistration review, the EPA “determined that all products containing the active ingredient dicamba are eligible for reregistration provided that the risk mitigation measures indicated in the document are adopted,” (EPA, 2009).

APHIS is currently considering the deregulation of new genetically engineered corn, soybean, and cotton plants resistant to the herbicides known as 2,4-D and dicamba. However, the use of GMO crops in the Iowa WMD is limited to glyphosate-tolerant corn and soybeans (FWS 2011c).

Since another federal agency, the EPA, regulates the use of pesticides, and that agency has completed NEPA documentation including effects analyses of this activity, the Service relies on the findings from that agency when determining the effects of the same activity on refuge system land. The EPA has both the regulatory authority and the necessary technical expertise to assess effects of pesticide use on the environment while the Service has no regulatory jurisdiction over that activity. Therefore, no other site-specific effects other than what have already been disclosed by the EPA are expected from pesticide use by the Service.

3. *The farming program in the district will follow the Service’s Midwest Region Environmental Assessment (EA) for row crop farming and the use of genetically-modified glyphosate tolerant (GMGT) corn and soybeans on refuge/district land.*

In 2011, the Service’s Midwest Region completed an EA for row crop farming and the use of GMGT corn and soybeans on refuge/district land (FWS, 2011c). Under the selected alternative, beginning in calendar year 2012, the use of GMGT corn and soybeans on Refuge System land in the Midwest Region would continue only for the purpose of habitat restoration. According to the EA, the use of GMGT corn and soybeans would be limited to five years on any individual tract being prepared for habitat restoration. Farming could continue to be used as a management tool for achieving multiple objectives; however, it would be limited to non-GMGT crops for objectives other than habitat restoration. Multiple objectives include but are not limited to the following:

- Habitat restoration

- Habitat management
- Supplemental food for wildlife
- Attracting wildlife for viewing and photography

Similarly, the Service's ecological integrity policy specifies that GMGT crops cannot be used on Refuge System land unless they are "essential to accomplishing refuge [district] purposes." Habitat restoration is a core objective of most refuges (districts) in achieving their purpose and in some circumstances, the use of GMGT crops could be essential. However, habitat management, supplemental food, and wildlife viewing objectives can more readily be accomplished without the use of GMGT seeds, and thus, their use is not likely essential.

Furthermore, refuge and district managers are required to demonstrate that their proposed use of GMGT crops is essential for habitat restoration. The Service has established an approval process for the use of GMGT corn and soybeans that includes completion of a Standard Eligibility Questionnaire for Genetically Modified Crops on National Wildlife Refuge System Lands (appendix L of the Iowa WMD Final CCP). When managers propose to use GMGT corn and soybeans, they are required to complete this questionnaire as part of the approval process. There will be strict adherence to the regional programmatic EA regarding the use of GMGT corn and soybeans within the Iowa WMD.

4. The farming program in the district will adhere to all national, Department of Interior, Service, and Region 3 policies regarding pest management and treatments.

Pest management activities on Service land and facilities must conform to all EPA regulations, chemical labels, Material Safety Sheets, and Service and Department of the Interior policies and directives including:

517 DM 1 (<http://www.nature.nps.gov/biology/ipm/Documents/DOI517DM1.pdf>),
 569 FW 1 (<http://www.fws.gov/policy/569fw1.html>), and
 242 FW 7 (<http://www.fws.gov/policy/242fw7.html>).

These policies state that pests will be managed using an integrated sustainable approach when the pest is detrimental to site management goals and objectives and the planned pest management actions will not interfere with achieving site management goals and objectives.

Service employees use their best professional judgment and available scientific information to select the lowest risk, most effective integrated pest management method, or combination of methods that is feasible for each pest management project.

If chemical treatment is considered, a Pesticide Use Proposal (PUP) must be prepared and approved by an appropriate level supervisor prior to the chemical application.

PUPS are extensive, detailed documents that require specific information about the planned treatment (pest target, threshold for treatment, active ingredient, application rate, application method) as well as a descriptions of the treatment site(s) (soil type, slope, organic content, nearest water, depth to ground water).

The PUPs are valid for only one year and provide a timely, site-specific evaluation of the current conditions. Reports regarding the efficacy of the treatments are required in February

of each year so Service staff can evaluate past management actions, and refine and improve subsequent control measures.

5. *Best Management Practices (BMPs) are currently being used for the farming program in the district, and a more thorough list of BMPs will be developed for the farming program to follow in the future.*

In general, the Refuge System is reducing the amount of farming on national wildlife refuges (NWRs, refuges) and WMDs including the use of genetically-modified crops and pesticides. Farming with genetically-modified crops within refuges/districts is restricted to a very specific purpose (i.e., habitat restoration). Due to the many policies (e.g., Pesticide Use Policy, (appendix M of the Iowa WMD Final CCP); the regional programmatic EA regarding the use of GMGT corn and soybeans, etc.; the approval processes (e.g., Pesticide Use Proposals, Special Use Permits, Habitat Management Agreements, Memorandums of Understanding, etc.); and guidelines (e.g., Best Management Practices, Regional Direction regarding cooperative farming, etc.) in place governing farming practices on Refuge System land, farming within the Iowa WMD is not expected to have the potentially significant adverse effects to the environment as surrounding farming practices on private land described within the Iowa WMD EA and Draft CCP.

Farming is used on the Iowa WMD to accomplish habitat and wildlife goals and purposes. Both the Service and Iowa DNR strive to use the best management practices when implementing farming as a habitat management strategy. Examples of items that are considered in habitat management plans include slope, distance to wetlands and ground water, habitat buffers, and disturbance of wildlife. When farming is used to prepare the seed bed of a newly acquired property (typically in row crop agriculture), both the Service and the Iowa DNR typically use farming cooperators and Habitat Management Lease Agreements or Special Use Permits. In these documents the Service articulates through stipulations the best management practices that will be used on the district property. Examples of agreement stipulations include the following:

Note: These stipulations may change over time to reflect new information.

- Use of chemicals must be approved through a Pesticide Use Proposal.
- Manure applications are prohibited.
- Fall tillage is prohibited unless its use is specified in the management plan for the year of prairie seeding.
- Habitat management plans must be followed.
- Glyphosate tolerant corn and soybean seed may only be used for habitat restoration purposes.
- Farming for wildlife food production or other purposes will utilize non-genetically-modified crop seed.
- No insecticides may be used.

Chemical application provides the most effective means for site preparation prior to prairie restoration. Chemical site preparation reduces potential future applications by reducing weed seeds prior to restoration. Crop rotations with brome-alfalfa nesting habitat, corn, soybeans, oats, and other crops allow for mechanical control of crop pests and chemical

rotations to reduce the development of chemical resistant weeds. The following Best Management Practices will be followed to lessen any potential effects from pesticide application within the Iowa WMD:

- Allow pesticide application buffers around sensitive areas,
- Follow pesticide labels,
- Spray only when winds are 12 mph or less (but not inversions),
- Control drift through use of low pressure and nozzles that create larger droplets,
- Monitor current and predicted winds,
- Monitor predicted rainfall,
- Be cautious around shallow groundwater, and
- Maintain a buffer around water and wetlands.

6. *The land in the farming program within the district has been privately farmed for over a century, more recently with the use of GMGT crops and pesticides.*

European settlers to Iowa began farming early in the 1800s. By the 1870s, farms and small towns covered the entire state. Over time, the settlers learned a lot about farming and made many changes in equipment and crops. The number of farms tended to decrease over time, but the size of farms steadily increased. Scientific advances in biotechnology (crop genetics, broadcast treatment of weeds, etc.) as well as general technology (larger and more aggressive tillage equipment, more accurate planting and harvesting equipment, etc.) continue to change and influence farming today as it did in the past. Farming in the Iowa WMD occurs on less than eight percent of the total district acres (updated as of January, 2014) and will occur on only previously disturbed areas, such as previously farmed or currently farmed land. The farming program is simply used as a tool to prepare the seedbed for restoration of natural cover.

In summary, no significant effects are expected from any of the proposed activities, based on the effects analysis completed in the EA for the Iowa WMD Draft CCP as well as the various effects analyses completed and cited above by APHIS regarding genetically engineered crops and the EPA regarding pesticide regulation. These analyses together constitute a “hard look” at the potential effects on the environment from the farming program in the Iowa WMD. Furthermore, various Section 7 consultations, with the Ecological Services branch of the Service in concurrence, have been completed for pesticide use in the Iowa WMD regarding threatened and endangered species.

Legal and Policy Compliance

Laws, Executive Orders, and DOI and Service policies guide administration of refuges (including WMDs). A list of pertinent statutes and policy guidance are in appendix C.

Wilderness Review

Refuge/district planning policy mandates that wilderness reviews be conducted through the comprehensive conservation planning process (FWS, 2000). The wilderness review process consists of three phases: inventory, study, and recommendation. In the inventory phase,

Service-owned lands and waters within the refuge or district that are not currently designated wilderness are analyzed for areas that meet the criteria for wilderness established by Congress. The criteria are size, naturalness, opportunities for solitude or primitive recreation, and supplemental values. Areas that meet the criteria become Wilderness Study Areas (WSAs). In the study phase, a range of management alternatives are developed and evaluated for the WSAs to determine if they are suitable for recommendation for inclusion in the National Wilderness Preservation System. In the recommendation phase, the suitable recommendations are forwarded in a Wilderness Study Report that moves from the director through the secretary and the president to Congress.

No lands within the Iowa WMD meet the criteria for wilderness established by Congress and described in Service policy (FWS, 2008b). The Iowa WMD does not contain 5,000 contiguous acres of roadless, natural lands, nor does it possess any units of sufficient size to make their preservation practicable as wilderness. District lands and waters have been substantially altered by humans, especially by agriculture and residential and industrial developments.

District Management Guidance

General guidance for managing the district comes from several sources including its purposes, the Refuge System mission, Service policies, and other laws. The vision and goals developed during this planning process will also guide management of the district.

Brief History of District Establishment and Acquisition

The Iowa WMD, like many other WMDs, was established due to the success of the Small Wetlands Program (figure 2-1). To help permanently protect habitat for waterfowl, the Small Wetlands Program was officially created in 1958, with an amendment to the 1934 Migratory Bird Hunting Stamp Act (also known as the Duck Stamp Act). This amendment allowed proceeds from the sale of federal Duck Stamps to be used to acquire WPAs in any state with the Director's (or Director's appointee) approval (figure 2-2).

In 1962, to help effectively manage the increasing number of WPAs acquired through the Small Wetlands Program, the Service created an administrative organization called a wetland management district (WMD). WMDs were established not only to manage all the WPAs in a multi-county area, but also to work closely with the private landowners, government and nongovernment organizations, businesses, and other federal agencies in their districts to improve wildlife habitat. Uniquely, however, in Iowa, with the signing of a Memorandum of Understanding (MOU) in 1978, it was decided that while the Service would provide federal Duck Stamp funds for land acquisitions, the Iowa DNR would supply the personnel necessary to restore and manage those acquisitions (WPAs). The initial approval from the state limited acquisition of land to 17 counties in north-central and northwest Iowa. This approval established the Iowa WMD, and in 1979 the first tract of land (WPA), known as West Swan Marsh, was purchased in Emmet County. A second tract, also in Emmet County, was purchased in 1980. Yearly acquisition, however, did not resume in the district until eight years later.

In 1988, through the Prairie Pothole Joint Venture (PPJV) Program, the Iowa DNR established a priority area within the state to focus the use of Small Wetlands Program funds. This 35-county area in north-central Iowa generally follows the geologic area referred to as the Des Moines Lobe. This represents the southernmost advancement of the glaciers that shaped the prairie

pothole landform in Iowa. Both the approval for acquisition from the state and the MOU with the Iowa DNR were revised to include these 35 counties.

In 2000, the MOU was updated again, and while the 35-county acquisition area remained the same, priority was given to the wetland complexes identified in "Identification of potential wetland complex restorations in the Iowa Prairie Pothole Region" (Iowa DNR, 1998). The Iowa DNR revised this plan in 1999 and 2002, and then in 2007, it completed a modeling exercise to revise focus areas for acquisition (figure 2-3).

Between 2000 and 2010, the Service's Habitat and Population Evaluation Team (HAPET) also developed and completed three revisions of thunderstorm maps utilizing the National Wetlands Inventory (NWI) data to help identify priority sites for acquisition and restoration. Most recently, in 2010, the Plains and Prairie Potholes Landscape Conservation Cooperative (LCC) began a wetland assessment and restorable wetland inventory to help refine priority acquisition areas. This project used Light Detection and Ranging (LiDAR) data to find depressions and substituted the NWI wherever available for existing water and wetlands to produce a layer of depressions where, if flooded, wetlands may be established (figure 2-4). Currently, the Iowa WMD consists of 75 WPAs totaling just over 25,000 acres (including fee title and both wetland and habitat easements) in 18 counties. Finally, a revision to the MOU was completed in 2012 during the Comprehensive Conservation Plan (CCP, Plan) planning process (appendix I).

Figure 2-1: Significant Events in the Establishment of the Iowa WMD

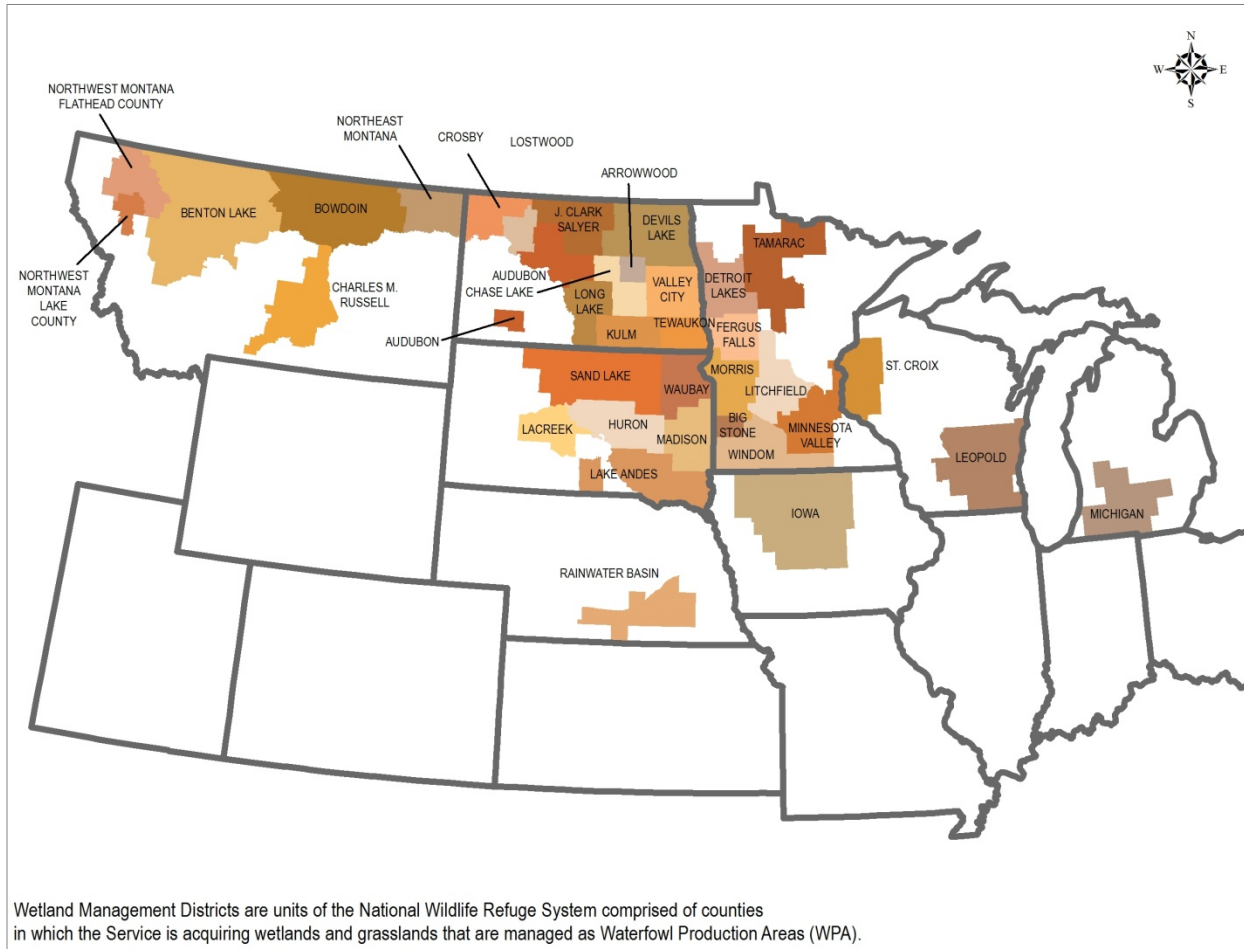

Figure 2-2: WMDs Established Under the Small Wetlands Program

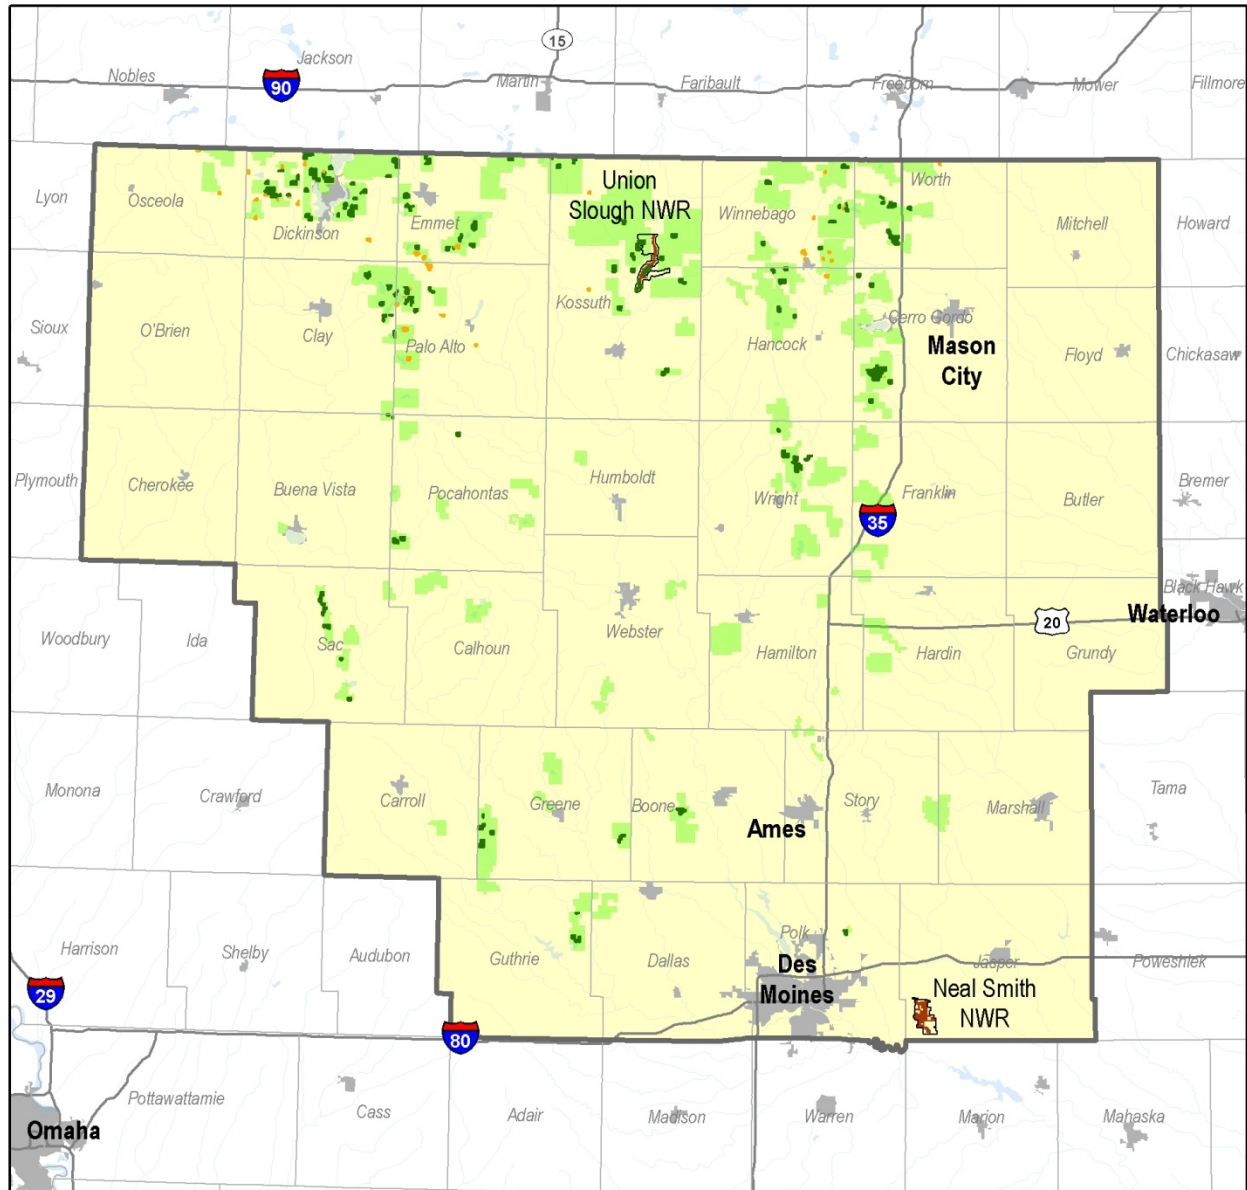

District Purposes

Iowa WMD is part of a national network of lands administered by the Service as the Refuge System. Each unit of the Refuge System has one or more purposes specified in or derived from the legal instrument that established, authorized, or expanded it. The first obligation is to fulfill and carry out the purposes of each refuge (or district) (FWS, 2006). The purposes for Iowa WMD are based upon its land acquisition authority, which is, the Migratory Bird Hunting and Conservation Stamp Act of 1934:

“ . . . as Waterfowl Production Areas subject to . . . all of the provisions of such Act [Migratory Bird Conservation Act of 1929] . . . except the inviolate sanctuary provisions . . . ” 16 U.S.C. § 718(c) “ . . . for any other management purpose, for migratory birds.” 16 U.S.C. § 715d

District Vision Statement

The vision provides a concise statement of what the district is, or what it is desired to be, based primarily upon the Refuge System mission and specific district purposes and other mandates. The Iowa WMD vision is:

Waterfowl and other winged wildlife herald the richness of resilient, productive wetlands and tallgrass prairies, bringing appreciation and satisfaction to visitors, the rewards of enduring commitments across ownerships throughout the Prairie Pothole Region of Iowa.

District Goals

The goals are broad statements that describe the desired future conditions of the district.

Goal 1: Wildlife

In partnership with the Iowa DNR and others, restore a natural diversity and abundance of waterfowl, migratory birds, and other native fauna within the Iowa WMD.

Goal 2: Habitat

In partnership with the Iowa DNR and others, conserve, restore, and expand grassland and wetland habitat managing for a natural diversity of native flora within the Iowa WMD.

Goal 3: People

In partnership with the Iowa DNR and others, promote understanding, appreciation, and support for the Iowa WMD as well as stewardship and understanding of the southern Prairie Pothole Region and its native ecosystems to visitors and local residents.

Relationship to Other Conservation Initiatives

Migratory Bird Conservation Initiatives

Several migratory bird conservation plans have been published over the last decade that can be used to help guide management decisions for the district. Bird conservation planning efforts have evolved from a largely local, site-based orientation to a regional, even intercontinental, landscape-oriented perspective. Several transnational migratory bird conservation initiatives have emerged to help guide the planning and implementation process. The one regional plan most relevant to the majority of the district is the Prairie Pothole Joint Venture Implementation Plan (<http://www.ppjv.org/>) (figure 2-5). This plan is a product of stepping-down and incorporating all other larger-scale (North American, United States, international, etc.) species and other management plans, in particular the North American Waterfowl Management Plan.

The PPJV of the North American Waterfowl Management Plan is an effort by government agencies and conservation organizations to protect and restore waterfowl habitat within the PPR of the United States and Canada. Although initially targeted at waterfowl species, emphasis within the PPJV has been extended to nongame species as well. Research sponsored by Iowa

DNR and Iowa State University has demonstrated that a variety of birds and other species of greatest conservation need have successfully re-colonized the restored habitats (Zohrer, 2005).

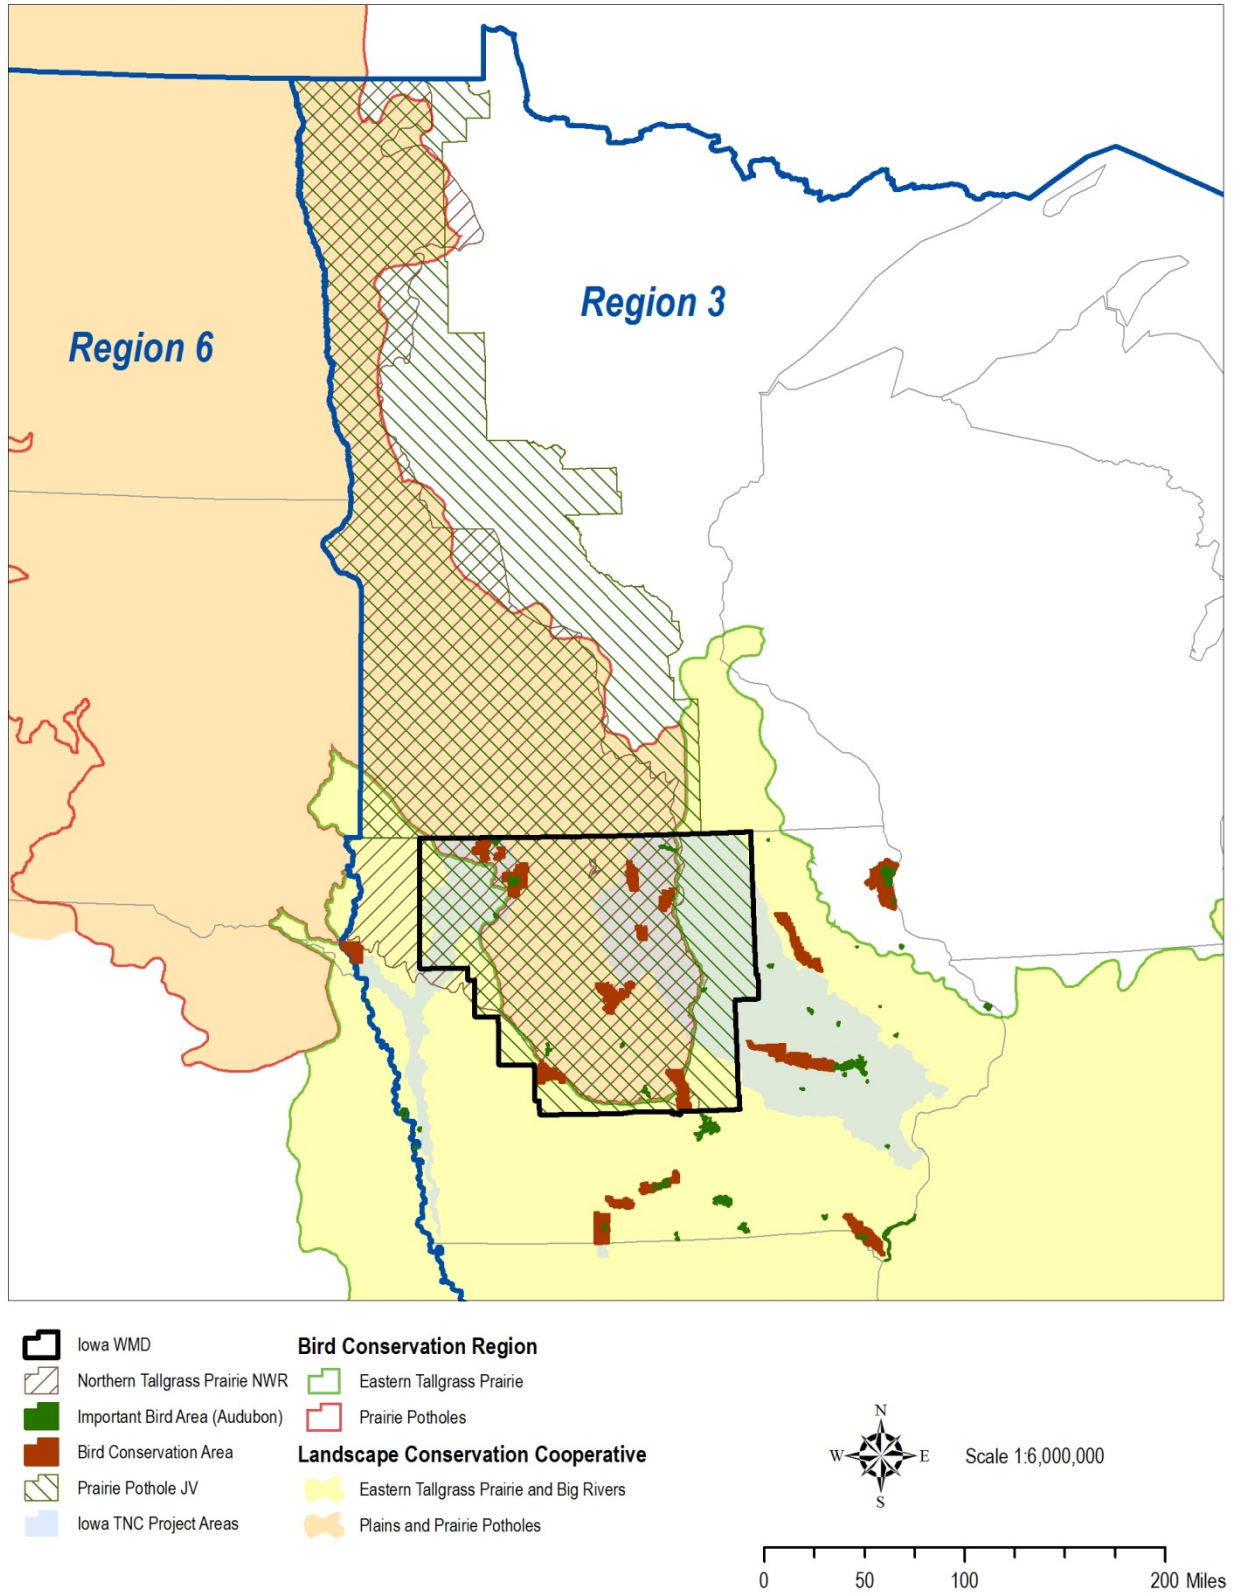

More specifically, the district lies primarily within the Prairie Potholes Bird Conservation Region (Bird Conservation Region [BCR] 11) (figure 2-5). This BCR is a glaciated area of mixed-grass prairie in the west and tallgrass prairie in the east. This is the most important waterfowl production area on the North American continent, despite extensive wetland drainage and tillage of native grasslands. Breeding dabbling duck density may exceed 100 pairs per square mile in some areas during years with favorable wetland conditions. The region comprises the core of the breeding range of most dabbling duck and several diving duck species, as well as providing critical breeding and migration habitat for over 200 other bird species, including such priority species as Franklin's Gull (*Leucophaeus pipixcan*), Yellow Rail (*Coturnicops noveboracensis*), and Piping Plover (*Charadrius melodus*). Baird's Sparrow (*Ammodramus bairdii*), Sprague's Pipit (*Anthus spragueii*), Chestnut-collared Longspur (*Calcarius ornatus*), Wilson's Phalarope (*Phalaropus tricolor*), Marbled Godwit (*Limosa fedoa*), and American Avocet (*Recurvirostra americana*) are among the many priority non-waterfowl species breeding in this region. Wetland areas also provide key spring migration sites for Hudsonian Godwit (*Limosa haemastica*), American Golden-Plover (*Pluvialis dominica*), White-rumped Sandpiper (*Calidris fuscicollis*), and Buff-breasted Sandpiper (*Tryngites subruficollis*). Continued wetland degradation and fragmentation of remaining grasslands threaten future suitability of the PPR for all of these birds.

BCR 11 contains 27 bird species listed as "Of Conservation Concern" by the Service (FWS, 2008a). This list identifies species, subspecies, and populations of all migratory nongame birds that, without additional conservation actions, are likely to become candidates for listing under the Endangered Species Act. The overall goal of this report is to identify the migratory and non-migratory bird species (beyond those already designated as federally threatened or endangered) that represent the Service's highest conservation priorities. The Service based its 2008 list of Birds of Conservation Concern primarily on the land bird, shorebird, and water bird status assessment scores. Some of the species on this list include Horned Grebe (*Podiceps auritus*), Least Bittern (*Ixobrychus exilis*), Swainson's Hawk (*Buteo swainsoni*), Mountain Plover (*Charadrius montanus*), Long-billed Curlew (*Numenius americanus*), Short-billed Dowitcher (*Limnodromus griseus*), Short-eared Owl (*Asio flammeus*), Grasshopper Sparrow (*Ammodramus savannarum*) and Dickcissel (*Spiza americana*).

Strategic Habitat Conservation

Strategic habitat conservation (SHC) is a science-based approach to conservation focused on providing landscapes capable of sustaining trust species populations at objective levels. This approach is founded on an adaptive, iterative process of biological planning, conservation design, conservation delivery, monitoring, and research. SHC is an application of the scientific method and adaptive management to conservation at multiple spatial scales. This strategic conservation approach will include all Service programs and address both habitat and non-habitat factors limiting fish and wildlife populations.

Figure 2-5: Conservation Initiatives Relevant to the Iowa WMD

As a leader in fish and wildlife and habitat conservation and management, the Service is embracing a framework designed to maximize agency efficiency and increase on the ground conservation impacts. SHC enables the Service to:

- Respond to new environmental challenges;
- Advance opportunities with new and existing partners;
- Utilize science-based tools and resources to plan and evaluate conservation efforts; and
- Continue to ensure conservation successes locally, while advancing landscape objectives.

The Service mission can be met at a landscape scale, especially in the face of climate change, by:

- Fully utilizing existing technology such as Geographic Information System (GIS);
- Becoming trained in better decision making through the Structured Decision Making process;
- Reaching out to even more partners that have the necessary expertise to advance knowledge of the resource and its needs at multiple spatial and temporal scales; and
- Being diligent and transparent in planning and decision making processes.

SHC Guiding Principles

- Habitat conservation is simply a means to attain the Service’s true goal—the conservation of populations and ecological functions that sustain them.
- Defining measurable population objectives is a key component of SHC, at any scale.
- Biological Planning must use the best scientific information available, both as a body of knowledge and a method of learning. Service understanding of ecological conditions is never perfect. An essential element of SHC is managing uncertainty through an iterative cycle of planning, doing, and evaluating.
- Management actions, decisions, and recommendations must be defensible and explicit about the nature and magnitude of potential errors.
- Conservation strategies consist of dynamic suites of objectives, tactics, and tools that change as new information enters the SHC cycle.
- Partnerships are essential, both for management and for developing conservation strategies.

Plains and Prairie Pothole Landscape Conservation Cooperative

The Service, with support and cooperation from the U.S. Geological Survey, has developed a national geographic framework for “putting science in the right places” to conserve our Nation’s fish and wildlife resources. Just as flyways provided an effective spatial frame of reference to build capacity and partnerships for international, national, state, and local waterfowl conservation, the national geographic framework provides a continental platform upon which the

Service can work with state and other partners to connect project- and site-specific efforts to larger biological goals and outcomes. By providing visual context for conservation at “landscape” scales—the entire range of a priority species or suite of species—the framework helps ensure that resource managers have the information and decision making tools they need to conserve fish, wildlife, plants, and their habitats in the most efficient and effective way possible.

The Service is using the framework as a basis for locating LCCs. Facilitated by DOI as part of its collaborative, science-based response to climate change, LCCs complement and build upon existing science and conservation efforts—such as fish habitat partnerships and migratory bird joint ventures—as well as water resources, land, and cultural partnerships. Iowa WMD is primarily within the boundary of the Plains and Prairie Pothole LCC, which is one of a network of partnerships working in unison to ensure the sustainability of America’s land, water, wildlife, and cultural resources.

The Plains and Prairie Potholes LCC is dedicated to the conservation of a landscape unparalleled in importance to a vast array of unique species whose populations are in steep decline. The LCC boundary transcends existing Service regional boundaries and the international border with Canada (figure 2-5). Currently, the Service and its partners are working to develop and apply the scientific tools necessary to determine how climate change, coupled with existing stressors such as the conversion of native prairie for agricultural purposes may affect the health and productivity of shared natural resources in this landscape. The actions of the Plains and Prairie Pothole LCC will support and supplement state wildlife action plans and enhance protection for fish and wildlife resources in the region.

Region 3 Fish and Wildlife Conservation Priorities

Every species is important; however, the number of species in need of attention exceeds the resources of the Service. To focus effort effectively, Region 3 of the Service compiled a list of Resource Conservation Priorities in 2002. The list includes:

- All federally listed threatened and endangered species and proposed and candidate species that occur in the region;
- Migratory bird species derived from Service-wide and international conservation planning efforts; and
- Rare and declining terrestrial and aquatic plants and animals that represent an abbreviation of the Endangered Species Program’s preliminary draft “Species of Concern” list for the region.

Climate Change Planning

U.S. Fish and Wildlife Service

The Service’s *Rising to the Urgent Challenge: Strategic Plan for Responding to Accelerating Climate Change* (FWS, 2010) establishes a basic framework within which the Service will work as part of the larger conservation community to help ensure the sustainability of fish, wildlife, plants, and habitats in the face of accelerating climate change. It was developed in an effort to rise up and respond to, as well as in recognition of, what is perhaps the 21st century’s largest stressor on fish, wildlife, and plants: climate change. Part of the plan’s primary purpose is to lay

out a vision for accomplishing the Service mission to “work with others to conserve, protect, and enhance fish, wildlife, and plants and their habitats for the continuing benefit of the American people” in the face of accelerating climate change. In this plan, a commitment to the Service’s vision is expressed through strategic goals and objectives that must be accomplished to sustain fish and wildlife nationally and internationally. A 5-Year Action Plan for Implementing the Climate Change Strategic Plan identifies specific actions that will lead to the accomplishment of these goals and objectives. The goals and objectives most relevant to this planning effort include the following:

- Goal 2: Develop long-term capacity for biological planning and conservation design and apply it to drive conservation at broad, landscape scales.
- Objective 2.1: Access regional climate science and modeling expertise through regional climate science partnerships.
- Objective 2.2: Develop landscape conservation cooperatives to acquire biological planning and conservation design expertise.
- Objective 2.3: Develop expertise in and conduct adaptation planning for key species and habitats.
- Objective 2.4: Incorporate climate change in service activities and decisions.
- Objective 2.5: Provide requested support to state and tribal managers to address climate change issues that affect fish and wildlife service trust resources.
- Objective 2.6: Evaluate fish and wildlife service laws, regulations, and policies to identify barriers to and opportunities for successful implementation of climate change actions.

The *Conserving the Future: Wildlife Refuges and the Next Generation* (FWS, 2011b) document is the Service’s bold, new vision for the Refuge System. This 21st-century strategic vision for the Refuge System acknowledges the broad social, political, and economic changes that have made habitat conservation more challenging since the agency last set comprehensive goals in 1999. In the intervening 12 years, the new vision states the Nation’s population has grown “larger and more diverse . . . and the landscape for conservation has changed—there is less undeveloped land, more invasive species, and we are experiencing the impacts of a changing climate.” The document includes 24 recommendations to guide the future of the Refuge System. The recommendation most relevant to this planning effort concerning climate change is:

Recommendation 2: Develop a climate change implementation plan for the Refuge System that dovetails with other conservation partners’ climate change action plans and specifically provides guidance for conducting vulnerability assessments of climate change impacts to refuge/district habitats and species as well as direction for innovation in the reduction of emissions and improved energy efficiency on federal lands.

State of Iowa

The Iowa General Assembly enacted legislation in 2007 and 2008 to create the Iowa Climate Change Advisory Council (ICCAC). The ICCAC conducted most of its business from late 2007 through the end of 2008, concluding with a final report (ICCAC, 2008) to the governor and legislature. The focus of that report was the need to reduce greenhouse gas (GHG) emissions

in the state. Some progress has been made, but much work remains to be done to reverse the general trend of increasing Iowa GHG emissions during the past two decades.

Following this report, the Iowa Legislature requested additional information on the ramifications of climate change for Iowans, and it enacted a new bill in 2009 (amendment). The amendment set in motion a review of climate change impacts and policies for the State of Iowa. The final product was another report of findings and recommendations to the governor and general assembly by the Iowa Climate Change Impacts Committee (ICIC). The major requirements of the study included the following:

- An initial review of available climate change impacts studies relevant to Iowa
- A summary of available data on recent changes in relevant climate conditions
- Identification of climate change impacts issues, which require further research and an estimate of their cost
- Identification of important public policy issues relevant to climate change impacts

Therefore, the *Climate Change Impacts on Iowa 2010* report was released in 2010 (ICIC, 2010). One of the major recommendations from this report was to, “Increase investments in state programs that enhance wildlife habitat and management and restore public and private lands.” The report stated, “Changes in climate will have a direct impact on both game and non-game species.” In general, this report sought to highlight the latest literature documenting impacts in Iowa caused by a changing climate. In doing so, several key themes emerged including:

- The world is interconnected; changes in climate can easily reverberate across the globe.
- Iowans cannot reverse global climate change alone.
- Climate extremes cause the greatest impacts on people and the planet.
- Water: Too little limits drinking water and causes disease; too much generates floods, soil erosion, and other disease; changes in precipitation may prove to be one of the greatest impacts to such an agricultural region.

While this report relates most to how Iowans might adapt to climate change, ultimately mitigation efforts will be needed worldwide to reverse the trends discussed within.

Furthermore, the Iowa Smart Planning Act was signed into law in 2010, which articulates ten Iowa Smart Planning Principles. Smart Planning Principle 8: Natural Resources and Agricultural Protection includes three relevant adaptation planning strategies:

- Identify and protect wetland areas that are critical to slow the release of water into streams during times of extreme rain events;
- Establish strategies to promote redevelopment and compact new development that will minimize the conversion of farmland and woodland for urban use, to reduce the amount of impervious surface coverage in watersheds; and
- Develop state plans and programs to help farmers incorporate environmental protection practices, such as wetland protection, wetland restoration, buffer strips,

and natural ground cover (grasses) that have been shown to lessen the “flashiness” of stream flow. Promote federal, state, and local funding for preservation of open space, farm, and forest land.

Iowa’s State Wildlife Action Plan

The Iowa DNR and over 100 public and private partners developed the Iowa state wildlife action plan with a 25-year vision for addressing concerns regarding 999 of Iowa’s birds, mammals, fish, amphibians, reptiles, mussels, land snails, dragonflies, and damselflies. Of the species considered, 147 are game species, and 297 are considered species of greatest conservation need (SGCN); nearly one third of all Iowa species are in need of conservation effort to prevent eventual candidacy for threatened or endangered status. Fish and birds have the greatest total number of species listed as SGCN, but aquatic and semi-aquatic wildlife have the highest percentages of their total number of species listed. Riverine habitats have the greatest number of SGCN among aquatic habitats, and woodlands have the most among the terrestrial habitats (Zohrer, 2005).

The vision elements and conservation actions in the plan are not specifically designed to be implemented by Iowa DNR. They are designed to provide a broad framework of actions that can be undertaken by conservationists at all levels of government, by private conservation organizations, and by private citizens. Extensive coordination will be necessary between stakeholders to make the vision a reality.

Partners for Fish and Wildlife Program

It is estimated that 73 percent of land in the United States and 98 percent of the land in Iowa is privately owned, and that the majority of fish and wildlife resources occur on those lands. Consequently, the conservation lands held by federal and state agencies and other conservation groups cannot completely provide for fish and wildlife needs. Because the habitat needs of all species of interest to the Service cannot be met solely on public lands, public funds are also expended on private lands to accomplish habitat improvements through programs such as the Partners for Fish and Wildlife Program (Partners Program).

The Partners Program provides technical and financial assistance to private landowners and tribes who are willing to, on a voluntary basis, help meet the habitat needs of the Service’s federal trust species. The Partners Program assists with projects in a diversity of habitat types, which conserve or restore native vegetation, hydrology, and soils associated with imperiled ecosystems. Locally based field biologists work one-on-one with private landowners and other partners to plan, implement, and monitor their projects. The Partners Program field staff help landowners find other sources of funding and help them through the permitting process. This personal attention and follow-through is a strength of the program and has led to national recognition and wide support.

The Partners Program is guided by a national policy (FWS, 2003) with the following objectives:

- Promote and implement habitat improvement projects that benefit federal trust species;
- Provide conservation leadership, and promote partnerships;
- Encourage public understanding and participation; and

- Work with U.S. Department of Agriculture (USDA) to implement conservation programs.

The Partners Program works in a diversity of habitat types throughout the State of Iowa. Designated as a Partners Program focus area, the Des Moines Lobe lies within the boundaries of the district. Typical Partners Program efforts within this focus area strive to restore wetlands and surrounding upland habitats to form complexes of habitat for maximum benefit to grassland and wetland migratory birds. Most of the original tallgrass prairie and wetlands within this focus area are now row crop agriculture, primarily corn and soybeans.

Over the past fifteen years, the Partners Program at Iowa WMD and Union Slough NWR has assisted with restoring nearly 3,600 acres of upland and wetland habitat in over 185 projects (tables 2-2 and 2-3). The program has a five-year target for habitat restoration of 250 wetland acres and 500 upland acres as well as a five-year target for habitat enhancement of 150 wetland acres and 250 upland acres. Primary partners in this effort include the USDA, Iowa DNR, County Conservation Boards (CCBs), Pheasants Forever, The Nature Conservancy, Ducks Unlimited, and private landowners.

This work has the potential to affect a variety of wildlife species. For example, the endangered Topeka shiner will benefit directly from wetland restoration of riverine oxbows and secondarily from both tallgrass prairie and oak savanna restoration through improved water quality. In addition, this type of restoration project will help improve habitat conditions for numerous other species such as the federally threatened western prairie fringed orchid and prairie bush clover as well as additional species of special concern to the state and other conservation agencies. Many of these species are listed as SGCN by the Iowa DNR including Buff-breasted Sandpiper (*Tryngites subruficollis*), American Bittern (*Botaurus lentiginosus*), Bobolink (*Dolichonyx oryzivorus*), and Dickcissel (*Spiza americana*).

The result of a century and a half of change on Iowa’s landscape has been a huge shift in the composition of Iowa’s plant communities and the wildlife that inhabits them. With fertile soils and a favorable climate, it is likely that much of Iowa will remain in agriculture and private ownership in the near future. Large tracts of land for biodiversity management are seldom available; therefore, utilizing a private lands approach is a critical part of overall conservation in Iowa.

Table 2-2: Past Partners for Fish and Wildlife Program Projects within the Iowa WMD

Year	Wetland		Riparian		Upland	
	Acres	Number*	Acres	Number*	Acres	Number*
1997	650.9	31	0	0	649.4	24
1998	185.8	25	0	0	97.5	10
1999	130.9	25	0	0	119.6	10
2000	44.9	13	0	1	229.1	17

2002	32.7	5	225 ft.	1	80	12

*Refers to individual projects.

Iowa DNR Private Lands Program

The Iowa DNR's Private Lands Program has also completed substantial habitat work within the district. Since the program began, over 148,000 acres of habitat restoration or improvement have been planned and nearly 70,000 acres have been implemented (figure 2-6). This includes activities such as converting cropland to grassland, interseeding, prescribed burning, woody invasion removal, wetland restoration, and edge feathering.

Table 2-3: Partners for Fish and Wildlife Program Projects within the Iowa WMD Recorded in HabITS*

Year	Wetland		Upland		Invasive Species		Wood Duck Box/ Nesting Structure
	Acres	Number**	Acres	Number**	Acres	Number**	Boxes
2001	1	1	1	1	0	0	0
2002	37.2	6	76.5	11	0	0	0
2003	23.5	4	37.1	6	0	0	5

**Refers to individual projects.

Bird Conservation Areas

Bird Conservation Areas (BCAs) have been designated by Iowa DNR as significant habitat complexes for birds generally following guidelines established by Partners in Flight. They are areas of 10,000 acres or more made up of a core area of permanently protected natural habitat surrounded by a matrix of public and private natural lands. While targeted specifically at birds, large tracts of natural habitat such as these have been identified as providing significant habitat protection and restoration potential for SGCN. Seven BCAs occur within the district: Spring Run in Dickinson County, Eagle Lake Wetlands in Winnebago and Hancock Counties, Dewey's Pasture in Emmet, Palo Alto, and Clay Counties, Union Hills in Cerro Gordo County, Lower Morse Lake in Wright County, Raccoon River Savanna in Guthrie County, and Chichaqua-Neal Smith in Polk and Jasper Counties (figure 2-5).

Important Bird Areas

Iowa Audubon's Important Bird Areas (IBAs) Program is a citizen-led, science-based and data-driven bird conservation initiative. The district contains nine IBAs with joint BCA designation and 18 other IBAs scattered across its counties (figure 2-5). The intent of the program is to:

- Identify, recognize, and prioritize habitats that support the most seriously declining species of birds;

- Monitor bird populations and habitat conditions, and organize education programs at designated IBA sites where appropriate; and
- Work with landowners and land managers to develop and implement long-term conservation plans to protect, restore, enhance and manage IBAs according to their environmental threats and conservation needs.

Wetland Reserve Program

The Wetland Reserve Program (WRP) was established with the 1990 Farm Bill. Major flooding that covered Iowa and the Midwest in 1993 led to an effort designed to get development and agriculture out of areas prone to flood and return them to their original wetland condition. Iowa DNR in cooperation with USDA Natural Resources Conservation Service (NRCS) and other partners have been able to acquire permanent easements in nearly every county within the district (figure 2-6). Iowa DNR is working with landowners to enroll lands in the WRP and acquire their residual value so that these lands will be managed for wildlife.

According to the NRCS, the cumulative acres enrolled in WRP in the State of Iowa in 2008 totaled just over 80,000. In 2010, an additional 3,548 acres were enrolled in WRP across the state, down from 4,184 acres enrolled in 2009. Cumulatively then, in 2010, nearly 88,000 acres were enrolled in WRP across the state.

Furthermore, the Wetlands Reserve Enhancement Program, which is a component of WRP and is administered through NRCS, is and will continue to be an important habitat protection tool used in the district. This program has been instrumental in stretching the funding of the Small Wetlands Program in Iowa by enrolling private lands in WRP. In this program, willing landowners in priority complex areas work with Iowa DNR biologists to enroll their properties in WRP. Once the properties are accepted by NRCS, Iowa DNR completes and carries out restoration plans. The Service, as a partner in the program, then targets this property for acquisition in either a permanent WPA easement or purchase as a WPA through fee title. Throughout this process both acquisition and restoration costs are greatly reduced.

Conservation Reserve Program

The USDA's Conservation Reserve Program (CRP) protects millions of acres of American topsoil from erosion and safeguards the Nation's natural resources. By reducing water runoff and sedimentation, CRP protects ground water and helps improve the condition of lakes, rivers, ponds, and streams. More recently, an emphasis has been placed on wetland and native prairie restoration as a condition of enrollment so the program has also become a major contributor to increased wildlife populations in many parts of the country.

In Iowa, new participants are making their lands available for wildlife habitat restoration. This presents an important role for the district to lend its restoration experience and expertise to make these CRP restorations as high quality as possible. According to the USDA Farm Service Agency, the total acres enrolled in CRP within the 35 counties of the district were 375,867 in 2010. This was the fourth year in a row for a decrease following an eight-year increase. This is likely due to recently high commodity prices, which are causing some producers to terminate their CRP contracts early to get the land back into row crop as soon as possible. Peak years for the district with just over 450,000 acres enrolled were 1993 and 1994. Guthrie County had the most acres (nearly 28,000) enrolled in 2010 while Cherokee had the least (just over 3,000).

-  Easement
-  NWR Approved Acquisition Boundary
-  NWR Owned Land

Class Description

-  Federal Land
-  State Land
-  Other Conservation Land (County, Local, WRP)
-  DNR Private Lands Habitat Projects
-  TNC Land

*Protected land does not necessarily imply permanency. Conservation Reserve Program as well as the Service's Partners for Fish and Wildlife Program project locations were unavailable.

Other Conservation Lands in the Area

The district is administered by the staff of the Union Slough NWR, which was established in 1938 to provide refuge and breeding ground for waterfowl and other migratory birds. The refuge proper is 2,916 acres including 70 acres of easement (FWS, 2011a). The refuge also manages 160 acres of the Tallgrass Prairie NWR that were purchased near the Prairie Smoke WPA (FWS, 2011a).

The Northern Tallgrass Prairie NWR overlaps the majority of the district in Iowa and continues up into northern Minnesota along its western border. The refuge was established in 1999 with a primary goal of preserving 77,000 acres of native prairie and buffer lands at widespread locations within the historic range of the northern tallgrass region of Minnesota and northwest Iowa. Currently, the refuge includes over 5,200 acres in fee title, easement, and under lease or agreement (FWS, 2011a).

Neal Smith NWR is in the far south central part of the district. It was established in 1990 to re-create a large expanse of tallgrass prairie and oak savanna. Currently, the refuge is 5,387 acres (of the 8,645 acres approved for acquisition) (FWS, 2011a). However, an expansion was recently approved, which added 3,207 acres to the existing acquisition boundary of the refuge.

Nearly 190,000 acres of state land exist within the district including 27 state parks, 32 state preserves, over 160 Wildlife Management Areas (WMAs) and eight recreation areas. Nearly 2,000 acres of county parks and preserves exist within the district as well. The Nature Conservancy also owns several preserves within the district and continues work in two major project areas: Boone River Watershed and Little Sioux Valley (figure 2-5). Finally, the Department of Defense and Department of Energy maintain the Red Rock and Saylorville Reservoirs, both of which contain recreational land around them (figure 2-6).

The Planning Process

Public Involvement

Initial conversations about comprehensive planning for the Iowa WMD began mid-year of 2009, however the official kick-off was in December of 2011. In addition to identifying information essential to the planning process, district staff also developed a communication plan and a preliminary list of issues to be addressed in the CCP. Both Iowa DNR and Tribal representatives from the Sac and Fox Tribe of the Mississippi were invited to join the core planning team.

Dickinson County Public Open House

The public scoping period began on January 30, 2012 and lasted for 30 days. Approximately 400 letters were mailed to stakeholders announcing the public scoping period, inviting them to the open houses, and explaining how to comment. The comment period

was also announced through a press release sent to a wide variety of media in Iowa and Minnesota. A series of open houses was held in Clear Lake, Algona, Spirit Lake, and Jefferson in February of 2012. The open houses gave the public an opportunity to discuss issues with district and state staff and regional planners. Thirty-nine people attended the open houses and 25 written comments were received during the public scoping period.

On April 10, 2012, an internal scoping review took place at the FWS Regional Office in Bloomington, Minnesota to further develop and refine the list of issues to focus the CCP around. Finally, during the first week of June 2012, the district hosted a planning workshop, which included nearly 40 invitees from the Service (regional office, district, HAPET, Partners Program and Neal Smith NWR staff), Iowa DNR, Iowa State University, University of Minnesota, University of Northern Iowa, and the Kossuth County Conservation Board. The workshop included a variety of exercises to review the issues and begin to develop the alternative ways of managing the district over the next 15 years.

Partner Planning Workshop

Planning Issues

An issue is any unsettled matter that requires a management decision, such as an initiative, opportunity, resource management problem, threat to the resources of the unit, conflict in uses, public concern, or the presence of an undesirable resource condition (FWS, 2000). Issues arise from both within and outside of the Service. Public scoping as well as scoping of district and regional Service staff and other agencies produced ten issues that suggest alternative ways of managing the district and several others that did not.

Issues that Drive an Alternative

Wildlife

- What species group and life cycle is the focus of district management?

The primary purposes of the district are to serve as production areas for waterfowl and to provide habitat for migratory birds. However, WPAs provide habitat for a variety of other wildlife as well. Therefore, management of WPAs should primarily be for waterfowl production and other migratory birds. Resident wildlife or other species should be a secondary focus. Focusing management on all species can lead to not managing for any one species or group very well.

Habitat

- How should the district address the decrease in populations of grassland-dependent birds due to the decline of grassland habitat?

- How can the district improve/maintain upland habitat quality?
- What wetland type is the focus of district management?
- How can the district improve/maintain wetland quality?
- How can the district manage food plot use?

While much of the surrounding landscape is agricultural row crop, the district provides a real opportunity to build larger grassland/wetland habitats. However, the use of cooperative farming as a management tool has kept even the district habitat relatively small and somewhat fragmented. Agricultural row crop is not ideal habitat for grassland-nesting birds, in decline across much of their native range. Furthermore, many grassland-nesting birds have differing habitat structure requirements. Some species prefer thick, dense, tall cover; others need shorter, thinner cover. Meeting all of these needs is challenging in a landscape with limited habitat.

The large size of the district makes restoration of complete plant communities in both the upland and wetland (primarily the wetland) difficult. Other challenges such as how to best manage the invasive woody vegetation across the district, the expense and limit of local ecotype seeds, and the time and size of crop conversion to natives are also present. Furthermore, the Iowa DNR has numerous shallow lake (water quality) improvement projects underway on state land with many more planned. Restorations include in-lake management strategies as well as on-going efforts to implement best management practices on public and private land in the watersheds.

Since 2006, the amount of land under cooperative farming leases across the district has decreased while the total number of acres in WPAs has increased. Currently, the Iowa DNR manages approximately 21,200 acres of WPAs of which approximately 17 percent is under a cooperative farming lease. The Iowa DNR has a goal of seeding at least 500 acres of row crop agriculture in WPAs to native tallgrass prairie species during the 2013 season. This is also an annual target for the district over the next 15 years as described in chapter 4 as an objective. This is the result of recent collaborations between the Service and Iowa DNR to make it a district priority to convert cooperative farmed land to perennial cover at a more rapid rate.

Currently, the district manages complexes that contain a variety of wetland types often within the watershed of a shallow lake owned by the State of Iowa. However, the wetland type the district will focus on in the future will be determined primarily by the habitat needs of the focal species group and life cycle. This is also true for the use of food plots. Currently, they account for approximately three percent of the total upland WPA acres and are used to discourage depredation on private land, provide winter food, and improve recreational opportunities. However, there is a desire for future use to be eliminated or reduced in number and more strategically located.

Strategic Land Protection

- How will the district address the decreasing purchasing power of existing funds?
- What are the district's priority areas for acquisition?

In general, the public supports growing the district both for wildlife-dependent recreational opportunities as well as to improve/protect water quality. However, much of the land within the district is privately owned, and much of that land is in row crop agriculture. High commodity

prices in recent years have driven land values within the district to an all-time high, therefore decreasing the amount of land that can be acquired with existing traditional funding. Current acquisition is based on priority complexes established by the state in conjunction with the Service many years ago. Recently, however, a project was completed that could aid in determining the restorable wetlands left within the State of Iowa. This and other new information could help refocus priority areas for acquisition.

People

- How can the district promote awareness and understanding of WPAs as well as educate the public on the importance of their management?
- What public uses can the district allow that are appropriate and compatible with the Service and Refuge System mission and meet the public demand for more recreational opportunities?

The purpose of and reason for managing WPAs is not well known by some adjacent landowners, local communities, and larger cities within the district (especially by non-consumptive users). Therefore, the support and appreciation of these sites is lacking and better stewardship on adjacent private land (minimize overspraying and loss of wetland/grassland marginal areas) is desired. Marketing and utilization of the private lands and easement programs for the Service as well as the state could be improved across the district.

While WPAs are generally open to hunting (unless deemed a “waterfowl refuge” by the state), fishing, trapping by law, and other public uses have not yet been determined appropriate and/or compatible for the district. In general, there is demand from the public for more recreation (hiking, environmental education, etc.), wildlife observation opportunities (bird watching, etc.), public access, and hunting opportunities. Some of the specific public use requests for the district include the following:

- Ride horses
- Ride bikes
- Train dogs
- Operate motorboats
- Geocache
- Creatively write, paint, and photograph

Alternative Development

Four management alternatives (including the no action alternative) were developed based on the issues determined during scoping. The primary drivers for each alternative were focal species group and lifecycle. Alternative D, the preferred alternative, constitutes this CCP and is mostly a combination of the other alternatives (including parts of the no action alternative). Breeding waterfowl, primarily represented by Mallard and Blue-winged Teal, is the focus for management activities. The dominant activity is restoring cropland to perennial grassland. Other “elements common to all alternatives” that are also a part of the preferred alternative include the following:

- The general management direction in this plan will apply to all district properties in which the Service has acquired an interest across the 35 counties.
- Existing WPAs or other district properties will be inventoried as necessary; any new techniques implemented will be monitored as necessary to allow for adaptive management; and research will be designed when and where it was needed to support and/or guide management.
- Since one of the goals of refuge/district planning is “to provide a basis for adaptive management by monitoring progress, evaluating plan implementation, and updating refuge plans accordingly” (FWS, 2000), the adaptive management process will be utilized in the district.
- The portions of three WPAs—Jemmerson Slough (Dickinson County), Elk Creek Marsh (Worth County), and Rice Lake (Winnebago and Worth Counties)— currently closed by state regulation as waterfowl refuges will remain closed.
- Within two years of CCP approval, it will be proposed through the federal rulemaking process to implement the following regulation on the Service’s fee title property within the Iowa WMD: “You may only use or possess approved nontoxic shot shells while in the field, including shot shells used for hunting wild turkey.” This requirement would be in line with current regulations at 50 CFR 32.2(k).
- The district will attempt to reduce its contribution to climate change as well as monitor the effects of climate change in the district.

Prepare NEPA Document and Draft Plan

All of the internal and public input was used to write an EA and Draft CCP, which was released for public review and comment. The 30 day review and comment period began on Monday August 19th, 2013 and was announced through postcards, news releases, and two open house meetings in Algona and Spirit Lake. Two hard copies of the document were made available for public review at the Algona and Spirit Lake libraries, a digital copy was available on the project’s website, and CDs were available at the open house meetings. Ten people attended the open houses, and five comments were received from four different commenters. Three comments were received from the same individual, one comment was from another federal agency, and one comment was on behalf of two different non-profit public interest and environmental advocacy organizations.

Prepare and Adopt Final Plan

Each of the comments received were considered in finalizing the CCP and responded to in appendix J. This CCP will guide management on the district over a 15-year period providing general direction for managing habitat, wildlife, and visitor services at Iowa WMD. It will also guide preparation of more detailed step-down management plans for specific resource areas.

Inventory, Monitoring, and Research

Following approval of the CCP and public notification of the decision, implementation will begin. Funding and staff time will be allocated to implementation of the CCP as appropriations and budgets allow. Development of a stepped down Habitat Management Plan (HMP) and other plans (i.e., Visitor Services Plan) will begin and serve to guide habitat management, restoration

and reconstruction priorities, and public use. A companion Inventory and Monitoring Plan or additional chapters on inventory and monitoring appended to the HMP will be written to guide the district's priorities for monitoring. Information gained via inventories, monitoring, or research activities will allow the station to evaluate its progress in achieving the planning unit purposes, vision, and goals. The associated step-down plans will address habitat and/or population objectives and provide a means for evaluating the effects of management activities and public use. Through adaptive management, evaluation of monitoring, and research results may indicate the need to modify district objectives or strategies.

Step-Down Management Plans

The CCP is a plan that provides general concepts and specific wildlife, habitat, and people-related objectives. Step-down management plans provide detail to managers and employees who will carry out the strategies described in the CCP. The district staff will develop the step-down plans listed in table 2-4 after completion of this CCP.

Table 2-4: Step-Down Management Plan Completion Schedule for the Iowa WMD

Step-Down Management Plan	Amount of Time for Completion after CCP Approval
Habitat Management Plan	3 years
Inventory and Monitoring Plan	3 years
Visitor Services Plan	4 years

Plan Review and Revision

The CCP is meant to provide guidance to the district manager and staff over the next 15 years. However, the CCP is also a dynamic and flexible document, and several of the strategies contained in this plan are subject to uncontrollable events of nature. Likewise, many of the strategies are dependent upon Service funding for staff and projects. For these reasons, the recommendations in the CCP will be reviewed annually and revised if necessary (FWS, 2000). The annual plan review process will include an evaluation of changing information and ecological conditions related to climate change. If significant changes are identified that compromise the district's purpose, vision, or goals, then the CCP will be revised. The CCP will be revised every 15 years or sooner when significant new information becomes available, ecological conditions change, major district expansion occurs, or when determined necessary by the periodic review (FWS, 2000). All plan revisions will follow the Service's planning process and will be compliant with NEPA. Minor plan revisions that meet the criteria of a categorical exclusion will be handled in that manner; however, if the plan requires a major revision, then the CCP process starts anew at the preplanning step (FWS, 2000).

Chapter 3: District Environment and Current Management

In this chapter:

[Physical Environment](#)
[Habitat](#)
[Wildlife](#)
[People](#)

This chapter describes the existing physical, biological and social environment of the Iowa Wetland Management District (WMD, district) and its surroundings. It also described the current management activities that are occurring on district land.

Physical Environment

Geographic Setting

The Iowa WMD is part of the larger Prairie Pothole Region (PPR) (figure 1-2). This geographic area of central North America, mostly the Midwestern Great Plains, consists primarily of midgrass and tallgrass prairies interspersed with wetlands. Stretching northwest from northern Iowa through southwest Minnesota, eastern South Dakota, eastern and northern North Dakota, southwest Manitoba, and southern Saskatchewan to southeast and east-central Alberta (and even a little of northern Montana), the region is covered with thousands of shallow, sometimes seasonal ponds known as potholes or sloughs. The area is the summer home and breeding grounds of some 45 million mallard, pintail, gadwall, and teal ducks as well as many other shorebirds, songbirds, and gamebirds.

More specifically, the Iowa WMD acquisition boundary includes a 35-county area in north-central and northwest Iowa (figure 1-1). The district spans from the Minnesota border to Des Moines, from Cherokee to Grundy Center, and from Guthrie Center to Newton. The district includes the cities of Fort Dodge, Spencer, Mason City, Clear Lake, Marshalltown, Webster City, and Charles City. The acquisition boundary encompasses over one-third of the State of Iowa including both the largest county by size (Kossuth) and the largest county by population (Polk).

Current Management

The geographic setting of the district and its surroundings cannot be managed.

Ecosystem Setting

At the time of the periodic advance and retreat of glaciers, the district was a mix of grasslands and forests of spruce, aspen, and oak. Stretching north of Des Moines—in areas where the ice had melted—marshes, wetlands, and bogs were common. This environment supported a variety of herbivores, revealed today in fossils, including mammoth, mastodon, giant ground sloth, musk ox, a variety of bison, and elk. However, within a few centuries, temperatures warmed and the ice melted for the last time. New forests filled the river valleys, and prairies stretched west and south with marshlands to the north (State Historical Society of Iowa, 2010).

Two ecoregional provinces are represented in the district: Eastern Broadleaf Forest and Prairie Parkland (Bailey, 1995). Within the Eastern Broadleaf Forest Province the district lies within the Minnesota and Northeast Iowa Morainal Oak Savanna section. Within the Prairie Parkland Province the district lies primarily within the North-Central Glaciated Plains section with a small portion in the Central Dissected Till Plains. Furthermore, the district lies primarily within the Southern Des Moines Lobe and Upper Minnesota River-Des Moines Lobe subsections with much smaller portions reaching into seven other subsections (figure 3-1). The Des Moines Lobe is also recognized as a landform of Iowa (figure 3-2) and is described in the [Topography and Geology](#) section below. A smaller portion of the district also stretches into the Northwest Iowa Plains, Iowan Surface, and the Southern Iowa Drift Plain landforms; however, these are most prevalent farther to the northwest, northeast, and south, respectively (Prior, 1991).

Current Management

The district manages the ecosystem setting primarily through activities designed to restore cropland to perennial grassland in the uplands and to wetlands in the lowlands. Wetland restoration is directly linked to generally improved hydrology.

Topography and Geology

The landscape of the district is considered geologically young, as it was affected by the most recent glacial advance in Iowa. The Pre-Illinoian (over two million years ago) and Illinoian (300,000 to 130,000 years ago) glacial deposits are buried under the Wisconsinan deposits from about 50,000 years ago. As the environment cooled, a large ice sheet formed in the Hudson's Bay region and began to spread south. One lobe entered central Iowa and moved as far south as Greene County. Then, as the climate warmed about 30,000 years ago, this lobe retreated.

As temperatures cooled again, another glacier known as the Des Moines Lobe, entered Iowa and moved down through its center to the modern-day city of Des Moines about 17,000 years ago. By 15,000 to 12,000 years ago, the ice sheet was gone, leaving behind a flat to undulating terrain. The landscape was poorly drained and filled with pebbly deposits from the stagnant decaying ice; sand and gravel from swift meltwater streams; as well as clay and peat from glacial lakes. The landscape was also left devoid of any loess deposits since the ice sheet was still covering it while those deposits were occurring elsewhere in the state. Today, glacial moraines form prominent features in the area including Ocheyedon Mound in Osceola County, Pilot Knob in Hancock County, and Pilot Mound in Boone County.

Current Management

The topography and geology of the district and its surroundings cannot be managed.

Figure 3-1: Bailey's Ecoregional Provinces, Sections, and Subsections for the Iowa WMD

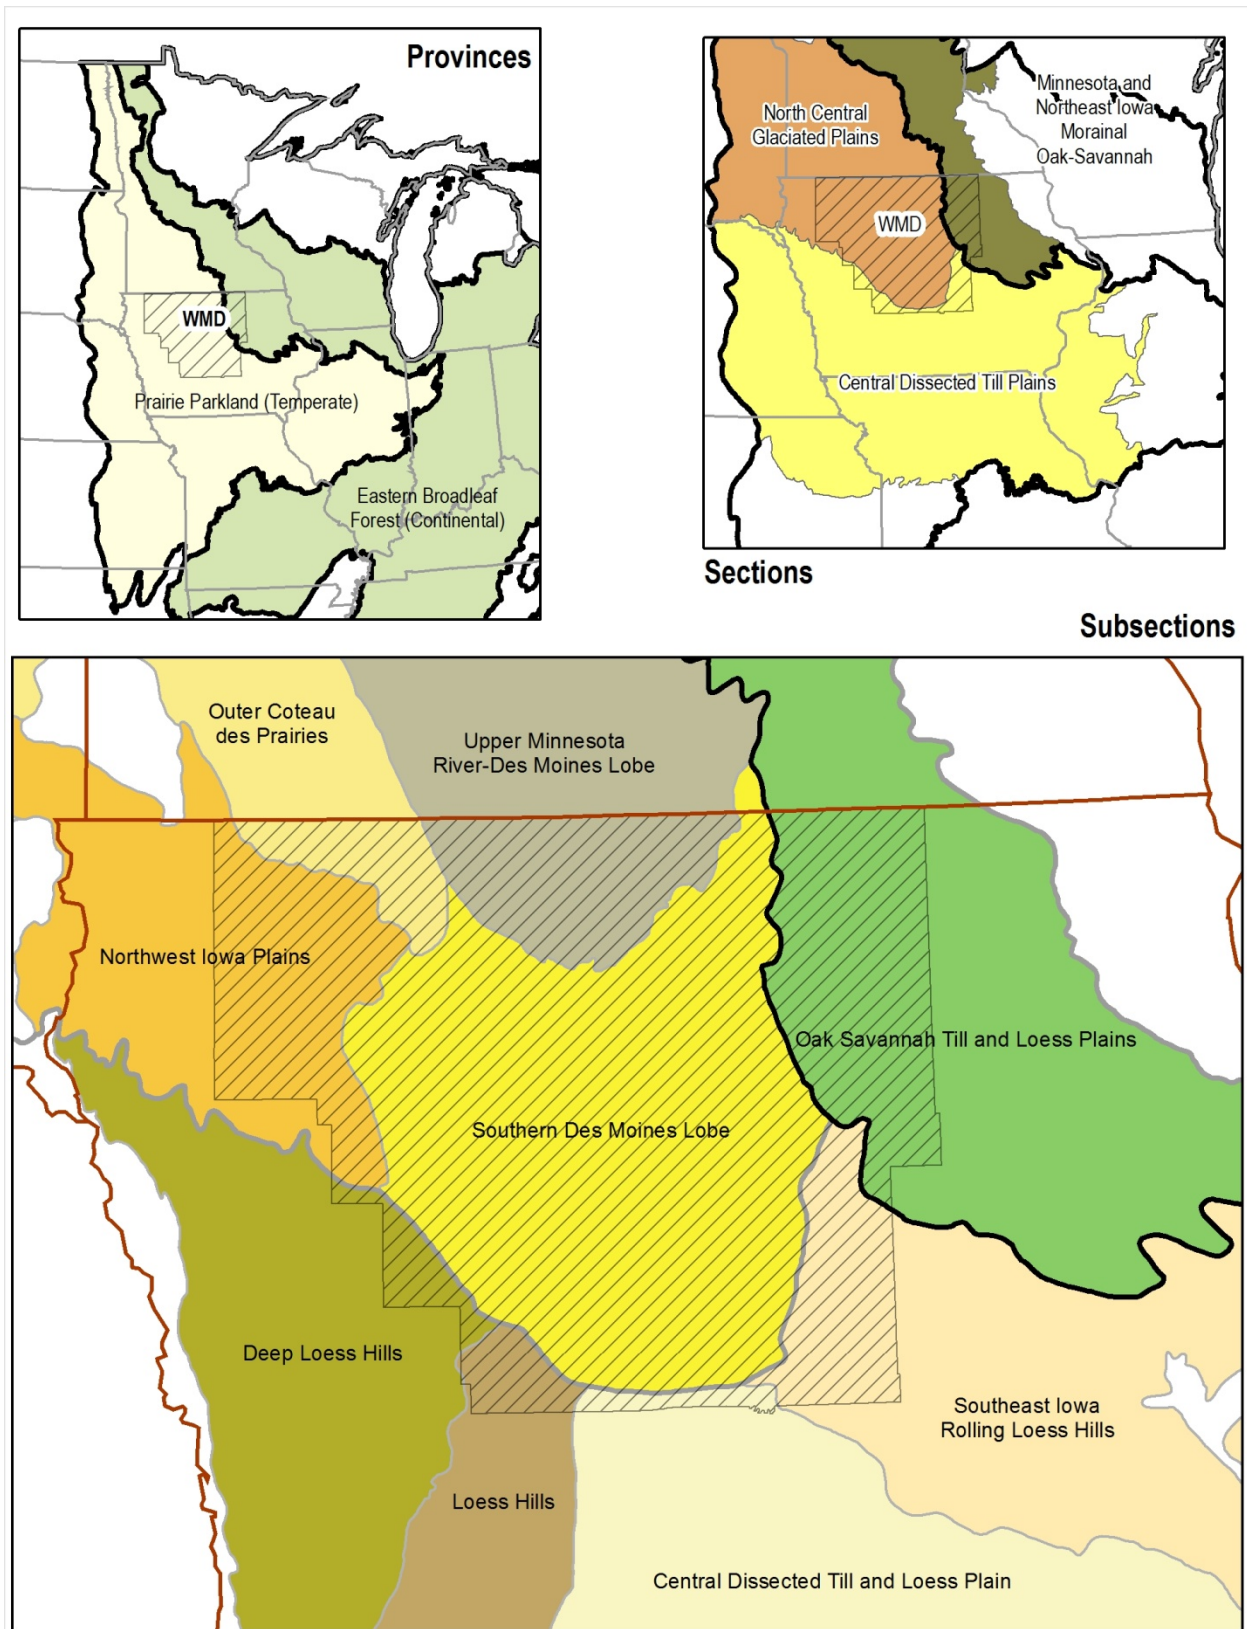

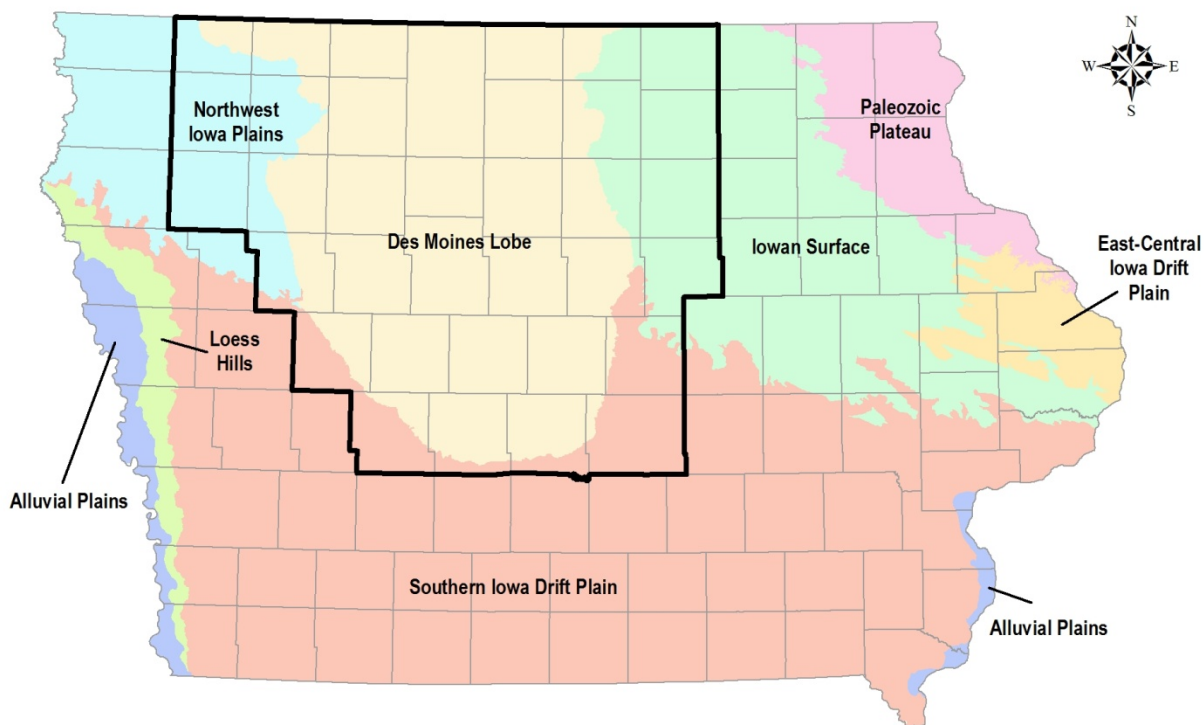

Figure 3-2: The Landforms of Iowa

Climate

The district climate is characterized as extreme mid-continental or humid continental with warm, usually hot, and humid summers and cold, snowy winters. The average summer temperature is 76 °F, and the average winter temperature is 33 °F. The July high averages 85 °F while the January low averages 8 °F. The average annual daytime relative humidity is around 72 percent,

increasing across the district from southwest to northeast. Prevailing winds are from the northwest with average wind speeds of 11 miles per hour.

Total annual precipitation increases across the district from the northwest to the southeast with an average of 30 inches. About two-thirds of this precipitation falls between April and September with a peak in late spring/early summer. Average annual snowfall is around 31 inches. The length of the growing season varies from 135 days in the northwest portion of the district to 155 days in the southeast portion. An approximate twenty-year drought cycle occurs in Iowa, which may be important in limiting the occurrence of some prairie species and certain northern wetland species and is critical in restricting woody species (Eilers and Roosa, 1994).

Predicted Change

Iowa is no exception to the well-documented changing climate across the globe (ICCIC, 2010). Geologic records of Iowa show that the state's climate has always been changing, although at a slower rate than today. Statistically significant changes in Iowa's precipitation, streamflow,

nighttime minimum temperatures, winter average temperatures, and dewpoint humidity readings have occurred during the past few decades. Iowa has already been experiencing warmer winters, longer growing seasons, warmer nights, higher dewpoint temperatures, increased humidity, greater annual streamflows, and more frequent severe precipitation events than were prevalent during the past 50 years (ICCIC, 2010).

Regardless if the impacts from such changes seem positive or negative; it is likely that these trends will continue, especially with increased global release of greenhouse gas (GHG) emissions. Unfortunately, Iowa is among the states with the largest GHG emissions per capita. However, Iowa is also among the states that could benefit the most economically by mitigating climate change using energy efficiency and renewable sources of energy (ICCIC, 2010).

More specifically, the PPR of Iowa appears to be particularly vulnerable to impacts from climate change. Even though much of the land in this area is in row crop agriculture, most of what is left of the state's wetlands also occur here. Since climate, precipitation, and temperature heavily influence the functionality of wetlands, these systems are expected to change dramatically with the changing climate. The most recent literature (Johnson et al., 2010) predicts the Iowa portion of the PPR will become the most dynamic and therefore productive when compared to the western portion of the PPR that is expected to dry significantly. However, the literature also suggests that the area will have "too few functional wetlands and nesting habitat to support historic levels of waterfowl and other wetland-dependent species."

According to the *Iowa Climate Change Adaptation & Resilience Report* (EPA, 2011), Iowa's climate has changed in the following ways:

- Precipitation in Iowa has increased since the 1940s: Total annual precipitation has increased about 10 percent; more rain falls during spring and early summer with more heavy downpours.
- Stream and river flow have increased about 20 to 50 percent since the 1940s: More days have high stream flow in central Iowa, and spring soil moisture is close to saturation more frequently.
- Statewide winter temperatures have increased: On average, there are about five more frost-free days than in 1950; thaw-freeze cycles are more frequent.
- Wind speeds have declined over the last 30 years, potentially worsening air quality.

These increases are predicted to continue well into the future. Floods, heat waves, and severe weather events are all also predicted to increase with these changes in Iowa's climate.

In general, these trends are similar to those found throughout the PPR from 1906 through 2000 (Millet et al., 2009). More specifically, the western portion of the PPR, which includes the Dakotas and portions of Montana and Canada, has been getting drier while the eastern portion, which includes Iowa and southwestern Minnesota is becoming wetter. As this gradient steepens, the productive wetland ecosystems of the PPR will shift and shrink.

Historically, the climate of the western (portions of Montana, Saskatchewan, and Alberta) and eastern (Iowa and southwestern Minnesota) portions of the PPR would have limited wetland productivity due to either insufficient moisture and very long time between vegetation cover change or slow vegetation cover change, prolonged lake-marsh conditions, and too much water, respectively (Johnson et al., 2010). The most dynamic and therefore most productive wetlands

would have occurred in the middle of these two extremes, across the Dakotas and parts of Canada.

Three climate change scenarios, (temperature increase by 2 °C, 4 °C, and 4 °C plus a 10 percent increase in precipitation) suggest that in the future, the eastern portion of the PPR could see improvements in wetland productivity (Johnson et al., 2010). A dryer climate could create a more balanced water/vegetation cycle, more dynamic wetlands, and therefore more productive wetlands. This both highlights the importance of the Iowa WMD within a changing climate but also poses a potential conservation challenge since much of the area has been drained and plowed for agriculture. It seems likely that this area will “have too few functional wetlands and nesting habitat to support historic levels of waterfowl and other wetland-dependent species” (Johnson et al., 2010). The challenge is further compounded by the high cost of wetland and grassland restoration in Iowa, high commodity prices, increased agricultural desires, and in turn high land values. Restoration of drained wetlands in Iowa, although expensive, could help diminish the effects of climatic drying and droughts in the western portion of the PPR (Millett et al., 2009). If any of these scenarios hold true, climate change would strongly reduce the contribution of the western PPR to overall wetland-associated biodiversity and would make the eastern PPR much more important. However, significant wetland restoration would have to occur in the eastern PPR to offset less productive conditions in the western PPR (Millett et al., 2009). Furthermore, adaptation of farming practices in wetland watersheds may buffer the effects of climate change on wetlands (Johnson et al., 2010).

Overall, a decrease in water supply to wetlands in the western PPR will likely cause significant shifts in plant communities either as direct responses to water level changes or indirectly through altered soil chemistry, decomposition, and disturbance regimes. For example in Minnesota, calcareous fens, providing habitat for a relatively large portion of rare plant species, may have reduced flow from lower hydraulic head in the ground water recharge favoring non-calciphitic vegetation (Galatowitsch et al., 2009). Unfortunately, several invasive species, including reed canarygrass, will also be favored. A shortened hydroperiod for wetlands will also severely affect vertebrates because of their longer life cycle requirements. These changes (based on a doubling of carbon dioxide output) could cut the U.S. mid-continent breeding duck population in half (Johnson et al., 2010).

The Soil Resource

The parent material of the district is all sedimentary rock including shales, sandstones, limestones, and dolomites. The western one-half is from the Cretaceous Era, the eastern one-half is from the Middle Paleozoic Era featuring Silurian, Devonian, and Mississippian Periods. The southern portion is from the Upper Paleozoic Era featuring Pennsylvanian and Permian Periods. The soils of the district are those typical of much of the Midwest, primarily mollisols with some alfisols. Mollisols naturally form under grassland cover with deep organic matter and are prime farmland especially if drained. Alfisols naturally form under hardwood forest cover with clay-enriched subsoil and high native fertility and are also prime farmland (figure 3-3).

Scale 1:2,000,000

Changes to the soil resource, such as erosion, are common occurrences in Iowa. It is well known that land use has a large influence on soil erosion rates and that soil erosion has a negative influence on soil fertility and its overall production potential (farmers often have to add fertilizer to maintain crop production). In the 1950s, after recognizing the increased potential for soil erosion under modern agriculture, the USDA developed soil-loss tolerance values, also known as “T-value.” This represents the amount of erosion loss the soil can withstand without sacrificing long-term productivity. The T-value for most soils in Iowa is 5 tons/acre/year. While the T-value is a useful concept for maintaining long-term sustainability of the site, there are conditions where those values could result in excessive sediment delivery to receiving waters to the detriment of fish and other aquatic organisms. In fact, Montgomery (2007) compiled studies from across the globe and confirmed that erosion rates from conventionally plowed agricultural fields average 1–2 orders of magnitude greater than rates of erosion under native vegetation and rates of soil production. Many of the erosion rates from fields in this study were at or above T-value, while most rates from native vegetation were less than T-value.

The Science-based Trials of Rowcrops Integrated with Prairies (STRIPs) project through Iowa State University at Neal Smith National Wildlife Refuge (NWR, refuge) has had similar results. The project is looking at the impacts of integrating small strips of prairie within row-cropped agricultural landscapes. Treatments consist of varying proportions of perennial vegetation within a row crop system. The 10 percent perennial vegetation treatments either have the perennial vegetation all at the bottom of the watershed or in contour strips distributed from the lower to the upper portions of the watershed. The 20 percent perennial vegetation treatment has contour strips distributed across the watershed. Two additional watersheds located adjacent to the study area with 100 percent reconstructed native prairie are also included for comparison. Preliminary data shows that from 2008 to 2012 soil lost from watersheds that contain 100 percent agricultural fields ranged from over 19,000 lbs./acre/year to over 1,000 lbs./acre/year. Soil lost from watersheds with the 20 percent perennial vegetation treatment ranged from 960 lbs./acre/year to 32 lbs./acre/year. Soil lost from watersheds with 100 percent reconstructed native prairie ranged from 300 lbs./acre in 2010 to 118 lbs./acre in 2011. Therefore, wetland and grassland cover types like those in the district are not only contributing less to soil erosion but are also trapping runoff water, soil, and nutrients from adjacent agricultural land. Furthermore, as this positive effect ripples across the landscape, downstream infrastructure including roads, culverts, and bridges are protected from the force of sedimentation and water as well.

Current Management

The soil resource is currently managed indirectly through habitat and vegetation management. Conversion from agricultural row crops to perennial grassland and wetland cover, permanent protection of remnant prairie, restoration of existing non-native grassland, restoration of pothole hydrology, and the use of prescribed fire all affect the soil resource.

Water Resources

Iowa's Des Moines Lobe forms the southernmost extent of the PPR of central North America. It terminates at the confluence of the Des Moines and Raccoon Rivers of which the Raccoon forms the southern and western border of the lobe. Small potholes and large, open water lakes are scattered throughout the landscape.

Prairie Potholes

Prior to agricultural drainage, this region contained abundant wetlands, many associated with "prairie potholes" or "kettles" evident from the General Land Office (GLO) surveyors' maps and notes (figure 3-4). Recent geologic studies of the Des Moines Lobe have changed ideas concerning the origin and hydrology of these wetlands and their relationship to other aspects of the landscape.

Geologists previously thought that Iowa's potholes and kettles formed when chunks of buried glacial ice melted to create isolated, bowl-shaped depressions on the freshly exposed land surface between 14,000 and 11,500 years ago. These depressions were thought to be "closed,"

having no drainage outlets. More recently, detailed examination of aerial photographs and subsurface earth materials has revealed that many of these depressions are only partially closed; they actually join with neighboring depressions to form linked systems.

Prairie Pothole

While subtle features on the ground, the linked depression systems stand out as dark web-like patterns when viewed from the air. The links outline the routes of former meltwater channels, and some of these actually connect drainage ways that today lie in two separate surface drainage basins. The linked-depressions originated as part of a glacial karst system that developed in a stagnant glacier loaded with sediment. As the glacier's surface melted, water entered cracks in the ice and began to widen and deepen. These eventually formed drainage tunnels within the stagnant glacier that joined with other drainage ways near the base of the ice. As water flowed through the system, sediment within the ice also entered the tunnels. Over time, fine-grained silt and clay were flushed from the tunnels, but more coarse sand and gravel settled along the routes. When all the ice was melted, the former branching passages, with their permeable sand and gravel deposits, were preserved as linked systems set into and intermingling with other surrounding glacial materials.

The real importance of this finding is in ground water quality. Rather than the sluggish ground water system previously envisioned for large parts of the Des Moines Lobe, the linked depressions actually act as a system of "natural drainage tiles" that join poorly drained upland areas with surface waters. This linkage provides a previously unrecognized pathway for dissolved contaminants, such as crop nutrients, to enter the region's waters (Iowa DNR, 1997).

Historically, these depressions provided an infiltrative hydrology, allowing surface water to be collected, stored, and gradually released to larger streams and underground aquifers. However, for nearly a century and a half, farmers drained, dredged, and tilled the wetlands and small streams on the Des Moines Lobe until approximately 99 percent were gone (figure 3-4). Larger streams and rivers were dredged and straightened for faster removal of surface water. Today, the landscape looks much different, dominated by agriculture that consists primarily of corn and soybeans. This alteration has led to an imbalanced hydrological regime. In the upstream or headwater portion of small streams, water moves off the land much faster, allowing greater stream bank and bed erosion, creating increased transport and deposition of materials

(including soil and agricultural chemicals), along with more severe flooding downstream. Draining of wetlands has lowered the water table, causing natural underground springs and small streams to stop flowing. Most of these hydrological changes have occurred within a human lifetime (Anderson, 2001).

Watersheds and Rivers

Historically, small prairie streams, meandering through the tall grasses, subtly linked the marshes, sloughs, and wetlands to larger streams and rivers, making it difficult to determine exact watershed boundaries. Today, after improved drainage from both natural and anthropogenic causes, the watersheds of the district are more easily defined. The western most portion (about one-third) of the district drains to the Missouri River, while the rest of the district drains to the Mississippi River. The primary watersheds, from west to east include the Missouri-Little Sioux, Des Moines, and Upper Mississippi-Iowa-Skunk-Wapsipicon. Major rivers that run through the district include the Little Sioux, Des Moines, Raccoon, Iowa, Cedar, Shell Rock, Upper Iowa, Boone, Winnebago, and Skunk (figure 3-5).

Many of these rivers have been environmentally degraded since they have been dammed, deepened, straightened, and rerouted to better regulate flood control and allow for development. Only the Boone and Upper Iowa do not have stretches within the district listed as impaired on the Iowa Impaired Waters List for 2010. However, several stretches of the Upper Iowa outside the district are listed as impaired. Reasons for listing include concerns for human health (fish consumption), aquatic life, and primary contact—recreation due to high levels of bacteria, mercury, and unknown impacts on freshwater mussels (Iowa DNR, 2010).

Figure 3-4: Historic and Existing Wetland Comparison of the Iowa WMD

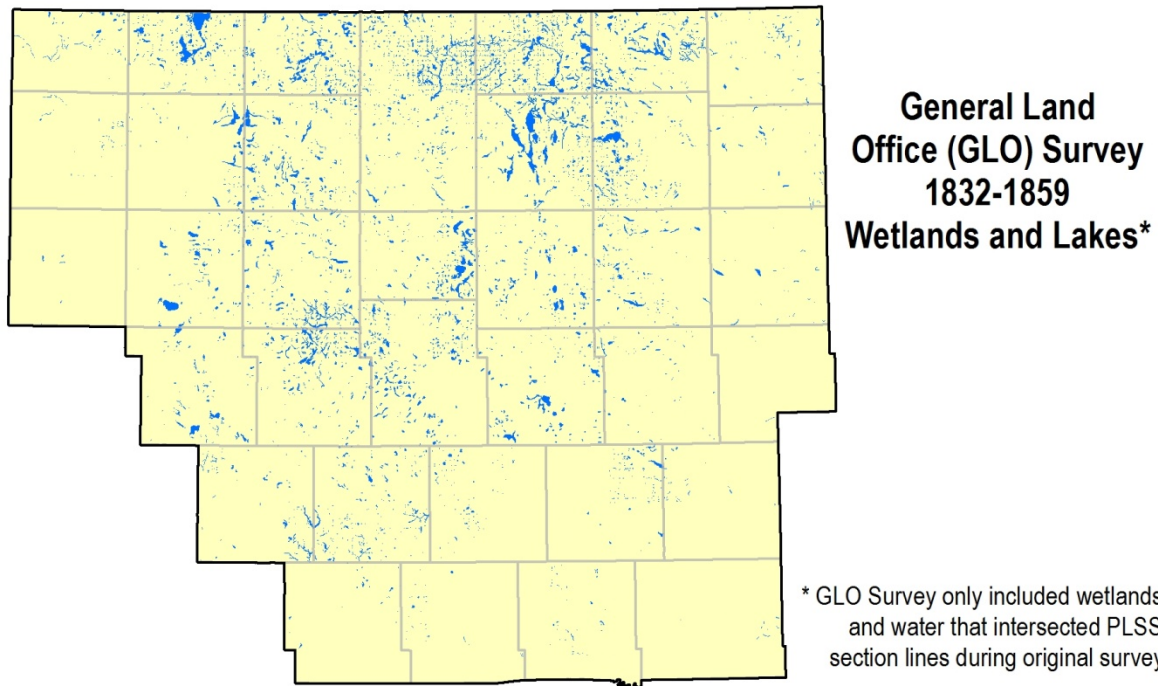

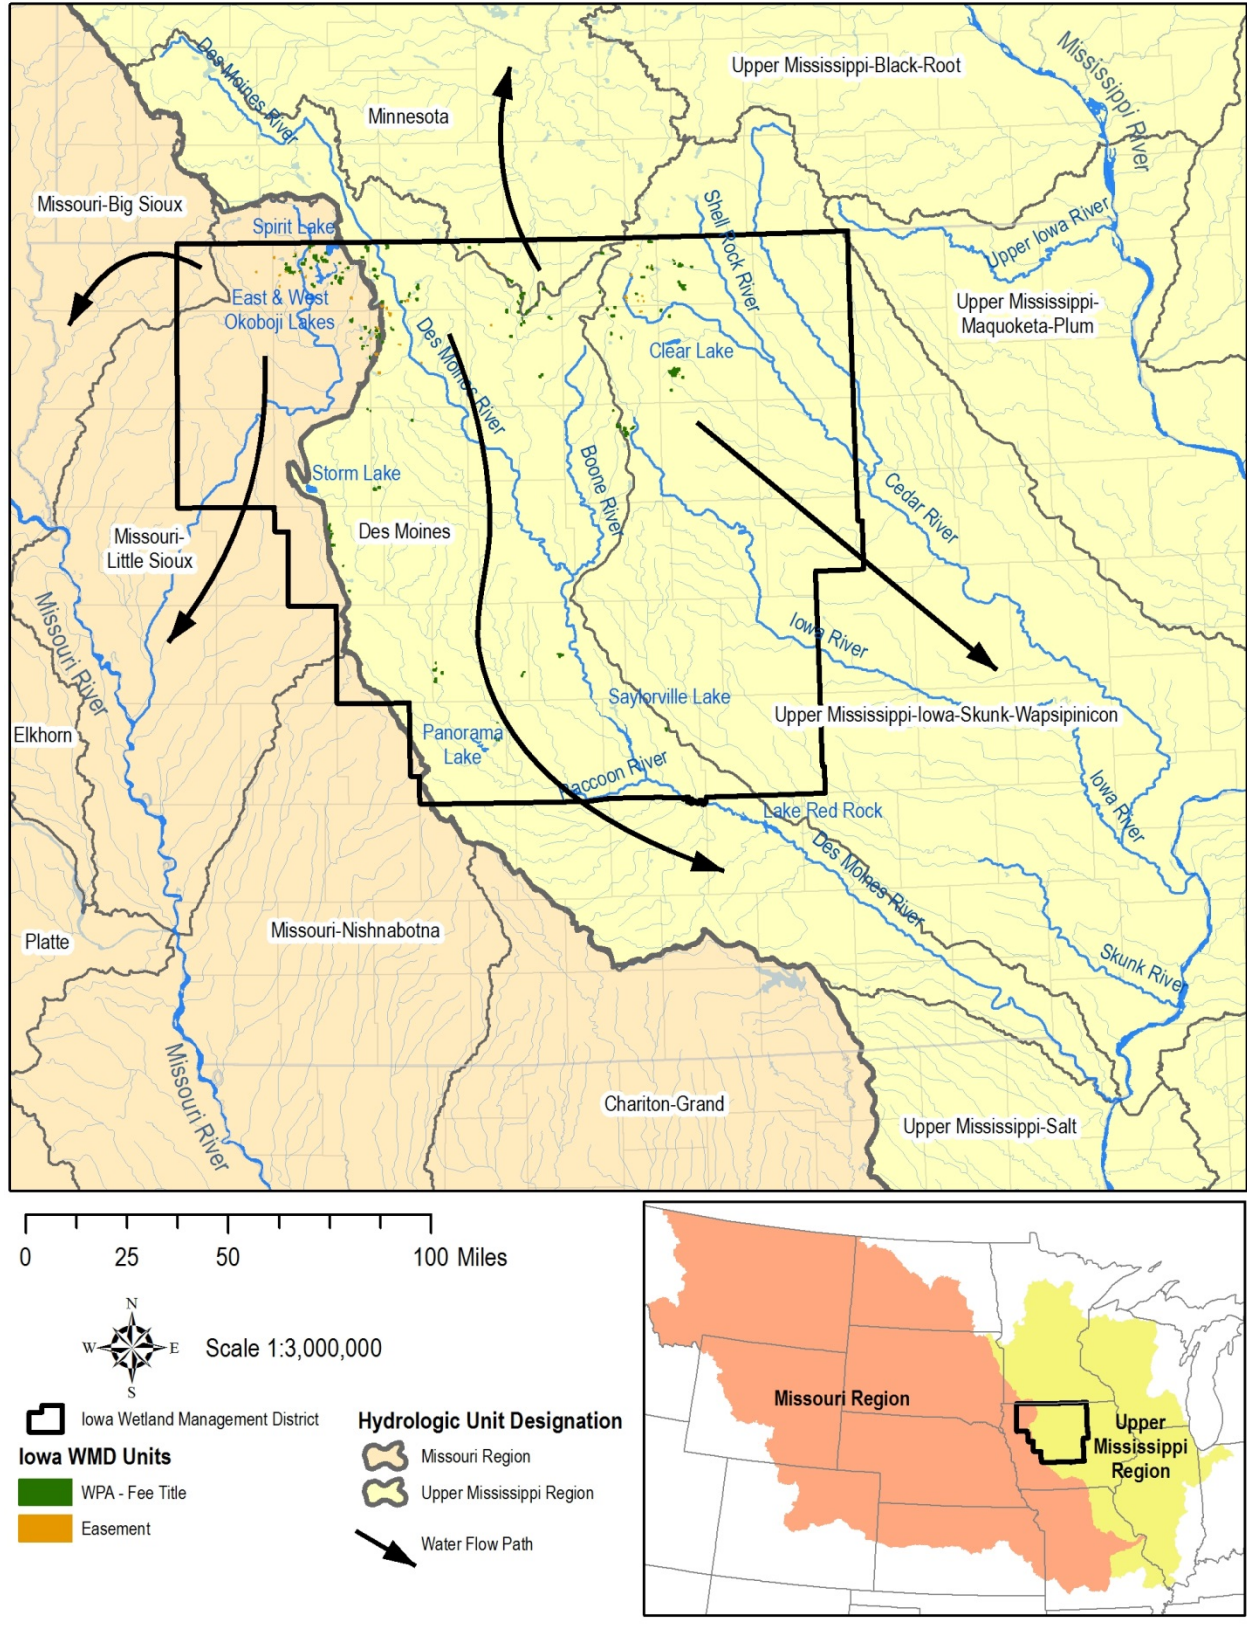

Figure 3-5: Watersheds, Rivers, and Lakes of the Iowa WMD

Lakes

The district includes many lakes, large and small, shallow and deep (figure 3-5). Saylorville Lake near Des Moines is a large man-made lake completed in 1977 as interest in flood protection for the city of Des Moines peaked after several major floods of the Des Moines River. Spirit Lake, East Okoboji Lake, and West Okoboji Lake near Spencer are Iowa's largest natural (glacial) lakes and have become known as the Iowa Great Lakes. Storm Lake near the City of Storm Lake is Iowa's fourth largest natural lake, while Lake Panorama near Guthrie Center is Iowa's largest private lake. Clear Lake near Mason City is another large natural lake of Iowa. Saylorville, West Okoboji, Spirit, and Clear lakes are all listed as impaired waters for the state due to high levels of bacteria (Iowa DNR, 2010).

Shallow Lake

Drainage and Pesticides

Drainage Tile Installation

The PPR of Iowa has been drastically altered since settlement. The glaciation that created this area left a landscape that was flat to rolling with few well defined drainage networks. Wetlands were connected by small, subtle prairie streams. Dense, deep-rooted vegetation and poorly developed drainage resulted in an infiltrative hydrology. Water was collected, stored, and slowly released to larger rivers and underground aquifers. This is in stark contrast to the present conditions in Iowa's PPR. Streams and drainage ways have been deepened and straightened.

Thousands of miles of drainage tile have been installed. The once vast prairie has been replaced with corn and beans. The result is a landscape that removes water quickly and increases soil erosion, nutrient and pesticide transport, and downstream flooding. Hydrologic changes in the landscape go far beyond the loss of the vast majority of the wetland basins. The water table has been lowered significantly, and both surface and subsurface drainage patterns have been drastically altered.

Since Waterfowl Production Areas (WPAs) are only islands in this sea of intensive agriculture with highly altered drainage patterns, the frequency, intensity, and duration of water flowing into many units is abnormally high. Siltation, nutrient loading, and contamination from point and

non-point sources of pollution are a serious problem on many WPAs. WPAs are also threatened by farming trespass, dumping, wildfires, and pesticide applications on adjacent agricultural land. A study in Ontario, Canada examined the effects of habitat and agricultural practices on birds breeding on farmland and determined that the most important variable decreasing total bird species abundance was pesticide use (Freemark and Csizy, 1993).

Recent changes in agriculture have accelerated the impact of pesticides on surrounding land. Genetically altered Roundup® ready corn, soybeans, cotton, and sugar beets have expanded the window of opportunity for pesticide applications and promises to kill everything green on fields except the genetically altered crops. Another altered crop, Bt. Corn, contains a genetically engineered insecticide. Even the pollen from this plant can kill certain insects, such as monarch butterflies.

Research has shown that insecticides commonly used for sunflowers, soybeans, and corn can kill wildlife directly and indirectly by decreasing the amount of food available. For example, ducks feed on grain much of the year, but in the spring they shift to aquatic invertebrates such as insect larvae, amphipods, and snails and depend on this food source for reproduction and survival. Even when aerial insecticide applications are completed carefully and wetlands are avoided, the chemicals drift into wetlands in measurable amounts and kill aquatic invertebrates (Tome et al., 1991 and Grue et al., 1986).

Insecticides have a direct effect by killing aquatic invertebrates, but herbicides also have an indirect effect on food available to waterfowl. The U.S. Fish and Wildlife Service (FWS, Service) conducted a study of the impact of agricultural chemicals on selected wetlands in four WMDs in Minnesota (Ensor and Smith, 1994). Herbicides from surrounding agricultural land enter wetlands and disrupt the functional interaction between vegetation structure and aquatic invertebrate life. The changing dynamic reduces food available to breeding waterfowl.

Seasonal and semi-permanent wetlands, which are the majority of WPA wetlands, are the most exposed to agricultural chemicals. These wetlands are small and interspersed with croplands, which increases the probability of pesticides from overspray and aerial drift. Most pesticides are applied to crops in the spring and early summer, coincident with maximum runoff and waterfowl breeding. Therefore, prairie pothole wetlands may involve interactions of multiple herbicides and possibly insecticides creating a unique "chemical soup" in each individual wetland (Ensor and Smith, 1994). Ensor and Smith's study showed that "typical agricultural use" of pesticides on surrounding land had a significant impact in reducing the biological quality of WPA wetlands.

The extensive open ditches and drainage tile also play a critical role as conduit for the transmission of exotic species into wetlands. Rough non-native fish species such as carp can reside in ditches and drainage tile surviving even low dissolved oxygen levels. These fish travel upstream through ditches and tile reaching wetlands, where they cause turbidity in the water, disturbing wetland soils, and preventing aquatic plant growth.

Current Management

At the district level, water resources are primarily managed indirectly through habitat and vegetation management. For example, the planting of perennial grassland cover around district wetlands provides a protective buffer that reduces silt and nutrient loading of the wetlands. However, some district wetlands use water control structures to allow the manipulation of water levels for management purposes such as rough fish control, wetland revegetation, or the prevention of negative impacts to adjacent private cropland. In fact, agricultural drainage

activities are the biggest challenge for the district when implementing management actions. Wetland restoration in the district must be carefully orchestrated as not to interrupt drainage on adjacent private land. In many cases, drainage must be maintained across WPAs so neighboring fields continue to drain. This often involves outletting tile into district wetlands, rerouting tile and/or replacing tile with nonperforated pipe, and/or installing water control structures. As mentioned above, this water brings excessive soil and nutrient runoff from adjacent crop fields into the wetlands in the district. Restoring wetlands in this landscape have foreseen consequences. If a restorable wetland is connected to a surface ditch, the restored wetland may act as a sediment retention basin and not function as a true wetland. This effects the vegetation in the wetlands and ultimately waterfowl production in those wetlands.

Air Quality

Iowa's rural setting tends to promote better air quality than some other states in the Nation. However, Iowa's tradition as a working lands state, especially agriculturally, actually exposes its air to numerous potential sources of pollution. Existing air quality within the district is subject to air pollutants from the following:

- Internal combustion engines, including vehicles, tractors, outboard motors, and chainsaws
- Agricultural sources, including livestock confinements and field dust
- Private sources, including burning brush piles
- Industrial sources, including factory and other large industry output in larger cities

Current Management

While several district management activities, such as using chainsaws, seeding cropland to native prairie, and driving trucks and tractors, release pollutants into the air, perhaps the activity of most concern regarding air quality is prescribed fire. Prescribed fire is one of the basic tools used to achieve a variety of management objectives in the fire dependent tallgrass prairie ecosystem within the district. Tallgrass prairie evolved with recurring fire and is therefore dependent on recurring fire for maintenance.

While prescribed fire affects air quality by releasing particulates and pollutant gases, it is only a sporadic and temporary source of air pollution. Air quality impacts are short-lived since a specific burn plan is written, indicating, among other variables, particular wind requirements (direction and speed) for igniting any given fire. Wind typically dissipates smoke rapidly. Approximately 5,000–7,000 acres of habitat are burned in the district each year either for restoration or maintenance of grasslands. This acreage will likely increase if the district continues acquisition. Presently, the vast majority of prescribed fire occurs in the spring with little accomplished in the fall. There is a desire for more autumn and summer prescribed fires; however, a variety of factors makes this challenging. Overall careful planning and good communication has reduced negative impacts to neighbors and sensitive facilities in the area.

Habitat

Often called the Prairie Pothole Region, the Des Moines Lobe was glaciated up until 12,000 years ago. As the glaciers receded, the lobe that extended into north-central Iowa left behind

7.6 million acres of grasslands, with the tallgrass prairie biome as a prime example, and two to three million acres of wetlands and small interconnected swamps. This prairie/wetland complex evolved under the influence of climate and processes such as fire and grazing. After the glaciers receded, the climate became much warmer and drier. This change led to a dramatic expansion of prairie over a period of several thousand years. About 3,000 years ago, the climate turned cooler and wetter. This should have favored the expansion of trees, but the prairie in Iowa was maintained by regular fires and grazing by large herbivores. However, in the late 1800s, Iowa suffered significant losses in wetland and grasslands as settlers began converting the rich soils of these habitats to cropland. Nonetheless, this region contains some of Iowa's finest remnants of the tallgrass prairie (figure 3-6). Prairie bush clover (*Lespedeza leptostachya*), a plant endemic to the upper Midwest, is found on some of these remnants (Eilers and Roosa, 1994).

Figure 3-6: Iowa's Remaining Tallgrass Prairie Remnants

Based on the Potential Natural Vegetation data derived from the USDA Natural Resources Conservation Service, Soil Survey Geographic database soil descriptions, historically over 90 percent of the district was prairie; over six percent was savanna and just over one percent was forest (figure 3-7). Pothole wetlands were not uniquely identified as a habitat type; however marsh, bog, muck/peat, and water were identified (figure 3-7). Since not much of these categories show up in the district, it is likely that the pothole wetland habitat is included in prairie, considered “wet prairie.” Currently, over 80 percent of the district is in row crop agriculture while nearly eight percent is developed. Surprisingly, seven percent remains in

grassland agriculture or herbaceous cover. Finally, two percent is forested and just over one percent is wetlands (figure 3-8).

During the Comprehensive Conservation Plan (CCP, Plan) planning process, a vegetative cover type Geographic Information System (GIS) layer was created. Aerial photography interpretation was used to classify the vegetation covering the district into several general categories including agriculture, developed, disturbed, grassland, open water, trees, and wetland. This layer was compared to a similar layer created by the Iowa DNR a couple of years ago; however, that layer did not include WPAs managed by Union Slough NWR (within the district) or the district's newest acquisitions. Table 3-1 summarizes the number of acres per cover type category. Figure 3-9 displays one WPA as an example showing the layer that was created during the CCP planning process.

Table 3-1: Iowa WMD Vegetative Cover Type Classifications as of Summer 2011

Cover Type	DNR Managed (acres)*	Union Slough NWR Managed (acres)*	Acquired After DNR Classification (acres)*	Total (acres)*
Agriculture	3,385	0	342	3,727
Developed	143	23	0.4	166.4
Disturbed	34	8	1	43
Grassland	13,262	2,839	86	16,187
Open Water	850	54	0	904
Trees	311	93	3	407
Wetland	3,235	276	6	3,517
Total	21,220	3,293	438.4	24,951.4

*Acres are based on GIS polygons and calculations, not on legal survey documents.

Wetlands

Prairie wetlands and prairie streams are an important part of the prairie ecosystem. The PPR is characterized by numerous, shallow wetlands known as potholes. These wetlands provide essential fish and wildlife habitat, permit ground water recharge, and act as filters of sediment and pollutants. They reduce floods by storing water and delaying runoff. The PPR of more than 300,000 square miles once included about 20 million acres of wetlands; today, only about 5.3 million acres remain in 2.7 million basins within five pothole area states, including Iowa. More than 78 percent of these wetland basins are smaller than one acre in size. They were poorly drained, and in the spring they retained water, acting like a great landscape sponge. Over the course of the season, water drained slowly.

Settlers found the shallow wetlands difficult to farm as the high water table kept the ground saturated for extended periods in wet years. Therefore, the vast prairie pothole wetlands of north central and northwest Iowa took longer to impact. Through the first 20 years of settlement there was plenty of good land available without trying to farm around wet acres. However, in 1850, Congress passed the Swamp Land Act. It directed each county to survey all wetlands and sell them at auction for five cents per acre. County drainage commissions and drainage districts were soon organized. Eventually pothole soils were discovered to be some of the most productive when dry, further accelerating the demand for drainage. When the land was converted to farms, the new owners built drainage ditches, straightened streams, and drained shallow wetlands off their land. Now, in the spring, water rushes off the land and floods the streams and rivers. Drainage has been so extensive that in many areas the water table has been lowered and the hydrology of the entire region has been transformed. In Iowa, 99 percent of pre-settlement wetlands have been lost (from 2.3 million to 26,470 acres), primarily between the 1780s and the 1980s (Noss et al., 1995).

The fluctuating water levels in the shallow wetlands are natural to the dynamic pattern of precipitation in the prairie. The changing water level results in circular bands of vegetation around each basin, because different plant species have different tolerances for saturated soils. The depth of the basin also affects the kind of vegetation that grows. The drying pattern is one of the features used to classify wetland basins. Deeper basins have perennial emergent vegetation such as cattails and dry up every five to 10 years. Wetlands that dry up every other year or on a several year cycle are called semi-permanent or permanent wetlands. Basins that dry up every year are temporary or seasonal wetlands. Some very shallow basins, called ephemeral wetlands, dry up early in the spring after the frost leaves the ground.

Freshwater wetlands like those in the PPR are among the most productive in the world (Weller, 1981). The dynamic water cycle creates a rich environment for many waterfowl and other marsh birds. Cycling water accelerates decomposition of marsh vegetation, resulting in a natural fertilizer. When the basins recharge in the spring, the water becomes a soup of nutrients and supports a diverse and healthy population of aquatic invertebrates, which feed reproducing waterfowl and marsh birds throughout the spring and summer. In the larger basins, the vegetation changes from densely closed cattail (*Typha sp.*) or bulrush (*Scirpus sp.*) cover to open with little cover over a period of years. In the process of transition, the cover vegetation moves through a phase, known as hemi-marsh, when clumps of emergent vegetation are interspersed with open water (Weller, 1981). In this phase, the structure of the vegetation itself creates habitat and stimulates the production of aquatic invertebrates, which in turn hosts the maximum number of marsh birds. Unfortunately, this phase is only temporary and most wetlands cycle out of it in one to three years.

Unfortunately, large-bodied fish appear to be critical determinants of wetland condition. Common carp (*Cyprinus carpio*), bullhead (*Ameiurus sp.*) and other large fish were not historically abundant in Iowa prairie pothole wetlands but now occur in many of these ecosystems and are causing significant problems. Large fish stir up wetland sediment while foraging, which reduces water clarity. Fish foraging activities also increase nitrogen and phosphorus in the water, which stimulates noxious algae blooms. Fish can also physically uproot plants and reduce the number of invertebrates by eliminating their habitat and consuming them. Large fish may be introduced to wetlands when nearby streams and rivers flood. When the flood water recedes, many fish are stranded in the ponds where they often thrive. Fish can also invade wetlands from streams and rivers via constructed drainage ditches (Galatowitsch and van der Valk, 1994).

According to the National Wetlands Inventory, updated over the past several years, the district contains approximately 372,722 wet acres. Those wet acres are either associated with rivers (riverine: 35,498 acres), lakes (lacustrine: 55,065 acres), or marshes, swamps or ponds (palustrine: 282,159 acres). However, nearly 40 percent (107,893 acres) of the palustrine acres are temporarily wet areas that have been farmed through, usually having very little or no wetland emergent vegetation (figure 3-10). The various water regimes for the wet acres in the district are presented in table 3-2.

Figure 3-10: National Wetlands Inventory of the Iowa WMD

Table 3-2: National Wetlands Inventory Water Regime for the Iowa WMD's Wet Acres

National Wetlands Inventory Water Regime	Acres
None	470
Temporarily Flooded including "ditched and farmed"	194,960
Saturated	1,107
Seasonally Flooded	54,438
Semi-permanently Flooded	19,504
Intermittently Exposed	24,586
Permanently Flooded	75,014
Artificially Flooded	2,642

Current Management

The goal of wetland management in the district is to provide diverse wetland complexes that provide high quality nesting and migratory habitat for waterfowl and other water birds. Most new lands acquired for the district have been crop fields for many decades. This has resulted in the draining of all wetlands on the property. After acquisition, one of the first management actions taken on these lands is to restore the drained wetlands. Wetland restoration is accomplished in a variety of ways including the removal and/or alteration of underground drainage tile, the plugging of drainage ditches, the construction of dikes or the installation of water control structures. After restoring the hydrology, most wetlands are allowed to naturally revegetate. Seeding appropriate wetland plants into the various zones of the wetland can increase plant diversity. This is rarely completed due to a lack of appropriate seed source, high cost, and extensive time commitment. The few attempts that have been made to increase plant diversity by seeding wetland areas have been met with mixed results at best. Once restored, the manipulation of vegetation is the primary management action that is being used more often with Iowa DNR zone seedings. Prescribed fire and water level manipulation are the most common tools used to manage wetland vegetation.

Native Grasslands

The natural prairie of Iowa was more than just a monolithic sea of grass, with some containing 200 plant species. Prairie plants are adapted to subtle changes in moisture and soils that occur along a gradient from lowlands to drier prairie ridges. Poorly drained wetlands and wetland margins supported rank growths of sedges (*Carex sp.*), sloughgrass (*Beckmannia sp.*), cordgrass (*Spartina pectinata*), bluejoint (*Calamagrostis canadensis*), and various panicgrasses. Common forbs (constituting 80 percent of the plant species in some areas) included such species as gayfeather (*Liatris pycnostachya*), cup plant (*Silphium perfoliatum*), turk's-cap lily (*Lilium superbum*), prairie clover (*Dalea sp.*), various coneflowers, and New England aster (*Symphotrichum novae-angliae*). Better-drained loamy soils on slopes and broad ridges were covered with more moderate stands of switchgrass (*Panicum virgatum*), big bluestem (*Andropogon gerardii*), Indiangrass (*Sorghastrum nutans*), and forbs like compass plant (*Silphium laciniatum*), rattlesnake master (*Eryngium yuccifolium*), smooth blue aster (*Symphotrichum laeve*), wild indigo (*Baptisia sp.*) and goldenrod (*Solidago sp.*). Drier sites on gravel and sand ridges or steep slopes supported shorter and more open stands of little bluestem (*Schizachyrium scoparium*), sideoats grama (*Bouteloua curtipendula*), and needlegrass (*Stipa sp.*), with forbs like pasqueflower (*Pulsatilla patens*), ground plum

(*Astragalus crassicaarpus*), pucoon (*Lithospermum sp.*) and downy gentian (*Gentiana puberulenta*).

Today, remnants of prairie and their associated wetlands are scattered and rare across their historic range, especially in Iowa. In fact, all types of tallgrass prairie are considered endangered ecosystems (85–98 percent decline), but tallgrass prairie east of the Missouri River and on mesic sites across its range is critically endangered (>98 percent decline). In Iowa, 99.9 percent of the natural tallgrass prairie has been lost. Remnants totaling approximately 30,000 acres remain mostly on dry and dry-mesic sites too rocky, sandy, dry, or inaccessible to plow (Noss et al., 1995). These remnants form the last refuge for many species of prairie plants and wildlife (Zohrer, 2005).

Purple Prairie Clover

As is often the case when something reaches levels so low that it is in danger of disappearing completely, tallgrass prairie has enjoyed a resurgence of interest over the last several decades. This has led to more plantings using native species. At first, monotypic stands of switchgrass were planted. Then mixes of three to five species of native grasses were used. Today, many prairie plantings include diverse mixes of native grasses and forbs, often up to 70 species of forbs and grasses. Although they still fall short, these diverse plantings do more closely resemble remnant prairie.

Savannas are areas of scattered, open canopy trees surrounded by tallgrass prairie. The dominant savanna tree species is burr oak (*Quercus macrocarpa*). Historically, pockets of savanna were found in portions of the Des Moines Lobe landform in Iowa. Notably, Winnebago and Worth Counties contained significant tracts of savanna. Savanna is important to bird species such as red-headed woodpecker (*Melanerpes erythrocephalus*), Eastern bluebird (*Sialia sialis*), loggerhead shrike (*Lanius ludovicianus*), and orchard oriole (*Icterus spurius*).

Current Management

Remnant prairie in the district is managed to provide high quality habitat for migratory birds. It is also important to preserve the remnant prairie for its intrinsic value. Some remnant prairie provides habitat for threatened and endangered species, and in fact, tallgrass prairie is itself an endangered ecosystem. All management activities on these lands occur only after considering the long-term effects they will have on the prairie community, especially effects on any known threatened or endangered species. Common management activities on these lands include prescribed fire, tree and brush removal, invasive species control, haying, and grazing.

The majority of district lands were crop fields when they were purchased. Therefore, most of the upland in the district was seeded with a goal of planting vegetation attractive as nesting cover to waterfowl and other migratory grassland birds. Currently, most new seedings planted

Tallgrass Prairie

in the district are diverse mixes of local ecotype native grasses and forbs. These diverse mixes often contain 50 to over 130 species. Some of the oldest native seedings in the district contain a single species such as switchgrass or big bluestem. There are also intermediate diversity seedings that contain anywhere from a mix of three to seven native grasses to a mix of ten to twenty native grasses and forbs. As the seed mixes evolved from low diversity to high diversity, it became clear that the geographic origin of the seed used was important. Southern ecotype seed will grow in

northern Iowa but frequently does not produce viable seed. Varieties from too far north of Iowa tend to be susceptible to disease. Therefore, great care is taken to ensure that all native seedings use appropriate ecotype seed. Once established, planted native grasslands are managed with prescribed fire, tree and brush removal, invasive species control, haying and grazing.

Savanna is not a habitat type that is targeted for purchase by the district. Restoring and managing savanna has little, if any, benefit to ground nesting waterfowl. In fact, savanna habitat is likely to attract avian and mammalian predators that will be a detriment to ground nesting waterfowl. However, some past acquisitions have contained a few small areas that may be degraded savanna. Savanna is an important habitat type; however, it is not currently the district's highest priority. Therefore, the current strategy to manage these savanna areas is passive—to leave them as they are for now.

Non-Native Grasslands

Prior to settlement, most of Iowa was covered with tallgrass prairie. As the state was settled and the prairie was broken up, introduced species gained a foothold. Europeans brought familiar plant species with them as they settled Iowa. Some of these new species were introduced intentionally as pasture “improvement.” Other species were introduced by accident from hay that was imported from overseas to feed livestock. Regardless of how they got here, many of these species have flourished since their introduction to Iowa. Grasses like smooth brome (*Bromus inermis*), timothy (*Phleum pratense*), orchardgrass (*Dactylis glomerata*), and Kentucky bluegrass (*Poa pratensis*) are now common grasses throughout Iowa. Broad-leaved plants such as crownvetch (*Coronilla varia*), birdsfoot trefoil (*Lotus corniculatus*), alfalfa (*Medicago sativa*), and Canada thistle (*Cirsium arvense*) are also commonly found in Iowa's grasslands today.

Current Management

There are many acres of non-native grassland in the district. In some cases, the land was purchased with existing stands of the non-native grassland. Hayfields, old pasture or land that had been enrolled by the previous landowner in CRP are frequently covered with non-native species such as smooth brome.

Non-native grasslands are, at times, planted on old crop fields in the district, because they are attractive as dense nesting cover for ducks and other migratory birds. Haying after July 15 is the primary tool used to manage these areas. Waiting until July 15 to mow the grass allows nesting birds a chance to hatch and fledge before the field is cut. Haying controls invasive woody vegetation and invigorates the alfalfa in the stand. Cool season introduced species are also planted at times as firebreaks around building sites or other sensitive areas.

Prescribed fire is also used to manage non-native grasslands. If the fire is conducted in the early spring, it will also invigorate the stand. Fire also works well as a first step in converting the non-native stand to native grassland. The fire removes all the vegetation from a site, and then as the plants resprout, the area is sprayed with a non-selective herbicide, killing the non-native plants and preparing a clean seedbed for the native seeding.

Other Habitats

In the northern part of the lobe, glacial knobs and ridges were partially or wholly surrounded by shallow marshes. The wetlands protected the ridges from frequent prairie fires and promoted the establishment of savannas. These are especially noticeable near Pilot Knob State Preserve. Some of these glacial knobs are known as "dry knobs" and contain such species as sideoats grama, hairy grama (*Bouteloua hirsuta*), prairie junegrass (*Koeleria macrantha*), cutleaf anemone (*Pulsatilla patens*), and little bluestem. Unfortunately, many of these knobs are being highly modified by land use; especially gravel mining (Eilers and Roosa 1994). Conversely, the shallow marshes or wet depressions in the area contain an array of plants most of which are at or near the southern terminus of their ranges. Some of these include watershield (*Brasenia schreberi*), water horsetail (*Equisetum fluviatile*), tall cottongrass (*Eriophorum angustifolium*), common mare's-tail (*Hippuris vulgaris*), tufted loosestrife (*Lysimachia thyrsoiflora*), buckbean (*Menyanthes trifoliata*), cosmopolitan bulrush (*Schoenoplectus maritimus*), and common rivergrass (*Scolochloa festucacea*) (Eilers and Roosa, 1994).

The Des Moines Lobe contained many peatlands and sedge swales as well. The peatlands contained drepanocladus moss, unlike those of the more northern parts of the United States, which are largely composed of sphagnum. However, in this part of the lobe is found the state's only example of a sphagnum bog (called by some researchers a "nutrient-poor fen" or "poor fen"), existing in Pilot Knob State Preserve. Recent palynological evidence indicates that this bog has been present since before Euro-American settlement and is probably a relic from conditions that prevailed at the end of the Pleistocene. A number of rare taxa, such as the following, are found on the floating mat: star sedge (*Carex echinata*), creeping sedge (*C. chordorrhiza*), mud sedge (*Carex limosa*), roundleaf sundew (*Drosera rotundifolia*), slender cottongrass (*Eriophorum gracile*), and bog willow (*Salix pedicellaris*) (Eilers and Roosa, 1994).

The Des Moines Lobe was also known to contain fen habitat. In fact, the northwestern portion of the lobe was thought, until recently, to be the only part of Iowa where fens existed. Today, fens are known to exist on the Iowa surface as well yet exhibit different characteristics. Des Moines Lobe fens are more likely to have a deposit of tufa (calcareous or siliceous rock deposits of springs or ground water) at the surface; are divided into distinctive vegetative zones; lack ferns and are less likely than Iowa surface fens to have trees and shrubs. Plants unique to Des Moines Lobe fens include: cutleaf waterparsnip (*Berula erecta*), tall cottongrass (*Eriophorum angustifolium*), lesser fringed gentian (*Gentianopsis virgata*), Ontario lobelia (*Lobelia kalmia*), Huron green orchid (*Platanthera huronensis*), needle beaksedge (*Rhynchospora capillacea*),

low nutrush (*Scleria verticillata*), hooded lady's tresses (*Spiranthes romanzoffiana*), seaside arrowgrass (*Triglochin maritima*), marsh arrowgrass (*T. palustris*), and lesser bladderwort (*Utricularia minor*) (Eilers and Roosa 1994). In Iowa, 40 percent of potential fen sites and 65–77 percent of actual fens have been destroyed by cultivation or drainage. Most of the remaining fens have been altered or threatened by grazing, cropland edge effects, woody plant invasion, drainage, excavation, or mining (Pearson and Leoschke, 1992).

Historically, forest in Iowa was concentrated in the eastern half of the state along the Iowa, Skunk and Des Moines Rivers and their major tributaries (Thompson, 1992). Today, Iowa's forest is widely scattered as woodlots and wooded margins of streams and rivers. The majority of the forest in the district is found along the middle section of the Des Moines River in Webster and Boone Counties. The Little Sioux River in the western part of the district also contains a fair amount of forest. Guthrie, Jasper, and Dallas Counties contain measurable amounts of forest as well.

Current Management

Currently, glacial knobs and ridges, sedge swales, fens, and peatlands in the district are not generally sought out for specific management. Prescribed fire as well as invasive species control, including tree and brush removal, are the primary management tools used on all these habitat types.

Forest is not a habitat type that is targeted for purchase by the district. Restoring and managing forest has little, if any, benefit to ground nesting waterfowl. Currently, district lands are not restored to or managed as forest.

Wildlife

Resident Wildlife

Plants

Plant species found within the district are numerous as 157 species alone are state listed (Iowa National Areas Inventory). Two, prairie bush clover and western prairie fringed orchid (*Platanthera praeclara*) are federal and state threatened; they are discussed in more detail under the Threatened and Endangered Species section below. Forty-eight other species are also state threatened, 18 species are state endangered, and 89 species are considered to be of special concern in the state (appendix A).

Swamp Milkweed

Mammals

Iowa has 40 species of mammals that are considered common in the state. Appendix B contains a list of 50 mammals known or likely to occur within the district (Iowa Gap Analysis Program [GAP]). The Indiana bat (*Myotis sodalist*) is both federal and state endangered, while the spotted skunk (*Spilogale putorius*) is state endangered. The southern bog lemming (*Synaptomys cooperi*) is considered state threatened, and the flying squirrel (*Glaucomys volans*) is considered of special concern. Mammals extirpated from the state include pygmy shrew (*Sorex hoyi*), eastern woodrat (*Neotoma floridana*), porcupine (*Erethizon dorsatum*), gray wolf (*Canis lupus*), swift fox (*Vulpes velox*), black bear (*Ursus americanus*), marten (*Martes americana*), fisher (*M. pennant*), wolverine (*Gulo gulo*), mountain lion (*Puma concolor*), Canada lynx (*Lynx canadensis*), moose (*Alces alces*), and pronghorn (*Antilocapra americana*).

Fish and Mussels

The water bodies within the district are home to many species of fish and mussels. Historically, Iowa waters were home to approximately 55 species of freshwater mussels; today only about half of those species can be found. Appendix B contains a list of fish species known to occur within the district (Iowa GAP) and mussel species primarily listed as species of greatest conservation need (SGCN) in Iowa (Zohrer, 2005). The Topeka shiner (*Notropis topeka*) is federally and state listed and is discussed in more detail under the Threatened and Endangered section below. Twenty other species are also state listed as threatened or endangered; they are noted in appendix A.

Reptiles and Amphibians

Iowa is home to 66 known species of reptiles and amphibians. Appendix B contains a list of the species known to occur within the district (HerpNet). The wood turtle (*Clemmys insculpta*) is state endangered, while the ornate box turtle (*Terrapene ornata*), Blanding's turtle (*Emydoidea blandingii*) and mudpuppy (*Necturus maculosus*) are state threatened. The smooth green snake (*Opheodrys vernalis*) and bullsnake (*Pituophis catenifer sayi*) are considered of special concern in the state. The eastern garter snake (*Thamnophis sirtalis*) is the only snake species to occur within the district that is not considered “protected”—that is, it is legal to kill or collect them in Iowa.

Insects

The habitats of the Des Moines Lobe contain a great variety of insects, although likely fewer species exist today than in the past. In the prairie, insects are important pollinators and food sources, especially for birds. Moths, butterflies, bees, and wasps are attracted to showy prairie flowers. The great mass of grasses, leaves, and stems provides an abundance of habitat for grasshoppers and other insects. Spittlebugs are responsible for the wet, saliva-like liquid that is found

Bee Pollinating Purple Prairie Clover

at the base of many grass leaves. Their young cover themselves with a frothy, bubbly liquid after they hatch that protects them from predators, parasites, and the drying wind and sun. Multitudes of ants aerate and mix the rich prairie soil. Insects are literally at the center of life on the prairie as prairie mammals, birds, reptiles, and amphibians need an abundance of insects in their food chains.

In the wetlands, insects were also important food sources for birds, mammals, reptiles, and amphibians as they outnumbered all other animals. In open waters, insects such as the water boatman (*Corixa sp.*) and backswimmer (*Notonecta sp.*) feed on plants, carrying bubbles of air with them as they make their dives. Water scorpions (Nepidae family), predacious diving beetles (*Thermonectus sp.*), and giant water bugs (Belostomatidae family) are predators that search wetland waters for zooplankton, other insects, and even tadpoles and larger crustaceans. Even the surface film of wetland waters contains insects, mosquito larvae, water striders (Gerridae family), whirligig beetles (*Gyrinus sp.*), and fishing spiders (*Dolomedes sp.*). Above the water, dragonflies and damselflies eat swarms of gnats, flies, and mosquitos; mayflies flutter after a hatch in spring and summer; and butterflies feed on the nectar of wetland flowers.

Threatened and Endangered Species

The district contains seven federally listed species. Three (Least Tern, Topeka shiner, and Indiana bat) are endangered, two (prairie bush clover and western prairie fringed orchid) are threatened. The Dakota skipper and Poweshiek skipperling are listed as candidate species. The district also contains numerous state listed species. Most of these are discussed in their relevant subsections above. The following provides more information on the federally protected species:

Least Tern – Endangered (*Sterna antillarum*)

Least Terns nest along large rivers of the Colorado, Red, Mississippi, and Missouri River systems on barren to sparsely vegetated sandbars, sand and gravel pits, and lake or reservoir shorelines. They winter in coastal Central and South America. Threats to Least Terns include unusable nesting habitat due to human disturbance and alteration of river systems and pesticide use that reduces food availability such as small fish.

Current Management

The Least Tern is currently only in one county of the district, Polk. Its recovery plan calls for protecting, enhancing, and restoring breeding habitat to increase the population to 7,000 birds. However, most of the district does not contain suitable habitat currently, nor is it targeted for future acquisition. The focus for the district is prairie potholes and surrounding uplands that are generally heavily vegetated. Therefore, management of the district has virtually no impact on Least Terns.

Topeka Shiner – Endangered (*Notropis topeka*)

Topeka shiners were historically common in small to mid-sized prairie streams, oxbows, and off-channel pools, in the central United States. Currently, Topeka shiners are found primarily in small, isolated populations in Iowa, Minnesota and portions of South Dakota in small streams that run continually with good water quality and cool to moderate temperatures. Threats to the Topeka shiner include habitat destruction, sedimentation, and changes in water quality. Stream

segments in the Raccoon River, Boone River, and Rock River watersheds in Iowa have been designated as critical habitat for Topeka shiners (figure 3-11). Critical habitat is a specific geographic area(s) that is essential for the conservation of a threatened or endangered species and that may require special management and protection. Critical habitat may include an area that is not currently occupied by the species but that will be needed for its recovery.

Figure 3-11: Topeka Shiner Critical Habitat in Iowa

- Critical Habitat Rivers
- Topeka Shiner - Critical Habitat Counties
- Iowa Wetland Management District
- Iowa WMD Units**
- WPA - Fee Title
- Easement

0 15 30 60 Miles

Current Management

Although the district does not target stream habitat for purchase, the Topeka shiner may receive benefits from habitat management within the district. Wetland and grassland restoration on former crop fields can have dramatic impacts on downstream water quality. Most land purchased in the district is cropland. The restoration of grassland/wetland complexes in the district acts to slow the movement of water across the land. This results in a slower release of water to area streams and a corresponding reduction in sediment and other pollutants entering the streams. The Topeka shiner does not currently have a recovery plan.

Indiana Bat – Endangered (*Myotis sodalis*)

Indiana bats can be found hibernating during winter in caves or, occasionally, in abandoned mines and in summer roosting in forest gaps, fencelines, or edges of wooded areas under the peeling bark of dead and dying trees. Indiana bats eat a variety of flying insects found along rivers or lakes and in uplands. Threats to the Indiana bat include human disturbance, commercialization of caves, loss of summer habitat, pesticides and other contaminants, and most recently, the disease white-nose syndrome.

Current Management

Currently within the district, the Indiana bat only utilizes summer habitat in Jasper County. However, this location is not in one of the four priority recovery units; therefore, the recovery plan calls for enhancing and improving habitat on private lands and protecting foraging habitat, water sources, and travel corridors. The recovery plan does not include a specific population objective. The district is primarily managed for waterfowl and other migratory grassland birds; thus, forested land is not targeted for acquisition. In fact, many district resources are expended to prevent and/or remove woody species. Therefore, the majority of the district does not provide roosting sites for Indiana bats. However, the restoration of grassland/wetland complexes does provide areas that produce insects, which can be important to foraging Indiana bats.

Prairie Bush Clover – Threatened (*Lespedeza leptostachya*)

Prairie bush clover is found in midwestern hill prairies that are dry and gravelly and in thin soil prairies containing big bluestem and Indiangrass—especially in the Little Sioux River and Des Moines River valleys. Prairie bush clover is apparently able to grow in disturbed areas so its population may be stable or, if declining, declining slowly.

Threats to the prairie bush clover include conversion of pasture to cropland, overgrazing, agricultural expansion, herbicide application, urban expansion, rock quarrying, and transportation right-of-way maintenance and rerouting. Hybridization with the more common round-headed bush clover has also been identified as a potential threat in some areas.

Current Management

Prairie bush clover is only in remnant prairie vegetation on a few sites throughout the district. The recovery plan calls for protecting and managing 20 populations in the core area and 15 outside the core area. Five counties within the district are completely within the core area including Dickinson, Clay, Emmet, Kossuth, and Palo Alto; four other counties (Humboldt, Pocahontas, Osceola and O'Brien) are partially within the core area. Management activities

occurring in the district that could affect prairie bush clover include prescribed fire, haying, grazing, and invasive plant treatments. Fire promotes healthy prairie plant communities and helps control invasive woody plants that may shade out prairie bush clover. However, fire during the growing season may kill prairie bush clover seedlings. Therefore, most district burns are conducted early enough in the spring that seedlings have not yet emerged. Fire and any other district management action that may affect prairie bush clover are carefully planned to avoid negative impacts to the plant.

Western Prairie Fringed Orchid – Threatened (*Platanthera praeclara*)

Western prairie fringed orchid occurs in moist, calcareous subsaline prairies and prairie sedge meadows and swales. The species may be stable, but loss of tallgrass prairie habitat has markedly reduced its original range. Present sites are threatened by human activities, land use changes, competition by invasive plants, indiscriminate grazing, annual mid-summer haying, and poorly timed prescribed fire.

Current Management

Currently, there are no known populations of western prairie fringed orchid in the district. The recovery plan calls for protectively managing sites harboring 257 more additional plants. Although prescribed fire is the main management tool used in the district grazing, haying, and invasive plant removal may also be used. Depending on timing and duration, all of these management tools can have either positive or negative impacts on western prairie fringed orchid. If a new acquisition contains orchids or a new population is discovered on existing property, the use of all of these tools will be carefully planned and implemented to avoid negative impacts.

Poweshiek Skipperling – Candidate Species (*Oarisma poweshiek*)

Poweshiek skipperlings are small, moth-like butterflies that are obligate residents of high, dry and low, wet tallgrass prairies. They are most often found in native prairie remnants in Iowa, Minnesota, North Dakota, South Dakota, and Wisconsin and in fens in Michigan. During preparation of a status assessment in 2005, there was evidence that populations were declining throughout its range, particularly in Iowa and Minnesota. Data since then confirms sharp population declines in most of its range. Of particular concern is its apparent disappearance from the majority of sites in the heart of its range in Iowa, Minnesota, and South Dakota. Population numbers in Iowa have likely dropped dramatically due to the huge losses of prairie across the landscape. In fact, the Service may propose critical habitat by the end of 2013 for the Poweshiek skipperling.

One important larval host plant is slender spike rush (*Eleocharis elliptica*), although there is good evidence from Minnesota and Wisconsin to indicate that prairie grasses, especially prairie dropseed (*Sporobolus heterolepis*) and little bluestem (*Schizachyrium scoparium*), are also important larval host plants (Shepherd, 2005). Adult Poweshiek skipperlings depend on nectar from a variety of flowers including blackeyed Susan (*Rudbeckia hirta*) and pale purple coneflower (*Echinacea pallida*). Threats to the Poweshiek skipperling include widespread conversion of native prairie for agriculture and other uses, woody and non-native plant invasion of prairie, over use of prescribed fire and overgrazing.

Current Management

The district is managed primarily to provide healthy, vigorous vegetation for the benefit of waterfowl and other migratory birds. Prescribed fire is the primary management tool used. Fire, if used too aggressively, however, can be a serious detriment to the Poweshiek skipperling. Fall and spring prescribed burns are likely to expose Poweshiek skipperling larvae and pupae to lethal temperatures. However, lack of fire can allow invasion of woody and non-native plants that threaten the long-term viability of the prairie. Losing the prairie plants will threaten the long-term viability of the Poweshiek skipperling and undermine the primary management goal of providing healthy, vigorous vegetation for use by migratory birds.

Currently, it is unknown if any Poweshiek skipperling populations occur in the district. There is a need to inventory all remnant prairie across the district to determine any presence. The Poweshiek skipperling does not currently have a recovery plan; however, protecting existing habitat, managing in a “butterfly friendly” manner, which includes mowing, burning, grazing, haying, and tree removal, and connecting fragments of native prairie are recommended. If the skipperling is found, management practices can be adjusted. Units could be subdivided and then burned on a rotational basis to leave some unburned refuge areas. Alternatively, haying could be used in place of fire, as long as cutting occurs after late July once skipperling eggs have hatched.

Dakota Skipper – Candidate Species (*Hesperia dacotae*)

The Dakota skipper is a small butterfly that is found on relatively flat and moist native bluestem prairie in which three species of wildflowers are usually present and in flower when in their adult (flight) stage: wood lily (*Lilium philadelphicum*), harebell (*Campanula rotundifolia*), and smooth camas (*Zigadenus elegans*). The Dakota skipper also is found on dry upland prairie that is often on ridges and hillsides dominated by bluestem grasses and needlegrasses where three wildflowers are typically present: pale purple coneflower (*Echinacea pallida*), upright coneflower (*Ratibida columnifera*), and blanketflower (*Gaillardia aristata*). Its only known location in Iowa was in the Little Sioux River valley; however, as of 2013, the Dakota skipper is believed to be extirpated from the state. Threats to the skipper include widespread conversion of native prairie for agriculture and other uses, over use of prescribed fire, and overgrazing.

Current Management

The district is managed primarily to provide healthy, vigorous vegetation for the benefit of waterfowl and other migratory birds. Prescribed fire is the primary management tool used. Dakota skippers are vulnerable to fire at virtually all life stages and likely depend on repopulation from unburned areas to persist. This strategy worked well when the prairie was a large, continuous, intact ecosystem. However it does not work well with the district’s present situation of small, isolated remnant prairie tracts. Healthy prairie tracts are essential for the long-term survival of the Dakota skipper. However, most management tools used to maintain small, isolated tracts of prairie can be detrimental to the Dakota skipper. Fire, haying, and intensive grazing can all eliminate Dakota skippers from a site. The challenge then, is managing remnant prairie in a high quality condition with the appropriate tools and timing as to not eliminate the Dakota skipper from the site.

The Dakota skipper is presumed extirpated from Iowa, so it is unlikely that any Dakota skipper populations occur in the district. There is, however, a need to inventory all remnant prairie across the district to determine any presence. There is no recovery plan for the Dakota skipper

at present, but protecting existing habitat, managing in a “butterfly friendly” manner, which includes mowing, burning, grazing, haying, and tree removal, and maintaining or creating tracts that are at least 1,000 acres in size are recommended. If the skipper is found, management practices can be adjusted. Units could be subdivided and then burned on a rotational basis to leave some unburned refuge areas. Alternatively, haying could be used in place of fire, as long as cutting is delayed until at least mid-August to reduce adverse effects to any life stage.

Migratory Birds

Approximately 270 species of birds are known or likely to occur within the district (appendix A). Seventy-eight of those species are listed as SGCN in the Iowa state wildlife action plan. Thirteen of those SGCN are state listed as threatened, endangered, or of special concern. The Least Tern (*Sterna antillarum*) is the only federally listed (endangered) bird species in the district.

Waterfowl

The largest group of birds to utilize the district is waterfowl since the PPR is considered the largest breeding ground for waterfowl in the continental United States. National wildlife refuges account for less than two percent of the landscape, yet they are responsible for producing nearly 23 percent of the region's waterfowl. Surveys have shown that although the PPR represents only 10 percent of the breeding habitat, it averages 50 to 75 percent of the duck recruitment each year in North America (North American Bird Conservation Initiative, U.S. Committee, 2011). Waterfowl species that use the prairie wetlands of Iowa include: Mallard (*Anas platyrhynchos*), Blue-winged Teal (*Anas discors*), Northern Shoveler (*Anas clypeata*), Northern Pintail (*Anas acuta*), American Wigeon (*Anas americana*), Gadwall (*Anas strepera*), Wood Duck (*Aix sponsa*), Ruddy Duck (*Oxyura jamaicensis*), Redhead (*Aythya americana*), Lesser Scaup (*Aythya affinis*), Canvasback (*Aythya valisineria*), Ring-necked Duck (*Aythya collaris*), and Canada Goose (*Branta canadensis*).

The Service's Habitat and Population Evaluation Team office receives survey data from the Iowa DNR for waterfowl populations within the nine most north and central counties of the district. In 2012, the survey resulted in 19.5 breeding pairs of all 13 species combined (Mallard, Gadwall, Blue-winged Teal, Northern Shoveler, Northern Pintail, American Wigeon, Green-winged Teal [*A. carolinensis*], Wood Duck, Redhead, Canvasback, Lesser Scaup, Ring-necked Duck, and Ruddy Duck). This was up from 16.0 in 2011, but down from 23.1 in 2010. The average duck pair density (pairs per square mile) in 2012 was 4.3, up from 3.6 in 2011 but down from 5.1 in 2010 (FWS, 2012a).

Rich soils and prairie wetlands make the region ideal for waterfowl but also highly productive for agriculture. The corn and soybean belt overlaps extensively with the southern PPR. Massive conversion of wetlands and prairie to agricultural fields has dramatically altered the landscape, the hydrology, and the region's carrying capacity for waterfowl. Some waterfowl species are more susceptible than others are to the transformation of prairie into agriculture. Mallards, Blue-winged Teal, and Canada geese have been successful in agricultural landscapes while species such as Northern Pintail, Gadwall, Canvasback, Redhead, and Lesser Scaup have not.

Current Management

The district is managed to produce a mosaic of wetland and upland habitats that are attractive to waterfowl and other migratory birds. Wetlands are restored and managed to provide diverse wetland complexes that support the various life requirements of migrating and nesting waterfowl. Once the wetland basins have been restored, manipulation of vegetation becomes the primary management action. Prescribed fire, mowing during dry periods, and water level manipulation are the tools used to manage wetland vegetation. Most prescribed fire in the district occurs in the spring, although

Mallard Brood

some fall burning has been used in recent years with good success. In the late summer or fall, mowing and/or prescribed fire have been used to remove dense wetland vegetation from some shallow wetlands. This effectively opens up the wetland and makes it more attractive to waterfowl the following spring. Fish barriers have been installed on some wetlands in the district to reduce water quality problems caused by rough fish populations. Water quality improvements lead to improved plant and invertebrate resources that directly benefit waterfowl.

Most upland in the district is converted from row crop fields to permanent grass cover. In addition to reducing erosion by slowing water's movement across the land, grass cover also provides important nesting cover for waterfowl.

Shorebirds

Shorebirds Feeding in Shallow Water

The PPR occurs within one of the major migration routes for shorebirds in North America. The U.S. PPR provides breeding habitat for 13 of 20 species of shorebirds that breed in the contiguous United States and offers important stopover habitat for 30 species of arctic breeders. The long distance migrations made by shorebirds are energetically expensive and require stopover sites to rest and refuel. During migration, shorebirds find protein rich food available in abundance in small, shallow wetlands scattered across the PPR. Some of the shorebird species that use the PPR of Iowa include:

Killdeer (*Charadrius vociferous*), Upland Sandpiper (*Bartramia longicauda*), Greater Yellowlegs (*Tringa melanoleuca*), Lesser Yellowlegs (*Tringa flavipes*), Stilt Sandpiper (*Calidris himantopus*), Hudsonian Godwit (*Limosa haemastica*), American Golden-Plover (*Pluvialis dominica*), Pectoral Sandpiper (*Calidris melanotos*), Spotted Sandpiper (*Actitis macularia*),

Wilson's Phalarope (*Phalaropus tricolor*), Long-billed Dowitcher (*Limnodromus scolopaceus*), and Dunlin (*Calidris alpina*).

Shorebirds are a morphologically diverse group that use a wide range of habitat types within the PPR, including dry grasslands, riverine beaches and sandbars, natural wetlands, lake margins, and flooded agricultural fields. During migration, shorebirds are generally associated with shallow water and moist mudflats. More than 70 percent of the species require water depths of less than 10 centimeters, and many are less than five centimeters (Skagen and Thompson, 2000). Many species prefer vegetation height to be less than half their body height, and most species prefer foraging sites with less than 25 percent vegetative cover (Skagen and Thompson, 2000). Due to the dynamic nature of prairie pothole wetlands, shorebird use of these potholes varies dramatically through time and space and is closely related to current wetland conditions.

The PPR has been dramatically altered since settlement. Agricultural fields have replaced the once vast grassland/wetland complexes that supported huge flocks of shorebirds. This is especially true in Iowa. As the landscape was transformed to agriculture, wetlands, especially seasonal and ephemeral wetlands, and grasslands have been reduced to the point where the Iowa PPR struggles to consistently provide for the needs of shorebirds.

Current Management

The district is managed primarily to produce a mosaic of wetland and upland habitats that are attractive to waterfowl and other migratory birds. Shorebirds are directly impacted by these management actions. Most of the district properties are managed as part of a bigger complex of habitat with various ownerships. Managing the district within a bigger complex of wildlife habitat increases the potential to provide a variety of wetland types in one area. This allows a greater diversity of shorebird species to find suitable habitat to meet their current life requirements.

Wetland drawdowns, prescribed fire, haying, and grazing are all management tools used to manipulate water levels and/or vegetation. Wetland drawdowns produce shallow water and exposed mudflats that are critical to many species of shorebirds. Prescribed fire, haying, and grazing are all used to manipulate vegetation with the goal of altering the current habitat in a way that will be beneficial to one or more groups of migratory birds.

Water Birds

Water birds are a diverse group of birds that are closely tied to water bodies for a large portion of their life history. The group includes loons, grebes, pelicans, cormorants, herons, night-herons, bitterns, egrets, ibises, rails, coots, moorhens, cranes, gulls, and terns. This diverse group uses nearly every type of wetland habitat available, from large deep lakes to ephemeral, shallow marshes (Beyersbergen et al., 2004). Some of the more common water birds found throughout the district include; Great Blue Heron (*Ardea herodias*), Least Bittern (*Ixobrychus exilis*), Pied-billed Grebe (*Podilymbus podiceps*), Virginia Rail (*Rallus limicola*), Sora (*Porzana Carolina*), American Coot (*Fulica americana*), Double-crested Cormorant (*Phalacrocorax auritus*), and American White Pelican (*Pelecanus erythrorhynchos*).

As previously mentioned, Iowa has lost 99 percent of its pre-settlement wetlands (Noss et al., 1995). Wetland loss of this magnitude has greatly hampered the ability to provide sufficient wetland habitat for water birds in the district. The remaining wetlands are frequently influenced

by adjacent agricultural practices. Water clarity, vegetation characteristics, and prey base can all be impacted in wetlands located in an agricultural landscape. Water birds benefit from preservation and restoration of wetlands and uplands. Grassland preservation and restoration in uplands directly maintains or improves water quality in the wetlands and provides sites for foraging and nesting.

Current Management

The district is managed primarily to produce a mosaic of wetland and upland habitats that are attractive to waterfowl and other migratory birds. Most of the district properties are managed as part of a bigger complex of habitat with various ownerships. Managing the district within a bigger complex of wildlife habitat increases the potential to provide a variety of wetland types in one area. Larger blocks of habitat also help mitigate the influences from adjacent agricultural lands.

Generally, management actions in the district are intended to improve the habitat for migratory birds. The water birds mentioned above are considered migratory birds and are directly impacted by these management actions. Restoring wetlands and grasslands provides vital habitat. After restoration, the goal of management is to maintain high quality habitat conditions that can help sustain healthy populations of migratory birds. Management tools used to accomplish this include water level management, prescribed fire, haying, mowing, and grazing.

Grassland Birds

Although agriculture has been an important feature in this area for over 100 years, it has been particularly intensive during the last several decades. Conversion from small, diverse, family farms to large agricultural operations specializing in monocultures of small grain and row crops has greatly reduced habitat on private lands such as pasture, hayed areas, and wetlands. Grassland birds are forced to nest in ever-dwindling fragments of remaining cover. Often the only nesting sites available are small isolated areas such as roadside ditches, abandoned farmsteads, rock piles, or other isolated patches of habitat. In North America, grassland birds have exhibited steeper declines than any other avian group. Their decline has a number of causes including loss of breeding and wintering habitat from agriculture, urbanization, habitat degradation from fire suppression, inappropriate grazing regimes, woody plantings, pesticides, nest predation, and Brown-headed Cowbird (*Molothrus ater*) parasitism.

Within the category of "grassland birds," individual species show a variety of habitat preferences based on vegetation height, cover density, grass/forb ratio, soil moisture, litter depth, degree of woody vegetation, and plant species composition. A mosaic of grassland habitats is needed to meet the varying needs of grassland birds. Some of the species of concern found in the district are area-sensitive, which means they require large, contiguous blocks of habitat to reproduce successfully. Area-sensitive species include the Short-eared Owl (*Asio flammeus*), Northern Harrier (*Circus cyaneus*), Upland Sandpiper (*Bartramia longicauda*), Bobolink (*Dolichonyx oryzivorus*), Henslow's Sparrow (*Ammodramus henslowii*), and Savannah Sparrow (*Passerculus sandwichensis*).

Current Management

The district is managed primarily to produce a mosaic of wetland and upland habitats that are attractive to waterfowl and other migratory birds. Most of the district properties are managed as part of a bigger complex of habitat with various ownerships. Managing the district within a

bigger complex of wildlife habitat increases the potential to provide a variety of wetland and grassland types in one area. Larger blocks of habitat also help mitigate the influences from adjacent agricultural lands.

District grasslands are managed to produce vigorous stands that will be attractive nesting sites for waterfowl and other migratory birds. Generally, new seedings are diverse mixes of native grasses and forbs that provide enough structural diversity to be attractive to a wide variety of birds. Since natural processes such as wildfire and grazing by free roaming ungulates have been virtually eliminated from the landscape, grasslands require management to keep them healthy and free from woody and other invasive plants. Prescribed fire is the primary management tool used on district grasslands. Haying, grazing, and invasive plant control/removal are also used to maintain healthy grasslands throughout the district.

Invasive Species

Noxious weeds are a continuing problem both ecologically and socially/politically. Invasive species present a daunting challenge to land managers. Canada thistle (*Cirsium arvense*), musk thistle (*Carduus nutans*), crown vetch (*Coronilla varia*), sweet clover (*Melilotus sp.*), leafy spurge (*Euphorbia esula*), sericea lespedeza (*Lespedeza cuneata*), and spotted knapweed (*Centaurea biebersteinii*) can displace native vegetation over large areas and are a serious concern to neighboring farmers and county officials. Purple loosestrife (*Lythrum salicaria*) can effectively displace cattails and other native wetland vegetation and turn productive marshes into a sea of purple flowers. Carp can destroy native submergent vegetation, which provides the base for invertebrates. Minnows, often from past stockings by bait dealers, can cause serious damage to wetland food chains by reducing invertebrate populations needed by breeding waterfowl and ducklings.

Control of these problem species is often costly, both in terms of chemicals, equipment, and staff time. Managers strive to use a balanced approach in controlling these species. Direct control, such as chemical application or mowing, is often needed on serious problem areas. Once healthy native plant communities are reestablished, they can often compete successfully against non-native and invasive species. Water level control, including complete drawdowns, can eliminate carp and minnow populations on wetlands where this capability is present.

Current Management

Many district resources in the form of time and money are spent attempting to control invasive species. Mowing, applying chemicals, and properly timed prescribed burning are all methods used to control invasive species. In cases where diverse prairie mixes are planted, frequently the best management tool is patience. As the seeding develops and matures during the first five to ten years, it will often crowd out mild infestations of Canada thistle with only a few well timed prescribed fires. Heavy infestations of Canada thistle and more persistent weeds like crown vetch, leafy spurge and sericea lespedeza often require more active management like mowing or chemical treatment. At times, chemical treatment is the only practical way to get control of some invasive species. Although carefully directed chemical use can be effective in controlling invasive plants, care needs to be taken to avoid killing the desirable plants that provide the long-term competition for the invasive plants. Killing non-target plants may create openings in the seeding that are susceptible to reinvasion by more invasive plants. Invasive species management is a balancing act of minimizing collateral damage while achieving effective control.

People

According to the 2010 U.S. Census (U.S. Census Bureau, 2010), the population of all 35 counties in the district is estimated to be 1.1 million while the population base of the largest cities combined is nearly 800,000. Few counties had population growth in the last two decades, and few are projected to have growth in the next five years. Pocahontas County has the biggest declines for the past and future while Dallas County has the biggest increases for the past and future. Changes in population from 1990–2000 varied across the district ranging from a decrease of 1 percent to an increase of 3.2 percent with an average 0.04 percent increase for the decade. The change in population from 2000–2010 ranged from a decrease of 1.18 percent to an increase of 4.34 percent with an average 0.2 percent decrease for the decade. The predicted change in population from 2010–2015 ranges from a 1.13 percent decrease to a 3.51 percent increase with an average 0.25 percent decrease for the five years.

Socioeconomic Setting

Current Situation

Demographics

The average household size across the district ranges from two to three people with a median age of 40–46 years old. Buena Vista, Webster, Dallas, and Polk Counties have median ages of 36–39 while Story County has a median age of 28, likely due to it being home to Iowa State University. The majority of the district has a median household income between 41,000 and 70,000 dollars per year with Palo Alto, Pocahontas, and Sac Counties at 40,000 dollars per year. However, the unemployment rate across most of the district in 2010 was between four and eight percent, with six counties between eight and 15 percent (U.S. Census Bureau, 2010).

In general most employment across the district is in manufacturing, educational, health or social services, and retail trade. Agriculture employment is higher in some counties while finance, real estate, and insurance are higher in others. Thirty-two to 40 percent of the population has a high school diploma while 11–20 percent of the population has a bachelor's degree (U.S. Census Bureau, 2010).

Agriculture, Commodity Prices and Land Valuation

According to Iowa State University's *2011 Farmland Value Survey*, 2011 was "one of the most remarkable years in Iowa land value history" (Duffy, 2011). The percentage increase reported for 2011 (32.5 percent) was the highest ever recorded by the survey. The previous high was 31.7 percent increase recorded in 1973. In addition, the 2011 survey value (\$6,708/acre), when adjusted for inflation, was at an all-time high. The previous inflation adjusted high was in 1979. The average land value per acre in 2011 for the four reporting districts that encompass the Iowa WMD: north central, northwest, west central, and central Iowa was \$7,356, \$8,338, \$7,419, and \$7781 respectively. These were the four highest values across the entire state.

High commodity prices were the most frequently mentioned positive factor influencing the agricultural real estate market, mentioned by 86 percent of survey respondents. According to Duffy,

“Farmland values are highly correlated with gross farm income. As gross farm income increases so will land values. In 2005, corn prices averaged \$1.94 per bushel in Iowa. The preliminary estimated price for November 2011 is \$6.05. Soybean prices changed from \$5.54 to \$11.40 over the same time period.”

Even though there has been “considerable variation” in commodity prices over the past few years, net farm income has increased substantially and is expected to continue. This increased income has been the primary cause for the increased farmland values along with historic low interest rates for loans to purchase farmland and a dismally performing stock market, where investing in land appears safer and wiser than investing in traditional stocks (Duffy, 2011). These trends pose a challenge to management of existing and continued acquisition of new public land in Iowa. Available funds will not buy as much land, desirable land may not be for sale, and even marginal land will likely be farmed. Increased agriculture in the PPR of Iowa may lead to increased drainage and decreased habitat for many grassland and wetland-dependent species.

Land Use Patterns

Croplands

The majority of the land in the district is farmed. Corn and soybeans are major crops grown in the area. Iowa had a record corn crop in 2010 and once again led the Nation in soybean production. Over the past fifty years, the state has seen a steady reduction in the overall land in farms and net income from farming, while farm size and crop yields have grown (USDA, 2011). With farm size expanding and commodity prices rising, agriculture threatens remaining wetlands and prairie now more than ever.

Grasslands

In Iowa, less than one-tenth of one percent of the remaining prairie is permanently protected. Much of this land is in public ownership. Recreational access is different for different sites, and there are varying degrees of protection and management on native prairie tracts. Natural prairie diversity is dependent upon intermittent grazing and burning. Prescribed burns are often used by government and private conservation organizations, but some protected tracts, such as those in easements, may not receive as much attention.

Hay fields, pastures, and fields in CRP are also grasslands. More quantifiable and less diverse, these areas may be restorable to some extent, but these areas cannot be restored to virgin prairie. Monoculture stands of alfalfa are obviously less diverse than the prairie they have displaced. Fenced pastures grazed by cattle are quite different from the prairie once grazed by wandering bison. Cattle are often permitted to overgraze, weakening native grasses, eliminating native flowers, and encouraging colonization by non-native weedy forbs and trees.

Wetlands

In Iowa, nearly 99 percent of all natural wetlands have disappeared from the landscape. Most have been tilled, drained, and converted to agriculture. Across the district, some wetlands have been preserved or restored and are primarily in public ownership while others have been enrolled in the Wetlands Reserves Program, remaining in private ownership but protected by permanent easement. Recreational access to these sites varies.

Urban Development

The largest urban center within the district is Des Moines, Iowa, with over one-half of a million people residing in the five-county metropolitan area. Other cities include Fort Dodge, Spencer, Mason City, Boone, Ames, Ankeny, and Marshalltown. All of these areas require manufacturing, retail services, government, education services, transportation, utilities, and other commercial services. Urban spread into rural areas is resulting in the conversion of additional agricultural lands and prairie and grassland areas. According to the 2010 U.S. Census, the major area of anticipated growth within the district is around the Des Moines metropolitan area. The Waterloo-Cedar Falls metropolitan area just outside of the district is expected to grow as well, which would affect the eastern edge of the district.

Aggregate Resources

Nearly every county within the district contains underlying materials that could be utilized for crushed stone or construction sand and gravel. Concentrated operations of these minerals exist in Cerro Gordo and Polk Counties, while Webster County contains a gypsum deposit with an active gypsum plant. Numerous rock quarries exist throughout the district providing materials for building and maintaining roads, construction, and concrete. In 2008, the production of such operations across the entire state was valued at \$680 million. This was nearly a two percent decrease from 2007 and an additional nearly two percent decrease from 2006 (U.S. Geological Survey, 2008).

Rural Development

Rural development also threatens district lands in counties with growing populations. Lands adjoining WPAs are often seen as highly desirable rural building lots that are purchased as small hobby farms or rural homesites. This can result in the WPA being "ringed" by homes, with a series of negative impacts on the WPA. This development can limit the use of prescribed fire for future management and can lead to the following:

- Increased trespass on district lands by neighbors using ATVs, horses, or vehicles
- Increased threats to wildlife from stray pets such as cats and dogs
- Increased use of district land by neighbors for illegal uses such as dumping, gardening, equipment storage, etc.
- Hunter and neighbor discrepancies about safety during the hunting seasons;
- Increased noise
- Increased storm water runoff

Alternative Energy Developments

Iowa is the leading state in wind power generation of electricity. The north and west portion of the state has, on average, stronger winds, making that area best suited for wind turbines.

Numerous wind farms exist within or near the district, and other new ones are planned. While finding alternatives to fossil fuel consumption is important, turbines are potential threats to wildlife.

Collision mortality, negative visual stimulus (similar to trees) and construction and access disturbance are all problematic. The Service,

working with the Wind Turbine Guidelines Advisory Committee,

developed voluntary land-based wind energy guidelines in 2012 to provide a structured, scientific process for addressing wildlife conservation concerns at all stages of land-based wind energy development. They also promote effective communication among wind energy developers and federal, state, and local conservation agencies and tribes. When used in concert with appropriate regulatory tools, the guidelines form the best practical approach for conserving species of concern (FWS, 2012b).

Waterfowl and Wind Turbines

Visitor Services

The main office for the Iowa WMD is located at Union Slough NWR, located approximately two and one-half hours southwest of Minneapolis, MN and northwest of Des Moines. Driving from Algona, Iowa take Highway 169 north to Bancroft; turn right (east) on A-42, and proceed six miles to the office. From Interstate 90, take the Blue Earth, MN exit, and follow Rt. 169 south into Iowa. At Lakota, follow P60 south to A-42, then west 0.25 miles on A-42 to the office. Interpretive displays, wetland district public use regulations, and other information are available 7:30 a.m.–4:00 p.m., Monday–Friday (excluding federal holidays). The Iowa DNR has six wildlife field offices that serve as points of contact for district visitors as well.

The Union Slough NWR office provides a visitor contact station for the Iowa WMD. The office is staffed with an administrative technician that also serves as a visitor contact liaison. The refuge office maintains a wildlife display interpreting both the district and the refuge. Both indoor and outdoor kiosks orient visitors to the area. District public use information and regulations are current and available both indoors and outdoors at the office.

Current Management

Waterfowl Production Areas differ from NWRs in that they are open to hunting, fishing, and trapping in accordance with state law. Therefore, WPAs are "open until closed" by state or federal law for hunting, fishing, and trapping. National Wildlife Refuges on the other hand are "closed until opened" to these uses. However, WPAs can be opened to other uses if determined to be appropriate and compatible with the mission of the National Wildlife Refuge System and the purposes of the district.

Hunting, in particular, has a long history with WPAs. When Congress amended the Duck Stamp Act (formally known as the Migratory Bird Hunting Stamp Act) in 1958, it authorized the acquisition of wetlands and uplands as WPAs and waived the usual "inviolable sanctuary" provisions. Thus, WPAs were intended to be open to waterfowl hunting, in part because waterfowl hunters, through the purchase of federal Duck Stamps and support for price increases of the stamp, played a major role in acquisition of these areas. Hunting, for both waterfowl and resident game species accounts for more than half of the visits to WPAs.

However, state regulations classify some WPAs as "waterfowl refuges." According to Iowa Code 52.1(3):

"Waterfowl refuges: The following areas under the jurisdiction of the department of natural resources are established as waterfowl refuges where posted. It shall be unlawful to hunt ducks and geese on the following areas, where posted, at any time during the year. It shall be unlawful to trespass in any manner on the following areas, where posted, during the dates posted, both dates inclusive . . . "

For Iowa WMD these regulations apply to at least some portion of the following WPAs: Jemmerson Slough (Dickinson County), Elk Creek Marsh (Worth County), and Rice Lake (Winnebago and Worth Counties). The Service's Memorandum of Understanding (MOU) with the Iowa DNR states, ". . . other wildlife-dependent uses (wildlife observation, wildlife photography, environmental education, and interpretation) are generally allowed."

Since the district is overseen by staff from Union Slough NWR, environmental education and interpretation programs are nearly always hosted at the refuge rather than the district. A recently rekindled partnership with the Kossuth County Conservation Board (KCCB) has also led to KCCB naturalists conducting environmental education and interpretation programs at the refuge particularly on prairie/wetland habitats and their dependent wildlife. However, other education, interpretation and outreach happens through the partnership. The Iowa DNR provides these services at the county and WPA level via the staff at each wildlife unit (biologist and technicians) as well as through their private lands program.

Upland Interpretation for Children

Historic and Cultural Resources

Native American History and Early Settlement

Archeological evidence in northwestern Iowa indicates people have occupied this area for approximately the past 12,000 years. As the glaciers retreated to the north in the warming period known as the Holocene, small bands of hunters moved into the tundra and boreal forest

and hunted Pleistocene megafauna. The Clovis and Folsom fluted lanceolate spear points and other tools of these PaleoIndians have been found in several locations near the district in Minnesota and Iowa. Folsom materials seem to be found in diverse settings, often associated with kill-sites although none of these sites have been identified in the district.

By 7,000 B.C. the glacial ice was north of Iowa, even north of Minnesota. Glacial Lake Agassiz in northwest Minnesota drained for the final time around 7,600 B.C. An oak and pine forest and early prairie replaced the boreal forest in western Iowa and Minnesota. The megafauna were extinct, and late PaleoIndian people adapted to reliance upon hunting bison and smaller game. Their representative artifact is the unfluted lanceolate spear point. Plano materials have been found in Iowa and across Minnesota except in Lake Agassiz. Dalton materials have been found in Iowa and southern Minnesota.

The long Archaic Period commenced just prior to the hot and dry Altithermal that peaked at approximately 6,000–4,000 B.C. Apparently the prairie-forest line moved east of the Mississippi River, surface waters reduced in size or disappeared, and many water courses changed their locations. Bison herds were much reduced in size, and the archeological record would indicate a decrease in human populations as well. The people developed a diverse array of stone tools, also bone and copper tools, and broadened their hunting and gathering to include many plant and animal species in addition to bison. Archeological sites indicate that after the Altithermal Period the human population expanded significantly. Due to the changing climate, Archaic sites are situated in areas that might appear to be unlikely based on modern topography, including within wetland basins. They would also be expected in alluvial fan deposits and other burial conditions.

Human populations continued to expand in the Woodland (or Ceramic/Mound) Period. With some exceptions, climate and vegetation patterns were similar to the modern era. The people adopted pottery and mound building from the Woodland cultures to the east but not horticulture to the same extent. Plains Woodland peoples continued reliance upon bison hunting. Sites are found on the margins of lakes, rivers, and streams.

Increasingly complex human cultures of the Late Prehistoric Period, beginning about A.D. 900, in western Iowa contended with fluctuating climatic conditions and shifting vegetation patterns. Initially during this period temperatures were warm. Agriculture became a large component of subsistence, although bison remained important when available. The bow and arrow came into use. Some groups lived in large, often fortified, villages composed of earth lodges. Exotic items indicate trade and some influence by the Mississippian culture from the southeast.

Arrival of Europeans and their Western civilization had a greater impact on Native American cultures. During the Proto-historic Period, tribes migrated from their prehistoric locations and gave up their prehistoric material culture. This change was so momentous that modern Native American tribes often cannot be identified with prehistoric antecedents. In the district, however, archeologists have identified some continuity from the Late Prehistoric through the contact period to modern tribes. The Late Prehistoric Oneota culture of northwestern Iowa was likely the antecedent for the Ioway, Oto, and perhaps Omaha tribes.

First the French, then the British, and last the Americans entered Iowa. Fur trading and early exploration had little apparent impact on the prairie. Fur traders built their fur trade posts at the confluence of rivers or on the shores of larger lakes, usually near a Native American village. In the second half of the 19th century during the Historical Period, American and European immigrants settled the prairie and started to transform Iowa into an agricultural state. The

Native Americans were largely removed through treaty and war. Frontier trails and government roads, followed by railroads, improved accessibility and markets. Homesteader dugouts and sod houses were replaced with frame houses and larger farmsteads. Highway construction and farm consolidation marked the 20th century.

A review of the National Register of Historic Places showed that, as of August 1, 1996, the 35 Iowa WMD counties contained 397 properties listed on the National Register. The vast majority of these properties are buildings in towns and cities. However, a number of the properties are located in rural areas and are indicative of the kinds of historic properties that could be found in the district: farmsteads and farm buildings, especially barns; bridges, segments of the Red River Oxcart trail, mill sites, battle sites, and prehistoric archeological sites such as mounds, villages, camps, and rock art.

Cultural Resource Management

Cultural resources—such as archaeological sites, historic structures, and Native American traditional cultural properties—are important parts of the Nation’s heritage. The Service strives to preserve evidence of these human occupations, which can provide valuable information regarding not only human interactions with each other, but also with the natural environment. Protection of cultural resources is accomplished in conjunction with the Service’s mandate to protect fish, wildlife, and plant resources.

The Service is charged with the responsibility, under Section 106 of the National Historic Preservation Act of 1966, of identifying historic properties—cultural resources that are potentially eligible for listing on the National Register of Historic Places—that may be affected by our actions. The Service is also required to coordinate these actions with the State Historic Preservation Office, Native American tribal governments, local governments, and other interested parties. Cultural resource management in the Service is the responsibility of the regional director and is not delegated for the Section 106 process when historic properties could be affected by Service undertakings, for issuing archaeological permits, and for Indian tribal involvement.

The Archaeological Resources Protection Act of 1979 (ARPA), Section 14 requires plans to survey lands and a schedule for surveying lands with “the most scientifically valuable archaeological resources.” This act also affords protection to all archeological and historic sites more than 100 years old on federal land, not just sites meeting the criteria for the National Register. It requires archeological investigations on federal land be performed in the public interest by qualified persons.

The Regional Historic Preservation Officer (RHPO) advises the regional director (RD) about procedures, compliance, and implementation of these and other cultural resource laws. The actual determinations relating to cultural resources are to be made by the RHPO for the RD for undertakings on Service fee title lands and for undertakings funded in whole or in part under the direct or indirect jurisdiction of the Service. This includes those carried out by or on behalf of the Service, those carried out with federal financial assistance, and those requiring a federal permit, license, or approval.

The responsibility of the refuge/district manager is to identify undertakings that could affect cultural resources and coordinate the subsequent review process as early as possible with the RHPO and state, tribal, and local officials. In addition, the refuge/district manager assists the RHPO by protecting archeological sites and historic properties on Service managed and

administered lands, by monitoring archaeological investigations by contractors and permittees and by reporting ARPA violations.

District Administration

Current Situation

An MOU with the Iowa DNR establishes the working relationship and how staffs are shared in the district. Through this partnership, the vast majority of the WPAs are maintained and managed by six Iowa DNR offices: Prairie Lakes, Clear Lake, Black Hawk, Great Lakes, Saylorville, and Red Rock. Current staffing at most of these units include a wildlife biologist, wildlife technician II and wildlife technician I. Some of these units also staff seasonal employees at times. These positions are not reflected in the current district budget, because they are funded by the state.

The Service does not currently pay any staff member's salary out of district funds; however, all Union Slough NWR staff as well as zoned fire and law enforcement resources are utilized and available to work in the district. Current Service staff, funded through Union Slough NWR and performing work in the district, includes project leader, deputy project leader, wildlife biologist, prescribed fire specialist, administrative technician, maintenance worker, and private lands biologist. Zone fire resources are also utilized almost entirely in the district including a Wildland Urban Interface Coordinator and Prescribed Fire Technician, located in Milford, Iowa. This staff plans and implements prescribed fire on all the WMD properties and also coordinates with partners to accomplish management goals. Funding for the fire program for both the refuge and WMD is administered through the refuge. Currently, the district receives \$250,000 to fund restoration projects on district land managed by the Iowa DNR. In addition, the district receives \$15,000 for management capability. Union Slough NWR funds are also regularly used for projects in the district.

Currently the MOU describes law enforcement as a shared responsibility of the Iowa DNR and the Service. According to the MOU, the Iowa DNR assumes primary law enforcement responsibility on WPAs necessary to protect the resource. The Service has the responsibility to control use for the protection of the resource and prosecute all possible violations in federal court. The Service also assumes the responsibility for enforcing Service conservation/wetland easements. The Iowa WMD currently does not have a law enforcement officer; however, the zoned law enforcement officer located in Prairie City, Iowa and others have provided assistance as available. Therefore, the district often has difficulty dealing with easement violations in a timely manner as required by the *Region 3 Easement Manual*.

District Support

Current Situation

The Service and the Iowa DNR have a long developed partnership in the district. This partnership was established in 1978 and has been effective in facilitating goals outlined in the Prairie Pothole Joint Venture. Currently, an MOU between the two agencies codifies the partnership. In this agreement, the Service requests two million dollars annually from the Migratory Bird Commission for land acquisition and the Iowa DNR finds properties for sale, negotiates with landowners, and completes inspections. Iowa DNR also provides on the ground restoration and day-to-day management of most WPAs within the district. Properties in Kossuth

County, one in Pocahontas County, and the WPA and FSA easements are managed by Union Slough NWR staff. All other district properties are managed by the Iowa DNR. Wildlife management biologists from six different Iowa DNR units manage these WPAs in their respective areas similar to state WMAs. One of the many advantages to this partnership is that properties can be targeted within priority complexes, providing excellent opportunities for public hunting and recreation.

While the Iowa WMD does not have its own Friends group, the Friends of Union Slough NWR also support the district. They support the district in many ways including financial assistance, volunteer labor, and educational outreach about the district.

Chapter 4: Management Direction and Implementation

This chapter presents the goals, objectives, and strategies that will guide management of the Iowa Wetland Management District (WMD, district) over the next 15 years. It also includes rationale for why these objectives are preferred and scientifically sound. This management direction represents the plan for the district and mirrors Alternative D in the EA/Draft CCP that was prepared as part of the planning process.

Objectives and Strategies

Goal 1: Wildlife

In partnership with the Iowa Department of Natural Resources (DNR) and others, restore a natural diversity and abundance of waterfowl, migratory birds, and other native fauna within the Iowa WMD.

Issue 1-1: Focal species group and life cycle

Objective 1-1-1	Over the 15-year life of the comprehensive conservation plan (CCP), increase the breeding population of Mallard by 450 pairs and Blue-winged Teal by 450 pairs on protected wetlands (permanent state and federal ownership) in the Prairie Pothole Region (PPR) of Iowa, and develop strategies, as part of the district's Inventory and Monitoring Plan, to set recruitment goals for these species in the PPR of Iowa.
Measures	<ul style="list-style-type: none"> • Mallard breeding population increased by 900 individuals on protected wetlands (permanent state and federal ownership) in the Prairie Pothole Region of Iowa. • Blue-winged Teal breeding population increased by 900 individuals on protected wetlands (permanent state and federal ownership) in the Prairie Pothole Region of Iowa. • Recruitment goals established in the district's Inventory and Monitoring Plan for Mallard and Blue-winged Teal within the PPR of Iowa.
Rationale	<p>Many species of wildlife use Waterfowl Production Areas (WPAs) in the district; however, its main purpose is for waterfowl production and to provide habitat for migratory birds, especially those that are grassland-/wetland-dependent. With limited staff and budgets it would be difficult to manage for all these species individually. Therefore, it is more practical to focus on a few species that represent a guild or group of other species. Mallard and Blue-winged Teal were chosen as focal species for the district, because their habitat and life cycle requirements are representative of a wide scale of other wetland and grassland-dependent migratory birds.</p> <p>A measure that is often used to determine nesting site suitability for ground nesting birds is a visual obscurity</p>

rating (VOR) (Robel et al., 1970). After looking at VOR readings for various species of both waterfowl and other grassland-dependent birds, it was clear that both Mallard and Blue-Winged Teal encompass most of the other ground nesting birds using the PPR (Laubhan et al., 2006). These focal species also require the various wetland types represented in the PPR of Iowa, such as temporary and seasonal wetlands for pair bonding and semi-permanent to permanent wetlands for brood rearing and molting. Thus, managing the district to provide the habitat requirements of these focal species will in turn provide for the needs of many other migratory birds and resident wildlife.

According to conversations with retired Iowa DNR waterfowl biologist Guy Zenner in 2012 and 2013 and other supporting literature, Mallard, Blue-winged Teal, and Wood Ducks are the most common nesting waterfowl species in the district (Bishop et al., 1979; Fleskes, 1986; Ohde et al., 1983; Weller, 1979). Mallard pairs represented 36 percent and Blue-winged Teal pairs represented 35 percent of the breeding ducks surveyed during the four-square mile pair counts across nine counties of the district from 2006 through 2011. Wetlands surveyed during the pair count are 69 percent privately owned and 31 percent publicly owned and therefore, protected or managed by the state or federal agency (U.S. Fish and Wildlife Service [FWS, Service], 2012a). Although breeding pair density varies from newly restored to existing wetlands, Iowa has an average of 0.9 pairs per wetland acre (FWS, 2012a). Since the district has an acquisition goal of 3,000–4,500 acres over the next 15 years, with generally a 3:1 ratio of uplands to wetlands, new habitat could be provided for approximately 900 new duck pairs. Based on the land acquisition and wetland restoration objectives in this CCP, increasing the populations from the current average from 2006 through 2011 breeding pair population of 6,406 Mallard pairs and 6,221 Blue-winged Teal pairs (state and federally protected wetland) by 450 pairs each, seems to be most realistic and achievable. This equates to an increase in the cumulative breeding population of Mallards and Blue-winged Teal by 1800. It is important to note that the wetlands restored in the district will be representative of the historic PPR of Iowa—that is, representing the area prior to Euro-American settlement.

Currently, recruitment rates are available for both Mallard and Blue-winged Teal nesting in the PPR of Iowa; however, many managers and biologists question the validity of these estimates due to the great variability in factors effecting recruitment. Studies such as nest dragging tend to be somewhat localized and difficult to extrapolate for the entire district. Brood count data is highly variable as well due to many factors such as vegetation cover on wetlands and survey methods. For these reasons, recruitment goals will not be used in this management plan but will be developed with partners in the Inventory and Monitoring Plan.

Even though the district will be adding protected and restored wetlands to the landscape, agricultural drainage on private land will likely continue to remove them. However, this objective only addresses the land that the Service and its partners control under permanent protection. The FWS Partners Program will continue working with private landowners using various Farm Service Agency (FSA) programs such as the U.S. Department of

	<p>Agriculture's Conservation Reserve Program (CRP), the Wetlands Reserves Program (WRP), and conservation agreements and easements to reduce the loss of wetlands on private land.</p>
<p>Strategies</p>	<ul style="list-style-type: none"> • Restore a minimum of 500 acres of existing cropland to native grassland annually as budget, staff, and weather allow. • Continue to acquire land (approximately 350–400 acres per year) per the FWS Region 3 Strategic Growth of the Small Wetland Acquisition Program's <i>Guidelines for Fee and Easement Purchase</i> and the Memorandum of Understanding (MOU) with Iowa DNR. • Convert newly acquired cropland in the uplands to native grassland ideally within two years of acquisition. (Exceptions to the two year goal will be outlined in the individual unit plan.) • Restore the wetland portion(s) of newly acquired property as soon after acquisition as funding and resources allow. • Assess the status of Objective 1-1-1 annually per Iowa DNR four-square mile survey results. • Work with Cooperative Fish and Wildlife Research Unit (Iowa State University), Iowa DNR Waterfowl Biologist and the Service's Habitat and Population Evaluation Team (HAPET) and secure funding to establish research to determine scientifically sound recruitment rates for Mallard and Blue-winged Teal populations in the PPR of Iowa as part of the development of the district's Inventory and Monitoring Plan.

Goal 2: Habitat

In partnership with the Iowa DNR and others, conserve, restore, and expand grassland and wetland habitat managing for a natural diversity of native flora within the Iowa WMD.

Issue 2-1: Prolonged decline of grassland-dependent bird populations due to the decline of grassland habitat

Objective 2-1-1	Over the 15-year life of the CCP, increase native grassland habitat by 7,500 acres with a plant diversity of 100 or more species, and provide more suitable habitat (in terms of vegetative structure as will be defined in the district's Habitat Management Plan) in existing grassland for a wide variety of grassland-dependent birds within the Iowa WMD.
Measures	<ul style="list-style-type: none"> • The district contains 23,687 acres of grassland habitat after the 15-year life of the plan. • Twenty-five percent of existing grassland bird habitat is managed annually (e.g., hay, graze, burn, mow, tree removal) assuring that all lands are treated at least once every four years to improve vegetative structure and diversity.
Rationale	<p>As Iowa was settled, the rich soils of the state were steadily converted from an almost endless sea of diverse prairie to a very orderly succession of row crop fields. Today, more than 99.9 percent of Iowa's prairies have disappeared (Smith, 1992). The huge loss of habitat produced a corresponding reduction in grassland-dependent birds. Maintaining prairie remnants and reconstructing prairie on crop fields is a critical first step to providing essential habitat for grassland-dependent migratory birds in a landscape that has lost almost all of the historic grasslands.</p> <p>As a group, grassland birds have a wide range of habitat requirements that can be categorized based on their vegetation height and density preferences (Ribic et al., 2009). For example, Vesper Sparrows (<i>Pooecetes gramineus</i>) prefer short, sparse habitats maintained by disturbances such as grazing, while Sedge Wrens (<i>Cistothorus platensis</i>) prefer tall, rank cover on moist sites (Ryan, 1986). In addition, there is great variability in preference for factors other than vegetation height, including litter depth, woody vegetation tolerance, and tract size. Historically, the sheer size of the unbroken prairie provided numerous opportunities for the expression of many different habitat conditions. This allowed many different bird species to find their preferred habitat within the larger matrix of the tallgrass prairie. The fragmented nature of current grasslands is much less likely to provide that kind of habitat diversity. This is especially true if grasslands are not subjected to some kind of periodic disturbance. Annually treating a portion of fragmented grasslands with some form of disturbance like haying, grazing, mowing, or burning will increase the structural diversity across the district. A combination of all these disturbance tools applied strategically throughout the district will create a continuum from bare ground to tall, dense standing vegetation. Burning generally removes all standing vegetation and litter from the ground.</p>

	<p>Mowing or haying generally remove most of the standing vegetation but frequently leave some amount of litter on the ground. Depending on stocking rates, timing and/or duration, grazing can remove virtually all standing vegetation and most of the litter, or it can be used to reach some predetermined vegetation condition that can vary across a wide spectrum of structural diversity.</p> <p>Prairie vegetative productivity declines and extensive invasion of woody and other invasive plant species occur in the absence of disturbances such as prescribed fire, grazing, haying, or mowing (Herkert, 1994). In addition, there is evidence that there is a positive relationship between plant species diversity and ecological stability in response to climatic stressors like drought, flooding, and climate change (Tillman and Downing, 1994). Various management tools must be used to manipulate grasslands to achieve the mosaic of habitat conditions needed to attract a diversity of grassland bird species. Management actions such as haying, mowing, burning, grazing, tree removal, and rest will all have positive influences for some bird species while simultaneously having negative influences for other bird species. The careful application of these management actions across the lands in the Iowa WMD will help to ensure that a wide variety of grassland-dependent bird species can find appropriate habitat throughout the Iowa prairie pothole landscape.</p>
<p>Strategies</p>	<ul style="list-style-type: none"> • Restore a minimum of 500 acres of existing cropland to native grassland annually as budget, staff, and weather allow. • Convert newly acquired cropland to native grassland ideally within two years of acquisition. Exceptions to the two year goal will be outlined in the individual unit plan. • Annually treat a minimum of 25 percent of district grasslands with a combination of the following types of treatment: haying, prescribed grazing, prescribed fire, mowing, or tree removal. This strategy will be employed in such a way as to have all district grassland acres receiving a treatment at least once every four years. • Develop an appropriate research and monitoring protocol to evaluate grassland bird use of WMD lands. Work with the Iowa DNR's Multiple Species Inventory and Monitoring Program if possible. • Complete the district's Habitat Management Plan that details the desired varying vegetative structure for the district's grasslands.

Issue 2-2: Upland habitat quality

Objective 2-2-1	At the end of the 15-year life of the CCP, perennial grassland, preferably native, is present on at least 97 percent of the uplands of the Iowa WMD.
Measure	<ul style="list-style-type: none"> • Perennial grassland covers at least 97 percent of the district uplands.
Rationale	<p>Grasslands can support greater abundance and diversity of birds than row crop fields (Rodenhouse and Best, 1983). Grasslands also provide far superior nest cover for the vast majority of ground nesting waterfowl as compared to annually tilled fields (Higgins, 1977). The main purpose of the district is to benefit waterfowl and other grassland-dependent migratory birds. Currently, about 15 percent of district land is in row crop fields. Therefore, it is a top priority to convert the vast majority of these fields to grassland as quickly as is financially and logistically possible. Planting these areas to diverse native seed mixes will help to ensure the long-term maintenance and restoration of healthy populations of native fish, wildlife, and plants and their habitats as is required by the Service’s Biological Integrity, Diversity, and Environmental Health policy (FWS, 2001).</p> <p>The majority of new land acquisitions in the district are row crop fields. These row crop fields will be seeded to diverse prairie plantings ideally within two years of acquisition. After the crop ground in the district has been seeded to grassland, degraded remnant prairie and old, low diversity plantings, both native and non-native, will be evaluated to determine if conversion to diverse native plantings is warranted. The advantages of planting diverse native mixes include increased structural diversity with an appeal to a wide array of grassland-dependent wildlife, increased ability to deal with climatic stressors, increased ability to compete with invasive plants, and increased acreage of critically endangered tallgrass prairie habitat (see rationale for Objective 2-1-1).</p> <p>The district includes both food plots and fields of rotational cover that have been planted to non-native vegetation such as smooth brome and alfalfa. Food plots are discussed in Objective 2-5-1. The rotational cover exists for a variety of reasons. In some cases, these fields were enrolled in CRP and planted to non-native vegetation such as smooth brome. When the Service acquired the land, the non-native cover was already established. In other cases, smooth brome and alfalfa were planted after purchase by the Service to provide attractive cover for nesting waterfowl. Since district resources will be focused on planting the existing crop ground as well as all newly purchased crop ground to diverse native plantings, the status quo of these existing rotational cover plantings will be maintained until at least the backlog of crop ground has been planted. This will allow the district to evaluate and compare bird use and nest success in brome/alfalfa plantings versus diverse native plantings. The information gathered during the comparison will help determine the ultimate fate of the existing brome alfalfa plantings. Proposals for new rotational cover plantings will be evaluated for appropriateness and compliance with Service policies.</p>

Woody encroachment into grasslands can happen rapidly without proper management (Herkert, 1994). Historically, the district was dominated by tallgrass prairie. Soil surveys and historic vegetation maps based on Iowa's original land surveys from the mid-1800s indicate trees were generally restricted to the major rivers throughout most of the district. Large portions of the area were almost treeless. Today, native grasslands are extremely rare across the district. In fact, grasslands of any type are rare across the district. To provide the open grassland habitat needed by many bird and other wildlife species, district uplands will be managed to prevent the establishment and/or spread of woody vegetation. Management tools such as grazing, mowing, haying, prescribed fire, and tree removal will all be used to promote and maintain open grasslands.

District lands occur in a highly altered agricultural landscape. This has contributed to the introduction and spread of aggressive, invasive plants across the district (Solecki, 1997). Grasslands are subject to invasion by some of these plants. If left unchecked, invasive plants can form monotypic stands that suppress the native plants and associated diversity (Solecki, 1997). As a result, a great deal of effort goes into managing these invasive species. Control efforts use the least destructive method possible to control and discourage invasive species, including hand pulling, mowing, grazing, haying, and chemical treatment.

Multiple strategies and techniques are used to seed native grassland across the district. Purchasing seed mixes allows for the creation of an exact mix with desired percentages of cool and warm season grasses, sedges, and forbs. However, much of the time, there are variable yearly limitations in species, quantities, and budgets. Therefore, a combination of techniques to acquire seed mixes for the district must be utilized. Existing native grassland is harvested in bulk with a combine. This provides a base seed mix with some known species based on what is growing in the field but unknown amounts of those species. A seed test is usually completed to determine what species are in the mix, the relative proportion of each species, and the viability of each species. However, the sample sent in for testing is very small compared to the total seed lot harvested. Generally, the most abundant species present in the seed (usually big bluestem and/or Indiangrass) is fairly accurate, but there is much less certainty about the many other species present in the mix.

As a result, a combination of purchased seed and hand harvested seed are added to the mix for more diversity. The purchased mix is usually more of what is available and affordable and not so much about what is desirable. Generally, the species most lacking in the seed harvested with the combine includes early growing plants (cool season), low growing plants (mostly cool season), and plants that grow in wet areas (sedges and others). Most cool season species have dropped their seeds by September when the harvest occurs and it is too difficult to combine in wet areas to get sedges and other wet-tolerant plants. These species can be hand collected, but getting large quantities is difficult without a large volunteer group. Furthermore, it is very difficult to find large quantities of local ecotype cool season species (grasses, forbs, sedges) to purchase. There is often reluctance by seed dealers to grow such species that are not generally in high demand especially when Service budgets

	<p>are unstable from year to year. In the end, the most diverse seed mix that is affordable and available is planted, but percentages of certain species or groups (cool season grasses, forbs, sedges, etc.) remain unknown.</p>
Strategies	<ul style="list-style-type: none">• Restore a minimum of 500 acres of existing cropland to native grassland annually as budget, staff, and weather allow.• Convert newly acquired cropland to native grassland ideally within two years of acquisition. Exceptions to the two year goal will be outlined in the individual unit plan.• Remove encroaching woody vegetation.• Only after existing cropland is planted to native grassland, replace low diversity grasslands, both native and non-native, with higher diversity native species seed mixes including warm season grasses, cool season grasses and sedges, and forbs to increase species and structural diversity on district grasslands.• Treat/remove aggressive, invasive species to minimize loss of species and structural diversity.• Develop an appropriate research/monitoring project to compare use and nest success rates of waterfowl and other grassland-dependent birds in diverse native seedings versus brome/alfalfa seedings.• Evaluate, before planting, any new rotational cover of brome/alfalfa on district land by considering factors such as budget, seed availability, purpose, location, and ecological integrity.

Issue 2-3: Focal wetland type

Objective 2-3-1	At the end of the 15-year life of the CCP a variety of wetland types (75 percent temporary and seasonal, 15 percent semi-permanent, and 10 percent permanent) exist across the Iowa WMD as representative of the pre-Euro-American settlement landscape.
Measure	<ul style="list-style-type: none"> District wetlands are 75 percent temporary and seasonal, 15 percent semi-permanent, and 10 percent permanent.
Rationale	<p><u>Wetland Complexes and Cycling:</u> The Des Moines Lobe contains wetlands varying in size and water regime including temporary, seasonal, semi-permanent, and permanent (Stewart and Kantrud, 1971). The dynamic wet-dry precipitation cycles of the prairie region create corresponding water, nutrient, and vegetative cycles that maintain the productivity and ecological health of these wetlands (Euliss et al., 1999). These cycles historically maintained wetlands in a clear water state, which supports healthy wetland vegetation providing seeds, tubers, aquatic insects, and other foods used by waterfowl and other migratory birds. A cluster or “complex” of these varying wetland types is required for waterfowl to complete their life cycle including nesting, brood rearing, molting and migration (Swanson and Duebber, 1989). This wetland variety increases the likelihood that productive and suitable habitat will be available at any given time as the water conditions vary both seasonally and from year to year. The quantity and quality of wetland habitat within Iowa not only affects the production of locally nesting birds but also affects the productivity of birds nesting farther north. These wetlands are critical in providing proper food resources to improve breeding condition of the birds when they arrive at their breeding grounds (Devries et al., 2008; Anteau and Afton, 2011).</p> <p><u>Altered Wetland Systems:</u> The intensive agricultural development currently dominating the Des Moines Lobe has had a dramatic effect on the quantity and quality of wetland habitat within the district. Due to extensive wetland drainage only three to four percent of the historic wetland acreage currently exists within the lobe (Miller et al., 2012). These drainage systems have lowered regional water tables creating dryer water regimes within the few remaining wetlands across broad landscapes. In many cases, these systems drain hundreds or even thousands of acres containing smaller basins into a larger basin lower on the landscape. This process is commonly called “consolidation drainage.” Consolidation drainage creates a more unchanging, permanent water regime in the receiving basin, which interrupts the wet-dry cycles critical to the productivity of the receiving wetlands (Weller and Fredrickson, 1974; Anteau, 2012). Because these drainage systems are interconnected, invasive and non-native fish are given a conduit to invade historically isolated wetlands leading to turbid conditions with low productivity and providing direct competition for aquatic food resources. Unchanging high water levels from consolidation drainage often prevent the fish from “freezing out” in winter as had occurred during historic wet-dry cycles (Anteau et al., 2011). Similarly, the more permanent water regime may interrupt natural predator cycles and, consequently, reduce duckling survival (Krapu et al., 2004). Surface and tile runoff from upstream cropland frequently carries excess nutrients, contaminants, and sediment into wetlands</p>

	<p>exacerbating the turbid state of the wetlands. As a result of these impacts, the existing wetland base within the lobe is skewed toward deeper water regimes, many of which are in poor ecological condition (Miller et al., 2012; Anteau and Afton, 2011; Anteau, 2012).</p> <p><u>Temporary and Seasonal Wetlands:</u> Smaller temporary and seasonal wetlands are preferred by nesting Mallards during pre-nesting and egg production (Krapu et al., 1997). As a result, these basins support more pairs of breeding waterfowl than larger, more permanent basins (Kantrud and Stewart, 1977; Cowardin et al., 1995). Krapu et al., (2000) found that the survival rate of Mallard broods was substantially higher when seasonal wetlands contained water, underscoring the importance of seasonal wetlands as a major component of wetland complexes for breeding waterfowl. LaGrange and Dinsmore (1989) found that Mallards migrating through Iowa used “sheetwater” wetlands almost exclusively for feeding while using larger, more permanent basins for roosting at night. More recently, the restoration of temporary and seasonal wetlands upstream from larger basins and shallow lakes has been recognized as highly beneficial to restoring the hydrologic cycle needed to return the productive clear water state to these deeper basins (Anteau, 2012).</p> <p><u>Semi-permanent Wetlands and Shallow Lakes:</u> In most years seasonal wetlands are dry by mid-summer. Consequently, semi-permanent wetlands and shallow lakes are typically needed for brood rearing later in the growing season (Swanson, 1986). In mid- to late-summer, larger more permanent wetlands also provide important molting habitat for post-breeding waterfowl (Swanson and Duebbert, 1989). Naturally, semi-permanent basins and shallow lakes also provide the only migratory habitat for fall migrating wetland-dependent species.</p> <p><u>Priority Wetland Complexes:</u> The identification and restoration of landscapes with high densities of temporary and seasonal basins in proximity to brood habitat is critical to meet the population objectives for the district. Beginning in the 1980s, the Iowa DNR collaborated with the Service and other partners to identify priority wetland complexes for restoration within the Des Moines Lobe as part of the Prairie Pothole Joint Venture (PPJV) of the North American Waterfowl Management Plan (Zohrer and Garner, 2002). Since that time, the Service has been working side by side with the Iowa DNR and a variety of other partners to restore large blocks of habitat that reestablish wetland complexes as well as the underlying water tables. Many of these complexes have targeted the watersheds upstream from existing larger wetlands and shallow lakes within these identified complexes. Because these existing larger basins are at the elevation of the water table, the true hydrology of the upstream wetlands can be established more effectively. Once restored, these complexes provide productive and ecologically healthy wetland habitats critical to meeting the life cycle needs of waterfowl. Due in large part to the PPJV initiative, the wetland acreage in the lobe has increased from an estimated 29,652 acres in the 1970s to an estimated 124,367 acres in 2011 (Miller et al., 2012).</p>
Strategies	<ul style="list-style-type: none"> Engage HAPET and/or other partners to inventory, categorize, and map wetlands on WPAs within

the district.

- Ensure restoration plans for new acquisitions *address* all restorable wetland basins within the acquired property.
- In acquisition planning, prioritize areas with high temporary and seasonal wetland densities, ideally within one-half mile of existing or restorable brood habitat (semi- to permanent wetlands).
- Review existing WPAs for small temporary or seasonal wetland basins that may have been overlooked during initial restoration.
- Remove, non-perforate and/or reroute drainage tile within WPAs to maximize water table restoration where financially, legally, and physically feasible.
- Remove sediment from basins prior to restoration where soil samples document the sedimentation.

Issue 2-4: Wetland quality

Objective 2-4-1	Over the 15-year life of the CCP, wetlands within the Iowa WMD are restored and managed to provide breeding waterfowl pair densities of at least 0.9 pairs per wetland acre.
Measure	<ul style="list-style-type: none"> Breeding waterfowl densities surveyed during the April and May four-square mile pair count in Iowa are at least 0.9 pairs per wetland acre.
Rationale	<p><u>Restoration and Management Challenges:</u> Lowered regional water tables, consolidation drainage, invasive fish, and agricultural runoff present challenges to wetland managers within the Des Moines Lobe. In addition, invasive plants, primarily reed canarygrass and hybrid cattail, commonly form dense monotypic stands in and around wetlands (Aronson and Galatowitsch, 2008), which limit the productivity and suitability of the habitat for waterfowl. Although native to the Des Moines Lobe, cottonwood and willow trees form dense monotypic stands in and around wetlands in areas where they were historically uncommon to non-existent based on records from the original land surveys and soil surveys. These dense stands of woody vegetation often shade out the desired marsh vegetation (Fredrickson and Reid, 1988) and interrupt the open landscape needed by many birds using the adjacent grasslands as discussed in the rationale for Objective 2-2-1. A wetland that contains a 50:50 mix of emergent vegetation in relation to open water (or “hemi-marsh”) provides the ideal habitat interspersed to maximize waterfowl pair densities and invertebrate food resources needed during breeding (Kaminski and Prince, 1981; Murkin et al., 1982). Nelson and Kadlec (1984) found that increased habitat interspersed among wetlands within a complex increases the suitability of the complex as a whole for breeding waterfowl. Left unmanaged, the current forces within the lobe tend to lock more permanent basins into a “lake phase” dominated by open water with little interspersed emergent vegetation while shallower wetlands become choked by reed canarygrass, hybrid cattail, and woody vegetation with little interspersed open water. In the end, the ultimate challenge is to restore and manage individual wetlands as well as wetland complexes to provide the interspersed needed to provide suitable habitat for nesting waterfowl.</p> <p><u>Wetland Restoration:</u> The vast majority of wetland restoration within the Des Moines Lobe has occurred within the past 30 years (Miller et al., 2012). Over that time a variety of guidelines and recommendations have been developed to improve the interspersed and overall ecological health of restored wetlands. Aronson and Galatowitsch (2008) tracked the floristic characteristics of 37 wetlands restored in the southern PPR over a 19-year period. They recommended five guidelines to improve native vegetative colonization in wetland restorations, which serve as the basis for many of the strategies below. Furthermore, Galatowitsch and van der Valk (1994) stressed that restored basins need to be surrounded by a vegetative buffer to filter sediments from entering the wetland. They also recommended that all semi-permanent and permanent basins have water control structures to allow for water level manipulation.</p> <p><u>Water Management on Deeper Basins:</u> Wet/dry cycles can be artificially simulated on deeper wetlands that</p>

have water control structures installed on them. Because wetlands are dynamic systems that require cycling to maintain their productivity, it is unrealistic to maintain constant hemi-marsh conditions. Weller and Spatcher (1965) recommend targeting 30 to 70 percent interspersion on manipulated wetlands while recognizing that they will invariably fall outside this range in years of extreme drought or deluge. Deeper basins on WPAs commonly have water control structures that allow for water level manipulation. However, in many cases the large wetlands and shallow lakes within a complex are under the jurisdiction of another conservation entity, most often the Iowa DNR. In recent years, the Iowa DNR and other conservation organizations have been actively developing water control systems and fish barriers on these larger basins and shallow lakes to mimic wet-dry water regimes, control rough fish, and ultimately restore the basins' ecological health (Brown et al., 2008). Many of these endeavors require infrastructure on WPAs and/or other cooperation from the Service. The Iowa DNR and Ducks Unlimited have acquired PPJV grant funding from the Service to evaluate these projects and establish thresholds for management actions on shallow lakes (Harland and Meyers, 2012).

Vegetation Management in Wetlands: Temporary and seasonal wetlands are highly susceptible to invasion by reed canarygrass and hybrid cattail (Aronson and Galatowitsch, 2008) as well as cottonwood and willow. According to a conversation with Susan Galatowitsch in 2012, once these invasive species (particularly reed canarygrass) become dominant in these basins, the investment (labor and otherwise) required to establish a native plant community is impractical. However, management actions that create interspersion within dense vegetative stands have been successful including mowing, crushing, grazing, burning, disking, and chemical treatment (Solberg and Higgins, 1993; Sojda and Solberg, 1993; Murkin et al., 1982). Since these wetlands are essentially imbedded within the uplands, treatments will most often occur as part of an upland treatment regime (see Objective 2-1-1).

Strategies

- Prioritize restoration sites near remnant natural wetlands as source populations for recolonizing native species.
- Restore semi-permanent basins, which are more floristically stable in addition to seasonal and temporary basins.
- Promote natural hydrology by restoring temporary and seasonal basins, avoiding excavation of pits and the concentration of water.
- As resources permit, plant vegetative stock and seeds to establish sedge meadow and wet prairie species.
- Control invasive reed canarygrass, cattail, and woody vegetation early in the restoration process, if possible.
- Manage for an emergent vegetation to open water ratio between 30:70 and 70:30 on basins with water control structures.

- Periodically open dense areas of cattails and reed canarygrass within existing wetlands through a variety of tools including mowing, crushing, grazing, burning, disking, and chemical treatment.
- Control dense stands of woody vegetation in existing wetlands through a variety of tools including mowing, cutting, grazing, burning, disking, dozing, and chemical treatment.
- Control invasive fish in wetland complexes using a variety of techniques including installing fish barriers, eliminating transport mechanisms (tile, ditches, etc.), water level management, chemical treatment, etc.
- Install water control structures on semi-permanent and permanent basins if feasible.
- Continue to partner with the Iowa DNR and other conservation entities to improve the ecological health of deeper wetlands and shallow lakes not under federal jurisdiction.

Issue 2-5: Food plot use

Objective 2-5-1	During the 15-year life of the CCP, food plots are present on no greater than three percent of the upland acres within the Iowa WMD.
Measure	<ul style="list-style-type: none"> • Food plots cover three percent or less of the upland acres in the district.
Rationale	<p>Through the Service’s partnership with the Iowa DNR, food plots have been established as an acceptable practice to provide winter food resources and provide wildlife viewing and hunting opportunities. The MOU between the Service and the Iowa DNR states that permanent food plots are permitted at levels identified in this CCP, the Iowa WMD Habitat Management Plan (to be written), and the WPA unit plans. Collaborative goals in the <i>North American Waterfowl Management Plan</i> (2012) include the following:</p> <ul style="list-style-type: none"> • Goal #2: Wetlands and related habitats sufficient to sustain waterfowl populations at desired levels, while providing places to recreate and ecological services that benefit society • Goal #3: Growing numbers of waterfowl hunters, other conservationists, and citizens who enjoy and actively support waterfowl and wetlands conservation <p>The goals in this plan focus on engaging people with nature and growing the number of hunters. Food plots in Iowa are thought of as a positive practice providing excellent viewing and hunting opportunities. Allowing food plots on WPAs within the district, albeit limited, will assist the Iowa DNR (a key Service partner) in providing hunting opportunities that will in turn gain public support for waterfowl and wetland protection.</p> <p>Food plots will not be necessary on all WPAs within the district. Service managers and Iowa DNR wildlife biologists will determine areas that are appropriate for food plot placement. Given the waterfowl production/migratory bird purposes of the district, creation of edge, size of habitat patch (Warner et al., 2012), timing of disturbance related to farming practices (Korschgen and Dahlgren, 1992), and herbicide treatments of crops will be considered in the determination. Although some species of both migratory and resident birds have been documented nesting in corn and soybean row crop this may create an ecological trap (Best, 1986). For this reason managers need to be cautious with locations of food plots within the district.</p> <p>It is not reasonable to have food plots on every WPA within the district and still maintain its waterfowl and migratory bird purpose. Preparing a data layer within the first year of this plan will facilitate discussions and strategic positioning of food plots on district properties. New management plans for individual units will involve evaluating the need for food plots on the tract and potential locations to lessen the impacts of disturbance, edge, chemical use, and soil erosion. Individual unit plans will also ensure that food plots are not located in wetland basins or remnant prairie sites. Many times food plots may be better situated on adjacent state WMAs, county</p>

	<p>conservation areas or private land. Currently, approximately 15 percent of the district WPA properties are in row crop agriculture, mostly in reconstruction to prairie. It is reasonable to believe that Iowa DNR food plot objectives can be met with three percent of the district's uplands in food plots without materially detracting from the waterfowl production purpose for the district. Three percent of the district uplands equates to approximately 500 acres of the WPAs in food plots. This rate of food plot use in the district will be evaluated through the early stages of this CCP to determine the minimum acceptable level for food plots, especially given the partnership with the Iowa DNR and the district's waterfowl production purpose.</p> <p>Wildlife food plots generally consist of plantings of corn, soybeans, sunflowers, wheat, barley, oats, rye, buckwheat, millet, milo, and sorghum. Cultivation of these crops is usually accomplished by cooperative farmers through an agreement with Iowa DNR. Food plots will not be manipulated in any way to constitute baiting of migratory game birds and waterfowl as defined in the Migratory Bird Treaty Act of 1918 (16 U.S.C. 703–712 P.L. 105–312) and 50 CFR 20.11–21. Standard agricultural practices will be used in farming operations with the exception that insecticide use will not be permitted. Crops will be left standing in the field, and may be harvested in the early spring each year.</p> <p>Some food plots that are designed, in particular, for winter survival of Ring-necked Pheasant include planting shelterbelts of conifer trees and shrubs. WPAs will not be locations considered for shelterbelt placement in conjunction with food plots. Grassland bird research suggests that some birds experience reductions in nest success and higher predation rates in grasslands that have been fragmented by trees (Johnson and Temple, 1990). Wetland vegetation can provide excellent winter cover for resident wildlife, therefore negating the need for shelterbelt plantings on WPAs.</p>
<p>Strategies</p>	<ul style="list-style-type: none"> • Within one year of CCP approval, create a database with a spatial component, for all existing food plots across the district. • Determine criteria for proper location of food plots considering amount of edge created, size, timing of disturbance to plant, effects from pesticide application, etc. • Maintain and update the food plot database at least annually.

Strategic Land Protection

Issues 2-6 and 2-7: Decreasing purchasing power of existing funds and priority areas for acquisition

Objective 2-6-1	Over the 15-year life of the CCP, continue to pursue perpetual protection of wetland and grassland of up to 112,000 acres in the Prairie Pothole Region of Iowa in collaboration with county, state, and other federal governments, conservation organizations, private businesses, and concerned citizens. Landscape level planning tools (i.e., four-square mile survey, restorable wetlands layer, etc.) utilized by Iowa DNR and the Service's HAPET office will guide partners as to where strategic land acquisition should occur.
Measures	<ul style="list-style-type: none"> • All partner accomplishments of wetland and grassland perpetual protection will be tracked through the Prairie Pothole Joint Venture. • Wetland and grassland perpetual protection by the Service within the PPR of Iowa is at least 200–300 acres annually.
Rationale	<p>It is estimated that the PPR of Iowa has lost at least 96 percent of the once 3.4 million wetland acres in the area. (Miller et al., 2012). Recent increases in grain prices coupled with inexpensive drainage tile has led to the rapid conversion of once avoided and untilled wetland areas to row crops. The district currently manages just over 25,000 acres of both fee title and both wetland and habitat easements. With the extensive agricultural drainage the district is experiencing on private lands it is imperative that the Service continue to acquire properties in fee title, easements, and work with partners to secure wetland habitat protection on private lands.</p> <p>Since 2006, the PPJV target for Iowa has been to increase breeding ducks by 25,000 pairs (extrapolated by Rex Johnson [FWS, HAPET] from U.S. Government Accountability Office, 2007). These 25,000 new pairs will need approximately 28,000 wetland acres of habitat. However, a 3:1 ratio of upland to wetland habitat is desired. Therefore, the wetland/grassland habitat target for Iowa is 112,000 acres in perpetual protection.</p> <p>The two million dollars requested annually by the FWS to acquire WPAs currently does not buy as much land as it once did due to ever increasing land values. However, the district still manages to grow by 200–300 acres annually, through purchase in fee title and supporting the WRP. One method the district has utilized to acquire WPA properties is to purchase the residual of WRP easement properties in the PPJV priority areas. Iowa DNR biologists negotiate with willing landowners to enroll in the WRP with the final outcome of either a permanent WPA easement through the Service or the purchase in fee title of the property as a WPA, using the Small Wetlands Program and Migratory Bird Conservation Funds (federal Duck Stamp). Using this process aids in wetland/upland restoration and reduces the final closing costs for the property. It is also essential that the district continue to provide support for the use of other FSA programs in the state that provide wetland and grassland protection, such as the CRP program.</p>

	<p>Since 1978 the Iowa DNR and the Service have worked under a partnership for WPA acquisition and management. Through this partnership the Iowa DNR has cooperated in identifying and delineating land of high waterfowl production capabilities. The strategy has been to acquire properties in complexes connecting state and county land with federal WPAs. Several models have been developed narrowing the focus within the district based on production potential, wetland densities, and existing conservation land. The current Iowa PPJV priority complexes were developed as a result of these modeling efforts. These priority complexes have allowed for strategic acquisition to create large areas of habitat with more completely restored hydrology.</p> <p>Since so much effort has been focused in these priority complexes, the Service and Iowa DNR do not want to abandon these sites. However, it is important to use the best available science and data to make sure the district is growing into areas that have the highest waterfowl production potential if cost effective. Newer and more accurate data and some potential models are becoming available through the Iowa DNR and HAPET that should be utilized to refine the existing areas of priority for acquisition. Currently, acquisition objectives focus on fee title and easement WPAs with natural or restorable wetlands possessing brood rearing cover and associated upland nesting cover in close proximity to existing public wetlands. Other areas of priority include uplands in the vicinity of wetlands where nesting cover is lacking. The ideal waterfowl production habitat to be acquired is a 3:1 ratio of uplands to wetlands. Acquisition will continue to be focused on areas identified as Iowa PPJV priority complexes; however, these will be altered if better scientific information suggests such a change.</p>
<p>Strategies</p>	<ul style="list-style-type: none"> • Work with Iowa DNR, the U.S. Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS), county conservation boards, Non-Government Organizations, and others to achieve this objective. • Continue to utilize fee title and conservation easement options for acquisition of at least 200–300 acres annually. • Utilize the Service’s Partners for Fish and Wildlife Program to promote conservation programs. • Support WRP proposals and other USDA conservation programs that perpetually protect wetland and grassland habitats within the Iowa WMD. • Within two years of CCP approval, work with Iowa DNR and HAPET to utilize any new models developed to select the areas of greatest waterfowl production within the district. • As priority areas are identified, develop a new Geographic Information System (GIS) layer or map book to guide acquisitions. • Apply for and secure grant funds for wetland and grassland acquisition and restoration (North American Wetlands Conservation Act, etc.).

Goal 3: People

In partnership with the Iowa DNR and others, promote understanding, appreciation, and support for the Iowa WMD as well as stewardship and understanding of the southern PPR and its native ecosystems to visitors and local residents.

Issue 3-1: District awareness and understanding

Objective 3-1-1	Within 15 years of CCP approval, provide the infrastructure on three WPAs (such as trails, kiosks, pull-offs, etc.) and information (brochure, website, Facebook page, etc.) necessary for visitors to appreciate resources in the Iowa WMD, as defined in the Visitor Services Plan.
Measures	<ul style="list-style-type: none"> A minimum of 500 “hits” annually on the district website.
Rationale	<p>District users have expressed some confusion over WPA locations, ownership and management, and permitted uses. Since the district’s inception, most of the properties have been managed by the Iowa DNR through an MOU. Many WPAs in the district are in complexes with Iowa DNR WMAs, and county conservation areas. WPAs that are managed through the MOU are signed with both a “Waterfowl Production Area” (FWS) sign and a “Public Hunting, Wildlife Management Area” (Iowa DNR) sign. This signing procedure can confuse users as many are not likely aware of the district’s partnership, and not all state and federal public use regulations are the same.</p> <p>Informing visitors about this partnership and the differences in ownership is essential. The public should be able to easily find the locations of all fee title WPA properties and know what special regulations are enforced on the properties. Utilizing 21st century social media will likely prove to be essential to reach the public with such information. Large and frequently used WPAs may be excellent locations to place informational kiosks to inform the public about the importance of wetlands, WPAs, and the unique partnership of the Iowa DNR and Service. Visitors to the district deserve consistency in signage, messaging, and regulations. It may be possible to tie the district website containing regulations to a Quick Response code for mobile phones at a site such as a parking area.</p> <p>Newly acquired WPAs will also need the proper infrastructure to allow safe access to the property for users. Included in this access will be the development of gravel parking areas. Most parking areas will be 30 feet by 50 feet up to 80 feet by 100 feet. Users should be able to easily locate the parking areas and be able to turn vehicles around prior to exiting onto the roadway.</p>
Strategies	<ul style="list-style-type: none"> Within two years of CCP approval, update and coordinate information (regulations, planned events, hunter atlas, etc.) on the Iowa DNR and district website.

- Within five years of CCP approval, develop an informational and regulatory brochure for the district in cooperation with Iowa DNR.
- Within five years of CCP approval, identify three key locations and cost estimates to place informational kiosks interpreting the wildlife resources and partnership efforts of the district.
- Over the 15-year life of the CCP, strive for consistent signage on WPAs across the district.
- Continue annual coordination meetings with local Iowa DNR Wildlife Bureau staff and include Service zone law enforcement as well as Iowa DNR conservation officers.
- Within four years of CCP approval, complete a Visitor Services Plan for the Iowa WMD.
- Promote public use facilities on WPAs to Service partners, in particular the three enhanced WPAs referenced in Objective 3-1-1.

Issue 3-2: Appropriate recreational opportunities

Objective 3-2-1	<p>Upon implementation of the CCP, allow uses required by regulation (hunting, recreational fishing, and recreational trapping—all in accordance with state regulations) as well as other public uses deemed appropriate and compatible across the Iowa WMD. Within four years of CCP approval, appropriate and compatible uses will be clearly articulated to the public through uniform signage, brochures, and Iowa DNR and Iowa WMD websites as identified in the Visitor Services Plan.</p>
Measure	<ul style="list-style-type: none"> • Appropriate and compatible uses of the district are up-to-date and accurate on signs, brochures, and websites. • Violations on WPAs are reduced by 25–30 percent over the 15 year life of the plan.
Rationale	<p>Hunting: Hunting is one of the most popular public uses of WPAs in the Iowa WMD. Waterfowl, Ring-necked Pheasant, deer, and other migratory game birds are the most hunted species on WPAs. Hunting seasons generally occur from September through mid-January each year. Some hunting use also occurs for light geese with a conservation season open from mid-January through mid-April.</p> <p>WPAs are open to hunting as authorized by the Code of Federal Regulations. This regulation states, "Lands acquired as 'waterfowl production areas' shall annually be open to the hunting of migratory game birds, upland game, and big game subject to the provisions of state law and regulations . . ." (50 CFR Ch. 1 (10-1-12 Edition) Part 32, Subpart A, Section 32.1. However, according to state regulations, (Iowa Code 52.1(3) <i>Waterfowl refuges</i>) "The following areas under the jurisdiction of the department of natural resources are established as waterfowl refuges where posted. It shall be unlawful to hunt ducks and geese on the following areas, where posted, at any time during the year. It shall be unlawful to trespass in any manner on the following areas, where posted, during the dates posted, both dates inclusive . . . :</p> <ul style="list-style-type: none"> • Jemmerson Slough (Dickinson County); • Elk Creek Marsh (Worth County); and • Rice Lake (Winnebago and Worth Counties) within the Iowa WMD." <p>These areas will continue to be waterfowl refuges during the implementation of the CCP.</p> <p>As hunting opportunities dwindle on private land due to CRP loss, hunting leases, and intensified farming practices that eliminate cover, public hunting lands have experienced an increase in use. As of 2004, public conservation lands in Iowa only accounted for 1.7 percent of the state, which is one of the lowest in the country (Zohrer, 2005). Therefore, WPAs provide an important opportunity for hunting in Iowa.</p>

Recreational (Sport) Fishing: Sport fishing is another use allowed on WPAs per the Code of Federal Regulations. This regulation states, “Lands acquired as ‘waterfowl production areas’ are open to sport fishing subject to the provision of state laws and regulations . . .” (50 CFR Ch. 1 (10-1-12 Edition) Part 32, Subpart A, Section 32.4. Few areas in the Iowa WMD provide fishing opportunities; however, anglers may find perch, northern pike, largemouth bass, blue-gill, and bullhead on some WPAs. Sport fishing use can occur during any month of the year; however, winter ice fishing and early spring tend to be the most popular. Sport fishing is permitted in accordance with State of Iowa law.

Recreational Trapping: Trapping of furbearers is an additional consumptive public use of WPAs in the Iowa WMD. Furbearer trapping in the State of Iowa continues to be a popular public use but tends to fluctuate with the fur prices. WPAs are open to trapping as authorized by the Code of Federal Regulations which states, “Lands acquired as ‘waterfowl production areas’ shall be open to public trapping without federal permit . . .” (50 CFR Ch. 1 (10-1-12 Edition) Part 31, Subpart B, Section 31.16. Trappers are required to comply with Iowa state trapping laws and regulations.

Furbearer trapping for most species occurs from early November through the end of January with the exception of spring beaver trapping, which is open through mid-April. According to the Iowa DNR’s 2012 *Furbearers Report*, the most numerous mammal species trapped in Iowa is the raccoon with 236,943 harvested during the 2010–2011 season. The second most popular furbearer trapped in Iowa is the muskrat with a total 2010–2011 season harvest of 98,079 (Iowa DNR, 2012). Both of these species occur on most WPAs within the district.

Other Wildlife-Dependent Public Uses: There are six priority public uses identified in the National Wildlife Refuge System Improvement Act of 1997 that are considered to be wildlife-dependent. Each unit of the National Wildlife Refuge System (NWRS, Refuge System) is encouraged to find these uses compatible. In the past, the Iowa WMD only considered hunting, fishing, and trapping as approved public uses based on statutory requirements. However, compatibility determinations can be used to allow the other priority public uses if deemed compatible with the purpose of the district. These other uses include wildlife observation, photography, environmental education, and interpretation.

Wildlife Observation and Photography: Wildlife observation and photography are growing activities in the United States drawing enthusiasts to natural areas such as national wildlife refuges (NWRs, refuges) and WMDs. WPAs can provide visitors with tremendous opportunities to both view and photograph wildlife species representative of the PPR. During the spring visitors can view and photograph numerous birds using the wetlands as they migrate. During the summer and fall, tallgrass prairie and wetlands can display inspiring vistas of color that change during the growing season with various wildflower blooms. Many of the WPAs in the district

are excellent places to both observe and photograph resident wildlife such as white-tailed deer and Ring-necked Pheasant. Currently, however, there is very little infrastructure in place to support this use with the exception of parking areas, the Visitor's Center at Union Slough NWR and some pull-offs along roads. The district will evaluate potential areas for interpretive signage and observational areas to be developed. A compatibility determination has been developed for wildlife observation and photography (appendix F).

Environmental Education: Currently WPAs are spread across eighteen counties in the state, providing excellent areas for local schools, clubs, and county programs to utilize for teaching the public about Iowa's rich wetland and prairie heritage. The Iowa WMD does not have the staff or budget to produce large environmental education programs; however, this can be mitigated by developing partnerships with County Conservation Board (CCB) naturalists. The district's WPAs provide great settings for programs about migratory birds, tallgrass prairie, and wetlands. Public understanding of how productive Iowa soils were developed from tallgrass prairie and wetlands will foster an appreciation for future wetland and prairie conservation efforts. A compatibility determination has been developed for environmental education (appendix F).

Interpretation: Similar to environmental education, the Iowa WMD has little staff and budget to develop interpretive programs. Several events are held each year at Union Slough NWR in partnership with the Friends of Union Slough NWR including International Migratory Bird Day, National Wildlife Refuge Week, and Wood Duck banding. These events could also include or be held in the district. Currently, interpretive displays about wildlife and habitats found in the district are housed at Union Slough NWR. Areas with excellent wildlife viewing opportunities or exceptional features near higher populated areas within the district could be potential target areas for interpretive displays in the future. Partnerships with CCB naturalists in the district could be explored to provide programs/media interpreting the importance of tallgrass prairie and wetland habitat. A compatibility determination has been developed for interpretation (appendix F).

Another growing interest is in the use of technology to interpret various natural things. One of the ways this may be accomplished in the district is through the use of virtual geocaching. This activity leads the user to a location such as a parking area on a WPA or a road pull-off, and then the user receives information about the site such as geologic features, wildlife, or the importance of wetlands and tallgrass prairie habitat. Local instructors have requested this use as a way for them to interpret the natural process of Iowa. Virtual geocaching differs from typical geocaching in that the user does not take or leave any items at the site. The end prize is to learn about the area or be directed to the refuge/district office. A compatibility determination has been developed for virtual geocaching (appendix F).

Economic Uses for Management Purposes: Some economic uses of the district have proven to be the most efficient and cost effective tools for management. These include:

	<ul style="list-style-type: none"> • Wood cutting to remove woody vegetation and restore tallgrass prairie/wetland habitat. • Hay harvest to increase primary productivity in grasslands. • Livestock grazing to reduce standing litter, fertilize, mimic natural disturbance of bison and other large ungulate grazing, and increase primary productivity. <p>With limited staff and funding, these uses are essential tools that make meeting the purpose of the district easier. Compatibility determinations have been developed for all of these uses (appendix F).</p> <p><u>Other Uses:</u> A number of other uses for the Iowa WMD have been requested and considered. For various reasons, including wildlife disturbance, legality, availability on adjacent properties, damage to wildlife resources, and conflict with the district's purpose (waterfowl production and migratory birds), these uses have been deemed not appropriate. Future requests for other uses will be considered in a similar manner.</p>
<p>Strategies</p>	<p>Upon approval of the CCP,</p> <ul style="list-style-type: none"> • The following uses are allowed by Regulation and are Compatible: hunting in accordance with state regulations, recreational fishing in accordance with state regulations, and recreational trapping in accordance with state regulations. • The following uses are Appropriate and Compatible (some require a special use permit or have other limitations described in the compatibility determination for that use): bicycle riding on roads and trails open to vehicular traffic, wood cutting (including firewood), hay harvest, environmental education, food plot cultivation for wildlife, virtual or waypoint geocaching, interpretation, prescribed livestock grazing, photography, and wildlife observation. • The following uses are Not Appropriate: dog training, horseback riding, off road vehicle use (including ATV, UTV, dirt bike, motor vehicle), overnight camping, private Ring-necked Pheasant stocking, snowmobiling, and target shooting. • Upon approval of the CCP complete an annual inspection of WMD/DNR websites to update allowable uses. • Upon approval of the CCP annually evaluate the Uniform Crime Report and any reports submitted by Iowa DNR Conservation Officers, of non-appropriate uses. • Evaluate appropriateness and compatibility (if found appropriate) of other uses upon request per the Service's appropriate use and compatibility determination policy.

-

Appendix A: Species Lists

In this appendix:

[Plants](#)

[Mammals](#)

[Birds](#)

[Fish and Mussels](#)

[Reptiles and Amphibians](#)

The following species lists were compiled by the Region 3 office from a variety of sources, and were reviewed and approved by the Iowa Wetland Management District biologist. A file of more detailed species lists and a file explaining the methodology used to compile them is in the Project File (completed under contract by the U.S. Geological Survey).

Plants

Common Name	Scientific Name	State Status	Federal Status
Alkali Muhly	<i>Muhlenbergia asperifolia</i>	S	
Alpine Rush	<i>Juncus alpinus</i>	S	
Arrow Grass	<i>Triglochin maritimum</i>	T	
Beakrush	<i>Rhynchospora capillacea</i>	T	
Bicknell Northern Crane's-bill	<i>Geranium bicknellii</i>	S	
Bigroot Prickly-pear	<i>Opuntia macrorhiza</i>	E	
Bird's-eye Primrose	<i>Primula mistassinica</i>	S	
Blue Giant Hyssop	<i>Agastache foeniculum</i>	E	
Bog Bedstraw	<i>Galium labradoricum</i>	E	
Bog Birch	<i>Betula pumila</i>	T	
Bog Willow	<i>Salix pedicellaris</i>	T	
Brittle Prickly Pear	<i>Opuntia fragilis</i>	T	
Broadleaf Water-milfoil	<i>Myriophyllum heterophyllum</i>	S	
Brook Lobelia	<i>Lobelia kalmii</i>	S	
Buckbean	<i>Menyanthes trifoliata</i>	T	
Canada Plum	<i>Prunus nigra</i>	E	
Cliff Conobea	<i>Leucospora multifida</i>	E	
Clustered Broomrape	<i>Orobanche fasciculata</i>	E	

Common Name	Scientific Name	State Status	Federal Status
Clustered Poppy-mallow	<i>Callirhoe alcaeoides</i>	T	
Coast-blite Goosefoot	<i>Chenopodium rubrum</i>	S	
Common Mare's-tail	<i>Hippuris vulgaris</i>	S	
Creeping Juniper	<i>Juniperus horizontalis</i>	T	
Creeping Sedge	<i>Carex chordorrhiza</i>	E	
Crowfoot	<i>Ranunculus gmelinii</i>	S	
Cutleaf Water-milfoil	<i>Myriophyllum pinnatum</i>	S	
Drooping Bluegrass	<i>Poa languida</i>	S	
Dry-spike Sedge	<i>Carex foenea</i>	S	
Earleaf Foxglove	<i>Tomanthera auriculata</i>	S	
Eastern Jointweed	<i>Polygonella articulata</i>	E	
False Loosestrife	<i>Ludwigia peploides</i>	S	
Fewflower Spikerush	<i>Eleocharis pauciflora</i>	S	
Fineberry Hawthorn	<i>Crataegus chrysocarpa</i>	S	
Flat Top White Aster	<i>Aster pubentior</i>	S	
Flatleaf Bladderwort	<i>Utricularia intermedia</i>	S	
Flax-leaved Aster	<i>Aster linariifolius</i>	T	
Fogg's Goosefoot	<i>Chenopodium foggii</i>	S	
Fragrant False Indigo	<i>Amorpha nana</i>	T	
Frost Grape	<i>Vitis vulpina</i>	S	
Glade Mallow	<i>Napaea dioica</i>	S	
Glandular Wood Fern	<i>Dryopteris intermedia</i>	T	
Glomerate Sedge	<i>Carex aggregata</i>	S	
Golden Corydalis	<i>Corydalis aurea</i>	T	
Grass Pink	<i>Calopogon tuberosus</i>	S	
Great Plains Ladies'-tresses	<i>Spiranthes magnicamporum</i>	S	
Green Adder's Mouth	<i>Malaxis unifolia</i>	S	
Green Arrow Arum	<i>Peltandra virginica</i>	E	

Common Name	Scientific Name	State Status	Federal Status
Green Violet	<i>Hybanthus concolor</i>	T	
Green's Rush	<i>Juncus greenei</i>	S	
Hawksbeard	<i>Crepis runcinata</i>	S	
Hill's Thistle	<i>Cirsium hillii</i>	S	
Hooded Ladies'-tresses	<i>Spiranthes romanzoffiana</i>	T	
Hooker's Orchid	<i>Platanthera hookeri</i>	T	
Illinois Pinweed	<i>Lechea racemulosa</i>	S	
Interrupted Wildrye	<i>Elymus diversiglumis</i>	S	
Kitten Tails	<i>Besseyia bullii</i>	T	
Large-leaf Pondweed	<i>Potamogeton amplifolius</i>	S	
Large-leaf White Violet	<i>Viola incognita</i>	E	
Leafy Northern Green Orchid	<i>Platanthera hyperborea</i>	T	
Ledge Spikemoss	<i>Selaginella rupestris</i>	S	
Lesser Bladderwort	<i>Utricularia minor</i>	S	
Limestone Rockcress	<i>Arabis divaricarpa</i>	S	
Little Grape Fern	<i>Botrychium simplex</i>	T	
Low Hairy Ground-cherry	<i>Physalis pubescens</i>	S	
Low Nut Rush	<i>Scleria verticillata</i>	T	
Marginal Shield Fern	<i>Dryopteris marginalis</i>	T	
Meadow Bluegrass	<i>Poa wolfii</i>	S	
Meadow Spikemoss	<i>Selaginella eclipses</i>	E	
Missouri Lambsquarters	<i>Chenopodium missouriensis</i>	S	
Muskroot	<i>Adoxa moschatellina</i>	S	
Narrowleaf Pinweed	<i>Lechea intermedia</i>	T	
Narrow-leaved Milkweed	<i>Asclepias stenophylla</i>	E	
Nodding Thistle	<i>Cirsium undulatum</i>	S	
Northern Adder's-tongue	<i>Ophioglossum pusillum</i>	S	
Nuttall Pondweed	<i>Potamogeton epihydrus</i>	S	

Common Name	Scientific Name	State Status	Federal Status
Oak Fern	<i>Gymnocarpium dryopteris</i>	T	
One-sided Pyrola	<i>Pyrola secunda</i>	T	
Oval Ladies'-tresses	<i>Spiranthes ovalis</i>	T	
Ovate Spikerush	<i>Eleocharis ovata</i>	S	
Pale Green Orchid	<i>Platanthera flava</i>	E	
Pennsylvania Cinquefoil	<i>Potentilla pensylvanica</i>	T	
Philadelphia Panic Grass	<i>Panicum philadelphicum</i>	T	
Pink Milkwort	<i>Polygala incarnata</i>	T	
Pod Grass	<i>Scheuchzeria palustris</i>	S	
Prairie Bulrush	<i>Scirpus maritimus</i>	S	
Prairie Bush Clover	<i>Lespedeza leptostachya</i>	T	T
Prairie Moonwort	<i>Botrychium campestre</i>	S	
Pretty Dodder	<i>Cuscuta indecora</i>	S	
Purple Angelica	<i>Angelica atropurpurea</i>	S	
Purple Fringed Orchid	<i>Platanthera psycodes</i>	T	
Queen-of-the-prairie	<i>Filipendula rubra</i>	T	
Raccoon Grape	<i>Ampelopsis cordata</i>	S	
Ragwort	<i>Senecio pseud aureus</i>	S	
Rattle Milk-vetch	<i>Astragalus adsurgens</i>	S	
Rose Turtlehead	<i>Chelone obliqua</i>	S	
Roundleaf Sundew	<i>Drosera rotundifolia</i>	E	
Roundstem Foxglove	<i>Agalinis gattingeri</i>	T	
Rush Aster	<i>Aster junciformis</i>	T	
Sage Willow	<i>Salix candida</i>	S	
Sand Cherry	<i>Prunus pumila</i>	S	
Saskatoon Service-berry	<i>Amelanchier alnifolia</i>	S	
Scarlet Hawthorn	<i>Crataegus coccinea</i>	S	
Sedge	<i>Carex cephalantha</i>	S	

Common Name	Scientific Name	State Status	Federal Status
Shadbush	<i>Amelanchier sanguinea</i>	S	
Shining Willow	<i>Salix lucida</i>	T	
Showy Lady's Slipper	<i>Cypripedium reginae</i>	T	
Showy Milkweed	<i>Asclepias speciosa</i>	T	
Shrubby Cinquefoil	<i>Potentilla fruticosa</i>	T	
Silver Bladderpod	<i>Lesquerella ludoviciana</i>	S	
Silver Buffalo-berry	<i>Shepherdia argentea</i>	T	
Silverweed	<i>Potentilla anserina</i>	T	
Slender Arrow Grass	<i>Triglochin palustris</i>	T	
Slender Cotton Grass	<i>Eriophorum gracile</i>	T	
Slender Ladies'-tresses	<i>Spiranthes lacera</i>	T	
Slender Sedge	<i>Carex tenera</i>	S	
Slim-leaved Panic Grass	<i>Dichanthelium linearifolium</i>	T	
Small Fringed Gentian	<i>Gentianopsis procera</i>	S	
Small Spikerush	<i>Eleocharis parvula</i>	S	
Small White Lady's Slipper	<i>Cypripedium candidum</i>	S	
Smith Bulrush	<i>Scirpus smithii</i>	S	
Smooth Black-haw	<i>Viburnum prunifolium</i>	S	
Spear Needlegrass	<i>Stipa comata</i>	S	
Spiral Pondweed	<i>Potamogeton spirillus</i>	S	
Spring Avens	<i>Geum vernum</i>	S	
Spurge	<i>Euphorbia missurica</i>	S	
Straight-leaf Pondweed	<i>Potamogeton strictifolius</i>	S	
Swamp Thistle	<i>Cirsium muticum</i>	S	
Sweet Indian Plantain	<i>Cacalia suaveolens</i>	T	
Tall Cotton Grass	<i>Eriophorum angustifolium</i>	S	
Three-seeded Mercury	<i>Acalypha ostryifolia</i>	S	
Toad Rush	<i>Juncus bufonius</i>	S	

Common Name	Scientific Name	State Status	Federal Status
Toothcup	<i>Rotala ramosior</i>	S	
Tumble Grass	<i>Schedonnardus paniculatus</i>	S	
Tunnel-formed Penstemon	<i>Penstemon tubiflorus</i>	S	
Valerian	<i>Valeriana edulis</i>	S	
Vasey Pondweed	<i>Potamogeton vaseyi</i>	S	
Virginia Rockcress	<i>Sibara virginica</i>	S	
Water Marigold	<i>Megalodonta beckii</i>	E	
Water Milfoil	<i>Myriophyllum verticillatum</i>	S	
Water Parsnip	<i>Berula erecta</i>	T	
Water Shield	<i>Brasenia schreberi</i>	S	
Water Starwort	<i>Callitriche heterophylla</i>	S	
Waterwort	<i>Elatine triandra</i>	S	
Waxleaf Meadowrue	<i>Thalictrum revolutum</i>	E	
Waxyfruit Hawthorn	<i>Crataegus pruinosa</i>	S	
Western Parsley	<i>Lomatium orientale</i>	T	
Western Prairie Fringed Orchid	<i>Platanthera praeclara</i>	T	T
White Prairie Aster	<i>Aster falcatus</i>	S	
White Water Crowfoot	<i>Ranunculus circinatus</i>	S	
White-stem Pondweed	<i>Potamogeton praelongus</i>	S	
Widgeon-grass	<i>Ruppia cirrhosa</i>	S	
Winterberry	<i>Ilex verticillata</i>	E	
Wolf Spike-rush	<i>Eleocharis wolfii</i>	S	
Woodland Horsetail	<i>Equisetum sylvaticum</i>	T	
Woolly Milkweed	<i>Asclepias lanuginosa</i>	T	
Yellow Monkey Flower	<i>Mimulus glabratus</i>	T	
Yellow Trout-lily	<i>Erythronium americanum</i>	T	
Yellow-eyed Grass	<i>Xyris torta</i>	E

Fish and Mussels

Common Name	Scientific Name	State Status	Federal Status
American Brook Lamprey	<i>Lampetra appendix</i>	T, SGCN	
American Eel	<i>Anguilla rostrata</i>		
Banded Darter	<i>Etheostoma zonale</i>		
Banded Killifish	<i>Fundulus diaphanus</i>		
Bigmouth Buffalo	<i>Ictiobus cyprinellus</i>		
Bigmouth Shiner	<i>Notropis dorsalis</i>		
Black Buffalo	<i>Ictiobus niger</i>	SGCN	
Black Bullhead	<i>Ameiurus melas</i>		
Black Crappie	<i>Pomoxis nigromaculatus</i>		
Black Redhorse	<i>Moxostoma duquesnei</i>	T, SGCN	
Blackchin Shiner	<i>Notropis heterodon</i>		
Blacknose Dace	<i>Rhinichthys atratulus</i>		
Blacknose Shiner	<i>Notropis heterolepis</i>	T, SGCN	
Blackside Darter	<i>Percina caprodes</i>	SGCN	
Blackstripe Topminnow	<i>Fundulus notatus</i>		
Blue Sucker	<i>Cycleptus elongatus</i>	SGCN	
Bluegill	<i>Lepomis macrochirus</i>		
Bluntnose Minnow	<i>Pimephales notatus</i>		
Bluntnose Darter	<i>Etheostoma chlorosomum</i>		
Bowfin	<i>Amia calva</i>	SGCN	
Brassy Minnow	<i>Hybognathus hankinsoni</i>		
Brook Silverside	<i>Labidesthes sicculus</i>		
Brook Stickleback	<i>Culaea inconstans</i>		
Brook Trout	<i>Salvelinus fontinalis</i>	SGCN	
Brown Bullhead	<i>Ameiurus nebulosus</i>	SGCN	
Brown Trout	<i>Salmo trutta</i>		
Bullhead (Sheepnose)	<i>Plethobasus cyphus</i>	SGCN	

Common Name	Scientific Name	State Status	Federal Status
Bullhead Minnow	<i>Pimephales vigilax</i>		
Butterfly	<i>Ellipsaria lineolata</i>	SGCN	
Central Mudminnow	<i>Umbra limi</i>	SGCN	
Central Stoneroller	<i>Campostoma anomalum</i>		
Chain Pickerel	<i>Esox niger</i>		
Channel Catfish	<i>Ictalurus punctatus</i>		
Chestnut Lamprey	<i>Ichthyomyzon castaneus</i>	T	
Common Carp	<i>Cyprinus carpio</i>		
Common Shiner	<i>Luxilus cornutus</i>		
Creek Chub	<i>Semotilus atromaculatus</i>		
Creek Heelsplitter	<i>Lasmigona compressa</i>	T, SGCN	
Creepers	<i>Strophitus undulatus</i>	T, SGCN	
Cylinder	<i>Anodontoides ferussacianus</i>	SGCN	
Cylindrical Papershell	<i>Anodontoides ferussacianus</i>	T, SGCN	
Ebonyshell	<i>Fusconaia ebena</i>	SGCN	
Elktoe	<i>Alasmidonta marginata</i>	SGCN	
Ellipse	<i>Venustaconcha ellipsiformis</i>	T, SGCN	
Emerald Shiner	<i>Notropis atherinoides</i>		
Fantail Darter	<i>Etheostoma flabellare</i>		
Fathead Minnow	<i>Pimephales promelas</i>		
Fawnsfoot	<i>Truncilla donaciformis</i>	SGCN	
Flat floater	<i>Anodonta suborbiculata</i>	SGCN	
Flathead Catfish	<i>Pylodictis olivaris</i>		
Flathead Chub	<i>Platygobio gracilis</i>	SGCN	
Fluted shell	<i>Lasmigona costata</i>	SGCN	
Freshwater Drum	<i>Aplodinotus grunniens</i>		
Gilt Darter	<i>Percina evides</i>		
Gizzard Shad	<i>Dorosoma cepedianum</i>		

Common Name	Scientific Name	State Status	Federal Status
Golden Redhorse	<i>Moxostoma erythrurum</i>		
Golden Shiner	<i>Notemigonus crysoleucas</i>		
Goldeye	<i>Hiodon alosoides</i>	SGCN	
Goldfish	<i>Carassius auratus</i>		
Grass Carp	<i>Ctenopharyngodon idella</i>		
Grass Pickerel	<i>Esox americanus</i>	T, SGCN	
Gravel Chub	<i>Erimytax x-punctatus</i>	SGCN	
Green Sunfish	<i>Lepomis cyanellus</i>		
Hickorynut	<i>Obovaria olivaria</i>	SGCN	
Higgins' eye pearlymussel	<i>Lampsilis higginsii</i>	SGCN	
Highfin Carpsucker	<i>Carpiodes velifer</i>		
Hornyhead Chub	<i>Nocomis biguttatus</i>		
Iowa Darter	<i>Etheostoma exile</i>		
Johnny Darter	<i>Etheostoma nigrum</i>		
Lake chub	<i>Couesius plumbeus</i>		
Largemouth Bass	<i>Micropterus salmoides</i>		
Largescale Stoneroller	<i>Campostoma oligolepis</i>	SGCN	
Least Darter	<i>Etheostoma microperca</i>	E, SGCN	
Lilliput	<i>Toxolasma parvus</i>	SGCN	
Longear Sunfish	<i>Lepomis megalotis</i>		
Longnose Dace	<i>Rhinichthys cataractae</i>	SGCN	
Longnose Gar	<i>Lepisosteus osseus</i>		
Mimic Shiner	<i>Notropis volucellus</i>		
Mississippi Silvery Minnow	<i>Hybognathus nuchalis</i>	SGCN	
Monkeyface	<i>Quadrula metanerva</i>	SGCN	
Mooneye	<i>Hiodon tergisus</i>		
Mud Darter	<i>Etheostoma asprigene</i>		
Muskellunge	<i>Esox masquinongy</i>		

Common Name	Scientific Name	State Status	Federal Status
Northern Hogsucker	<i>Hypentelium nigricans</i>		
Northern Logperch	<i>Percina caprodes</i>		
Northern Pike	<i>Esox lucius</i>		
Northern Rock Bass	<i>Ambloplites rupestris</i>		
Orangespotted Sunfish	<i>Lepomis humilis</i>		
Orangethroat Darter	<i>Etheostoma spectabile</i>	T	
Ozark Minnow	<i>Notropis nubilus</i>	SGCN	
Ozark Pigtoe	<i>Fusconaia ozarkensis</i>	E, SGCN	
Paddlefish	<i>Polyodon spathula</i>	SGCN	
Pallid Shiner	<i>Notropis amnis</i>		
Paper pondshell	<i>Utterbackia imbecillis</i>	SGCN	
Pearl Dace	<i>Margariscus margarita</i>	E, SGCN	
Pistolgrip	<i>Tritogonia verrucosa</i>	E, SGCN	
Plains Minnow	<i>Hybognathus placitus</i>	SGCN	
Plains Topminnow	<i>Fundulus sciadicus</i>		
Pondhorn	<i>Unio merus tetralasmus</i>	SGCN	
Pondmussel	<i>Ligumia subrostrata</i>	SGCN	
Pugnose Shiner	<i>Notropis anogenus</i>	E, SGCN	
Pumpkinseed	<i>Lepomis gibbosus</i>		
Purple pimpleback	<i>Cyclonaias tuberculata</i>	SGCN	
Quillback Carpsucker	<i>Carpiodes cyprinus</i>		
Rainbow Darter	<i>Etheostoma caeruleum</i>		
Rainbow Trout	<i>Oncorhynchus mykiss</i>		
Red Shiner	<i>Cyprinella lutrensis</i>		
Redear Sunfish	<i>Lepomis microlophus</i>		
Redfin Shiner	<i>Lythrurus umbratilis</i>	SGCN	
River Carpsucker	<i>Carpiodes carpio</i>		
River Redhorse	<i>Moxostoma carinatum</i>		

Common Name	Scientific Name	State Status	Federal Status
River Shiner	<i>Notropis blennioides</i>		
Rock pocketbook	<i>Arcidens confragosus</i>	SGCN	
Rosyface Shiner	<i>Notropis rubellus</i>		
Round Pigtoe	<i>Pleurobema sintoxia</i>	E, SGCN	
Sand Shiner	<i>Notropis stramineus</i>		
Sauger	<i>Stizostedion canadense</i>		
Shorthead Redhorse	<i>Moxostoma macrolepidotum</i>		
Shortnose Gar	<i>Lepisosteus platostomus</i>		
Shovelnose Sturgeon	<i>Scaphirhynchus platyrhynchus</i>	SGCN	
Silver Chub	<i>Macrhybopsis storeriana</i>		
Silver Lamprey	<i>Ichthyomyzon unicuspis</i>	SGCN	
Silver Redhorse	<i>Moxostoma anisurum</i>		
Slender Madtom	<i>Noturus exilis</i>	SGCN	
Slenderhead Darter	<i>Percina phoxocephala</i>	SGCN	
Slimy Sculpin	<i>Cottus cognatus</i>	SGCN	
Slippershell	<i>Alasmidonta viridis</i>	SGCN	
Slippershell Mussel	<i>Alasmidonta viridis</i>	E, SGCN	
Slough sandshell	<i>Lampsilis teres teres</i>	SGCN	
Smallmouth Bass	<i>Micropterus dolomieu</i>		
Smallmouth Buffalo	<i>Ictiobus bubalus</i>		
Southern Redbelly Dace	<i>Phoxinus erythrogaster</i>		
Speckled Chub	<i>Macrhybopsis aestivalis</i>	SGCN	
Spectacle case	<i>Cumberlandia monodonta</i>	SGCN	
Spike	<i>Elliptio dilatata</i>	SGCN	
Spotfin Shiner	<i>Cyprinella spiloptera</i>		
Spottail Shiner	<i>Notropis hudsonius</i>	SGCN	
Spotted Bass	<i>Micropterus punctulatus</i>		
Spotted Sucker	<i>Minytrema melanops</i>		

Common Name	Scientific Name	State Status	Federal Status
Starhead Topminnow	<i>Fundulus dispar</i>		
Stonecat	<i>Noturus flavus</i>		
Strange floater (Squawfoot)	<i>Strophitus undulatus</i>	SGCN	
Suckermouth Minnow	<i>Phenacobius mirabilis</i>		
Tadpole Madtom	<i>Noturus gyrinus</i>	SGCN	
Topeka Shiner	<i>Notropis topeka</i>	T, SGCN	E
Trout-Perch	<i>Percopsis omiscomaycus</i>	SGCN	
Walleye	<i>Sander vitreum</i>		
Warmouth	<i>Lepomis gulosus</i>		
Wartyback	<i>Quadrula nodulata</i>	SGCN	
Weed Shiner	<i>Notropis texanus</i>	E, SGCN	
Western Sand Darter	<i>Ammocrypta clara</i>	T, SGCN	
Western Silvery Minnow	<i>Hybognathus argyritis</i>	SGCN	
White Bass	<i>Morone chrysops</i>		
White Crappie	<i>Pomoxis annularis</i>		
White Sucker	<i>Catostomus commersoni</i>		
Yellow Bass	<i>Morone mississippiensis</i>		
Yellow Bullhead	<i>Ameiurus natalis</i>		
Yellow Perch	<i>Perca flavescens</i>		
Yellow Sandshell	<i>Lampsilis teres</i>	E, SGCN	
E = Endangered, T = Threatened, SGCN = Species of Greatest Conservation Need			

Reptiles and Amphibians

Common Name	Scientific Name	State Status
American Toad	<i>Bufo americanus</i>	
Blanding's Turtle	<i>Emydoidea blandingii</i>	T
Boreal Chorus Frog	<i>Pseudacris maculata</i>	*
Brown Snake	<i>Storeria dekayi</i>	P
Bullfrog	<i>Rana catesbeiana</i>	*
Bullsnake	<i>Pituophis catenifer sayi</i>	S
Cope's Gray Tree Frog	<i>Hyla chrysoscelis</i>	*
Crayfish Snake	<i>Regina grahamii</i>	P
Cricket Frog	<i>Acris crepitans</i>	*
Eastern Garter Snake	<i>Thamnophis sirtalis</i>	
Fox Snake	<i>Elaphe vulpina</i>	P
Green Frog	<i>Rana clamitans</i>	*
Lined Snake	<i>Tropidoclonion lineatum</i>	P
Milk Snake	<i>Lampropeltis triangulum</i>	P
Mudpuppy	<i>Necturus maculosus</i>	T
Northern Leopard Frog	<i>Rana pipiens</i>	*
Northern Prairie Skink	<i>Eumeces septentrionalis</i>	
Northern Water Snake	<i>Nerodia sipedon</i>	P
Ornate Box Turtle	<i>Terrapene ornata</i>	T
Painted Turtle	<i>Chrysemys picta</i>	*
Plains Garter Snake	<i>Thamnophis radix</i>	P
Plain's Leopard Frog	<i>Rana blairi</i>	*
Racer	<i>Coluber constrictor</i>	P
Redbelly Snake	<i>Storeria occipitomaculata</i>	P
Ringneck Snake	<i>Diadophis punctatus</i>	P
Smooth Earth Snake	<i>Virginia valeriae</i>	P
Smooth Green Snake	<i>Opheodrys vernalis</i>	S

Common Name	Scientific Name	State Status
Smooth Softshell Turtle	<i>Apalone mutica</i>	*
Snapping Turtle	<i>Chelydra serpentina</i>	*
Spiny Softshell Turtle	<i>Apalone spinifera</i>	*
Spring Peeper	<i>Pseudacris crucifer</i>	*
Tiger Salamander	<i>Ambystoma tigrinum</i>	*
Western Ribbon Snake	<i>Thamnophis proximus</i>	P
Wood Turtle	<i>Clemmys insculpta</i>	E
<p>E = Endangered, P = Protected, cannot kill or collect in Iowa S = Special Concern, T = Threatened *A valid fishing license is required to possess this species for bait and/or food.</p>		

Appendix B: Abbreviations and Glossary

Abbreviations

The following is a list of the most frequently used abbreviations in this document. More detail for some of the abbreviations is included in the Glossary.

NOTE: “Abbreviations” is used generically to refer to abbreviations (shortened version of a term or series of words), acronyms (word formed from letters or parts of a series of words), and initialisms (initial letters pronounced separately).

BCA:	Bird Conservation Areas
BCC:	Birds of Conservation Concern
BCR:	Bird Conservation Region
CCP:	Comprehensive Conservation Plan
CD:	Compatibility Determination
CFR:	Code of Federal Regulations
CRP:	U.S. Department of Agriculture’s Conservation Reserve Program
DNR:	Department of Natural Resources (often preceded by state abbreviation)
DOI:	U.S. Department of the Interior
DU:	Ducks Unlimited
EA:	Environmental Assessment
EAS:	Environmental Action Statement
EE:	Environmental Education
EIS:	Environmental Impact Statement
EO:	Executive Order
EPA:	U.S. Environmental Protection Agency
ESA:	Endangered Species Act
FONSI:	Finding of No Significant Impact
FR:	Federal Register
FTE:	Full-time Equivalent
FWS:	U.S. Fish and Wildlife Service (also USFWS and Service)
FY:	Fiscal Year
GAP:	Gap Analysis Program
GIS:	Geographic Information System
HAPET:	U.S. Fish and Wildlife Service’s Habitat and Population Evaluation Team
IBA:	Audubon Society’s Important Bird Area
IPCC:	Intergovernmental Panel on Climate Change
LCC:	Landscape Conservation Cooperative
LCD:	Landscape Conservation Design
MOA:	Memorandum of Agreement
MOU:	Memorandum of Understanding
NABCI:	North American Bird Conservation Initiative
NAI:	Natural Areas Inventory
NEPA:	National Environmental Policy Act of 1969
NRHP:	National Register of Historic Places
NWR:	National Wildlife Refuge (also refuge)
NWRS:	National Wildlife Refuge System (also Refuge System)
PFT:	Permanent Full-time
PPJV:	Prairie Pothole Joint Venture

PPR:	Prairie Pothole Region
R3:	Region 3 (Midwest) of the U.S. Fish and Wildlife Service (Illinois, Indiana, Iowa, Michigan, Minnesota, Missouri, Ohio, Wisconsin)
ROD:	Record of Decision
SGCN:	Species of Greatest Conservation Need
SHC:	Strategic Habitat Conservation
TFT:	Temporary Full-time
UMR/GLR JV:	Upper Mississippi River & Great Lakes Region Joint Venture
USC:	United States Code
USDA:	U.S. Department of Agriculture
USGS:	U.S. Geologic Survey
WMA:	Wildlife Management Area
WMD:	Wetland Management District (also district)
WPA:	Waterfowl Production Area
WRP:	U.S. Department of Agriculture's Wetland Reserve Program
WSA:	Wilderness Study Areas

Glossary

Adaptation: Adjustment in natural or human systems to a new or changing environment. Adaptation to climate change refers to adjustment in natural or human systems in response to actual or expected climatic stimuli or their effects, which moderates harm or exploits beneficial opportunities. Various types of adaptation can be distinguished, including anticipatory and reactive adaptation, private and public adaptation, and autonomous and planned adaptation.

Adaptive Management: The rigorous application of management, research, and monitoring to gain information and experience necessary to assess and modify management activities. A process that uses feedback from refuge research and monitoring and evaluation of management actions to support or modify objectives and strategies at all planning levels (FWS, 602 FW 1.6(A)).

Alternatives: Different sets of objectives and strategies or means of achieving refuge purposes and goals, helping fulfill the National Wildlife Refuge System mission, and resolving issues (FWS, 602 FW 1.6(B)).

Appropriate Use: A proposed or existing use on a refuge that meets at least one of the following four conditions (FWS, 603 FW 1.6):

- The use is a wildlife-dependent recreational use as identified in the Fish and Wildlife Improvement Act of 1978.
- The use contributes to fulfilling the refuge purpose(s), the National Wildlife Refuge System mission, or goals or objectives described in a refuge management plan approved after October 9, 1997, the date the National Wildlife Refuge System Improvement Act of 1997 was signed into law.
- The use involves the take of fish and wildlife under state regulations.
- The use has been found to be appropriate as specified in section 1.11.

Approved Acquisition Boundary: A project boundary that the Director of the U.S. Fish and Wildlife Service approves upon completion of the planning and environmental compliance process. An approved acquisition boundary only designates those lands that the Service has authority to acquire and/or manage through various agreements. Approval of an acquisition boundary does not grant the Service jurisdiction or control over lands within the boundary, and it does not make lands within the refuge boundary part of the National Wildlife Refuge System. Lands do not become part of the Refuge System until they are purchased or are placed under an agreement that provides for management as part of the Refuge System.

Biological Control: The use of organisms or viruses to control weeds or other pests.

Biological Diversity: The variety of life, including the variety of living organisms, the genetic differences among them, and the communities in which they occur (FWS, 602 FW 1.6(C)).

Biological Integrity: Biotic composition, structure, and functioning at the genetic, organism, and community levels consistent with natural conditions, including the natural biological processes that shape genomes, organisms, and communities (FWS, 602 FW 1.6(D)).

Candidate Species: Plants and animals for which the U.S. Fish and Wildlife Service has sufficient information on their biological status and threats to propose them as endangered or threatened under the Endangered Species Act of 1973, but for which development of a proposed listing regulation is precluded by other higher priority listing activities.

Carbon Sequestration: The uptake and storage of carbon. Trees and plants, for example, absorb carbon dioxide, release the oxygen, and store the carbon. Fossil fuels were at one time biomass and continue to store the carbon until burned.

Climate Change: Climate change refers to any significant change in measures of climate (such as temperature, precipitation, or wind) lasting for an extended period (decades or longer). Climate change may result from (1) natural factors, such as changes in the sun's intensity or slow changes in the Earth's orbit around the sun; (2) natural processes within the climate system (e.g., changes in ocean circulation); (3) human activities that change the atmosphere's composition (e.g., through burning fossil fuels) and the land surface (e.g., deforestation, reforestation, urbanization, desertification, etc.).

Code of Federal Regulations (CFR): The codification of the general and permanent rules published in the *Federal Register* by the departments and agencies of the federal government. It is divided into 50 titles that represent broad areas subject to federal regulation. The 50 subject matter titles contain one or more individual volumes, which are updated once each calendar year, on a staggered basis.

Compatible Use: A proposed or existing wildlife-dependent recreational use or any other use of a national wildlife refuge that, based on sound professional judgment, will not materially interfere with or detract from the fulfillment of the National Wildlife Refuge System mission or the purposes of the national wildlife refuge (FWS, 603 FW 2.6(B)).

Compatibility Determination (CD): A written determination signed and dated by the refuge manager and the U.S. Fish and Wildlife Service regional chief signifying that a proposed or existing use of a national wildlife refuge is a compatible use or is not a compatible use. The director of the Service makes this delegation through the regional director (FWS, 603 FW 2.6(A)).

Comprehensive Conservation Plan (CCP): A document that describes the desired future conditions of a refuge or planning unit and provides long-range guidance and management direction to achieve the purposes of the refuge; helps fulfill the mission of the Refuge System; maintains and, where appropriate, restores the ecological integrity of each refuge and the National Wildlife Refuge System; helps achieve the goals of the National Wilderness Preservation System; and meets other mandates (FWS, 602 FW 1.6(E)).

Consumptive Use: Use of a refuge resource that removes the resource from the refuge (e.g., killing an animal to eat, catching and keeping fish, harvesting berries or plants, or removal of mineral or other specimens).

Council on Environmental Quality (CEQ): An executive office of the president whose members are appointed by the president. CEQ recommends national policies to promote the improvement of the quality of the environment.

Cultural Resource Inventory: A professionally conducted study designed to locate and evaluate evidence of cultural resources present within a defined geographic area. Inventories may involve various levels, including background literature search, comprehensive field examination to identify all exposed physical manifestations of cultural resources, or sample inventory to project site distribution and density over a larger area. Evaluation of identified cultural resources to determine eligibility for the National Register of Historic Places follows the criteria found in 36 CFR 60.4.

Cultural Resources: “Those parts of the physical environment—natural and built—that have cultural value to some kind of sociocultural group . . . [and] those non-material human social institutions . . .” Cultural resources include historic sites, archeological sites and associated artifacts, sacred sites, traditional cultural properties, cultural items (human remains, funerary objects, sacred objects, and objects of cultural patrimony), and buildings and structures.

Easement: A privilege or right that is held by one person or other entity in land owned by another.

Ecological Integrity: The integration of biological integrity, natural biological diversity, and environmental health; the replication of natural conditions (FWS, 602 FW 1.6(G)).

Ecosystem: A biological community together with its environment, functioning as a unit. For administrative purposes, 53 ecosystems covering the United States and its possessions have been designated. These ecosystems generally correspond with watershed boundaries, and their sizes and ecological complexity vary (FWS, 602 FW 1.6(H)).

Effects (Impacts): Effects include:

- Direct effects, which are caused by the action and occur at the same time and place.
- Indirect effects, which are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable. Indirect effects may include growth-inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems.

- Cumulative effects, which result from past, present, and reasonably foreseeable future actions that, collectively, become significant over time.

Effects and impacts as used in these regulations are synonymous. Effects includes ecological (such as the effects on natural resources and on the components, structures, and functioning of affected ecosystems), aesthetic, historic, cultural, economic, social, or health, whether direct, indirect, or cumulative. Effects may also include those resulting from actions that may have both beneficial and detrimental effects, even if on balance the agency believes that the effect will be beneficial (40 CFR 1508.8).

Endangered Species: Any species of plant or animal defined through the Endangered Species Act of 1973 as being in danger of extinction throughout all or a significant portion of its range and published in the *Federal Register*.

Endangered Species Act (ESA): Through federal action and by encouraging the establishment of state programs, the Endangered Species Act of 1973 provided for the conservation of ecosystems upon which threatened and endangered species of fish, wildlife, and plants depend. The act authorizes the determination and listing of species as endangered and threatened; prohibits unauthorized taking, possession, sale, and transport of endangered species; provides authority to acquire land for the conservation of listed species, using land and water conservation funds; authorizes establishment of cooperative agreements and grants-in-aid to states that establish and maintain active and adequate programs for endangered and threatened wildlife and plants; authorizes the assessment of civil and criminal penalties for violating the act or regulations; and authorizes the payment of rewards to anyone furnishing information leading to arrest and conviction for any violation of the act or any regulation issued thereunder.

Section 7 of the Endangered Species Act of 1973 requires federal agencies to ensure that any action authorized, funded, or carried out by them is not likely to jeopardize the continued existence of listed species or modify their critical habitat.

Environmental Action Statement (EAS): The decision document for an environmental assessment for the U.S. Fish and Wildlife Service. The EAS will consist of a one-page document indicating the proposal, the Service decision, references to supporting documents (if any), and a signature block. The purposes of the EAS are to establish a process for internal review of National Environmental Policy Act-related decision documents and to provide an appropriate administrative record of NEPA-related decisions at all management levels of the Service (FWS, 550 FW 3.3 (C)).

Environmental Analysis: The process associated with preparing documents such as environmental assessments and environmental impact statements and the decision whether to prepare an environmental impact statement. It is an analysis of alternative actions and their predictable short-term and long-term effects, which include physical, biological, economic, and social factors and their interactions.

Environmental Assessment (EA): A systematic analysis to determine if proposed actions would result in a significant effect on the quality of the environment.

Environmental Consequences: The scientific and analytic basis for the comparison of alternatives. The environmental impacts of the alternatives including the proposed action, any

adverse environmental effects that cannot be avoided should the proposal be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible and irretrievable commitments of resources that would be involved in the proposal should it be implemented (40 CFR 1502.16).

Environmental Health: Abiotic composition, structure, and functioning of the environment consistent with natural conditions, including the natural abiotic processes that shape the environment (FWS, 602 FW 1.6(I)).

Environmental Impact Statement (EIS): A detailed written statement, required by section 102(2)(C) of the National Environmental Policy Act of 1969, analyzing the environmental impacts of a proposed action, adverse effects of the project that cannot be avoided, alternative courses of action, short-term uses of the environment versus the maintenance and enhancement of long-term productivity, and any irreversible and irretrievable commitment of resources (40 CFR 1508.11).

Environmental Justice: The fair treatment and meaningful involvement of all people in the development, implementation, and enforcement of environmental laws regardless of race, color, national origin, or income.

Extirpation: The local extinction of a species that is no longer found in a locality or country but exists elsewhere in the world.

Finding of No Significant Impact (FONSI): A document prepared in compliance with the National Environmental Policy Act of 1969 and supported by an environmental assessment that briefly presents why a federal action will have no significant effects on the human environment and for which an Environmental Impact Statement will not be prepared (40 CFR 1508.13).

Global Warming: Global warming is an average increase in the temperature of the atmosphere near the Earth's surface and in the troposphere, which can contribute to changes in global climate patterns. Global warming can occur from a variety of causes, both natural and human induced. In common usage, "global warming" often refers to the warming that can occur as a result of increased emissions of greenhouse gases from human activities.

Goal: A descriptive, open-ended, and often broad statement of desired future conditions that conveys purposes but does not define measurable units (FWS, 602 FW 1.6(J)).

Greenhouse Gas (GHG): Any gas that absorbs infrared radiation in the atmosphere. Greenhouse gases include, but are not limited to, water vapor, carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), chlorofluorocarbons (CFCs), hydrochlorofluorocarbons (HCFCs), ozone (O₃), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF₆).

Habitat: The physical and biological resources required by an organism for its survival and reproduction; these requirements are species-specific. Food and cover are major components of habitat and must extend beyond the requirements of the individual to include a sufficient area capable of supporting a viable population.

Incompatible: Any use (recreational or nonrecreational) of a refuge that, in the sound professional judgment of the Director of the U.S. Fish and Wildlife Service, will materially

interfere with or detract from the fulfillment of the mission of the National Wildlife Refuge System or the purposes of the refuge. Incompatible uses are not allowed to occur on Service areas.

Indicator: In effects analysis, a way for measuring effects from management alternatives on a particular resource or issue.

Interjurisdictional Fish: Fish that occur in waters under the jurisdiction of one or more states, for which there is an interstate fishery management plan or which migrates between the waters under the jurisdiction of two or more states bordering on the Great Lakes.

Invasive Species: Invasive species are organisms that are introduced into a non-native ecosystem and that cause, or are likely to cause, harm to the economy, environment, or human health.

Inventory: Accepted biological methods to determine the presence, relative abundance, and/or distribution of species (FWS, 701 FW 2.6(A)).

Issue: Any unsettled matter that requires a management decision—that is, a U.S. Fish and Wildlife Service initiative, opportunity, resource management problem, a threat to the resources of the unit, conflict in uses, public concern, or the presence of an undesirable resource condition (FWS, 602 FW 1.6(K)).

Landscape Conservation Cooperative (LCC): A national network of public-private partnerships that provide shared science to ensure the sustainability of America's land, water, wildlife, and cultural resources.

Landscape Conservation Design (LCD): A partnership-driven activity that results in an assessment of current and anticipated future resource patterns and processes, and a spatially explicit depiction of a desired future condition. These products guide partners' identification of broad management, restoration, and protection strategies that could be implemented on the ground to address identified resource concerns, attain desired future conditions, sustain ecosystem function, and achieve the missions, mandates, and goals of partner agencies, organizations, and tribes.

Major Federal Action: Includes action with effects that may be major and that are potentially subject to federal control and responsibility. "Major" reinforces but does not have a meaning independent of significantly. "Actions" include new and continuing activities. Federal actions include adoption of official policy, formal plans, programs, and approval of specific projects (40 CFR 1508.18).

Memorandum of Understanding or Agreement (MOU or MOA): A legal document outlining the terms and details of an agreement between parties (often U.S. Fish and Wildlife Service and a state natural resource agency), including each party's requirements and responsibilities. It sets forth the basic principles and guidelines under which the parties will work together to accomplish their goals. A memorandum of understanding or agreement are generally recognized as binding, even if no legal claim could be based on the rights and obligations laid down in them.

Migratory Birds: Birds that follow a seasonal movement from their breeding grounds to their wintering grounds. Waterfowl, shorebirds, raptors, and songbirds are all migratory birds.

Monitoring: Accepted biological methods to determine the status and/or demographics of species over time (FWS, 701 FW 2.6(B)).

National Environmental Policy Act of 1969 (NEPA): This act, promulgated in 1969, requires all federal agencies to disclose the environmental effects of their actions, incorporate environmental information, and use public participation in the planning and implementation of all actions. Federal agencies must integrate NEPA with other planning requirements and must prepare appropriate NEPA documents to facilitate better environmental decision making (40 CFR 1500). The law also established the Council on Environmental Quality to implement the law and to monitor compliance with the law.

National Wilderness Preservation System: A network of federally owned areas designated by Congress as wilderness and managed by one of four federal agencies: the U.S. Fish and Wildlife Service, Bureau of Land Management, National Park Service, or the U.S. Forest Service. Includes over 600 areas and more than 105 million acres. The National Wildlife Refuge System includes over 20 million acres of wilderness in more than 60 refuges (FWS, 610 FW 1.9).

National Wildlife Refuge (NWR, refuge): A designated area of land, water, or an interest in land or water within the National Wildlife Refuge System, but does not include Coordination Areas. A complete listing of all units of the Refuge System is located in the current Report of Lands Under Control of the U.S. Fish and Wildlife Service (FWS, 602 FW 1.6(L)).

National Wildlife Refuge System (NWRS, Refuge System): All lands, waters, and interests therein administered by the U.S. Fish and Wildlife Service as wildlife refuges, wildlife ranges, wildlife management areas, waterfowl production areas, and other areas for the protection and conservation of fish, wildlife, and plant resources.

National Wildlife Refuge System Improvement Act of 1997 (improvement act): Sets the mission and administrative policy for all refuges in the National Wildlife Refuge System. Clearly defines a unifying mission for the Refuge System; establishes the legitimacy and appropriateness of the six priority public uses (hunting, fishing, wildlife observation and photography, and environmental education and interpretation); establishes a formal process for determining compatibility; establishes the responsibilities of the Secretary of the Interior for managing and protecting the Refuge System; and requires a Comprehensive Conservation Plan for each refuge by the year 2012. This act amended portions of the Refuge Recreation Act and National Wildlife Refuge System Administration Act of 1966.

Native Species: A species, subspecies, or distinct population that occurs within its natural range or natural zone of potential dispersal (i.e., the geographic area the species occupies naturally or would occupy in the absence of direct or indirect human activity or an environmental catastrophe).

No Action Alternative: In the context of a Comprehensive Conservation Plan, this refers to the current management direction. With this alternative, no change from the current CCP would be implemented.

Non-consumptive Uses: Recreational activities (e.g., hiking, photography, and wildlife observation) that do not involve the taking or catching of fish, wildlife, or other natural resources.

Non-native Species: A species, subspecies, or distinct population that has been introduced by humans (intentionally or unintentionally) outside its natural range or natural zone of potential dispersal.

Objective: A concise statement of what we want to achieve, how much we want to achieve, when and where we want to achieve it, and who is responsible for the work. Objectives derive from goals and provide the basis for determining strategies, monitoring refuge accomplishments, and evaluating the success of strategies. Objectives are to be attainable, time-specific, and measurable (FWS, 602 FW 1.6(N)).

Ozone (O₃): Ozone, the triatomic form of oxygen (O₃), is a gaseous atmospheric constituent. In the troposphere, it is created both naturally and by photochemical reactions involving gases resulting from human activities (photochemical smog). In high concentrations, tropospheric ozone can be harmful to a wide range of living organisms. Tropospheric ozone acts as a greenhouse gas. In the stratosphere, ozone is created by the interaction between solar ultraviolet radiation and molecular oxygen (O₂). Stratospheric ozone plays a decisive role in the stratospheric radiative balance. Depletion of stratospheric ozone, due to chemical reactions that may be enhanced by climate change, results in an increased ground-level flux of ultraviolet (UV) B radiation.

Planning Area: The area upon which the planning effort will focus. A planning area may include lands outside existing planning unit boundaries currently studied for inclusion in the National Wildlife Refuge System and/or partnership planning efforts. It also may include watersheds or ecosystems outside of our jurisdiction that affect the planning unit. At a minimum, the planning area includes all lands within the authorized boundary of the refuge (FWS, 602 FW 1.6(O)).

Planning Team: A planning team is interdisciplinary in membership and function. A team generally consist of a planning team leader, refuge manager, staff biologists, a state natural resource agency representative, and other appropriate program specialists (e.g., social scientist, ecologist, recreation specialist). Other federal and tribal natural resource agencies may also be asked to provide team members, as appropriate. The planning team prepares the Comprehensive Conservation Plan and appropriate National Environmental Policy Act of 1969 documentation (FWS, 602 FW 1.6(P)).

Prescribed Burning: Controlled application of fire to the landscape that allows the fire to be confined to a predetermined area while producing the intensity of heat and rate of spread required to achieve planned management objectives.

Preferred Alternative: A proposed action in the National Environmental Policy Act of 1969 document for the Comprehensive Conservation Plan identifying the alternative that the U.S. Fish and Wildlife Service believes best achieves planning unit purposes, vision, and goals; helps fulfill the National Wildlife Refuge System mission; maintains and, where appropriate, restores the ecological integrity of each refuge and the Refuge System; addresses the significant issues and mandates; and is consistent with principles of sound fish and wildlife management.

Priority Public Uses: Six uses authorized by the National Wildlife Refuge System Improvement Act of 1997 to have priority and are found to be compatible with the refuge purposes. This includes hunting, fishing, wildlife observation and photography, and environmental education and interpretation.

Proposed Action: In the context of a Comprehensive Conservation Plan, this is the same as the Preferred Alternative.

Public Involvement: A process that offers affected and interested individuals and organizations opportunities to become informed about, and to express their opinions on, U.S. Fish and Wildlife Service actions and policies. In the process, these public views are studied thoroughly and are thoughtfully considered in shaping decisions for refuge management.

Purposes of the Refuge: The purposes specified in or derived from the law, proclamation, executive order, agreement, public land order, donation document, or administrative memorandum establishing, authorizing, or expanding a refuge, refuge unit, or refuge subunit. For refuges that encompass congressionally designated wilderness, the purposes of the Wilderness Act are additional purposes of the refuge (FWS, 602 FW 1.6(S)).

Record of Decision (ROD): A concise public record of a decision prepared by the federal agency, pursuant to National Environmental Policy Act of 1969, that contains a statement of the decision, identification of all alternatives considered, identification of the environmentally preferable alternative, a statement whether all practical means to avoid or minimize environmental harm from the alternative selected have been adopted (and if not, why they were not), and a summary of monitoring and enforcement where applicable for any mitigation (40 CFR 1505.2).

Resident Species: A nonmigratory species inhabiting a given locality throughout the year. Examples include white-tailed deer, muskrat, raccoon, mink, and fox.

Scoping: A process for determining the scope of issues to be addressed by a Comprehensive Conservation Plan and for identifying the significant issues. Involved in the scoping process are federal, state, and local agencies; private organizations; and individuals.

Shorebird: Long-legged birds, also known as waders, belonging to the order Charadriiformes that use shallow wetlands and mud flats for foraging and nesting.

Significant Issue: A significant issue is typically: within Service jurisdiction, suggests different actions or alternatives, and will influence the decision (FWS, 602 FW 3.4 (3)(b)).

Species: A distinctive kind of plant or animal having distinguishable characteristics, and that can interbreed and produce young. A category of biological classification.

Sound Professional Judgment: A finding, determination, or decision that is consistent with principles of sound fish and wildlife management and administration, available science and resources, and adherence to the requirements of the National Wildlife Refuge System Administration Act of 1966 and other applicable laws.

Stakeholder: A person or group who has an interest in activities within the Planning Area.

Step-down Management Plan: A plan that provides specific guidance on management subjects (e.g., habitat, public use, fire, safety) or groups of related subjects. It describes strategies and implementation schedules for meeting Comprehensive Conservation Plan goals and objectives (FWS, 602 FW 1.6(U)).

Strategic Habitat Conservation (SHC): A structured, science-driven approach for making efficient, transparent decisions about where and how to expend Service resources for species, or groups of species, that are limited by the amount or quality of habitat. It is an adaptive management framework integrating planning, design, delivery, and evaluation.

Strategy: A specific action, tool or technique, or combination of actions, tools, and techniques used to meet unit objectives (FWS, 602 FW 1.6(V)).

Surrogate Species: Species that are used to represent other species or aspects of the environment.

Threatened Species: Those plant or animal species likely to become endangered species throughout all of or a significant portion of their range within the foreseeable future. A plant or animal identified and defined in accordance with the Endangered Species Act of 1973 and published in the *Federal Register*.

Vision Statement: A concise statement of what the planning unit should be or hope to do, based primarily upon the National Wildlife Refuge System mission, specific refuge purposes, and other mandates. The vision statement for the refuge should be tied to the mission of the Refuge System; the purpose(s) of the refuge; the maintenance or restoration of the ecological integrity of each refuge and the Refuge System; and other mandates (FWS, 602 FW 1.6(Z)).

Waterfowl: A group of birds that include ducks, geese, and swans (belonging to the order Anseriformes).

Waterfowl Production Area (WPA): Prairie wetlands with associated uplands managed to provide nesting areas for waterfowl and owned in fee title by the U.S. Fish and Wildlife Service. These lands are purchased from willing sellers with funds from federal Duck Stamp sales. They are open to public hunting, fishing, and trapping according to state and federal regulations.

Watershed: The entire land area that collects and drains water into a river/stream or river/stream system.

Wetland: A wetland is land transitional between terrestrial and aquatic systems where the water table is usually at or near the surface or the land is covered by shallow water. For the purposes of this classification a wetland must have one or more of the following three attributes: (1) at least periodically, the land supports predominantly hydrophytes; (2) the substrate is predominantly undrained hydric soil; and (3) the substrate is nonsoil and is saturated with water or covered by shallow water at some time during the growing season of each year (Cowardin et al. 1979).

Wetland Management District (WMD, district): An area covering several counties that acquires (with federal Duck Stamp funds), restores, and manages prairie wetland habitat critical to waterfowl and other wetland birds.

Wildlife-Dependent Recreational Use: A use of a refuge involving hunting, fishing, wildlife observation and photography, or environmental education and interpretation. These are the six priority public uses of the National Wildlife Refuge System as established in the National Wildlife Refuge System Administration Act of 1966, as amended. Wildlife-dependent recreational uses, other than the six priority public uses, are those that depend on the presence of wildlife. These

other uses will also be considered in the preparation of refuge Comprehensive Conservation Plans; however, the six priority public uses always will take precedence (FWS, 602 FW 1.6(Y)).

Wildlife Diversity: A measure of the number of wildlife species in an area and their relative abundance.

Water Birds: This general category includes all birds that inhabit lakes, marshes, streams and other wetlands at some point during the year. The group includes all waterfowl such as ducks, geese, and swans and other birds such as loons, rails, cranes, herons, egrets, ibis, cormorants, pelicans, shorebirds, and passerines that nest and rely on wetland vegetation.

Appendix C: Legal and Policy Guidance

Administrative Procedures Act of 1946

Outlines administrative procedures to be followed by federal agencies with respect to identification of information to be made public; publication of material in the *Federal Register*; maintenance of records; attendance and notification requirements for specific meetings and hearings; issuance of licenses; and review of agency actions.

American Indian Religious Freedom Act of 1978

Establishes as policy of the United States the protection and preservation for American Indians of their inherent right to freedom to believe, express, and practice their traditional religions. The act directs federal agencies to evaluate their policies and procedures, in consultation with native traditional religious leaders, in order to determine changes required to protect and preserve Native American religious cultural rights and practices.

Americans with Disabilities Act of 1990, as amended by the ADA Amendments Act of 2008

Prohibits discrimination of individuals based on disability. It requires that public transportation services be accessible to individuals with disabilities and prohibits discrimination in employment of qualified individuals with disabilities. It requires the Equal Employment Opportunity Commission to issue regulations relating to discrimination of disabled individuals, and requires the National Council on Disability to conduct a study of areas designated as wilderness to determine the effect of the designation on the ability of individuals to enjoy such areas. The ADA Amendments Act of 2008 restored the intent and protections of the original act.

Antiquities Act of 1906

Authorizes the president to designate as National Monuments objects or areas of historic or scientific interest on lands owned or controlled by the United States. The act requires that a permit be obtained for examination of ruins, excavation of archaeological sites, and the gathering of objects of antiquity on lands under the jurisdiction of the Secretaries of Interior, Agriculture, and Army; and provides penalties for violations.

Archaeological Resources Protection Act of 1979

Largely supplanted the resource protection provisions of the Antiquities Act for archaeological items. This act established detailed requirements for issuance of permits for any excavation for or removal of archaeological resources from federal or Indian lands. It also established civil and criminal penalties for the unauthorized excavation, removal, or damage of any such resources; for any trafficking in such resources removed from federal or Indian land in violation of any provision of federal law; and for interstate and foreign commerce in such resources acquired, transported or received in violation of any state or local law. This act also required the land managing agencies to establish public awareness programs regarding the value of archaeological resources to the Nation.

Archeological and Historic Preservation Act of 1960, as amended

This act carries out the policy established by the Historic Sites, Buildings and Antiquities Act of 1935 (known as the Historic Sites Act). It directs federal agencies to notify the Secretary of the Interior whenever they find a federal or federally assisted, licensed, or permitted project may cause loss or destruction of significant scientific, prehistoric, or archaeological data. The act authorizes use of appropriated, donated, and/or transferred funds for the recovery, protection, and preservation of such data.

Archeological and Historic Preservation Act of 1974

Directs the preservation of historic and archaeological data in federal construction projects.

Architectural Barriers Act of 1969

Ensures that certain buildings financed or leased by federal agencies are constructed (or renovated) so that they will be accessible to the physically handicapped.

Bald and Golden Eagle Protection Act of 1940, as amended

Prohibits the possession, sale, or transport of any bald or golden eagle, alive or dead, or part, nest, or egg except as permitted by the Secretary of the Interior for scientific or exhibition purposes or for the religious purposes of Indians.

Bankhead-Jones Farm Tenant Act of 1937

Directs the Secretary of Agriculture to develop a program of land conservation and utilization in order to correct maladjustments in land use and thus assist in such things as control of soil erosion, reforestation, preservation of natural resources, and protection of fish and wildlife. Some early refuges and hatcheries were established under authority of this act.

Clean Air Act of 1970

Regulates air emissions from area, stationary, and mobile sources. The act and its amendments charge federal land managers with direct responsibility to protect the "air quality and related values" of land under their control. These values include fish, wildlife, and their habitats.

Emergency Wetlands Resources Act of 1986

Authorized the purchase of wetlands from Land and Water Conservation Fund moneys, removing a prior prohibition on such acquisitions. Requires the Secretary of the Interior to establish a National Wetlands Priority Conservation Plan, requires the states to include wetlands in their comprehensive outdoor recreation plans, and transfers to the Migratory Bird Conservation Fund amounts equal to import duties on arms and ammunition. It established entrance fees at national wildlife refuges. It also extended the Wetlands Loan Act authorization through 1988 and required the Secretary to report to Congress on wetlands loss. In addition, it directed the Secretary, through the U.S. Fish and Wildlife Service, to continue the National Wetlands Inventory; to complete mapping of the contiguous United States; and to produce at ten-year intervals reports to update and improve in the September 1982 "Status and Trends of Wetlands and Deepwater Habitat in the Conterminous United States, 1950s to 1970s." This act also increased the price of Duck Stamps.

Endangered Species Act of 1973, as amended

Directs federal agencies to take actions that would further the purposes of the act and to ensure that actions they carry out, authorize, or fund do not jeopardize endangered species or their critical habitat. The act also provides authority for land acquisition. Conservation of threatened and endangered species has become a major objective of both land acquisition and refuge management programs.

Endangered Species Conservation Act of 1969

This act expanded the provisions of the Endangered Species Preservation Act of 1966 to include the listing of species in danger world-wide and added mollusks and crustaceans to the animals that could be listed.

Endangered Species Preservation Act of 1966

This act was the predecessor to the Endangered Species Act of 1973 and directed the Secretary of the Interior to produce a list of native U.S. vertebrate species in danger of extinction for the limited protection of those animals.

Environmental Education Act of 1990

Established the Office of Environmental Education within the Environmental Protection Agency to develop and administer a federal environmental education program in consultation with other federal natural resource management agencies, including the U.S. Fish and Wildlife Service.

Executive Order 11593: Protection and Enhancement of the Cultural Environment (1971)

States that if the U.S. Fish and Wildlife Service proposes any development activities that may affect the archaeological or historic sites, the Service will consult with federal and state Historic Preservation Officers to comply with section 106 of the National Historic Preservation Act of 1966, as amended.

Executive Order 11644: Use of Off-road Vehicles on the Public Lands (1972)

Established policies and procedures to ensure that the use of off-road vehicles on public lands will be controlled and directed to protect the resources of those lands, to promote the safety of all users of those lands, and minimize conflicts among the various uses of those lands. EO 11989 (1977) amends section 2 of EO 11644 and directs agencies to close areas negatively impacted by off-road vehicles.

Executive Order 11988: Floodplain Management (1977)

Prevents federal agencies from contributing to the “adverse impacts associated with occupancy and modification of floodplains” and the “direct or indirect support of floodplain development.” In the course of fulfilling their respective authorities, federal agencies “shall take action to reduce the risk of flood loss, minimize the impact of floods on human safety, health, and welfare, and restore and preserve the natural and beneficial values served by floodplains.

Executive Order 11990: Protection of Wetlands (1977)

Directs federal agencies to: (1) minimize destruction, loss, or degradation of wetlands; and (2) preserve and enhance the natural and beneficial values of wetlands when a practical alternative exists.

Executive Order 12372: Intergovernmental Review of Federal Programs (1982)

Seeks to foster intergovernmental partnerships by requiring federal agencies to use the state process to determine and address concerns of state and local elected officials with proposed federal assistance and development programs.

Executive Order 12898: Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations (1994)

Mandates that each federal agency shall make achieving environmental justice part of its mission by identifying and addressing disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations. This order also creates an Interagency Working Group on Environmental Justice to provide guidance to federal agencies in overcoming these issues.

Executive Order 12906: Coordinating Geographical Data Acquisition and Access: The National Spatial Data Infrastructure (1994), as amended by Executive Order 13286:

Amendment of Executive Orders, and Other Actions, in Connection With the Transfer of Certain Functions to the Secretary of Homeland Security (2003)

Recommended that the executive branch develop, in cooperation with state, local, and tribal governments, and the private sector, a coordinated National Spatial Data Infrastructure to support public and private sector applications of geospatial data. Of particular importance to Comprehensive Conservation Plans is the National Vegetation Classification System (NVCS), which is the adopted standard for vegetation mapping. Using NVCS facilitates the compilation of regional and national summaries, which, in turn, can provide an ecosystem context for individual refuges.

Executive Order 12962: Recreational Fisheries (1995)

Directs federal agencies to improve the quantity, function, sustainable productivity, and distribution of United States aquatic resources for increased recreational fishing opportunities in cooperation with states and tribes.

Executive Order 12996: Management and General Public Use of the National Wildlife Refuge System (1996)

Defines a conservation mission for the National Wildlife Refuge System, six compatible wildlife-dependent recreational activities, and four guiding principles for management of the Refuge System. Directs the Secretary of the Interior to undertake several actions in support of management and public use and to ensure the maintenance of the biological integrity and environmental health of the Refuge System. It also provides for the identification of existing wildlife-dependent uses that will continue to occur as lands are added to the Refuge System.

Executive Order 13007: Indian Sacred Sites (1996)

Directs federal land management agencies to accommodate access to and ceremonial use of Indian sacred sites by Indian religious practitioners, avoid adversely affecting the physical integrity of such sacred sites, and where appropriate, maintain the confidentiality of sacred sites.

Executive Order 13061: Federal Support of Community Efforts Along American Heritage Rivers (1997)

Established the American Heritage Rivers initiative for the purpose of natural resource and environmental protection, economic revitalization, and historic and cultural preservation. The act directs federal agencies to preserve, protect, and restore rivers and their associated resources important to our history, culture, and natural heritage.

Executive Order 13084: Consultation and Coordination With Indian Tribal Governments (2000)

Provides a mechanism for establishing regular and meaningful consultation and collaboration with tribal officials in the development of federal policies that have tribal implications.

Executive Order 13112: Invasive Species (1999)

Directs federal agencies to prevent the introduction of invasive species, detect and respond rapidly to and control populations of such species in a cost effective and environmentally sound manner, accurately monitor invasive species, provide for restoration of native species and habitat conditions, conduct research to prevent introductions, to control invasive species, and to promote public education on invasive species and the means to address them. This EO replaces and rescinds EO 11987: Exotic Organisms (1977).

Executive Order 13186: Responsibilities of Federal Agencies to Protect Migratory Birds (2001)

Instructs federal agencies to conserve migratory birds by several means, including the incorporation of strategies and recommendations found in Partners in Flight Bird Conservation plans, the North American Waterfowl Plan, the North American Waterbird Conservation Plan, and the United States Shorebird Conservation Plan, into agency management plans and guidance documents.

Executive Order 13443: Facilitation of Hunting Heritage and Wildlife Conservation (2007)

Directs federal agencies that have programs and activities that have a measurable effect on public land management, outdoor recreation, and wildlife management, including the Department of the Interior and the Department of Agriculture, to facilitate the expansion and enhancement of hunting opportunities and the management of game species and their habitat.

Farmland Protection Policy Act of 1981, as amended

Minimizes the extent to which federal programs contribute to the unnecessary conversion of farmland to nonagricultural uses. Federal programs include construction projects and the management of federal lands.

Federal Advisory Committee Act of 1972, as amended

Governs the establishment of and procedures for committees that provide advice to the federal government. Advisory committees may be established only if they will serve a necessary, nonduplicative function. Committees must be strictly advisory unless otherwise specified and meetings must be open to the public.

Federal-Aid Highways Act of 1968

Establishes requirements for approval of federal highways through wildlife refuges and other designated areas to preserve the natural beauty of such areas. The Secretary of Transportation is directed to consult with the Secretary of the Interior and other federal agencies before approving any program or project requiring the use of land under their jurisdiction.

Federal Aid in Sport Fish Restoration Act (Dingell-Johnson Act) of 1950

Authorizes the Secretary of the Interior to provide financial assistance for state fish restoration and management plans and projects. It is financed by excise taxes paid by manufacturers of rods, reels, and other fishing tackle.

Federal Aid in Wildlife Restoration Act (Pittman-Robertson Act) of 1937

Taxes the purchase of ammunition and firearms and earmarks the proceeds to be distributed to the states for wildlife restoration.

Federal Cave Resources Protection Act of 1988

Established requirements for the management and protection of caves and their resources on federal lands, including allowing the land managing agencies to withhold the location of caves from the public and requiring permits for any removal or collecting activities in caves on federal lands.

Federal Lands Recreation Enhancement Act (REA) of 2004

Allows the government to charge a fee for recreational use of public lands managed by the U.S. Fish and Wildlife Service and other agencies. The recreation fee program is a program by which fees paid by visitors to certain federal recreation sites are retained by the collecting site and used to improve the quality of the visitor experiences at those sites.

Federal Noxious Weed Act of 1975, as amended

The Secretary of Agriculture was given the authority to designate plants as noxious weeds and to cooperate with other federal, state, and local agencies; farmers associations, and private individuals in measures to control, eradicate, prevent, or retard the spread of such weeds. The act requires each federal land-managing agency, including the U.S. Fish and Wildlife Service, to designate an office or person to coordinate a program to control such plants on the agency's land and implement cooperative agreements with the states, including integrated management systems to control undesirable plants.

Federal Records Act of 1950

Directs the preservation of evidence of the government's organization, functions, policies, decisions, operations, and activities, as well as basic historical and other information.

Federal Water Pollution Control Act of 1948, as frequently amended particularly by the Clean Water Act of 1977

This act and its amendments have as their objectives the restoration and maintenance of the chemical, physical, and biological integrity of the Nation's waters and, therefore, regulates the discharge of pollutants into waters of the United States. The act protects fish and wildlife, establishes operation permits for all major sources of water pollution, limits the discharge of pollutants or toxins into water, and makes it unlawful for any person to discharge any pollutant from a point source into navigable waters unless a permit is obtained under the Clean Water Act. Section 404 charges the U.S. Army Corps of Engineers with regulating discharge of dredge or fill materials into waters of the United States, including wetlands. The "Clean Water Act" became the common name with amendments in 1977.

Federal Water Project Recreation Act of 1965, as amended

Declares the intent of Congress that recreation and fish and wildlife enhancement be given full consideration as purposes of federal water development projects. The act also authorizes the use of federal water project funds for land acquisition in order to establish refuges for migratory waterfowl when recommended by the Secretary of the Interior, and authorizes the Secretary to provide facilities for outdoor recreation and fish and wildlife at all reservoirs under his control, except those within national wildlife refuges.

Fish and Wildlife Act of 1956, as frequently amended

Establishes a comprehensive national fish, shellfish, and wildlife resources policy with emphasis on the commercial fishing industry but also with a direction to administer the act with regard to the inherent right of every citizen and resident to fish for pleasure, enjoyment, and betterment and to maintain and increase public opportunities for recreational use of fish and wildlife resources. The 1998 amendments to the act modified the powers of the Secretary of the Interior in regard to volunteer service, community partnerships, and education programs.

Fish and Wildlife Conservation Act of 1980, as amended

Requires the Service to monitor non-gamebird species, identify species of management concern, and implement conservation measures to preclude the need for listing under the Endangered Species Act of 1973.

Fish and Wildlife Coordination Act of 1934

Promotes equal consideration and coordination of wildlife conservation with other water resource development programs by requiring consultation with the U.S. Fish and Wildlife Service and the state fish and wildlife agencies where the "waters of a stream or other body of

water are proposed or authorized, permitted or licensed to be impounded, diverted . . . or otherwise controlled or modified” by any agency under federal permit or license. This act also authorized use of surplus federal property for wildlife conservation purposes and authorized the Secretary of the Interior to provide public fishing areas and accept donations of lands and funds.

Fish and Wildlife Improvement Act of 1978

Improves the administration of fish and wildlife programs and amends several earlier laws including the Refuge Recreation Act, the National Wildlife Refuge System Administration Act of 1966, and the Fish and Wildlife Act of 1956. It authorizes the Secretary of the Interior to accept gifts and bequests of real and personal property on behalf of the United States. It also authorizes the use of volunteers on Service projects and appropriations to carry out a volunteer program.

Food Security Act of 1985 (Farm Bill), as amended

Known as the Farm Bill, this act contains several provisions that contribute to wetland conservation. The Swampbuster provisions state that farmers who convert wetlands for the purpose of planting after enactment of the law are ineligible for most farm program subsidies. The act also established the Wetlands Reserve Program to restore and protect wetlands through easements and restoration of the functions and values of wetlands on such easement areas.

Freedom of Information Act of 1966

Requires all federal agencies to make available to the public for inspection and copying administrative staff manuals and staff instructions; official, published and unpublished policy statements; final orders deciding case adjudication; and other documents. Special exemptions have been reserved for nine categories of privileged material. The act requires the party seeking the information to pay reasonable search and duplication costs.

Geothermal Steam Act of 1970, as amended

Authorizes and governs the lease of geothermal steam and related resources on public lands. Section 15(c) of the act prohibits issuing geothermal leases on virtually all U.S. Fish and Wildlife Service-administered lands.

Historic Sites, Buildings and Antiquities Act of 1935

Popularly known as the Historic Sites Act, as amended in 1965, declared it a national policy to preserve historic sites and objects of national significance, including those located on refuges. It provided procedures for designation, acquisition, administration, and protection of such sites. Among other things, National Historic and Natural Landmarks are designated under authority of this act.

Lacey Act of 1900, as amended

Originally designed to help states protect their native game animals and to safeguard U.S. crop production from harmful foreign species. The act prohibits interstate and international transport and commerce of fish, wildlife, or plants taken in violation of domestic or foreign laws. It regulates the introduction to the United States of foreign species into new locations.

Land and Water Conservation Fund Act of 1965

Provides funding through receipts from the sale of surplus federal land, appropriations from oil and gas receipts from the outer continental shelf, and other sources for land acquisition under several authorities. Appropriations from the fund may be used for matching grants to states for

outdoor recreation projects and for land acquisition by various federal agencies including the Fish and Wildlife Service.

Migratory Bird Conservation Act of 1929

Establishes a Migratory Bird Conservation Commission to approve areas recommended by the Secretary of the Interior for acquisition with Migratory Bird Conservation Funds. Authorizes the Secretary of the Interior to cooperate with local authorities in wildlife conservation and to conduct investigations, to publish documents related to North American birds, and to maintain and develop refuges. The act provides for cooperation with states in enforcement. It establishes procedures for acquisition by purchase, rental, or gift of areas approved by the Commission for migratory birds. This act includes acquisition authority for purchase or rental of a partial interest in land or waters and requires the Secretary of the Interior to consult with the appropriate units of local government and with the governor of the state concerned, or the appropriate state agency, before recommending an area for purchase or rental. This provision was subsequently amended in 1983, 1984, and 1986 to require that either the governor or the state agency approve each proposed acquisition. The role of the Commission was expanded by the North American Wetland Conservation Act to include approving wetlands acquisition, restoration, and enhancement proposals recommended by the North American Wetlands Conservation Council.

Migratory Bird Hunting and Conservation Stamp Act (Duck Stamp Act) of 1934

Known as the Duck Stamp Act, this act requires every waterfowl hunter 16 years of age or older to carry a stamp, and earmarks proceeds of Duck Stamps to buy or lease waterfowl habitat. A 1958 amendment authorizes the acquisition of small wetland and pothole areas to be designated as “Waterfowl Production Areas,” which may be acquired without the limitations and requirements of the Migratory Bird Conservation Act.

Migratory Bird Treaty Act of 1918

Implements various treaties and conventions between the United States and Canada, Japan, Mexico, and the former Soviet Union for the protection of migratory birds. Except as allowed by special regulations, the act makes it unlawful to pursue, hunt, kill, capture, possess, buy, sell, purchase, barter, export, or import any migratory bird, part, nest, egg, or product.

Mineral Leasing Act for Acquired Lands of 1947, as amended

Authorizes and governs mineral leasing on acquired public lands.

Minerals Leasing Act of 1920, as amended

Authorizes and governs leasing of public lands for development of deposits of coal, oil, gas, and other hydrocarbons, sulphur, phosphate, potassium, and sodium. Section 185 of this act contains provisions relating to granting rights-of-way over federal lands for pipelines.

Mining Act of 1872, as amended

Authorizes and governs prospecting and mining for the so-called “hardrock” minerals (such as gold and silver) on public lands.

National and Community Service Act of 1990

Authorizes several programs to engage citizens of the United States in full and/or part-time projects designed to combat illiteracy and poverty, provide job skills, enhance educational skills, and fulfill environmental needs. Among other things, this law established the American Conservation and Youth Service Corps to engage young adults in approved human and natural resource projects, which will benefit the public or are carried out on federal or tribal lands.

National Environmental Policy Act of 1969 (NEPA), as amended

This act and the implementing regulations developed by the Council on Environmental Quality (40 CFR 1500–1508) require federal agencies to integrate the National Environmental Policy Act of 1969 (NEPA) process with other planning at the earliest possible time to provide a systematic interdisciplinary approach to decision making; to identify and analyze the environmental effects of their actions; to describe appropriate alternatives to the proposed actions; and to involve the affected state and federal agencies, tribal governments, and public in the planning and decision making process. This act requires the disclosure of the environmental impacts of any major federal action significantly affecting the quality of the human environment.

National Historic Preservation Act of 1966

Repeatedly amended, the act provides for preservation of significant historical features (buildings, objects, and sites) through a grant-in-aid program to the states. It established a National Register of Historic Places and a program of matching grants under the existing National Trust for Historic Preservation (16 U.S.C. 468–468d). The act established an Advisory Council on Historic Preservation, which was made a permanent independent agency in 1976 (90 Stat. 1319). That act also created the Historic Preservation Fund. Federal agencies are directed to take into account the effects of their actions on items or sites listed or eligible for listing in the National Register and afford the Advisory Council on Historic Preservation a reasonable opportunity to comment. Section 110 requires federal agencies to manage historic properties, e.g., to document historic properties prior to destruction or damage; section 101 requires federal agencies consider Indian tribal values in historic preservation programs and requires each federal agency to establish a program leading to inventory of all historic properties on its land.

National Trails System Act of 1968

Established the National Trails System to protect the recreational, scenic, and historic values of some important trails. National Recreation Trails may be established by the Secretaries of the Interior or Agriculture on land wholly or partly within their jurisdiction, with the consent of the involved state(s) and other land managing agencies, if any. National scenic and national historic trails may only be designated by an act of Congress. Several national trails cross units of the National Wildlife Refuge System.

National Wildlife Refuge System Administration Act of 1966 (amended by the National Wildlife Refuge System Improvement Act of 1997)

This act consolidates the authorities relating to the various categories of lands for the conservation of fish and wildlife administered by the Secretary of the Interior through the U.S. Fish and Wildlife Service by designating all such areas part of a single National Wildlife Refuge System. Areas include wildlife refuges, areas for the protection and conservation of fish and wildlife threatened with extinction, wildlife ranges, game ranges, wildlife management areas, and waterfowl production areas. The law also prohibits knowingly disturbing any area within the system or the take of Refuge System wildlife without a permit. The act addresses the growing need for recreational opportunities by providing a decision framework for allowing appropriate and compatible uses of the Refuge System.

National Wildlife Refuge System Centennial Act of 2000

Establishes a commission to promote awareness by the public to develop a long-term plan to meet priority needs of the National Wildlife Refuge System, require an annual report on the needs, and improve public use programs and facilities.

National Wildlife Refuge System Improvement Act of 1997

This act, which amends the National Wildlife Refuge System Administration Act of 1966, serves as the "organic act" for the National Wildlife Refuge System. The act states first and foremost that the mission of the National Wildlife Refuge System is focused singularly on wildlife conservation. It establishes a unifying mission for the Refuge System, reinforces the importance of refuge purposes to guide management direction, articulates a process for determining compatible uses of refuges, identifies six priority wildlife-dependent recreation uses (hunting, fishing, wildlife observation and photography, and environmental education and interpretation), and adds a requirement for preparing comprehensive conservation plans through a public planning process. The act requires the Secretary of the Interior to maintain the biological integrity, diversity, and environmental health of the Refuge System.

National Wildlife Refuge System Volunteer and Community Partnership Enhancement Act of 1998

Amends the Fish and Wildlife Act of 1956 to encourage the use of volunteers to help in the management of refuges within the National Wildlife Refuge System; facilitates partnerships between the Refuge System and nonfederal entities to promote public awareness of the resources of the Refuge System and public participation in the conservation of the resources; and encourages donations and other contributions.

National Wildlife Refuge Volunteer Improvement Act of 2010

Maintains the current funding authorization level for the U.S. Fish and Wildlife Service's volunteer and community partnerships programs that are vital to national wildlife refuges but makes a number of important amendments. The law amends the National Wildlife Refuge Volunteer and Community Partnership Enhancement Act of 1998 to direct the Service to carry out a National Volunteer Coordination Program within the National Wildlife Refuge System. It also requires the Director of the Service to publish a national strategy for the coordination and utilization of volunteers within the Refuge System and provide at least one regional volunteer coordinator for each Service region to implement the strategy.

Native American Graves Protection and Repatriation Act (NAGPRA) of 1990

Requires federal agencies and museums to inventory, determine ownership of, and repatriate cultural items under their control or possession. This act imposes serious delays on a project when human remains or other cultural items are encountered in the absence of a plan.

Neotropical Migratory Bird Conservation Act of 2000

Establishes a matching grants program to fund projects that promote the conservation of neotropical migratory birds in the United States, Latin America, and the Caribbean.

North American Wetlands Conservation Act of 1989

Provides funding and administrative direction for implementation of the North American Waterfowl Management Plan and the Tripartite Agreement on wetlands between the United States, Canada, and Mexico. North American Wetlands Conservation Council is created to recommend projects to be funded under the act to the Migratory Bird Conservation Commission. Available funds may be expended for up to 50 percent of the United States' share cost of wetlands conservation projects in Canada, Mexico, or the United States (or 100 percent of the cost of projects on federal lands).

Partnerships for Wildlife Act of 1992

Established a Wildlife Conservation and Appreciation Fund to receive appropriated funds and donations from the National Fish and Wildlife Foundation and other private sources to assist the

state fish and game agencies in carrying out their responsibilities for conservation of non-game species. The funding formula is no more than 1/3 federal funds, at least 1/3 foundation funds, and at least 1/3 state funds.

Refuge Recreation Act of 1962, as amended

Requires that any recreational use on areas of the National Wildlife Refuge System be "compatible" with the primary purpose(s) for which the area was acquired or established. This act also requires that sufficient funding be available for the development, operation and maintenance of recreational uses that are not directly related to the area's primary purpose(s).

Refuge Revenue Sharing Act of 1935

Provides for payments to counties in lieu of taxes, using revenues derived from the sale of products from refuges. A major revision in 1964 requires all revenues received from refuge products be distributed to counties for public schools and roads (this stipulation later removed). Another revision in 1974 requires that any remaining funds be transferred to the Migratory Bird Conservation Fund for land acquisition. A 1978 amendment stated payments to counties were established as:

- on acquired land, the greatest amount calculated on the basis of 75 cents per acre, three-fourths of one percent of the appraised value, or 25 percent of the net receipts produced from the land, and
- on land withdrawn from the public domain, 25 percent of net receipts and basic payments.

This amendment also required counties to pass payments along to other units of local government within the county that suffer losses in revenues due to the establishment of U.S. Fish and Wildlife Service areas.

Rehabilitation Act of 1973, as amended

Prohibits discrimination on the basis of disability under any program or activity receiving federal financial assistance.

Rivers and Harbors Appropriations Act of 1899, as amended

Requires the authorization by the Chief of Engineers prior to any work in, on, over, or under navigable waters of the United States. The Fish and Wildlife Coordination Act provides authority for the U.S. Fish and Wildlife Service to review and comment on the effects on fish and wildlife activities proposed to be undertaken or permitted by the COE. Service concerns include contaminated sediments associated with dredge or fill projects in navigable waters.

Secretarial Order 3289 Amendment 1: Addressing the Impacts of Climate Change on America's Water, Land, and Other Natural and Cultural Resources (2010)

Secretarial Order 3285, issued in March 2009, made production and transmission of renewable energy on public lands a priority for the Department of the Interior. This Secretarial Order, 3289A1, issued in February 2010 establishes a Department-wide approach for applying scientific tools to increase understanding of climate change and to coordinate an effective response to its impacts on tribes and on the land, water, ocean, fish and wildlife, and cultural resources that the Department manages.

Sikes Act of 1960, as amended

Provides for the cooperation by the U.S. Departments of the Interior and Defense with state agencies in planning, development, and maintenance of fish and wildlife resources and outdoor recreation facilities on military reservations throughout the United States. It requires the Secretary of each military department to use trained professionals to manage the wildlife and fishery resource under his jurisdiction and requires federal and state fish and wildlife agencies be given priority in management of fish and wildlife activities on military reservations.

Surface Mining Control and Reclamation Act of 1977

Regulates surface mining activities and reclamation of coal-mined lands. Further regulates the coal industry by designating certain areas as unsuitable for coal mining operations.

Transfer of Certain Real Property for Wildlife Conservation Purposes Act of 1948

Provides that upon a determination by the Administrator of the General Services Administration, real property no longer needed by a federal agency can be transferred without reimbursement to the Secretary of the Interior if the land has particular value for migratory birds or to a state agency for other wildlife conservation purposes.

Transportation Equity Act for the 21st Century of 1998

Established the Refuge Roads Program, requires transportation planning that includes public involvement, and provides funding for approved public use roads and trails and associated parking lots, comfort stations, and bicycle/pedestrian facilities.

Treasury and General Government Appropriations Act of 2000

In December 2002, Congress required federal agencies to publish their own guidelines for ensuring and maximizing the quality, objectivity, utility, and integrity of information that they disseminate to the public (44 U.S.C. 3502). The amended language is included in section 515(a). The Office of Budget and Management directed agencies to develop their own guidelines to address the requirements of the law. The Department of the Interior instructed bureaus to prepare separate guidelines on how they would apply the act. The U.S. Fish and Wildlife Service has developed "Information Quality Guidelines" to address the law.

Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970

Provides for uniform and equitable treatment of persons who sell their homes, businesses, or farms to the U.S. Fish and Wildlife Service. The act requires that any purchase offer be no less than the fair market value of the property.

Water Resources Planning Act of 1965

Established the Water Resources Council to be composed of Cabinet representatives, including the Secretary of the Interior. The Council reviews river basin plans with respect to agricultural, urban, energy, industrial, recreational, and fish and wildlife needs. The act also established a grant program to assist states in participating in the development of related comprehensive water and land use plans.

Wild and Scenic Rivers Act of 1968

Established a National Wild and Scenic Rivers System and prescribes the methods and standards through which additional rivers may be identified and added to the system. Section 5(d)(1) requires that in all planning by federal agencies for the use and development of water and related land resources, consideration be given to potential wild, scenic, and recreation rivers. Rivers are added to the national system based on their free-flowing character and their outstandingly remarkable scenic, recreation, geologic, fish and wildlife, historic, cultural,

ecological, or other values. Rivers in the system are managed to maintain and protect these outstandingly remarkable values for present and future generations.

Wilderness Act of 1964

Defined the Wilderness resource and established the National Wilderness Preservation System. It directed the Secretary of the Interior, within 10 years, to review every roadless area of 5,000 or more acres and every roadless island (regardless of size) within National Wildlife Refuge and National Park Systems and to recommend to the president the suitability of each such area or island for inclusion in the National Wilderness Preservation System, with final decisions made by Congress. The Secretary of Agriculture was directed to study and recommend suitable areas in the National Forest System. This act also prescribes the management of new inclusions as wilderness.

Youth Conservation Corps Act of 1970

Established a permanent Youth Conservation Corps program within the Departments of the Interior and Agriculture. Within the U.S. Fish and Wildlife Service, YCC participants perform many tasks on refuges, fish hatcheries, and research stations.

Appendix E: Appropriate Use Designations

Introduction

Iowa Wetland Management District (WMD, district) managers decide if a new or existing use is an appropriate district use. This appendix includes a list of the appropriate use designations for the Iowa WMD.

The U.S. Fish and Wildlife Service (FWS, Service) appropriate use policy (603 FW 1) explains the decision process the district manager follows when first considering whether or not to allow a proposed use on a district. The district manager must first find a use to be appropriate before undertaking a compatibility review of the use and outlining the stipulations of the use.

The appropriate use policy clarifies and expands on the compatibility policy (603 FW 2.10(D)(1)), which describes when the district manager should deny a proposed use without determining compatibility. If a proposed use is found “not appropriate,” the use will not be allowed and a compatibility determination will not be prepared. By screening out proposed uses not appropriate to the district, the district manager avoids unnecessary compatibility reviews. Although a use may be both appropriate and compatible, the district manager retains the authority to not allow the use or modify the use.

This policy does not generally apply to proposed public use of wetland and grassland easement areas of the National Wildlife Refuge System (NWRS, Refuge System). The rights acquired on these areas generally do not extend to control over such public uses except where those uses would conflict with the conditions of the easement (603 FW 1.2(A)). The Service’s *Midwest Region Easements Manual* provides more direction on applying the appropriate use policy to easements (FWS, 2012c).

Background for this policy as it applies to Iowa WMD is found in the following statutory authorities:

- National Wildlife Refuge System Administration Act of 1966 (Administration Act), as amended by the National Wildlife Refuge System Improvement Act of 1997 (Improvement Act) (16 U.S.C. § 668dd–668ee). This law provides the authority for establishing policies and regulations governing district uses, including the authority to prohibit certain harmful activities. The Administration Act does not authorize any particular use, but rather authorizes the Secretary of the Interior to allow uses only when they are deemed compatible. The Improvement Act provides the Refuge System mission and includes specific directives and identifies six wildlife-dependent uses as priorities for the Refuge System.
- *Refuge Recreation Act of 1962*, (16 U.S.C. § 460k). This law authorizes the Secretary of the Interior to allow public recreation in areas of the Refuge System when the use is an “appropriate incidental or secondary use.”

District uses must meet at least one of the following four conditions to be deemed appropriate:

1. It is a wildlife-dependent recreational use as identified in the Improvement Act.

2. It contributes to fulfilling the district purpose(s), the Refuge System mission, or goals or objectives described in a district management plan approved after the Improvement Act was signed into law.
3. The use involves the take of fish and wildlife under state regulations.
4. The district has evaluated the use following the guidelines in this policy and found that it is appropriate. The criteria used by the manager to evaluate appropriateness can be found on the appropriate use forms completed for the district.

Uses that have been administratively determined to be appropriate but still require compatibility determinations are:

- six wildlife-dependent recreational uses as defined by the Improvement Act as hunting, fishing, wildlife observation, photography, environmental education and interpretation; and
- take of fish and wildlife under state regulations including hunting, fishing, and trapping.

Also covered under this policy are “specialized uses,” or uses that require specific authorization from the Refuge System, often in the form of a special use permit, letter of authorization, or other permit document. These uses do not include uses already granted by a prior existing right. Appropriateness findings for specialized uses are made on a case-by-case basis.

This policy does NOT apply to the following:

- Situations where reserved rights or legal mandates provide certain uses must be allowed.
- District management activities conducted by the Refuge System or a Refuge System-authorized agent designed to conserve fish, wildlife, and plants and their habitats. These activities fulfill district purpose(s) or the Refuge System mission and are based on sound professional judgment.

Appropriate use findings are made without public review and comment. However, if a proposed use is found to be appropriate, we must still determine that the use is compatible. The compatibility determination includes an opportunity for public involvement (603 FW 1.9(B)).

The following uses are deemed **appropriate** for the Iowa WMD:

- [Bicycle Riding on Roads and Trails](#)
- [Commercial Firewood Cutting](#)
- [Commercial Hay Harvest](#)
- [Food Plot Cultivation for Wildlife](#)
- [Prescribed Commercial Livestock Grazing](#)

The following uses are deemed **not appropriate** for the Iowa WMD:

- Dog Training
- Horseback Riding
- Off Road Vehicle Use: ATV, UTV, Dirt Bike, Motor Vehicle
- Overnight Camping
- Pheasant Stocking, Private
- Snowmobiling
- Target Shooting

Districts are national treasures for the conservation of wildlife. Through careful planning, consistent application of regulations and policies, diligent monitoring of the impacts of uses on wildlife resources, and preventing or eliminating uses not appropriate, the Refuge System conservation mission can be achieved while also providing the public with lasting opportunities to enjoy quality, compatible, wildlife-dependent recreation.

The virtual or waypoint geocaching appropriate use form that was included in the Draft CCP is included under environmental education, which is administratively determined to be appropriate, and therefore needs no stand-alone appropriate use form. This change was made simply for consistency with other plans and refuges/districts.

FINDING OF APPROPRIATENESS OF A REFUGE USE

Refuge Name: Iowa Wetland Management District

Use: Bicycle Riding on Roads and Trails

This form is not required for wildlife-dependent recreational uses, forms of take regulated by the State, or uses already described in a refuge CCP or step-down management plan approved after October 9, 1997.

Decision Criteria:	YES	NO
(a) Do we have jurisdiction over the use?	x	
(b) Does the use comply with applicable laws and regulations (Federal, State, tribal, and local)?	x	
(c) Is the use consistent with applicable Executive orders and Department and Service policies?	x	
(d) Is the use consistent with public safety?	x	
(e) Is the use consistent with goals and objectives in an approved management plan or other document?	x	
(f) Has an earlier documented analysis not denied the use, or is this the first time the use has been proposed?	x	
(g) Is the use manageable within available budget and staff?	x	
(h) Will this be manageable in the future within existing resources?	x	
(i) Does the use contribute to the public's understanding and appreciation of the refuge's natural or cultural resources, or is the use beneficial to the refuge's natural or cultural resources?	x	
(j) Can the use be accommodated without impairing existing wildlife-dependent recreational uses or reducing the potential to provide quality (see section 1.6D, 603 FW 1, for description), compatible, wildlife-dependent recreation into the future?	x	

Where we do not have jurisdiction over the use ("no" to (a)), there is no need to evaluate it further as we cannot control the use. Uses that are illegal, inconsistent with existing policy, or unsafe ("no" to (b), (c), or (d)) may not be found appropriate. If the answer is "no" to any of the other questions above, we will **generally** not allow the use.

If indicated, the refuge manager has consulted with State fish and wildlife agencies. Yes x No

When the refuge manager finds the use appropriate based on sound professional judgment, the refuge manager must justify the use in writing on an attached sheet and obtain the refuge supervisor's concurrence.

Based on an overall assessment of these factors, my summary conclusion is that the proposed use is:

Not Appropriate **Appropriate** x

Refuge Manager: /Timothy A. Miller/ Date: 01 / 08 / 2014

If found to be **Not Appropriate**, the refuge supervisor does not need to sign concurrence if the use is a new use.

If an existing use is found **Not Appropriate** outside the CCP process, the refuge supervisor must sign concurrence.

If found to be **Appropriate**, the refuge supervisor must sign concurrence.

Refuge Supervisor: /James T. Leach/ Date: 01 / 16 / 2014

A compatibility determination is required before the use may be allowed.

FWS Form 3-2319
02/06

FINDING OF APPROPRIATENESS OF A REFUGE USE

Refuge Name: Iowa Wetland Management District

Use: Commercial Firewood Cutting

This form is not required for wildlife-dependent recreational uses, forms of take regulated by the State, or uses already described in a refuge CCP or step-down management plan approved after October 9, 1997.

Decision Criteria:	YES	NO
(a) Do we have jurisdiction over the use?	x	
(b) Does the use comply with applicable laws and regulations (Federal, State, tribal, and local)?	x	
(c) Is the use consistent with applicable Executive orders and Department and Service policies?	x	
(d) Is the use consistent with public safety?	x	
(e) Is the use consistent with goals and objectives in an approved management plan or other document?	x	
(f) Has an earlier documented analysis not denied the use, or is this the first time the use has been proposed?	x	
(g) Is the use manageable within available budget and staff?	x	
(h) Will this be manageable in the future within existing resources?	x	
(i) Does the use contribute to the public's understanding and appreciation of the refuge's natural or cultural resources, or is the use beneficial to the refuge's natural or cultural resources?	x	
(j) Can the use be accommodated without impairing existing wildlife-dependent recreational uses or reducing the potential to provide quality (see section 1.6D, 603 FW 1, for description), compatible, wildlife-dependent recreation into the future?	x	

Where we do not have jurisdiction over the use ("no" to (a)), there is no need to evaluate it further as we cannot control the use. Uses that are illegal, inconsistent with existing policy, or unsafe ("no" to (b), (c), or (d)) may not be found appropriate. If the answer is "no" to any of the other questions above, we will **generally** not allow the use.

If indicated, the refuge manager has consulted with State fish and wildlife agencies. Yes x No

When the refuge manager finds the use appropriate based on sound professional judgment, the refuge manager must justify the use in writing on an attached sheet and obtain the refuge supervisor's concurrence.

Based on an overall assessment of these factors, my summary conclusion is that the proposed use is:

Not Appropriate **Appropriate** x

Refuge Manager: /Timothy A. Miller/ Date: 01 / 08 / 2014

If found to be **Not Appropriate**, the refuge supervisor does not need to sign concurrence if the use is a new use.

If an existing use is found **Not Appropriate** outside the CCP process, the refuge supervisor must sign concurrence.

If found to be **Appropriate**, the refuge supervisor must sign concurrence.

Refuge Supervisor: /James T. Leach/ Date: 01 / 16 / 2014

A compatibility determination is required before the use may be allowed.

FWS Form 3-2319

(h) Will this be manageable in the future within existing resources?	x	
(i) Does the use contribute to the public's understanding and appreciation of the refuge's natural or cultural resources, or is the use beneficial to the refuge's natural or cultural resources?	x	
(j) Can the use be accommodated without impairing existing wildlife-dependent recreational uses or reducing the potential to provide quality (see section 1.6D, 603 FW 1, for description), compatible, wildlife-dependent recreation into the future?	x	

Where we do not have jurisdiction over the use ("no" to (a)), there is no need to evaluate it further as we cannot control the use. Uses that are illegal, inconsistent with existing policy, or unsafe ("no" to (b), (c), or (d)) may not be found appropriate. If the answer is "no" to any of the other questions above, we will **generally** not allow the use.

If indicated, the refuge manager has consulted with State fish and wildlife agencies. Yes x No

When the refuge manager finds the use appropriate based on sound professional judgment, the refuge manager must justify the use in writing on an attached sheet and obtain the refuge supervisor's concurrence.

Based on an overall assessment of these factors, my summary conclusion is that the proposed use is:

Not Appropriate **Appropriate** x

Refuge Manager: /Timothy A. Miller/ Date: 01 / 08 / 2014

If found to be **Not Appropriate**, the refuge supervisor does not need to sign concurrence if the use is a new use.

If an existing use is found **Not Appropriate** outside the CCP process, the refuge supervisor must sign concurrence.

If found to be **Appropriate**, the refuge supervisor must sign concurrence.

Refuge Supervisor: /James T. Leach/ Date: 01 / 16 / 2014

A compatibility determination is required before the use may be allowed.

FWS Form 3-2319
02/06

FINDING OF APPROPRIATENESS OF A REFUGE USE

Refuge Name: Iowa Wetland Management District

Use: Dog Training

This form is not required for wildlife-dependent recreational uses, forms of take regulated by the State, or uses already described in a refuge CCP or step-down management plan approved after October 9, 1997.

Decision Criteria:	YES	NO
(a) Do we have jurisdiction over the use?	x	
(b) Does the use comply with applicable laws and regulations (Federal, State, tribal, and local)?	x	
(c) Is the use consistent with applicable Executive orders and Department and Service policies?	x	
(d) Is the use consistent with public safety?	x	
(e) Is the use consistent with goals and objectives in an approved management plan or other document?		x
(f) Has an earlier documented analysis not denied the use, or is this the first time the use has been proposed?		x
(g) Is the use manageable within available budget and staff?		x
(h) Will this be manageable in the future within existing resources?		x
(i) Does the use contribute to the public's understanding and appreciation of the refuge's natural or cultural resources, or is the use beneficial to the refuge's natural or cultural resources?		x
(j) Can the use be accommodated without impairing existing wildlife-dependent recreational uses or reducing the potential to provide quality (see section 1.6D, 603 FW 1, for description), compatible, wildlife-dependent recreation into the future?		x

Where we do not have jurisdiction over the use ("no" to (a)), there is no need to evaluate it further as we cannot control the use. Uses that are illegal, inconsistent with existing policy, or unsafe ("no" to (b), (c), or (d)) may not be found appropriate. If the answer is "no" to any of the other questions above, we will **generally** not allow the use.

[Recreational Trapping in Accordance with State Regulations \(includes motorboat use\)](#)

[Wildlife Observation](#)

[Wood Cutting \(including firewood\)](#)

Introduction

Compatibility determinations are documents written, signed, and dated by the district manager and the regional chief of refuges that signify whether proposed or existing uses of the Wetland Management District (WMD, district) are compatible with its establishing purposes and the mission of the National Wildlife Refuge System (NWRS, Refuge System). This appendix provides copies of the compatibility determinations for Iowa WMD.

Before undertaking a compatibility review of a use, the district manager must first determine that the use is appropriate. A compatible use is any proposed or existing wildlife-dependent recreational use or other use of a district by the public or entity other than the U.S. Fish and Wildlife Service (FWS, Service) that, based on sound professional judgment, will not materially interfere with or detract from fulfilling the mission of the Refuge System or the purposes of the district. The final policy and regulations required by the National Wildlife Refuge System Improvement Act of 1997 provide guidance for determining compatibility.

If a proposed use is not appropriate, the use will not be allowed, and a compatibility determination will not be prepared.

A compatibility determination is required for activities on a refuge/district by the public or entity other than the Service including:

- all refuge/district recreational and educational programs;
- construction or expansion of recreational and educational facilities such as boardwalks and boat ramps;
- management activities performed by private parties in return for a market commodity, such as cooperative farming to provide food for wildlife; and
- granting or modifying rights-of-way through refuges/districts for pipelines, roads, or electrical transmission lines.

Activities when a compatibility determination is NOT required include:

- refuge/district management activities such as prescribed burning, managing water levels, and controlling invasive species;
- routine scientific monitoring, studies, surveys, and censuses;
- conducting historic preservation;
- law enforcement activities; and
- maintaining refuge/district facilities, structures, or improvements.

Although a refuge/district use may be both appropriate and compatible, the district manager retains the authority to not allow the use or modify the use. The Service's *Midwest Region Easements Manual* provides more direction on applying compatibility to easements (FWS, 2012c).

The virtual or waypoint geocaching compatibility determination that was included in the Draft CCP is no longer a stand-alone document, but has been incorporated into the environmental education compatibility determination. This change was made simply for consistency with other plans and refuges/districts.

Compatibility Determination

Use: Bicycle Riding on Roads and Trails Open to Vehicular Traffic

Refuge/District Name: Iowa Wetland Management District

Establishing and Acquisition Authorities:

Migratory Bird Hunting and Conservation Stamp Act (Duck Stamp), March 16 1934, (16 U.S.C. § 718–718h, 48 Stat. 452) as amended August 1, 1958, (P.L. 85–585; 72 Stat. 486) for acquisition of “Waterfowl Production Areas.”

Wetlands Loan Act, October 4, 1961, as amended (16 U.S.C. 715k-5, Stat. 813).

Funds appropriated under the Wetlands Loan Act are merged with Duck Stamp receipts in the fund and appropriated to the Secretary for the acquisition of migratory bird refuges under provisions of the Migratory Bird Conservation Act, February 18, 1929, (16 U.S.C. § 715, 715d–715r).

Refuge/District Purposes:

Iowa Wetland Management District was established in 1979:

“ . . . as Waterfowl Production Areas subject to . . . all of the provisions of such Act [Migratory Bird Conservation Act of 1929] . . . except the inviolate sanctuary provisions . . . ” 16 U.S.C. § 718(c) “ . . . for any other management purpose, for migratory birds.” 16 U.S.C. § 715d

National Wildlife Refuge System Mission:

The mission of the Refuge System is to administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans.

Description of Use:

Riding bicycles on the Iowa WMD for the purposes of pleasure, exercise, transportation, and wildlife viewing as environmentally sound transportation without noise or air pollution, typically associated with motor vehicles.

Is the use a proposed new use or an existing use?

Proposed new use.

Is the use a priority public use?

No.

Where would the use be conducted?

On all roads and trails open to vehicular traffic, self-guided by regulatory signage on Waterfowl Production Areas (WPAs) within the WMD.

When would the use be conducted?

Year round; however, snow levels during the winter months make this use difficult

How would the use be conducted?

Self-guided. The number of users at any one time is expected to be minimal. The large size of the district is expected to keep users spread out; the frequency of users is expected to be irregular.

Why is this use being proposed?

Public request.

Availability of Resources:

What resources are needed to properly and safely administer use?

Few to no new resources will need to be utilized to allow bicycle riding on roads and trails open to vehicular traffic. Currently WPAs contain regulatory signs showing where vehicles can and cannot travel. Service roads are currently gated with chain gates restricting vehicles including bicycles. No new infrastructure is anticipated such as bicycle lanes, racks, etc. WPAs are currently set up for vehicles with parking areas and pull-offs, and are annually maintained. The approximate annual cost to maintain these parking areas is \$4,000 and is completed regardless of this use.

Are existing district resources adequate to properly and safely administer the use?

Yes.

Anticipated Impacts of the Use:

How does the use affect district purposes, the Refuge System mission, and district goals and/or objectives?

The short-term impact of bicycle riding on roads and trails open to vehicular traffic within the district will be conflicts with other users such as hunters, anglers, trappers, and wildlife observers. Impacts will be temporary and be less than that of other motor vehicles. Impacts may occur if bicycles travel off the designated open roads creating ruts and damage to wildlife habitat. Short-term temporary disturbance to waterfowl may occur but most likely will not negatively affect production due to infrequency. No long-term impacts are anticipated with this use.

Public Review and Comment:

This compatibility determination is available for public review as part of the *Iowa WMD Environmental Assessment and Draft Comprehensive Conservation Plan* from Monday, August 19th, 2013 to Tuesday, September 17th, 2013. Comments received and agency responses are included in the final Iowa WMD Comprehensive Conservation Plan.

Determination:

Use is Not Compatible

Use is Compatible with the Following Stipulations*

***According to state regulations Iowa Code 52.1(3) Waterfowl refuges:** “The following areas under the jurisdiction of the department of natural resources are established as waterfowl refuges where posted. It shall be unlawful to hunt ducks and geese on the following areas, where posted, at any time during the year. It shall be unlawful to trespass in any manner on the following areas, where posted, during the dates posted, both dates inclusive . . . “ **This compatibility determination does not apply to at least some portion of the following WPAs: Jemmerson Slough (Dickinson County), Elk Creek Marsh (Worth County), and Rice Lake (Winnebago and Worth Counties).**

Stipulations Necessary to Ensure Compatibility:

1. Use limited to non-motorized pedal powered bicycles.
2. No infrastructure will be constructed for this use including construction of bicycle trails, racks etc.
3. Bicycle use will only be permitted on existing trails open to motorized travel, and parking areas open to the public.

Justification:

Use of bicycles by visitors to the Iowa Wetland Management District is an excellent method to observe wildlife. Bicycles are quiet and pose little to no effect to nesting waterfowl when they remain in designated areas. Using bicycles can enhance a priority public use of wildlife observation. This use provides a green solution to visitors wishing to get exercise and observe the wildlife of the district.

Mandatory 10- or 15-year Re-evaluation Date: 2023

Compatibility Determination

Use: Environmental Education

Refuge/District Name: Iowa Wetland Management District

Establishing and Acquisition Authorities:

Migratory Bird Hunting and Conservation Stamp Act (Duck Stamp), March 16 1934, (16 U.S.C. § 718–718h, 48 Stat. 452) as amended August 1, 1958, (P.L. 85–585; 72 Stat. 486) for acquisition of “Waterfowl Production Areas.”

Wetlands Loan Act, October 4, 1961, as amended (16 U.S.C. § 715k–5, Stat. 813).

Funds appropriated under the Wetlands Loan Act are merged with Duck Stamp receipts in the fund and appropriated to the Secretary for the acquisition of migratory bird refuges under provisions of the Migratory Bird Conservation Act, February 18, 1929, (16 U.S.C. § 715, 715d–715r).

Refuge/District Purposes:

Iowa Wetland Management District was established in 1979:

“ . . . as Waterfowl Production Areas subject to . . . all of the provisions of such Act [Migratory Bird Conservation Act of 1929] . . . except the inviolate sanctuary provisions . . . ” 16 U.S.C. § 718(c) “ . . . for any other management purpose, for migratory birds.” 16 U.S.C. § 715d

National Wildlife Refuge System Mission:

The mission of the Refuge System is to administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans.

Description of Use:

A process designed to teach citizens and visitors the history and importance of conservation and the biological and the scientific knowledge of the Nation’s natural resources. Environmental education within the Refuge System incorporates on-site, off-site, and distance learning materials, activities, programs, and products that address the audience’s course of study, district purpose(s), physical attributes, ecosystem dynamics, conservation strategies, and the Refuge System mission. Methods may include GPS use (i.e. virtual geocaching-type activities); minimal collection of insects, aquatic invertebrates, plants or seeds for examination; off-trail and road experiences; and after hours use (stargazing). Programs across the district will include interpretation of wetland, tallgrass prairie resources, migratory birds, resident wildlife, and water quality. FWS staff or partner organizations including Iowa Department of Natural Resources, County Conservation Boards (CCBs), Friends organizations, colleges, and 4-H and scouting groups could conduct environmental education activities in the district.

Partner colleges and universities may use Waterfowl Production Areas (WPAs) to observe, and study prairie seeding and restoration efforts. Management of this use will be through a signed special use permit issued by the district manager or a similar agreement with the Iowa DNR.

Is the use a proposed new use or an existing use?

Proposed new use.

Is the use a priority public use?

Yes.

Where would the use be conducted?

Across the district, except in prohibited areas.

When would the use be conducted?

Activities may be authorized throughout the year, but participants will be encouraged to abstain from activities during the primary waterfowl-nesting season (April through July).

How would the use be conducted?

Access for this use will be mainly by foot but may include snowshoeing, cross-country skiing, and canoe/kayak (boating).

Why is this use being proposed?

Priority public use and public request.

Availability of Resources:

What resources are needed to properly and safely administer use?

Most of the district is managed by Iowa DNR biologists through a Memorandum of Understanding. Limited staff and funds are available to conduct and enhance environmental education opportunities on the WMD; however, partnering with neighboring CCBs and schools has proven to be a cost effective solution to staffing for this use. Staff time to develop and issue special use permits will be necessary for this use along with monitoring and working with partners on developing a message for the use. Some structures, boundary and regulatory signs, parking lots, and other minor facilities are currently on WPAs and will facilitate environmental education without any further costs.

Are existing district resources adequate to properly and safely administer the use?

Yes, if utilize partners.

Anticipated Impacts of the Use:

How does the use affect district purposes, the Refuge System mission, and district goals and/or objectives?

Overall, the impacts to WPAs and their associated wildlife populations from environmental education uses will be minimal. There will be temporary disturbance to waterfowl and other wildlife, but it will not likely interfere with waterfowl production. Special use permits for this use will be limited to times and locations that will have the least impact during pair bonding, nesting, and brood rearing of waterfowl. Group sizes will be limited to lessen possible impacts to waterfowl and WPA purpose. Vehicles and school busses will be limited to parking areas and service roads to minimize disturbance to vegetation and wildlife.

Public Review and Comment:

This compatibility determination is available for public review as part of the *Iowa WMD Environmental Assessment and Draft Comprehensive Conservation Plan* from Monday, August 19th, 2013 to Tuesday, September 17th, 2013. Comments received and agency responses are included in the final Iowa WMD Comprehensive Conservation Plan.

Determination:

Use is Not Compatible

Use is Compatible with the Following Stipulations*

***According to state regulations Iowa Code 52.1(3) Waterfowl refuges.** “The following areas under the jurisdiction of the department of natural resources are established as waterfowl refuges where posted. It shall be unlawful to hunt ducks and geese on the following areas, where posted, at any time during the year. It shall be unlawful to trespass in any manner on the following areas, where posted, during the dates posted, both dates inclusive . . . “ **This compatibility determination does not apply to at least some portion of the following WPAs: Jemmerson Slough (Dickinson County), Elk Creek Marsh (Worth County), and Rice Lake (Winnebago and Worth Counties).**

Stipulations Necessary to Ensure Compatibility:

1. Environmental education may be authorized at various times of the year; however, partners are encouraged to avoid the primary nesting period (April through July).
2. GPS (virtual geocaching), plant or animal collection, after hours use, and travel off designated routes and parking areas are only allowed as stipulated in a special use permit.
3. All applicable federal, state, and special district regulations will apply.

Justification:

This use is a wildlife-dependent priority public use and will not diminish the primary purposes of the district, which is to serve as production areas for waterfowl and to provide habitat for migratory birds. This use will meet the mission of the Refuge System by furthering understanding and knowledge of the Nation’s migratory bird status, needs, and conservation efforts. Use of WPAs for environmental education will increase the public’s appreciation for conservation areas and local efforts, along with providing local schools and communities a look into the natural wildlife heritage of this area prior to settlement.

Mandatory 10- or 15-year Re-evaluation Date: 2028

Compatibility Determination

Use: Farming

Refuge Name: Iowa Wetland Management District (WMD)

Establishing and Acquisition Authorities: Waterfowl Production Areas - The Migratory Bird Hunting and Conservation Stamp Act, March 16, 1934, (16 U.S.C. Sec. 718-718h, 48 Stat. 452) as amended August 1, 1958, (P.L. 85-585; 72 Stat. 486) for acquisition of Waterfowl Production Areas; the Wetlands Loan Act, October 4, 1961, as amended (16 U.S.C. 715k-3 - 715k-5, Stat. 813), funds appropriated under the Wetlands Loan Act are merged with duck stamp receipts in the fund and appropriated to the Secretary for the acquisition of migratory bird refuges under provisions of the Migratory Bird Conservation Act, February 18, 1929, (16 U.S.C. Sec. 715, 715d - 715r, as amended).

FmHA fee title transfer properties - Consolidated Farm and Rural Development Act 7 U.S.C. 2002.

Refuge Purposes:

Waterfowl Production Areas - "...as Waterfowl Production Areas" subject to "...all of the provisions of such Act [Migratory Bird Conservation Act]....except the inviolate sanctuary provisions..." and "...for any other management purpose, for migratory birds."

FmHA fee title transfer properties - "for conservation purposes..."

National Wildlife Refuge System Mission:

The Mission of the National Wildlife Refuge System is to administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans.

Description of Use: Use Cooperative farming as a habitat management tool to enhance and restore WMD grasslands.

Is the use a priority public use?

Farming is not a priority public use in the National Wildlife Refuge System

Where would the use be conducted?

Farming occurs on approximately 5-10 percent of WMD lands annually, depending on acquisition of newly acquired lands and restoration needs and objectives of these lands.

When would the use be conducted?

Spring planting typically begins in early April and harvest typically concludes by November of each year.

How would the use be conducted?

The WMD will allow farming by private individuals for the purpose of habitat management. Cooperative farming is the term used for cropping activities (growing agricultural products) conducted by a third party on land that is owned by or managed as part of the WMD. This activity is implemented to prepare a quality seed bed for the establishment of native prairie species.

Cooperative farming activities will only be performed on previously disturbed areas such as previously farmed land which have unacceptable levels of chemical residue, noxious weeds, or non-native plant species or ecotypes.

Cooperators are selected through a drawing. The drawn applicant receives the contract for that area. Cooperative farming is conducted under the terms and conditions of a Special Use Permit or a Cooperative Farming Agreement issued by the Wetland District Manager. The terms of the Permit or Agreement ensure compliance with Service policy and area-specific stipulations to meet management objectives and safeguard resources.

Most cropping is conducted to convert recently acquired tracts from corn stubble into soybean stubble in preparation of seeding. These contracts are typically written for one year of cropping in soybeans. However, in some cases it may be necessary to extend contracts up to 5 years. Soybean stubble is the preferred substrate to seed native grasses and forbs into.

Conversion of non-native plant species and/or noxious weeds to native grasses and forbs requires a longer time period. These contracts are typically written for 3-5 years. The cooperator breaks up the ground the first year and then farms it for the remaining 2-4 years. The last year of the contract requires the cooperator to seed the field to soybeans in preparation of seeding.

Farming entails the use of mechanical equipment such as tractors, disks, and seeders. Each site is tilled prior to spring planting, once ground conditions permit the use of heavy equipment without damage to the soil. Tilling requires 1-2 days per site. Some sites may also be treated with herbicide prior to planting. Crops such as corn and soybeans are planted. Typically, planting is completed in one day or less on any individual site and planting on all sites usually begins as early as mid-April and is completed as late as early June depending on soil conditions and type of crop planted. Cooperators are limited to using only FWS approved herbicides. The use of Genetically Modified Crops (GMO crops), specifically Glyphosate-tolerant corn and soybeans, will be authorized on WMD lands consistent with current Regional Policy.

Beginning in calendar year 2012, the use of genetically-modified, glyphosate-tolerant corn and soybeans will be used only for the purpose of habitat restoration.

Harvest techniques are the same for both no-till and traditional farming practices. Harvest begins in the fall, using a self-propelled harvesting implement such as a combine, and usually takes about one day per site and is complete on all sites by late October.

Why is this use being proposed?

Farming is used to prepare seed beds for the WMD's grassland restoration program.

Availability of Resources:

What resources are needed to properly (considering quality and compatibility) and safely administer use?

Most of the needed work to prepare for this use would be done as part of routine management duties. The decision to use cooperative farming as a management tool would occur as part of strategies developed under specific program or unit habitat management planning. The additional time needed to coordinate issuance and oversight of the needed Special Use Permit or Agreements is relatively minor and within existing WMD resources.

Are existing refuge resources adequate to properly and safely administer the use?

The needed staff time for development and administration of a cooperative farming program is available. The additional time needed to coordinate issuance and oversight of the needed Special Use Permit or Agreements is relatively minor and within existing WMD resources.

Anticipated Impacts of the Use:

How does farming affect Refuge purposes and the NWRS mission?

The use of farming provides a management tool that allows the WMD staff to meet the habitat goals and objectives. Service policy calls for maintaining or restoring WMD habitats to historic conditions if doing so does not conflict with refuge purposes (U. S. Fish and Wildlife Service 2001).

How does farming affect Fish, wildlife, plants, and their habitats; and the biological integrity, diversity, and environmental health of the refuge/NWRS?

Cooperative farming to prepare suitable seed beds for native prairie plantings will result in short-term disturbances and long-term benefits to both resident and migratory wildlife using WMD lands. Short-term impacts will include disturbance and displacement typical of any noisy heavy equipment operation. Cropping activities in old fields or abandoned croplands will also result in short-term loss of habitat for any animal or insect species using those areas for nesting, feeding, or resting. Long-term benefits are extremely positive due to establishment of diverse nesting cover utilizing local eco-type Northern Tallgrass Prairie Ecosystem plant species. The resulting habitat will greatly improve conditions for most of the same species affected by the short-term negative impacts. Strict time constraints placed on this use will limit anticipated impacts to these relatively minor areas. Farming and any associated impacts are expected to occur on approximately 5-10 percent of WMD lands annually.

Public Review and Comment:

This Compatibility Determination was available for public review from November 8, 2011 through November 23, 2011. No comments were received.

Determination:

Farming

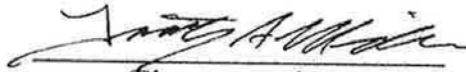

- Use is Not Compatible
- Use is Compatible with the Following Stipulations

Stipulations Necessary to Ensure Compatibility:

1. Farming activity will only take place on previously altered tracts of land within the refuge and must meet specific habitat and related wildlife objectives and contribute to the purposes of the WMD.
2. Cooperating farmers will be subject to Service policy and regulation regarding use of chemicals. Herbicide and pesticide use is restricted by type and to the minimum necessary amount applied.
3. Special conditions of Special Use Permits and Cooperative Farming Agreements will address unique local conditions as applicable.
4. Planting and harvest activities are restricted to minimize disturbance of wildlife species.
5. The use of GMO crops is limited to Glyphosate-tolerant corn and soybeans.
6. Beginning in calendar year 2012, the use of genetically-modified, glyphosate-tolerant corn and soybeans will be used only for the purpose of habitat restoration.

Justification: In view of the above and with the stipulations previously described, farming will not materially interfere with or detract from the NWRS mission or purposes of the WMD. As practiced at the Iowa WMD, farming, both conventional and with the use of Glyphosate-tolerant corn and soybeans, contributes to the achievement of WMDs purposes and the National Wildlife Refuge System mission because it helps enhance and restore grassland habitat for migratory birds and resident wildlife.

Compatibility Determination

Use: Food Plot Cultivation for Wildlife

Refuge/District Name: Iowa Wetland Management District

Establishing and Acquisition Authorities:

Migratory Bird Hunting and Conservation Stamp Act (Duck Stamp), March 16 1934, (16 U.S.C. § 718–718h, 48 Stat. 452) as amended August 1, 1958, (P.L. 85–585; 72 Stat. 486) for acquisition of “Waterfowl Production Areas.”

Wetlands Loan Act, October 4, 1961, as amended (16 U.S.C. § 715k–5, Stat. 813).

Funds appropriated under the Wetlands Loan Act are merged with Duck Stamp receipts in the fund and appropriated to the Secretary for the acquisition of migratory bird refuges under provisions of the Migratory Bird Conservation Act, February 18, 1929, (16 U.S.C. § 715, 715d–715r).

Refuge/District Purposes:

Iowa Wetland Management District was established in 1979:

“ . . . as Waterfowl Production Areas subject to . . . all of the provisions of such Act [Migratory Bird Conservation Act of 1929] . . . except the inviolate sanctuary provisions . . . ” 16 U.S.C. § 718(c) “ . . . for any other management purpose, for migratory birds.” 16 U.S.C. § 715d

National Wildlife Refuge System Mission:

The mission of the Refuge System is to administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans.

Description of Use:

Establishment of wildlife food plots on Waterfowl Production Areas (WPAs) throughout the Iowa Wetland Management District to provide important food and cover resources in harsh winter conditions. The vast majority of WPAs are managed by the Iowa Department of Natural Resources (DNR) under a Memorandum of Understanding (MOU). Food plots are addressed in the MOU which authorizes the Iowa DNR to establish and maintain food plots at levels identified in the Comprehensive Conservation Plan, Habitat Management Plan (to be written), and individual unit plan.

Food plots are small agriculture fields typically ranging in size from three to 10 acres consisting mainly of corn, soybeans, sunflowers, wheat, barley, oats, rye, buckwheat, millet, and sorghum. Placement and movement of individual food plots within a WPA will vary based on factors such as food plot availability on neighboring properties, best conservation practices, shape and arrangement of other habitat types within a WPA, invasive species control, and wildlife disturbance factors. Establishment of food plots will provide winter cover and food resources to resident wildlife during harsh weather conditions.

Food plots are not a priority public use as identified in the National Wildlife Refuge System Improvement Act of 1997. Food plots are a nonessential but helpful tool to facilitate other priority public uses including hunting, wildlife observation, and photography. Food plots may also be helpful in reaching goals outlined in the North American Waterfowl Management Plan (NAWMP) of growing hunters and other outdoor enthusiast groups to conserve and protect wetland areas. These plots may help provide desirable densities of wildlife for public viewing, hunting and photography.

Is the use a proposed new use or an existing use?

Existing use.

Is the use a priority public use?

No.

Where would the use be conducted?

Select WPA tracts within the Iowa WMD that have been identified as a strategic location for a food plot.

When would the use be conducted?

Crops will typically be planted in spring and may be harvested in early spring the following year.

How would the use be conducted?

Food plots are generally planted and maintained by private individuals (cooperative farmers), other agencies (Iowa DNR) or sporting clubs. Cropping activities are controlled through an agricultural agreement between the cooperator and the Iowa DNR; however, the Service provides guidelines such as pesticide use.

Why is this use being proposed?

Wildlife management tool for the district.

Availability of Resources:

What resources are needed to properly and safely administer use?

The staff time required for this use is already committed through partnership efforts with Iowa DNR and the MOU. The agriculture program in the district is the responsibility of the Iowa DNR. Service staff time will only include planning efforts to evaluate the need for food plots on newly acquired properties and reviewing management plans for food plot use. Service staff will be needed within the first year of the Comprehensive Conservation Plan implementation to review food plot locations in the district, along with preparing a Geographic Information System (GIS) map layer with food plot locations. On years following this evaluation, staff time will be required to update the GIS layers annually. Currently staff time is available and committed for this use.

Are existing district resources adequate to properly and safely administer the use?

Yes.

Anticipated Impacts of the Use:

How does the use affect district purposes, the Refuge System mission, and district goals and/or objectives?

The proposed use will positively affect wintering Ring-necked Pheasants by providing reliable food resources near high quality cover, thus reducing exposure to predators and harsh weather conditions. Food plots also make high-energy grains available to waterfowl, Mourning Doves, and other migratory birds during spring and fall migration. The borders of food plots often contain annual forbs, which provide forage for a variety of sparrows and other songbirds. Some species of wildlife, such as white-tailed deer, will benefit from the type of habitat produced by the creation of a food plot.

Food plots help facilitate priority public uses that engage the public with wildlife such as hunting, wildlife observation, and photography. Good neighbors and an engaged public provide positive long-term support for the conservation of waterfowl and other migratory birds, as well as their habitats.

Minimal negative impacts are anticipated, because food plots will typically be smaller than 10 acres in size. In addition, food plots will be limited to three percent or less of district uplands. Food plots will reduce the available nesting cover for waterfowl, migratory birds, and other wildlife. Grassland bird research suggests that birds will utilize crop fields for nesting; however, the disturbance common with farming practices may be detrimental to nest success (Warner 1994 and Best, 1986). Many grassland nesting birds and all upland nesting waterfowl species have better nesting success in larger contiguous blocks of grassland habitat (Winter and Faaborg, 1999 and Winter et al., 2000). Careful placement of food plots can lessen the impacts of edge and the fragmentation of habitat.

Impacts to waterfowl may be lessened by placing food plots strategically in the best locations for critical resident wildlife needs. The public uses associated with food plots may increase wildlife disturbance somewhat. However, the beneficial aspects of food plots for these uses are typically realized outside of the breeding season, and food plots can be used to concentrate these uses to areas where the associated disturbance is less detrimental (Korschgen and Dahlgren, 1992). Since WPAs are open to hunting, any increases in the white-tailed deer population related to food plots will be controlled. Soils will be impacted through the placement and management of food plots. Farming practices that disturb the soil by tilling create the potential for soil erosion. Chemical usage on food plots could potentially have negative effects on adjacent waters, vegetation, and associated wildlife. Food plot farming practices will use best management practices to lessen the effects of soil erosion and chemical usage. The stipulations listed later in this document will address the criteria needed for food plot placement and management in the district.

Public Review and Comment:

This compatibility determination is available for public review as part of the *Iowa WMD Environmental Assessment and Draft Comprehensive Conservation Plan* from Monday, August 19th, 2013 to Tuesday, September 17th, 2013. Comments received and agency responses are included in the final Iowa WMD Comprehensive Conservation Plan.

Determination:

Use is Not Compatible

Use is Compatible with the Following Stipulations

Stipulations Necessary to Ensure Compatibility:

1. No greater than three percent of the Iowa WMD uplands may be in food plots at any one time.
2. Food plot species will be limited to corn, soybeans, milo, sunflowers, wheat, barley, oats, rye, buckwheat, millet, and sorghum. The entire crop will remain standing through the winter. Manipulation of the crop such as mowing is not allowed.
3. Food plot farming and maintenance will comply with the Migratory Bird Treaty Act 16 U.S.C. 703–712 P.L. 105–312 and 50 CFR 20.11–21 and not constitute baiting.
4. Crop seeds used in food plots will be from a non-genetically modified seed source.
5. Chemicals used on food plots must be approved through the pesticide use proposals. No insecticides will be allowed on food plots.
6. New WPA acquisitions requesting food plot placement will need project leader approval.

Justification:

Food plot use in the Iowa WMD is a compatible practice when the above stipulations are in place. This use as proposed will not materially detract from the waterfowl and migratory bird purposes of the district. Allowing the use of food plots will assist the Iowa DNR in reaching their resident wildlife goals and provide the public with opportunities to recreate on district properties. Use of food plots may also grow the number of hunters that will support a goal of the NAWMP. An MOU between the Service and Iowa DNR establishes that food plots are an acceptable practice in the district. Any negative impacts to waterfowl will be lessened by following the stipulations and evaluating the effects of the program.

The goals of the NAWMP focus on engaging people with nature and growing the number of hunters. Within Iowa, the Iowa DNR and the public generally view food plots as a positive practice providing excellent viewing and hunting opportunities. Allowing food plots on WPAs within the district, albeit limited, will assist the Iowa DNR (a key Service partner) in providing hunting opportunities that will in turn gain public support for waterfowl and wetland protection.

Compatibility Determination

Use: Hay Harvest

Refuge/District Name: Iowa Wetland Management District

Establishing and Acquisition Authorities:

Migratory Bird Hunting and Conservation Stamp Act (Duck Stamp), March 16 1934, (16 U.S.C. § 718–718h, 48 Stat. 452) as amended August 1, 1958, (P.L. 85–585; 72 Stat. 486) for acquisition of “Waterfowl Production Areas.”

Wetlands Loan Act, October 4, 1961, as amended (16 U.S.C. § 715k–5, Stat. 813).

Funds appropriated under the Wetlands Loan Act are merged with Duck Stamp receipts in the fund and appropriated to the Secretary for the acquisition of migratory bird refuges under provisions of the Migratory Bird Conservation Act, February 18, 1929, (16 U.S.C. § 715, 715d–715r).

Refuge/District Purposes:

Iowa Wetland Management District was established in 1979:

“ . . . as Waterfowl Production Areas subject to . . . all of the provisions of such Act [Migratory Bird Conservation Act of 1929] . . . except the inviolate sanctuary provisions . . . ” 16 U.S.C. § 718(c) “ . . . for any other management purpose, for migratory birds.” 16 U.S.C. § 715d

National Wildlife Refuge System Mission:

The mission of the Refuge System is to administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans.

Description of Use:

The cutting and removal, by baling and transport to an off-district location, of grasses and forbs, either non-native cool season species such as brome or native warm or cool season species. This use is typically completed by a cooperative farmer under authority of a cooperative farming agreement or special use permit issued by the district manager or Iowa Department of Natural Resources district biologists.

Is the use a proposed new use or an existing use?

Existing use.

Is the use a priority public use?

No.

Where would the use be conducted?

Waterfowl Production Area (WPA) tracts in Iowa average 100 acres in size and are intermingled with private and other public lands. Although specific acreages for fields to be hayed will vary by

unit, they will typically range from five-acre firebreaks to 80-acre units. In that case, haying could possibly occur over the entire unit and up to several hundred acres. Hay acreages for firebreaks will be very small, estimated at less than five acres per WPA.

When would the use be conducted?

Seasonally, after July 15 of each year.

How would the use be conducted?

Haying can be an effective management tool as part of an overall grassland management plan to improve and maintain grasslands for the benefit of migratory birds. Grasslands need periodic renovation to maintain vigor, diversity, and the structure necessary for migratory bird use. Haying is an effective alternative to burning or grazing, which are the two other primary means used to maintain grassland vigor. If local site conditions preclude use of prescribe fire due to hazards to neighboring property or a similar challenge, removal of accumulated biomass through haying will reduce unwanted overstory cover and encroaching woody vegetation. This will allow for more vigorous regrowth of desirable species following the haying, although results are neither as dramatic nor as positive as with the use of prescribed fire.

Haying of a nonnative cool season field is an effective preparatory step prior to spraying the field with herbicide to kill all existing vegetation. Removal of the heavy grass overstory through haying allows the chemical to be more effective at treating the target plants. Thorough removal of the unwanted grasses ensures greater success of the planted native grasses for both interseeding or plowing the soil prior to seeding. Haying is also effective at preparing WPAs for wetland restoration activities. The haying can be used to remove the tall vegetation and facilitate the construction of dikes, water control structures, and rerouting drainage tile. Finally, haying can be used to establish firebreaks that facilitate safe prescribed fire. Strategically placed grass strips are hayed in early fall, so the vegetation green-ups earlier in the spring with no dead overstory biomass. Firebreaks have also been developed on WPAs and hayed annually to create defensible space for houses and other Wildland Urban Interface structures. Haying of these firebreaks creates a green space between neighboring houses and dense grass fuels.

Why is this use being proposed?

District management tool.

Availability of Resources:

What resources are needed to properly and safely administer use?

Planning for this use will not require any additional resources and will be a normal part of grassland management. Staff time will be need to complete the hay bid process, develop public notices, and issue special use permits and bills for collection.

Are existing district resources adequate to properly and safely administer the use?

Yes.

Anticipated Impacts of the Use:

How does the use affect district purposes, the Refuge System mission, and district goals and/or objectives?

Haying will result in short-term disturbances and long-term benefits to both resident and migratory wildlife that use WPAs. Short-term impacts will include disturbance and displacement typical of any noisy heavy equipment operation. Cutting and removal of standing grasses will also result in short-term loss of habitat for those species requiring tall grasses for feeding and perching (i.e., Bobolink and Dickcissel). Long-term benefits will result as increased vigor of regrown grasses and establishment of highly desirable native tallgrass species improves conditions for those same species affected by the short-term negative impacts. Longer-term negative impacts may occur to resident wildlife species such as pheasant that could lose overwintering habitat in the hayed areas. However, strict time constraints placed on this use will limit anticipated impacts to these relatively minor areas.

Public Review and Comment:

This compatibility determination is available for public review as part of the *Iowa WMD Environmental Assessment and Draft Comprehensive Conservation Plan* from Monday, August 19th, 2013 to Tuesday, September 17th, 2013. Comments received and agency responses are included in the final Iowa WMD Comprehensive Conservation Plan.

Determination:

Use is Not Compatible

Use is Compatible with the Following Stipulations

Stipulations Necessary to Ensure Compatibility:

1. Haying will only be allowed after July 15 to minimize disturbance to nesting migratory birds. In normal years, most birds are off the nest by this date.
2. Bales must be removed from the WPA within two days of baling.
3. Windrowed grass left lying to dry prior to baling must be raked and moved every two days if left on newly seeded native grass and under no circumstances should remain on the ground more than six days prior to baling.

Justification:

Haying will not materially interfere with waterfowl production if completed within the necessary stipulations. Use of haying, as a management tool can be a valuable technique for providing long-term habitat improvements to grassland that otherwise, would degrade through natural succession or dominance of non-native plants.

Without this tool, the areas would suffer encroachment of undesirable woody species such as box elder or ash or would remain in unwanted non-native cool season grasses such as brome. Use of the areas by waterfowl or grassland-dependent species such as Bobolink, Dickcissel, or Grasshopper Sparrow would slowly decline in the absence of haying or other similar management.

Signature: District Manager /Timothy A. Miller/ 01 / 08 / 2014
(Signature and Date)

Concurrence: Regional Chief /Charles W. Blair/ 01 / 17 / 2014
(Signature and Date)

Mandatory 10- or 15-year Re-evaluation Date: 2023

Compatibility Determination

Use: Hunting in Accordance with State Regulations (includes motorboat use)

Refuge/District Name: Iowa Wetland Management District

Establishing and Acquisition Authorities:

Migratory Bird Hunting and Conservation Stamp Act (Duck Stamp), March 16 1934, (16 U.S.C. § 718–718h, 48 Stat. 452) as amended August 1, 1958, (P.L. 85–585; 72 Stat. 486) for acquisition of “Waterfowl Production Areas.”

Wetlands Loan Act, October 4, 1961, as amended (16 U.S.C. § 715k–5, Stat. 813).

Funds appropriated under the Wetlands Loan Act are merged with Duck Stamp receipts in the fund and appropriated to the Secretary for the acquisition of migratory bird refuges under provisions of the Migratory Bird Conservation Act, February 18, 1929, (16 U.S.C. § 715, 715d–715r).

Refuge/District Purposes:

Iowa Wetland Management District was established in 1979:

“ . . . as Waterfowl Production Areas subject to . . . all of the provisions of such Act [Migratory Bird Conservation Act of 1929] . . . except the inviolate sanctuary provisions . . . ” 16 U.S.C. § 718(c) “ . . . for any other management purpose, for migratory birds.” 16 U.S.C. § 715d

National Wildlife Refuge System Mission:

The mission of the Refuge System is to administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans.

Description of Use:

Shooting migratory game birds, upland game birds and mammals, and big game on Waterfowl Production Areas (WPAs) throughout the district in accordance with state seasons and governed by both federal and state regulations. Hunting on WPAs may be suspended due to unusual or critical conditions affecting land, water, vegetation, or wildlife populations. Hunting will facilitate four other priority public uses: wildlife observation, wildlife photography, environmental education, and interpretation.

Is the use a proposed new use or an existing use?

Existing use.

Is the use a priority public use?

Yes.

Where would the use be conducted?

On all open WPAs; see Determination section below.

When would the use be conducted?

The majority of the use occurs in the fall, from mid-September through the end of December. Spring turkey hunting occurs on a few WPAs with a state season running from early April to the end of May.

How would the use be conducted?

This use must occur in accordance with state regulations. Some WPAs have trails to them from public roads to gain access. Most WPAs have parking areas, usually less than one acre in size, to keep vehicles and traffic off public roads. The State of Iowa uses hunting as a management tool through appropriate season setting and harvest objectives. This tool allows for wildlife-dependent public recreation and supports the harvest of surplus wildlife.

Why is this use being proposed?

Regulation, wildlife management tool, priority public use, and public request.

Availability of Resources:

What resources are needed to properly and safely administer use?

Few additional fiscal resources are necessary to conduct this use. WPAs are open by statute to hunting, fishing, and trapping and have provided such opportunities since acquired. As a result, some infrastructure is already in place to facilitate this use. The majority of the WPAs in the district are managed cooperatively through a Memorandum of Understanding with the Iowa Department of Natural Resources (DNR), which includes some law enforcement responsibilities.

Are existing district resources adequate to properly and safely administer the use?

Yes, by partnering with the Iowa DNR staff of conservation officers and local wildlife biologists.

Anticipated Impacts of the Use:

How does the use affect district purposes, the Refuge System mission, and district goals and/or objectives?

Although hunting causes mortality and temporary disturbance to migratory birds and other wildlife, harvesting populations to the carrying capacity of existing habitat ensures long-term health and survival for the species and its habitat. Most hunting occurs well after the breeding season for migratory birds and other wildlife so there will be little or no disturbance to the district's central purpose. Since most access for hunting occurs by foot traffic, some disturbance is anticipated; however, it will be temporary. Hunting on WPAs will assist in promoting an understanding and appreciation of wetland and prairie natural resources as well as management of land administered by the Refuge System.

Public Review and Comment:

This compatibility determination is available for public review as part of the *Iowa WMD Environmental Assessment and Draft Comprehensive Conservation Plan* from Monday, August 19th, 2013 to Tuesday, September 17th, 2013. Comments received and agency responses are included in the final Iowa WMD Comprehensive Conservation Plan.

Determination:

Use is Not Compatible

Use is Compatible with the Following Stipulations*

***According to state regulations Iowa Code 52.1(3) *Waterfowl refuges*.** “The following areas under the jurisdiction of the department of natural resources are established as waterfowl refuges where posted. It shall be unlawful to hunt ducks and geese on the following areas, where posted, at any time during the year. It shall be unlawful to trespass in any manner on the following areas, where posted, during the dates posted, both dates inclusive . . . “ **This compatibility determination does not apply to at least some portion of the following WPAs: Jemmerson Slough (Dickinson County), Elk Creek Marsh (Worth County), and Rice Lake (Winnebago and Worth Counties).**

Stipulations Necessary to Ensure Compatibility:

1. Travel in, or use of, any motorized or other vehicle is prohibited except by special use permit. Parking in designated areas or on public roads is permissible for access, but use of horses is not permissible.
2. Personal property may not be left unattended or abandoned.
3. Hunting tree stands that are not removed daily must have the hunter’s name or Iowa hunting license number clearly marked on the stand. Tree stand installation and removal will comply with regulations for state Wildlife Management Areas. Current regulations: seven days prior to hunting season and removal seven days after hunting season.
4. All watercraft are restricted to no larger than 15 horsepower motors.
5. All applicable federal, state, and special district regulations apply.

Justification:

WPAs are open to hunting of migratory game birds, upland game, and big game by regulation and in accordance with state law. Hunting will not materially interfere with or detract from the purposes for which these units were established. As a management tool, hunting can be used to ensure healthy wildlife populations and sustainable habitat. Hunting is a priority wildlife-dependent public use and will facilitate four other priority public uses: wildlife observation, wildlife photography, environmental education, and interpretation. The use of hunting will assist the district in meeting the mission of the Refuge System by managing the Nation’s wildlife and plant resources for the benefit of the American public.

(Signature and Date)

Concurrence: Regional Chief /Charles W. Blair/ 01 / 17 / 2014
(Signature and Date)

Mandatory 10- or 15-year Re-evaluation Date: 2028

Compatibility Determination

Use: Interpretation

Refuge/District Name: Iowa Wetland Management District

Establishing and Acquisition Authorities:

Migratory Bird Hunting and Conservation Stamp Act (Duck Stamp), March 16 1934, (16 U.S.C. § 718–718h, 48 Stat. 452) as amended August 1, 1958, (P.L. 85–585; 72 Stat. 486) for acquisition of “Waterfowl Production Areas.”

Wetlands Loan Act, October 4, 1961, as amended (16 U.S.C. § 715k–5, Stat. 813).

Funds appropriated under the Wetlands Loan Act are merged with Duck Stamp receipts in the fund and appropriated to the Secretary for the acquisition of migratory bird refuges under provisions of the Migratory Bird Conservation Act, February 18, 1929, (16 U.S.C. § 715, 715d–715r).

Refuge/District Purposes:

Iowa Wetland Management District was established in 1979:

“ . . . as Waterfowl Production Areas subject to . . . all of the provisions of such Act [Migratory Bird Conservation Act of 1929] . . . except the inviolate sanctuary provisions . . . ” 16 U.S.C. § 718(c) “ . . . for any other management purpose, for migratory birds.” 16 U.S.C. § 715d

National Wildlife Refuge System Mission:

The mission of the Refuge System is to administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans.

Description of Use:

Interpretation is a communication process that forges emotional and intellectual connections between the audience and the resource. Programs may include activities, talks, publications, audio-visual media, signs, and exhibits that convey key natural and cultural resource messages to visitors. Programs across the district will include interpretation of wetland, tallgrass prairie resources, migratory birds, resident wildlife, and water quality. Service staff or partner organizations including Iowa Department of Natural Resources (DNR), County Conservation Boards (CCBs), Friends organizations, colleges, and 4-H and scouting groups could conduct environmental education activities in the district.

Partner colleges and universities may use Waterfowl Production Areas (WPAs) to observe, and study prairie seeding and restoration efforts. Management of this use will be through a signed special use permit issued by the district manager or a similar agreement with the Iowa DNR.

Is the use a proposed new use or an existing use?

Proposed new use.

Is the use a priority public use?

Yes.

Where would the use be conducted?

Across the district, except in prohibited areas.

When would the use be conducted?

Activities may be authorized throughout the year, but participants will be encouraged to abstain from activities during the primary waterfowl-nesting season (April through July).

How would the use be conducted?

Access for this use will be mainly by foot but may include snowshoeing, cross-country skiing, and canoe/kayak (boating).

Why is this use being proposed?

Priority public use and public request.

Availability of Resources:

What resources are needed to properly and safely administer use?

Most of the district is managed by Iowa DNR biologists through a Memorandum of Understanding. Limited staff and funds are available to conduct and enhance interpretation opportunities on the WMD; however, partnering with neighboring CCBs and schools has proven to be a cost effective solution to staffing for this use. Staff time to develop and issue special use permits will be necessary for this use along with monitoring and working with partners on developing a message for the use. Some structures, boundary and regulatory signs, parking lots, and other minor facilities are currently on WPAs and will facilitate interpretation without any further costs.

Are existing district resources adequate to properly and safely administer the use?

Yes, if utilize partners.

Anticipated Impacts of the Use:

How does the use affect district purposes, the Refuge System mission, and district goals and/or objectives?

Overall, the impacts to WPAs and their associated wildlife populations from interpretation will be minimal. There will be temporary disturbance to waterfowl and other wildlife, but it will not likely interfere with waterfowl production. Special use permits for this use will be limited to times and locations that will have the least impact during pair bonding, nesting, and brood rearing of waterfowl. Group sizes will be limited to lessen possible impacts to waterfowl and WPA purpose. Vehicles and school busses will be limited to parking areas and service roads to minimize disturbance to vegetation and wildlife. If auto tour roads are proposed to facilitate this use, they will be designed to minimize disturbance to waterfowl during the spring breeding/nesting season.

Public Review and Comment:

This compatibility determination is available for public review as part of the *Iowa WMD Environmental Assessment and Draft Comprehensive Conservation Plan* from Monday, August 19th, 2013 to Tuesday, September 17th, 2013. Comments received and agency responses are included in the final Iowa WMD Comprehensive Conservation Plan.

Determination:

Use is Not Compatible

Use is Compatible with the Following Stipulations*

***According to state regulations Iowa Code 52.1(3) Waterfowl refuges.** “The following areas under the jurisdiction of the department of natural resources are established as waterfowl refuges where posted. It shall be unlawful to hunt ducks and geese on the following areas, where posted, at any time during the year. It shall be unlawful to trespass in any manner on the following areas, where posted, during the dates posted, both dates inclusive . . . “ **This compatibility determination does not apply to at least some portion of the following WPAs: Jemerson Slough (Dickinson County), Elk Creek Marsh (Worth County), and Rice Lake (Winnebago and Worth Counties).**

Stipulations Necessary to Ensure Compatibility:

1. Interpretation may be authorized at various times of the year; however, partners are encouraged to avoid the primary nesting period (April through July).
2. Travel off designated routes and parking areas is prohibited, except as stipulated in a special use permit.
3. All applicable federal, state, and special district regulations will apply.

Justification:

This use is a wildlife-dependent priority public use and will not diminish the primary purposes of the district, which is to serve as production areas for waterfowl and to provide habitat for migratory birds. This use will meet the mission of the Refuge System by furthering understanding and knowledge of the Nation’s migratory bird status, needs, and conservation efforts. Use of WPAs for interpretation will increase the public’s appreciation for conservation areas and local efforts, along with providing local schools and communities a look into the natural wildlife heritage of this area prior to settlement.

Mandatory 10- or 15-year Re-evaluation Date: 2028

Compatibility Determination

Use: Photography (includes creative nature writing and art)

Refuge/District Name: Iowa Wetland Management District

Establishing and Acquisition Authorities:

Migratory Bird Hunting and Conservation Stamp Act (Duck Stamp), March 16 1934, (16 U.S.C. § 718–718h, 48 Stat. 452) as amended August 1, 1958, (P.L. 85–585; 72 Stat. 486) for acquisition of “Waterfowl Production Areas.”

Wetlands Loan Act, October 4, 1961, as amended (16 U.S.C. § 715k–5, Stat. 813).

Funds appropriated under the Wetlands Loan Act are merged with Duck Stamp receipts in the fund and appropriated to the Secretary for the acquisition of migratory bird refuges under provisions of the Migratory Bird Conservation Act, February 18, 1929, (16 U.S.C. § 715, 715d–715r).

Refuge/District Purposes:

Iowa Wetland Management District was established in 1979:

“ . . . as Waterfowl Production Areas subject to . . . all of the provisions of such Act [Migratory Bird Conservation Act of 1929] . . . except the inviolate sanctuary provisions . . . ” 16 U.S.C. § 718(c) “ . . . for any other management purpose, for migratory birds.” 16 U.S.C. § 715d

National Wildlife Refuge System Mission:

The mission of the Refuge System is to administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans.

Description of Use:

Year round general public access to Waterfowl Production Areas (WPAs) to photograph, write creatively about, or draw/paint nature and its associated flora and fauna. Access for photography, creative nature writing and art will allow for public enjoyment of an array of wildlife and plant species including waterfowl, grassland birds, resident mammals, tallgrass prairie, and wetland plants. WPAs provide the public with a view into the past of landscapes that early Iowa pioneers and Native Americans saw.

Is the use a proposed new use or an existing use?

Proposed new use.

Is the use a priority public use?

Yes.

Where would the use be conducted?

All open WPAs. Allowable access to the WPAs includes hiking, snowshoeing, cross-country skiing, and non-motorized boating. Limited motorized and bicycle access for this use will be allowed in designated parking areas, and open designated routes of travel. Entry on all or portions of WPAs may be suspended, by posting, upon occasion of unusual or critical conditions affecting land, water, vegetation, wildlife populations, or public safety.

When would the use be conducted?

Year round. The frequency is expected to be irregular, the large size of the district is expected to spread out users, so the intensity of use is expected to be minor as well.

How would the use be conducted?

Typically individuals or small groups on foot either moving through a WPA or sitting at a location of interest for a longer period to capture the flora, fauna, or scenery. Artist's easels, camera tripods, cameras, sketchpads, notebooks, or other small and minor equipment may be used to facilitate the use.

Why is this use being proposed?

Priority public use and public request.

Availability of Resources:

What resources are needed to properly and safely administer use?

Photography, creative nature writing, and art require little to no additional resources. Since WPAs have been open by regulation to hunting, fishing, and trapping, infrastructure is in place for public use. Parking areas and regulatory signs are present at most WPAs. The Iowa Department of Natural Resources (DNR) assumes most management and maintenance responsibilities of the WPAs in the district through a Memorandum of Understanding. Iowa DNR conservation officers provide the primary enforcement of the public use regulations. Updated brochures will be developed for each of the Iowa DNR's six geographic units within the WMD. The Service also provides some law enforcement support; however, it is lacking a dedicated officer to the WMD. Assistance from the zone law enforcement officer in Prairie City, Iowa has been utilized in the past. It is not anticipated that this use will entail any greater enforcement issues than what currently exist.

Are existing district resources adequate to properly and safely administer the use?

Yes.

Anticipated Impacts of the Use:

How does the use affect district purposes, the Refuge System mission, and district goals and/or objectives?

Photography, creative nature writing, and art pose minimal impact on the purpose for which WPAs were established. Access is typically by individual or small groups on foot. Damage to habitat by foot traffic is minimal and temporary. There may be some temporary disturbance to wildlife due to human activity on the ground. The most likely impact to breeding waterfowl will be during the spring and early summer nesting and brood rearing period; however, the expected sporadic and limited use by the public should not create unreasonable impacts. Disturbance to wildlife, such as flushing a nesting bird, is inherent to these activities; however, the disturbance is temporary and generally not malicious. Many WPAs are located in sparsely populated rural areas, compared to a few that are located near highly populated areas. Monitoring of this use

will be needed to ensure anticipated impacts are not exceeded. Winter activities pose no impacts to nesting waterfowl and little impact to vegetation. The winter disturbance to resident wildlife will be temporary and minor.

Public Review and Comment:

This compatibility determination is available for public review as part of the *Iowa WMD Environmental Assessment and Draft Comprehensive Conservation Plan* from Monday, August 19th, 2013 to Tuesday, September 17th, 2013. Comments received and agency responses are included in the final Iowa WMD Comprehensive Conservation Plan.

Determination:

Use is Not Compatible

Use is Compatible with the Following Stipulations*

***According to state regulations Iowa Code 52.1(3) Waterfowl refuges.** “The following areas under the jurisdiction of the department of natural resources are established as waterfowl refuges where posted. It shall be unlawful to hunt ducks and geese on the following areas, where posted, at any time during the year. It shall be unlawful to trespass in any manner on the following areas, where posted, during the dates posted, both dates inclusive . . . “ **This compatibility determination does not apply to at least some portion of the following WPAs: Jemmerson Slough (Dickinson County), Elk Creek Marsh (Worth County), and Rice Lake (Winnebago and Worth Counties).**

Stipulations Necessary to Ensure Compatibility:

1. Certain modes of access such as motorized vehicles and bicycles are limited to designated trails, public roads, and parking lots. All watercraft are restricted to no larger than 15 horsepower motors.
2. Camping, overnight use, and fires are prohibited.
3. No photo or viewing blinds may be left overnight.
4. Harassment of wildlife including hazing and calling at birds and other wildlife is prohibited.
5. All applicable federal, state, and special district regulations apply.

Justification:

Photography, creative nature writing, and art will not materially interfere with or detract from the district purposes, including waterfowl production. The level of use for photography, creative writing, and art is moderate on most WPAs.

The associated disturbance to wildlife is temporary and minor. Photography is a priority public use and inspires visitors with the joys of abundant wildlife and wild lands. These uses also help fulfill the mission of the Refuge System. Those WPAs with increased activities generally have facilities present to accommodate the public use with minor impacts to the habitat.

Mandatory 10- or 15-year Re-evaluation Date: 2028

Compatibility Determination

Use: Prescribed Livestock Grazing

Refuge/District Name: Iowa Wetland Management District

Establishing and Acquisition Authorities:

Migratory Bird Hunting and Conservation Stamp Act (Duck Stamp), March 16 1934, (16 U.S.C. § 718–718h, 48 Stat. 452) as amended August 1, 1958, (P.L. 85–585; 72 Stat. 486) for acquisition of “Waterfowl Production Areas.”

Wetlands Loan Act, October 4, 1961, as amended (16 U.S.C. § 715k–5, Stat. 813).

Funds appropriated under the Wetlands Loan Act are merged with Duck Stamp receipts in the fund and appropriated to the Secretary for the acquisition of migratory bird refuges under provisions of the Migratory Bird Conservation Act, February 18, 1929, (16 U.S.C. § 715, 715d–715r).

Refuge/District Purposes:

Iowa Wetland Management District was established in 1979:

“ . . . as Waterfowl Production Areas subject to . . . all of the provisions of such Act [Migratory Bird Conservation Act of 1929] . . . except the inviolate sanctuary provisions . . . ” 16 U.S.C. § 718(c) “ . . . for any other management purpose, for migratory birds.” 16 U.S.C. § 715d

National Wildlife Refuge System Mission:

The mission of the Refuge System is to administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans.

Description of Use:

Limited removal of grass and forb vegetation by domestic livestock, chiefly cattle, but potentially including other domestic livestock to improve grassland vigor and health. Prescribed controlled grazing is recognized as a valuable tool to remove standing vegetation, reduce vegetative litter, and suppress undesirable woody vegetation.

Is the use a proposed new use or an existing use?

Proposed new use.

Is the use a priority public use?

No.

Where would the use be conducted?

Across the district, as necessary for management .

When would the use be conducted?

Grazing may take place anytime from April through November. Most commonly, the grazing will be of high intensity and short-term duration, for example, 200 yearlings for one month on 40 acres. There will be three typical seasons of use:

1. Early spring (mid-April to late May) on native prairie or seeded native grasses designed to reduce the vigor of exotic species and increase the vigor of native species.
2. Summer grazing (July 15 to September 1) may be used, especially on non-native grasslands, to stimulate the grassland after the peak nesting season yet allow vegetative regrowth in the fall.
3. Fall grazing (September 1 to October 31) will be designed to have effects similar to spring grazing, mostly on native prairie remnants or fields seeded with native tallgrass prairie species.

How would the use be conducted?

Fencing and control of livestock will be the responsibility of the cooperating livestock producer. Market rate grazing fees will be required of permittees. Market grazing fees will include typical market deductions for unusual fencing requirements, required cattle movement, or special watering needs. Rates will be assessed in Animal Unit Months (AUM). One AUM is equal to one adult cow for one month (thirty days). One cow/calf pair is equal to 1.20 AUM. Market rates will be determined annually in consultation with the U.S. Department of Agriculture based on prevailing local average grazing rates.

Frequency of grazing on any unit will be based on site-specific plans and availability of other management tools such as prescribed fire and haying. Typically, a unit will be grazed for either one or two years and then will not be grazed for several years, allowing a period of rest. Cooperating livestock producers will be selected by closed bid process, drawing, or the priority system outlined in the U.S. Fish and Wildlife Service Refuge Manual 6 RM 9 (1982).

Why is this use being proposed?

District management tool.

Availability of Resources:

What resources are needed to properly and safely administer use?

Developing grazing agreements and monitoring compliance and biological effects will require some Service resources. Most grazing costs, such as fencing, monitoring herd health, and so on, are assumed by the permittee. Station resources will be used to acquire some unit infrastructure such as boundary fencing and electrical fencing. Some alternative grassland management tools such as prescribed burning, mowing, or haying will be required if grazing is not utilized. Haying has comparable costs to controlled grazing since it also requires administering special use permits. Mowing is more expensive since all costs are assumed by the agency. Prescribed burning is an effective grassland management tool, but staff limitations prevent burning as many acres as is desirable each year. In addition, there is an ecological benefit to rotating grassland management techniques and seasons, such as grazing one year and burning another.

Are existing district resources adequate to properly and safely administer the use?

Yes.

Anticipated Impacts of the Use:

How does the use affect district purposes, the Refuge System mission, and district goals and/or objectives?

Grazing by domestic livestock has severe short-term effects on grassland communities. Many of these effects are desirable and are designed to maintain and improve healthy grassland communities. Some of these effects include removing standing vegetation, trampling of other vegetation, and reducing populations of pioneering woody plants. Other effects of grazing are more harmful but generally short-lived.

Grazing in the spring can cause direct loss of grassland bird nests due to trampling and loss of standing vegetation. Grazing at any time of year creates an aesthetic issue of concern; seeing public land being grazed by domestic livestock reduces the appeal of the visit for some visitors. Fortunately, controlled grazing is typically of short duration and does not occur annually on any unit. Grazing livestock can create minor direct disturbance of wildlife, but any harm should be negligible. There is a slight potential for conflict between members of the public and livestock or the permittee, particularly in the autumn when most Waterfowl Production Areas receive their heaviest use. All permittees will be advised that the unit is open to the public for hunting and other recreation. There is a very slight risk of injury to the public caused by livestock. Most visitors who are uncomfortable using property containing livestock are likely to select another unit or another time of year for their visit.

Public Review and Comment:

This compatibility determination is available for public review as part of the *Iowa WMD Environmental Assessment and Draft Comprehensive Conservation Plan* from Monday, August 19th, 2013 to Tuesday, September 17th, 2013. Comments received and agency responses are included in the final Iowa WMD Comprehensive Conservation Plan.

Determination:

Use is Not Compatible

Use is Compatible with the Following Stipulations

Stipulations Necessary to Ensure Compatibility:

1. Grazing will not occur more frequently than three out of every five years without the preparation of a site-specific compatibility determination.
2. No insecticides, including insecticidal dusting bags, will be used on WPAs.
3. Control and confinement of the livestock will be the responsibility of the permittee.

Justification:

Prescribed controlled grazing by domestic livestock will not materially interfere with or detract from the purposes for which the units were established. Limited livestock grazing creates temporary disturbances to vegetation of which many are desirable for grassland management. Grazing produces an undesirable but short-term impact to grassland bird nesting and site

aesthetics. Prescribed controlled grazing is an alternative management tool that can be used to replace or complement prescribed burning, mowing, or haying on grasslands. Without occasional disturbance caused by mowing, haying, burning, or grazing, the health of the grassland community will decline, as will the potential for waterfowl production.

Compatibility Determination

Use: Recreational Fishing in Accordance with State Regulations (includes motorboat use)

Refuge/District Name: Iowa Wetland Management District

Establishing and Acquisition Authorities:

Migratory Bird Hunting and Conservation Stamp Act (Duck Stamp), March 16 1934, (16 U.S.C. § 718–718h, 48 Stat. 452) as amended August 1, 1958, (P.L. 85–585; 72 Stat. 486) for acquisition of “Waterfowl Production Areas.”

Wetlands Loan Act, October 4, 1961, as amended (16 U.S.C. § 715k–5, Stat. 813).

Funds appropriated under the Wetlands Loan Act are merged with Duck Stamp receipts in the fund and appropriated to the Secretary for the acquisition of migratory bird refuges under provisions of the Migratory Bird Conservation Act, February 18, 1929, (16 U.S.C. § 715, 715d–715r).

Refuge/District Purposes:

Iowa Wetland Management District was established in 1979:

“ . . . as Waterfowl Production Areas subject to . . . all of the provisions of such Act [Migratory Bird Conservation Act of 1929] . . . except the inviolate sanctuary provisions . . . ” 16 U.S.C. § 718(c) “ . . . for any other management purpose, for migratory birds.” 16 U.S.C. § 715d

National Wildlife Refuge System Mission:

The mission of the Refuge System is to administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans.

Description of Use:

Recreational fishing on Waterfowl Production Areas (WPAs) throughout the district in accordance with State of Iowa regulations. Fishing on WPAs may be suspended due to unusual or critical conditions affecting land, water, vegetation, or wildlife populations. Fishing will facilitate four other priority public uses: wildlife observation, wildlife photography, environmental education, and interpretation.

Is the use a proposed new use or an existing use?

Existing use.

Is the use a priority public use?

Yes.

Where would the use be conducted?

Although the entire wetland acreage is open to recreational fishing only about one percent of the wetlands provide water deep enough to support viable fisheries. The few WPAs with viable

fisheries are generally connected to adjacent streams or lakes, located off Service property, and aquatic species move between these bodies of water.

When would the use be conducted?

Year round. The frequency is expected to be irregular, the large size of the district is expected to spread out users, so the intensity of use is expected to be minor as well.

How would the use be conducted?

The State of Iowa uses recreational fishing to help maintain healthy populations of these species. Some WPAs have trails necessary to gain access from public roads and for safety reasons in high traffic areas; parking lots, usually less than one acre in size, may exist.

Why is this use being proposed?

Priority public use, regulation, and fish management.

Availability of Resources:

What resources are needed to properly and safely administer use?

Few additional fiscal resources are necessary to conduct this use. WPAs are open by statute to hunting, fishing, and trapping and have provided such opportunities since acquired. As a result, some infrastructure, such as parking lots, signs, etc., is already in place to facilitate this use. The majority of the WPAs in the district are managed cooperatively through a Memorandum of Understanding with the Iowa Department of Natural Resources (DNR), which includes some law enforcement and facility management responsibilities. Currently, Iowa DNR staff of conservation officers and local wildlife biologist are adequate to support this public use; however, some staff time will be needed to develop and maintain a brochure for fishing in the district.

Are existing district resources adequate to properly and safely administer the use?

Yes.

Anticipated Impacts of the Use:

How does the use affect district purposes, the Refuge System mission, and district goals and/or objectives?

Recreational fishing activities may cause brief disturbance to migratory birds and other wildlife using WPAs, which may temporarily displace individual animals to other parts of the WPA. However, this brief disturbance will be limited in scope due to the small number of WPAs with viable fisheries, limited access to fishing (mainly by foot travel), and lack of boat launching facilities. Recreational fishing at anticipated levels and on small areas of relatively few WPAs should not materially interfere with the district's purpose. Recreational fishing will promote understanding and appreciation of natural resources and their management on all land included in the Refuge System.

Public Review and Comment:

This compatibility determination is available for public review as part of the *Iowa WMD Environmental Assessment and Draft Comprehensive Conservation Plan* from Monday, August 19th, 2013 to Tuesday, September 17th, 2013. Comments received and agency responses are included in the final Iowa WMD Comprehensive Conservation Plan.

Determination:

Use is Not Compatible

Use is Compatible with the Following Stipulations*

***According to state regulations Iowa Code 52.1(3) *Waterfowl refuges*.** “The following areas under the jurisdiction of the department of natural resources are established as waterfowl refuges where posted. It shall be unlawful to hunt ducks and geese on the following areas, where posted, at any time during the year. It shall be unlawful to trespass in any manner on the following areas, where posted, during the dates posted, both dates inclusive . . . “ **This compatibility determination does not apply to at least some portion of the following WPAs: Jemmerson Slough (Dickinson County), Elk Creek Marsh (Worth County), and Rice Lake (Winnebago and Worth Counties).**

Stipulations Necessary to Ensure Compatibility:

1. Travel off designated routes and parking areas is prohibited, except as stipulated in a special use permit; travel by horse is not permissible.
2. All watercraft are restricted to no larger than 15 horsepower motors.
3. All applicable federal, state, and special district regulations apply.

Justification:

WPAs are open to fishing by regulation. Fishing will not materially interfere with or detract from the purposes for which these units were established. Fishing is a priority public use and will facilitate four other priority public uses: wildlife observation, wildlife photography, environmental education, and interpretation. The use of fishing will assist in meeting the mission of the Refuge System by facilitating the management of the Nation's wildlife and plant resources for the benefit of the American public.

(Signature and Date)

Mandatory 10- or 15-year Re-evaluation Date: 2028

Compatibility Determination

Use: Recreational Trapping in Accordance with State Regulations (includes motorboat use)

Refuge/District Name: Iowa Wetland Management District

Establishing and Acquisition Authorities:

Migratory Bird Hunting and Conservation Stamp Act (Duck Stamp), March 16 1934, (16 U.S.C. § 718–718h, 48 Stat. 452) as amended August 1, 1958, (P.L. 85–585; 72 Stat. 486) for acquisition of “Waterfowl Production Areas.”

Wetlands Loan Act, October 4, 1961, as amended (16 U.S.C. § 715k–5, Stat. 813).

Funds appropriated under the Wetlands Loan Act are merged with Duck Stamp receipts in the fund and appropriated to the Secretary for the acquisition of migratory bird refuges under provisions of the Migratory Bird Conservation Act, February 18, 1929, (16 U.S.C. § 715, 715d–715r).

Refuge/District Purposes:

Iowa Wetland Management District was established in 1979:

“ . . . as Waterfowl Production Areas subject to . . . all of the provisions of such Act [Migratory Bird Conservation Act of 1929] . . . except the inviolate sanctuary provisions . . . ” 16 U.S.C. § 718(c) “ . . . for any other management purpose, for migratory birds.” 16 U.S.C. § 715d

National Wildlife Refuge System Mission:

The mission of the Refuge System is to administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans.

Description of Use:

Trapping of furbearers is a consumptive public use of Waterfowl Production Areas (WPAs) in the Iowa WMD. Furbearer trapping in the State of Iowa continues to be a popular public use but tends to fluctuate with the fur prices. WPAs are open to trapping as authorized by the Code of Federal Regulations which states, “Lands acquired as ‘waterfowl production areas’ shall be open to public trapping without federal permit . . . ” (50 CFR Ch. 1 (10-1-12 Edition) Part 31, Subpart B, Section 31.16). Trappers are required to comply with Iowa State trapping laws and regulations. A copy of the current Iowa Trapping Regulations may be viewed at www.iowadnr.gov. Furbearer trapping for most species occurs from early November through the end of January, with the exception of spring beaver trapping, which is open through mid-April. According to the Iowa DNR’s 2012 *Furbearers Report*, the most numerous mammal species trapped in Iowa is the raccoon with 236,943 harvested during the 2010–2011 season. The second most popular furbearer trapped in Iowa is the muskrat with a total 2010–2011 season harvest of 98,079 (Iowa Department of Natural Resources [DNR], 2012). Both of these species occur on most WPAs within the district.

Is the use a proposed new use or an existing use?

Existing use.

Is the use a priority public use?

No.

Where would the use be conducted?

All open WPAs; the majority of the trapping activity on WPAs concentrates around wetland areas.

When would the use be conducted?

Trapping seasons for most of the Iowa furbearers run from November through the end of January. Beaver trapping season runs from November through the middle of April most years. With the exception of the early spring beaver trapping, most of the trapping use occurs during the late fall and winter months. Trap tending typically occurs during daylight hours; however, state regulations do not restrict trap-tending times.

How would the use be conducted?

Trappers may use leg hold traps, snares, “body gripping Conibear” style, and live box traps. Iowa DNR sets regulations for trap dimensions and set locations for the various permitted trap types. These regulations are contained in Iowa Code 481a and 483a and are available in the *Iowa Hunting and Trapping Regulations* guide at www.iowadnr.gov. Access for trappers using WPAs is primarily by foot; however, they also may use snowshoes or cross-country skis. Some WPAs contain large enough waterways to allow use of both motorized and non-motorized boat use for trapping. Travel onto WPAs using wheeled motorized vehicles such as ATVs, trucks and passenger vehicles, and motorcycles is restricted to parking areas and designated open roads. The majority of trappers will access the WPAs by foot and park their vehicles in the parking areas.

Why is this use being proposed?

Regulation and wildlife management.

Availability of Resources:

What resources are needed to properly and safely administer use?

Few additional fiscal resources are necessary to conduct this use. WPAs are open by statute to hunting, fishing, and trapping and have provided such opportunities since acquired. As a result, some infrastructure is already in place to facilitate this use. The majority of the WPAs in the district are managed cooperatively through a Memorandum of Understanding with the Iowa DNR, which includes some law enforcement responsibilities. Currently, the Iowa DNR staff of conservation officers is adequate to support this public use.

Are existing district resources adequate to properly and safely administer the use?

Yes.

Anticipated Impacts of the Use:**How does the use affect district purposes, the Refuge System mission, and district goals and/or objectives?**

Recreational trapping can potentially affect the waterfowl production of WPAs both directly and indirectly. Direct impacts may include such effects as killing or displacing of waterfowl during the pair bonding/nesting season or destruction of nest by trampling. Indirect impacts may include catch of target and not-target species that are predators on waterfowl and/or nests or removal of species that induce habitat change (i.e., beaver and muskrat). Impacts, either direct or indirect, may be positive, neutral, or negative.

With the exception of beaver season (November to April 15), all the other trapping seasons are during periods that will not negatively affect waterfowl production. Beaver trappers will be checking traps daily during the pair bonding and early nest cycle. These disturbances are temporary and generally of short duration. Most of the impacts from this use will be during the fall migration time. The greatest impact times will be during the trap-setting phase; however, this is still short and temporary. Trap line checks are required daily and represent a frequent but short-lived disturbance.

Public Review and Comment:

This compatibility determination is available for public review as part of the *Iowa WMD Environmental Assessment and Draft Comprehensive Conservation Plan* from Monday, August 19th, 2013 to Tuesday, September 17th, 2013. Comments received and agency responses are included in the final Iowa WMD Comprehensive Conservation Plan.

Determination:

Use is Not Compatible

Use is Compatible with the Following Stipulations*

***According to state regulations Iowa Code 52.1(3) Waterfowl refuges.** “The following areas under the jurisdiction of the department of natural resources are established as waterfowl refuges where posted. It shall be unlawful to hunt ducks and geese on the following areas, where posted, at any time during the year. It shall be unlawful to trespass in any manner on the following areas, where posted, during the dates posted, both dates inclusive . . . “ **This compatibility determination does not apply to at least some portion of the following WPAs: Jemmerson Slough (Dickinson County), Elk Creek Marsh (Worth County), and Rice Lake (Winnebago and Worth Counties).**

Stipulations Necessary to Ensure Compatibility:

1. Travel in or use of any motorized or other vehicle is prohibited except by special use permit. Parking in designated areas or on public roads is permissible for access, but use of horses is not permissible.
2. Traps must be attended and tagged by the owner in accordance with State of Iowa trapping regulations. Traps and personal property may not be left unattended or abandoned.
3. All watercraft are restricted to no larger than 15 horsepower motors.

4. All applicable federal, state, and special district regulations apply.

Justification:

Most trapping use occurs outside the time for pair bonding, nesting, and brood rearing (waterfowl production), so this use will have little to no direct impact on waterfowl production. Spring beaver trapping is the one exception. Its impact, however, will be temporary and isolated due to the short duration of the visits, small number of waterfowl involved, and the limited geographic area impacted by the presence of one or a few individuals. These impacts on waterfowl production and the WMD mission are negligible.

Most species of interest to trappers and common “non-target” catches such as skunks and free-ranging house cats are predators on waterfowl at some point in the production cycle. Management of red fox, raccoon, mink, opossum, and skunk populations through a regulated trapping program is, at worst, a neutral impact and likely a positive. Due to edge effects and concentrations of nesting waterfowl, the impacts of predator management are likely inversely related to WPA size. The average size of WPAs in the Iowa WMD is 100 acres. In these small parcels, the effects of only a few individual predators can be highly significant on waterfowl production in the local area. Timing of removal of predators also affects the impact that this activity has on waterfowl production. Again, depending on the time of year, impacts on waterfowl production may be neutral or positive. The harvest through the trapping program of other species such as those permitted by state regulations (coyote, muskrat, badger, beaver, otter, and bobcat) that may or may not be predators of waterfowl is insignificant.

Waterfowl production is also impacted by the natural habits of beaver and muskrat populations. Upon initial analysis, it is often thought that beaver and their wetland construction activities and muskrat with their propensity to maintain open water are beneficial to waterfowl production. In exceptionally large marshes and in pre-settlement times, this was likely the case. However, the landscape of the district has been so altered through agricultural conversion that few ecosystem functions remain intact. Current hydrologic function resembles very little of that from pre-settlement. Dikes, levees, roads, culverts, tile lines, pumps, and water control structures work to move and confine water with calculated purpose. Ramifications of disruption to this system can include private property damage, public safety hazards, disgruntled neighbors, and legal liability. As a result, the Service and Iowa DNR manage wetlands in WPAs through manipulating water levels, providing for the needs and stages of target waterfowl. Left unchecked, beaver activity results in disruption to the water flow when culverts and other water control structures are blocked. High muskrat populations are detrimental to levees and dikes as individuals burrow into these structures and compromise the structural integrity. Without the ability to control water levels, the waterfowl production purpose of the district would suffer, as would the Refuge System mission.

A public trapping program facilitates management of beaver and muskrat populations at such levels that the many benefits created of these species are realized, yet the ability of the district to manage water levels is not compromised. According to the Iowa DNR’s 2012 *Furbearer’s Report* for Iowa on a statewide level, beaver harvest has depended on the weather and conditions and fluctuating fur prices. Total Iowa beaver harvest during the 2010–2011 trapping season was 5,382 (Iowa DNR, 2012). Muskrat harvest in Iowa has also tends to fluctuate with fur prices and populations.

Overall trapping is a minor public use of WPAs but is an important management tool in localized areas. Trapping on WPAs will provide the public the opportunity to assist the WMD with furbearer management. Consistent with the mission for the Refuge, trapping on WPAs results in management of populations and is not a “control program” intending to eliminate components of the ecosystem for the benefit of others. Data from the Iowa DNR on trapping indicate that the current level of furbearer harvest is not resulting in harm to these populations. The public trapping program as managed by state regulations does not materially interfere with or detract from the Service’s ability to meet the district’s purpose of waterfowl production or the mission of the Refuge System.

Mandatory 10- or 15-year Re-evaluation Date: 2023

Compatibility Determination

Use: Wildlife Observation

Refuge/District Name: Iowa Wetland Management District

Establishing and Acquisition Authorities:

Migratory Bird Hunting and Conservation Stamp Act (Duck Stamp), March 16 1934, (16 U.S.C. § 718–718h, 48 Stat. 452) as amended August 1, 1958, (P.L. 85–585; 72 Stat. 486) for acquisition of “Waterfowl Production Areas.”

Wetlands Loan Act, October 4, 1961, as amended (16 U.S.C. § 715k–5, Stat. 813).

Funds appropriated under the Wetlands Loan Act are merged with Duck Stamp receipts in the fund and appropriated to the Secretary for the acquisition of migratory bird refuges under provisions of the Migratory Bird Conservation Act, February 18, 1929, (16 U.S.C. § 715, 715d–715r).

Refuge/District Purposes:

Iowa Wetland Management District was established in 1979:

“ . . . as Waterfowl Production Areas subject to . . . all of the provisions of such Act [Migratory Bird Conservation Act of 1929] . . . except the inviolate sanctuary provisions . . . ” 16 U.S.C. § 718(c) “ . . . for any other management purpose, for migratory birds.” 16 U.S.C. § 715d

National Wildlife Refuge System Mission:

The mission of the Refuge System is to administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans.

Description of Use:

Visitors observing wildlife. This can instill an appreciation for the value of and need for fish and wildlife habitat conservation. Access for wildlife observation will allow for public enjoyment of an array of wildlife and plant species including waterfowl, grassland birds, resident mammals, tallgrass prairie, and wetland plants. Waterfowl Production Areas (WPAs) provide the public with a view into the past of landscapes that early Iowa pioneers and Native Americans saw.

Is the use a proposed new use or an existing use?

Proposed new use.

Is the use a priority public use?

Yes.

Where would the use be conducted?

All open WPAs, entry on all or portions of WPAs may be suspended, by posting, upon occasion of unusual or critical conditions affecting land, water, vegetation, wildlife populations, or public

safety. Certain modes of transportation for wildlife viewing will be limited to designated roads, trails, and parking lots.

When would the use be conducted?

Year round.

How would the use be conducted?

Allowable access to the WPAs includes hiking, snowshoeing, cross-country skiing, and non-motorized boating. Limited motorized and bicycle access for this use will be allowed in designated parking area, and open designated routes of travel.

Why is this use being proposed?

Priority public use.

Availability of Resources:

What resources are needed to properly and safely administer use?

Wildlife observation requires little to no additional resources. Since WPAs have been open by regulation to hunting, fishing and trapping, infrastructure is in place for public use. Parking areas and regulatory signs are present at most WPAs. The Iowa Department of Natural Resources (DNR) assumes most management and maintenance responsibilities of the WPAs in the district through a Memorandum of Understanding. Iowa DNR conservation officers provide the primary enforcement of the public use regulations. Updated brochures will be developed for each of the Iowa DNR's six geographic units within the WMD. The Service also provides some law enforcement support; however, it is lacking a dedicated officer to the WMD. Assistance from the zone law enforcement officer in Prairie City, Iowa has been utilized in the past. It is not anticipated that this use will entail any greater enforcement issues than what currently exist.

Are existing district resources adequate to properly and safely administer the use?

Yes.

Anticipated Impacts of the Use:

How does the use affect district purposes, the Refuge System mission, and district goals and/or objectives?

Wildlife observation poses minimal impact on the purpose for which WPAs were established. Access is typically by individual or small groups on foot. Damage to habitat by foot traffic is minimal and temporary. There may be some temporary disturbance to wildlife due to human activity on the ground. The most likely impact to breeding waterfowl will be during the spring and early summer nesting and brood rearing period; however, the expected sporadic and limited use by the public should not create unreasonable impacts. Disturbance to wildlife, such as flushing a nesting bird, is inherent to these activities; however, the disturbance is temporary and generally not malicious. Many WPAs are located in sparsely populated rural areas, compared to a few that are located near highly populated areas. Monitoring of this use will be needed to ensure anticipated impacts are not exceeded. Winter activities pose no impacts to nesting waterfowl and little impact to vegetation. The winter disturbance to resident wildlife will be temporary and minor.

Public Review and Comment:

This compatibility determination is available for public review as part of the *Iowa WMD Environmental Assessment and Draft Comprehensive Conservation Plan* from Monday, August 19th, 2013 to Tuesday, September 17th, 2013. Comments received and agency responses are included in the final Iowa WMD Comprehensive Conservation Plan.

Determination:

Use is Not Compatible

Use is Compatible with the Following Stipulations*

***According to state regulations Iowa Code 52.1(3) *Waterfowl refuges*.** “The following areas under the jurisdiction of the department of natural resources are established as waterfowl refuges where posted. It shall be unlawful to hunt ducks and geese on the following areas, where posted, at any time during the year. It shall be unlawful to trespass in any manner on the following areas, where posted, during the dates posted, both dates inclusive . . . “ **This compatibility determination does not apply to at least some portion of the following WPAs: Jemmerson Slough (Dickinson County), Elk Creek Marsh (Worth County), and Rice Lake (Winnebago and Worth Counties).**

Stipulations Necessary to Ensure Compatibility:

1. Certain modes of access such as motorized vehicles and bicycles are limited to designated trails, public roads, and parking lots. Non-motorized boats are permitted with the exception of state designated waterfowl refuge sites (see above).
2. Camping, overnight use, and fires are prohibited.
3. No photo or viewing blinds may be left overnight.
4. Harassment of wildlife including hazing and calling at birds and other wildlife is prohibited.
5. All applicable federal, state, and special district regulations apply.

Justification:

Wildlife observation will not materially interfere with or detract from the district purposes, including waterfowl production. The level of use for wildlife observation is moderate on most WPAs. The associated disturbance to wildlife is temporary and minor. Wildlife observation is a priority public use and inspires visitors with the joys of abundant wildlife and wild lands. These uses also help fulfill the mission of the Refuge System. Those WPAs with increased activities generally have facilities present to accommodate the public use with minor impacts to the habitat.

Compatibility Determination

Use: Wood Cutting (including firewood)

Refuge/District Name: Iowa Wetland Management District

Establishing and Acquisition Authorities:

Migratory Bird Hunting and Conservation Stamp Act (Duck Stamp), March 16 1934, (16 U.S.C. § 718–718h, 48 Stat. 452) as amended August 1, 1958, (P.L. 85–585; 72 Stat. 486) for acquisition of “Waterfowl Production Areas.”

Wetlands Loan Act, October 4, 1961, as amended (16 U.S.C. § 715k–5, Stat. 813).

Funds appropriated under the Wetlands Loan Act are merged with Duck Stamp receipts in the fund and appropriated to the Secretary for the acquisition of migratory bird refuges under provisions of the Migratory Bird Conservation Act, February 18, 1929, (16 U.S.C. § 715, 715d–715r).

Refuge/District Purposes:

Iowa Wetland Management District was established in 1979:

“ . . . as Waterfowl Production Areas subject to . . . all of the provisions of such Act [Migratory Bird Conservation Act of 1929] . . . except the inviolate sanctuary provisions . . . ” 16 U.S.C. § 718(c) “ . . . for any other management purpose, for migratory birds.” 16 U.S.C. § 715d

National Wildlife Refuge System Mission:

The mission of the Refuge System is to administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans.

Description of Use:

Removal of standing and/or fallen trees applies to all wood removal activities regardless of the ultimate use of the wood (firewood, lumber, pulp, etc.). Wood cutting by the public is considered an economic use of a district natural resource and will be allowed in the district under the authority of a special use permit issued by the district manager.

Is the use a proposed new use or an existing use?

Existing use.

Is the use a priority public use?

No.

Where would the use be conducted?

Harvest could occur throughout the district varying in size from a portion of an acre up to several hundred acres depending on the management objective of the area, as well as the quantity and quality of the wood. These sites are typically be found at abandoned farmsteads, along existing

shelter belts and windbreaks, and in other areas where trees are encroaching on grassland and wetland habitats.

When would the use be conducted?

Wood cutting activities could be authorized throughout the year; however, the majority of activity will occur during the winter months when frozen ground facilitates access and afford protection to underlying soils and desired vegetation.

How would the use be conducted?

The district is located at the southernmost portion of the Prairie Pothole Region, an area known for its duck production. Land is primarily acquired, restored, and managed for the production of waterfowl. These uplands and wetlands provide the first suitable breeding habitat available to waterfowl on their northern flight. They also benefit other migratory birds and resident wildlife as well. Today, the tallgrass prairie ecosystem is globally endangered, and most of Iowa's wetlands have been drained. As a result, many grassland- and wetland-dependent migratory birds are in great peril.

The majority of the district is comprised of restored and intact grassland in the uplands and restored wetlands in the lowlands. These habitat complexes contain both native and nonnative grass and forb species, as well as encroaching woody vegetation. If left untreated, overtime, the encroaching woody vegetation reduces or eliminates desirable prairie/wetland herbaceous vegetation growth necessary for waterfowl and other migratory birds. Typically, prescribed burning, haying, and grazing are used as tools to inhibit the encroaching woody vegetation. However, various factors can limit the use of these tools on all or portions of some Waterfowl Production Areas (WPAs). Nevertheless, active removal of the encroaching woody vegetation by wood cutting is often less limiting. Therefore, wood cutting will be another tool used to accomplish the same objectives by promoting the reestablishment of the grasses and forbs in the uplands and maintain healthy wetlands. Due to the loss of large wildfires and large-ungulate grazing prior to European settlement and the fast-growing nature of many tree species, wood cutting has become a more frequently utilized tool to help restore and maintain the tallgrass prairie community and its associated wetlands. This is especially true as funding and other factors limit the use of primary grassland management tools.

Equipment used for harvest depends on the site and its management objectives, as well as the permittee's capabilities and may include axes, chainsaws, tractor-mounted shredders and shears, and traditional logging equipment.

Why is this use being proposed?

District management tool and public request.

Availability of Resources:

What resources are needed to properly and safely administer use?

Staff time will be needed to administer special use permits for wood cutting, along with mapping and designating areas that need woody encroachment removed. Approximately twelve staff hours per year are anticipated for this use.

Are existing district resources adequate to properly and safely administer the use?

Yes.

Anticipated Impacts of the Use:

How does the use affect district purposes, the Refuge System mission, and district goals and/or objectives?

In permitting this type of activity, the potential exists to directly impact waterfowl production. This could happen by displacement of birds from localized areas due to disturbance, or crushing of nests because of access for this activity. These impacts are easily avoided by timing of the activity in accordance with site-specific characteristics. In limited and rare instances, a small number of individuals of tree-nesting species (e.g. wood duck, hooded merganser, etc.) may be displaced from a local area after their nest trees are removed. The indirect impacts to waterfowl production that will occur are primarily beneficial by facilitating the restoration of tallgrass prairie and removing artificially created predator habitat from within the WPAs. Access for removing wood may affect habitat by rutting soils, destroying ground cover, creating weed seedbeds, and increasing sedimentation due to runoff in nearby wetlands. However, these impacts can also be avoided by regulating the timing of the activity.

Public Review and Comment:

This compatibility determination is available for public review as part of the *Iowa WMD Environmental Assessment and Draft Comprehensive Conservation Plan* from Monday, August 19th, 2013 to Tuesday, September 17th, 2013. Comments received and agency responses are included in the final Iowa WMD Comprehensive Conservation Plan.

Determination:

Use is Not Compatible

Use is Compatible with the Following Stipulations*

***According to state regulations Iowa Code 52.1(3) *Waterfowl refuges*.** “The following areas under the jurisdiction of the department of natural resources are established as waterfowl refuges where posted. It shall be unlawful to hunt ducks and geese on the following areas, where posted, at any time during the year. It shall be unlawful to trespass in any manner on the following areas, where posted, during the dates posted, both dates inclusive . . . “ **This compatibility determination does not apply to at least some portion of the following WPAs: Jemmerson Slough (Dickinson County), Elk Creek Marsh (Worth County), and Rice Lake (Winnebago and Worth Counties).**

Stipulations Necessary to Ensure Compatibility:

1. Travel off designated routes, will be limited to periods when ground is frozen.
2. Wood harvest activities will avoid the primary nesting period for waterfowl and migratory birds.
3. Special use permits are required for this use.
4. Best management practices will be implemented to avoid disturbance, erosion, desirable habitat damage, weed dispersal and migratory bird take.
5. All applicable federal, state, and special district regulations will apply.

Justification:

Any direct impacts on waterfowl production (take, disturbance, etc.) can be largely avoided by timing the activity so that it is not coincident with the waterfowl production season. Removal of trees in certain instances will, on occasion, eliminate Wood Duck, Hooded Merganser, or other cavity-nesting species habitat. This will be an irregular and occasional impact and, since most wood harvest will be associated with restoration sites, it is unlikely that these areas would have provided historic nesting sites. Due to the benefits that will be realized by other waterfowl species, and the abundance of artificial and natural nest sites for cavity-nesting species in the area, these impacts will not significantly detract from the WPAs' purpose or Refuge System mission.

Impacts to the habitat because of access to WPAs for wood removal purposes are potentially significant but also easily avoided. Areas where woody species are removed for the purpose of conversion of the habitat type to prairie will likely receive follow-up treatments of burning, farming, or both. Ground disturbance in these areas is less problematic and possibly desirable depending on the specific site. Access to and from these areas will need to be carefully controlled via special use permit to avoid impacts such as rutting and increased sedimentation in area wetlands due to runoff. If existing roads are not present, access can be restricted to periods of frozen ground to avoid or minimize impacts to underlying vegetation and soils.

Other indirect impacts are generally considered positive and thus do not materially interfere with or detract from the purpose of waterfowl production or the Refuge System mission. The removal of trees along trails, in shelterbelts, and within old homesites will benefit waterfowl production by assisting with the restoration of prairie habitat and eliminating predator habitat and perch sites. Individuals participating in the wood harvest program will be under special use permit, and thus site-specific stipulations will ensure resource protection and achievement of management goals. Control of woody species encroachment on prairie habitats is a necessary management activity for the district in converting areas back to their historical grassland condition and directly supports the mission of the Refuge System.

Preparers

The following individuals were members of the core planning team, instrumental in the development of this document, and/or made major contributions throughout the planning process.

Iowa Wetland Management District Staff

Tim Miller, Project Leader

Erich Gilbert, Deputy Project Leader

Tom Skilling, Wildlife Biologist

Anne Szelag, Administrative Technician

AnnMarie Krmpotich, Wildlife Biologist (Partners Program)

Iowa Department of Natural Resources

Mark Gulick, Northwest District Supervisor

Rick Trine, Central District Supervisor (retired during the planning process)

Jeff Joens, Central Office Executive Officer

Northwest District Biologists and Technicians

Central District Biologists and Technicians

FWS Branch of Conservation Planning Staff, Region 3

Connie Rose, Biologist Planner

Gabe DeAlessio, GIS Specialist

Mark Hogeboom, Writer/Editor

Contributors

The following individuals also provided guidance, contributions, and support to the Environmental Assessment and Draft Comprehensive Conservation Plan:

FWS Regional Office Staff, Region 3

Matt Sprenger, Area 2 Refuge Program Supervisor (relocated during planning process)

Josh Eash, Regional Hydrologist

Patricia Heglund, Regional Biologist

James Myster, Regional Archaeologist

Maggie O'Connell, Chief, Visitor Services Branch

Rick Speer, Refuge Program Specialist

Jim Leach, Area 3 Refuge Program Supervisor, and Jason Goldberg, Acting Area 2 Refuge Program Supervisor, provided comments during internal review.

FWS Partners for Fish and Wildlife Staff

Doug Helmers, State Private Lands Coordinator, Iowa Private Lands Office

Academia

Steve Dinsmore, Professor, Natural Resource Ecology and Management, Iowa State University

Susan Galatowitsch, Professor of Horticultural Science, University of Minnesota (Twin Cities)

Daryl Smith, Director and Professor Tallgrass Prairie Center, University of Northern Iowa

Appendix H: Communications

In this appendix:

[U.S. Fish and Wildlife Service](#)
[Tribes](#)
[Individuals](#)
[Media](#)
[Congressional Officials](#)
[Organizations](#)

The following groups and individuals were contacted to solicit their involvement throughout the planning process:

U.S. Fish and Wildlife Service

Regional planning chiefs and other planners as requested
National planning coordinator
National Conservation Training Center librarian

Tribes

Flandreau Santee Sioux Tribe
Lower Sioux Indian Community of Minnesota
Prairie Island Indian Community of Minnesota
Sac and Fox Tribe of the Mississippi in Iowa
Santee Sioux Nation
Sisseton-Wahpeton Oyate
Spirit Lake Sioux Tribe
Upper Sioux Community of Minnesota

Individuals

District cooperative farmers
Other general public as requested

Media

All Iowa and Minnesota media on file with the U.S. Fish and Wildlife were contacted at various times throughout the planning process.

Appendix I: Memorandum of Understanding with Iowa Department of Natural Resources

Memorandum of Understanding Iowa Wetland Management District

Cooperating Partners:

**U.S. Fish and Wildlife Service
and
Iowa Department of Natural Resources**

October 2012

MEMORANDUM OF UNDERSTANDING

Iowa Department of Natural Resources
State of Iowa

Fish and Wildlife Service
U.S. Department of Interior

This MEMORANDUM OF UNDERSTANDING, entered into by and between the Iowa Department of Natural Resources, State of Iowa, hereinafter referred to as the Department, under Chapters 107.24 and 107.30, Code of Iowa; and the Fish and Wildlife Service, United States Department of the Interior, hereinafter referred to as the Service, acting by and through the Regional Director, Region 3, under the Authority of the Migratory Bird Conservation Act of February 18, 1929, as amended (16 U.S.C. 715-715r); Migratory Bird Hunting and Conservation Stamp Act of March 16, 1934 (48 Stat. 451), as amended (16 U.S.C. 718 et seq.); Fish and Wildlife Act of August 8, 1956 (708 Stat. 1119), as amended (16 U.S.C. 742a-742j); the Land and Water Conservation Fund Act of 1965 (16 U.S.C. 460 et seq.); the Emergency Wetland Resources Act of 1986 (P.L. 99-645); the National Wildlife Refuge System Improvement Act of 1997 (P.L. 105-57); and in accordance with the policy of cooperation with the various states expressed in 43 CFR, part 24.

WHEREAS, the Department has been created under the laws of the State of Iowa to provide an adequate and flexible system for the protection, development, and use of forests, fish and wildlife, lakes, streams, plant life, flowers, and other outdoor resources, and

WHEREAS, the Service has as its responsibility the management of migratory birds and seeks to maintain and increase populations of migratory birds so they may continue to provide recreational and educational benefits for people, and

WHEREAS, the Department has a responsibility for the management of migratory birds and other wildlife within the boundaries of the state of Iowa, and

WHEREAS, the Department and the Service recognize the value of wetlands developed under this agreement to wildlife species other than waterfowl, and

WHEREAS, it is the mutual desire of the Department and the Service to work in harmony for the common purpose of acquiring and managing production habitat in Iowa in order to maintain and increase waterfowl and other migratory bird populations for the best interests of the people of Iowa and the United States.

This MEMORANDUM OF UNDERSTANDING between the Department and the Service supports the goals of the Prairie Pothole Joint Venture, a component of the North American Waterfowl Management Plan. In Iowa, the goals for wetland preservation are to: 1) acquire land through a combination of county, state and federal governments, conservation organizations, private businesses and concerned citizens to protect 100,000 acres, 2) acquire existing or restorable wetlands and adjacent upland nesting habitat at an optimum ratio of one wetland acre per three upland acres within each priority complex, and 3) continue an aggressive wetland restoration program on private land to create new wetland habitat.

The Iowa Department of Natural Resources and The Fish and Wildlife Service Mutually Agree:

1. To cooperate in planning, carrying out, and operating a program to acquire, protect, and manage lands for wetlands preservation and waterfowl production in the state of Iowa for the express purpose of maintaining and increasing the production of waterfowl. These lands will be known as Waterfowl Production Areas (WPAs). This program shall be known as the Iowa Small Wetlands Acquisition Program (Program).
2. To cooperate in identifying communities of waterfowl production habitat in Iowa, and delineate for purchase or easement those lands of high waterfowl production capabilities of said communities. Each wetland community selected for habitat acquisition shall be within the 35 counties identified in the Prairie Pothole Joint Venture Plan.
3. To coordinate activities under this agreement with the Iowa PPJV Implementation Committee.
4. To manage lands acquired under this Program in accordance with the Iowa Wetland Management District (WMD) approved Comprehensive Conservation Plan (CCP) incorporating updated management practices as mutually agreed by both agencies.
5. To abide by the attached Procedural Agreement which has been mutually agreed upon as the document that will guide activities under this Memorandum of Understanding and is attached hereto and made a part of this Memorandum of Understanding.
6. To review annually, the management of lands acquired under this Program, the progress of the Program, and to plan for the future Program direction as appropriate.
7. That each and every provision of this Memorandum of Understanding is subject to the laws of the State of Iowa and the laws of the United States.
8. The Service shall retain primary jurisdiction and be principally responsible for the management of these lands as part of the National Wildlife Refuge System as outlined in the attached Procedural Agreement.
9. That nothing in this Memorandum shall be construed as obligating the Department or the State of Iowa to the expenditure of funds or for the future payment of money in excess of appropriations authorized by law.
10. That nothing in this Memorandum shall be construed as obligating the Service to expend or as involving the United States in any contracts or other obligations for the future payment of money in excess of the appropriations authorized by law.
11. That this Memorandum shall become effective as soon as it is signed by the parties hereto and shall continue in force until terminated by either party upon a thirty (30) day notice upon a date indicated.

12. That amendments to this basic Memorandum of Understanding may be proposed by either party and shall become effective upon approval by both parties.

13. To share the operation and use of equipment and vehicles in the course of cooperative management operations subject to the following special provision:

Each party to this agreement agrees to be responsible for damages to their own property and injuries to their own employees/volunteers, except for damages/injuries resulting from the faulty or negligence of the other party. Any claim for damages to property or persons made against the respective governments will be pursued in accordance with the provision of the respective Tort Claims Acts.

The Fish and Wildlife Service Agrees:

1. To request a minimum of \$2 million of the Region's annual migratory bird fund allocation to this Program.
2. To provide the necessary personnel to plan for and carry out the purpose of this Program.
3. To review and approve or disapprove completed land acquisition appraisal reports.
4. To prepare and authorize Statements of Just Compensation, as required by provisions of P.L. 91-646.
5. To take necessary steps to vest title in the United States of land acquired for this Program, and make payment for property so purchased.
6. To make payments for all relocation benefits to displaced persons affected by the acquisition of lands under this Memorandum of Understanding, as required by P.L. 91-646.
7. To conduct cadastral surveys of lands purchased for this Program if required for legal description or relocation of boundary.
8. To complete appropriate use findings and compatibility determinations for uses in accordance with Service policy.
9. To provide Department \$250,000 annually for management of WPAs within the Iowa WMD.

The Iowa Department of Natural Resources Agrees:

1. To provide the necessary personnel to plan for and carry out the purpose of this Program.
2. To provide, when requested by the Service, appraisal reports on proposed projects.
3. To negotiate with landowners and obtain purchase agreements on Service forms, to conduct relocation advisory services as required by P.L. 91-646, and to assist the landowners in filing claims for reimbursement of expenses under P.L. 91-646.

4. To obtain necessary state approvals for lands purchased for this Program in accordance with applicable state and federal laws.
5. To forward signed purchase agreements, completed appraisal reports and other documents deemed necessary to the Division of Realty, U.S. Fish and Wildlife Service, Bloomington, Minnesota.
6. To provide information concerning proposed secondary and economic uses to the Service for compatibility determinations.
7. To provide the Service a summary activity report, by WPA, on an annual basis.

In WITNESS WHEREOF, the parties hereto have executed this Memorandum of Understanding as of the date when last signed below.

DEPARTMENT OF NATURAL RESOURCES
STATE OF IOWA

FISH AND WILDLIFE SERVICE
U.S. DEPARTMENT OF THE
INTERIOR

By Thomas O. Melius
Regional Director

Date 11/20/12

PROCEDURAL AGREEMENT

I. LIAISON AND COORDINATION

The Service Project Leader at Union Slough National Wildlife Refuge, Titonka, IA, is designated as Iowa Wetland Management District (WMD) Coordinator. The Service Project Leader will represent the Service in exercising jurisdiction over the management of Waterfowl Production Areas (WPAs), and provide local assistance to the Department in carrying out the Program. Acquisition, however, shall be coordinated through the Division of Realty, in Bloomington, MN.

The Wildlife Bureau Chief will be the Program Coordinator representing the Department in all matters related to the Memorandum of Understanding and Procedural Agreement.

II. GUIDELINES FOR SELECTING WPAs

Acquisition objectives will be to identify and acquire, in fee title or easement, WPAs with highest priority given to acquiring natural or restorable wetlands having brood-rearing cover and associated upland nesting cover in close proximity to existing public wetlands. Other areas of priority will be uplands in the vicinity of wetlands where nesting cover is lacking.

- A. Project areas will be located within the 35 eligible counties listed in the Prairie Pothole Joint Venture Plan. Priority will be given to wetland complexes as delineated in the *Identification of Potential Wetland Complex Restorations in the Prairie Pothole Region of Iowa* (2002). This does not preclude consideration of tracts outside of the delineated areas which may be deemed important focal areas of habitat.
- B. WPAs to be acquired will be selected primarily on the basis of their importance to waterfowl and other migratory birds.
- C. The upland-nesting component of waterfowl production habitat will be emphasized and situated to complement designated wetlands ideally in a 3:1 ratio of uplands to wetlands within a targeted complex. Whole farm units can be considered. Surplus upland can be exchanged where appropriate.
- D. Legal access to the property for the purpose of management and public use is required. This can be either in fee or easement.
- E. Creeks and rivers do not qualify as core wetlands for purchase but their presence may enhance the unit.

III. ACQUISITION PROCEDURES

- A. Service Division of Realty will maintain a record of all WPA projects and provide updates to the Department on request.

- B. Potential projects will be evaluated by Department or Service. Selected project packages containing a Service delineation sheet and other project data will be forwarded to the Department.
- C. Department will review and forward selected WPA project packages to the Service Project Leader for review.
- D. The Service Project Leader will review packages and forward to Service Division of Realty.
- E. Service Division of Realty conducts or contracts for the appraisal. The Service shall have the appraisal reviewed and upon approval, send a Statement of Just Compensation, copy of appraisal and purchase agreement to the Department Realty office for negotiation.
- F. Negotiations will be conducted with the intent not to exceed the appraised value. While the Service has authority to accept purchase agreements in excess of the appraised value for WPAs; it rarely does so. In special circumstances, justification to obtain price agreement in excess of appraised value is warranted. Before a WPA agreement for a price exceeding the appraised value is accepted, the Regional Director must approve a statement, for the record, citing the case history of negotiations and the reasons that a higher price is justified. Coordination shall be through the Division of Realty, Bloomington, Minnesota.
- G. Federal purchase agreement forms will be used, including Statements of Just Compensation.
- H. The value for use and occupancy reservation of less than 2 years duration is not usually discounted. Use reservations, especially for buildings, are permitted for periods not to exceed five years. Any additional tenancies beyond five years, if permitted, will be handled by Special Use Permit executed by the Service Project Leader. Tenancy for Cooperative Farming Agreements shall be administered in accordance with the WMD approved CCP and 50 CFR 29.2 (Cooperative Land Management).
- I. Upon Service acceptance of the purchase agreement, a certified letter of acceptance will be sent to the vendor. A copy of the letter of acceptance and a copy of the accepted option and tract maps will be sent to the Department and Service Project Leader. Service Division of Realty (or designee) will conduct necessary acquisition surveys.
- J. After transfer of title to the United States, the following documents will be furnished at time of completion to the Department and Service Project Leader.
 - 1. Copy of executed deed.
 - 2. Notification of payment to vendor
 - 3. Title vesting memorandum with copy of final opinion from Solicitor.
- K. Department will provide owner/tenants with legal notification of termination of cropping rights per state law at date of closing and Service will notify USDA-FSA of title transfers

**IV. COMPREHENSIVE CONSERVATION PLAN (CCP) AND STEP DOWN
MANAGEMENT PLAN REQUIREMENTS**

Within one year after the Service takes possession of a given tract, a unit plan will be prepared by the Department and Service and will be based on goals and objectives outlined in the WMD CCP and Habitat Management Plan (HMP). The jointly developed unit plan will describe the objectives for management of WPAs in the Iowa WMD and will include objectives for upland habitats, wetland habitats, and public uses.

Objectives will primarily consider migratory waterfowl, other migratory birds, and endangered and threatened species. Public use objectives will be consistent with those authorized in Title 50 Code of Federal Regulations and National Wildlife Refuge System guidelines. Cultural resources will be managed according to federal regulations.

An inventory of present land use practices and recommended future use and development for each habitat type will be included in the plan. Existing facilities will be identified along with recommendations as to their future use or disposal. GIS generated aerial photographs, maps and soils data will be incorporated into management planning when available and feasible.

V. LAND MANAGEMENT RESPONSIBILITIES

The MOU identifies the Department as the lead management agency for WPAs in Iowa. As such, the Department provides major financial support for WPA management. The cooperative nature of this partnership affords flexibility in our shared responsibilities to ensure that critical elements are accomplished in a timely manner. Work will be accomplished in accordance with the approved CCP and applicable step down plans (e.g. HMP, Visitor Services Plan, Hunt Plan). The Iowa WMD CCP and step down plans are hereby made a part of the Procedural Agreement and will be used in the management of Iowa's WPAs. Responsibilities for specific elements are described as follows:

A. Administration

1. Service will make annual federal payments to the counties according to P.L. 95-469, Refuge Revenue Sharing Act as amended in 1978.
2. Service will issue Special Use Permits and receive monetary receipts.
3. Department will negotiate and administer Cooperative Farming Agreements following Department and Service land management policy and guidelines. One copy will be kept at the WMD office. The Service Project Leader will review the Cooperative Farming Agreements for consistency with the CCP at the beginning of each agreement period. Department shall not accrue income nor barter goods or services under these agreements. All cooperative farming activities will be consistent with 50 CFR 29.2 (Cooperative land management). Department will have signature authority for FSA and NRCS documents pertaining to Cooperative Farming Agreements.
4. Service and Department will conduct compliance checks for all Special Use Permits and Cooperative Farming Agreements.

5. Service will process all applications for rights-of-way.
6. Service will conduct real property inventory.
7. Service and Department will provide administrative services associated with construction contracts.
8. Department will erect, maintain, and/or remove fences.
9. Service will provide all Service boundary, recognition, and regulatory signs and posts. Department will provide special use, boundary, public hunting, and recognition signs as appropriate and as outlined in the CCP or Visitor Services Plan.
10. Department will install and maintain signs on WPAs.
11. Service and Department will evaluate all WPAs at least once a year for wildlife and habitat resource values.
12. Service will maintain a closed case file of all fee and easement purchases. The original closed case file will be available in the Division of Realty, Bloomington, Minnesota.

B. Building Sites and Other Improvements

1. Service will inventory, administer sales, and bury and/or remove debris, junk, and unsold buildings and structures. Department will assist when appropriate.
2. Service and/or Department will fill and/or cap wells, septic systems, and deep holes.
3. Service and/or Department will level and seed disturbed areas to suitable wildlife cover.

C. Cultural Resources

1. Department will provide the Service Project Leader with a Cultural Resource Clearance form, aerial photograph, and any consultant's findings regarding cultural resources. The Service Project Leader will notify the Regional Historic Preservation Officer who will evaluate all projects and consult with the State Historic Preservation Officer, Indian tribes, and other parties as applicable. The Service will pay for archeological investigations and studies. The Service Project Leader will provide the Department with results and will approve project implementation.

D. Wetland Development, Enhancement, and Restoration

Service and Department will design and construct water control facilities, plug existing ditches, and break or outlet tile lines. The Service will maintain these facilities. Department can provide labor, equipment and technical support.

E. Upland Habitat Management

1. Service and Department will manage existing cover and establish and manage permanent and rotational nesting cover for migratory waterfowl and grassland birds in accordance to objectives outlined in the CCP and HMP.
2. Crop production as a method for the conversion of uplands to waterfowl nesting cover is an acceptable practice.
3. Permanent food plots are permitted at levels identified in the WMD CCP, WMD HMP, and WPA unit plans.
4. Department will control noxious weeds as necessary adhering to Pesticide Use Proposals and reporting use to the Service Project Leader as requested.

F. Law Enforcement

1. Department will assume primary responsibility to enforce regulations on WPAs necessary to protect the resource. Department will submit an annual WMD report summarizing law enforcement incidents and citations (by category) to Service.
2. Service will enforce regulations and prosecute violations in federal court. Service will conduct annual reconnaissance to detect violations on Service easements.
3. Service and Department will inspect WPAs annually for land-use violations.

G. Public Use

1. WPAs will be open for hunting, fishing, and trapping in accordance with existing federal regulations. Other wildlife-dependent uses (wildlife observation, wildlife photography, environmental education, and interpretation) are allowed as stated in the WMD CCP. The public will be notified of allowed uses through signage, leaflets or other means. The use of any vehicle is prohibited except for persons with disabilities holding a special Department permit. Other uses may be permitted following the approval of a Service compatibility determination. In special cases, WPAs, or portions thereof, may be closed to all uses for resource protection or for reasons of human health and safety. Such closures must be approved by the Service's Regional Office. Refer to Title 50, Code of Federal Regulations for complete regulations governing the use of WPAs.

Appendix J: Response to Comments

Editor's Note: All "comments" are presented verbatim as received by the U.S. Fish and Wildlife Service (FWS, Service).

Comment 1: you did not use the words nwr anywhere in the federal register title. why is that? is this a sneaky nwr? what is the purpose here? you said every nwr has a purpose - what have the almighty fws decided is the purpose here. please send me a paper copy of the ea, which should be an eis, asap. i believe all human slime murder of innocents birds and animals should be prohibited in this site since their numbers are precipitously declining from climate change, human predation, oil and gas drilling extremes, etc. your population numbers that you use are so out of whack they are complete frauds. Jean Public

Response 1: This particular management plan is for a Wetland Management District (WMD, district). While it is a part of the National Wildlife Refuge System (NWRS, Refuge System) and does require a comprehensive conservation plan (CCP), it is a little different from a National Wildlife Refuge (NWR, refuge) in terms of land acquisition funding, some of the management, and public use regulations. As described in the environmental assessment (EA) and Draft CCP, the purposes for the Iowa WMD are based upon its land acquisition authority, which is the Migratory Bird Hunting and Conservation Stamp Act of 1934:

“ . . . as Waterfowl Production Areas subject to . . . all of the provisions of such Act [Migratory Bird Conservation Act of 1929] . . . except the inviolate sanctuary provisions . . . ” 16 U.S.C. § 718(c) “ . . . for any other management purpose, for migratory birds.” 16 U.S.C. § 715d

Land for the district is primarily acquired with federal “duck stamp” money, most often originating from duck hunters. Therefore, the overall primary purpose of the district is waterfowl production for the overall primary use of waterfowl hunting.

Comment 2: these sites are not for the birds. they are for the human slime killing and murdering the birds, that is who they are for. that needs to be stopped. this is not 1929 have you noticed that this is not 1929? IT IS TIME TO UPDATE 1929 LAWS THAT ARE COMPLETELY OUT OF SYNC WITH 2013. Jean Public

Response 2: The Migratory Bird Conservation Act of 1929, which established the Migratory Bird Conservation Commission, along with the Migratory Bird Hunting and Conservation Stamp Act of 1934 (also known as the Duck Stamp Act) have been very important for wetland and waterfowl conservation since their inception and remain so today. Federal Duck Stamps are vital tools for wetland conservation. Ninety-eight cents out of every dollar generated by the sale of federal Duck Stamps goes directly to purchase or lease wetland habitat for protection in the National Wildlife Refuge System. Understandably, the federal Duck Stamp has been called one of the most successful conservation programs ever initiated and is a highly effective way to conserve America's natural resources.

Since 1934, sales of federal Duck Stamps have generated more than \$800 million, which has been used to purchase or lease over six million acres of wetlands habitat in the United States. These lands are protected in the Service's Refuge System.

Waterfowl are not the only wildlife to benefit from the sale of federal Duck Stamps. Numerous other bird, mammal, fish, reptile, and amphibian species that rely on wetlands have prospered. Further, an estimated one-third of the nations endangered and threatened species find food or shelter on refuges established using federal Duck Stamp funds.

People, too, have benefited from the federal Duck Stamp. Hunters have places to enjoy their sport, and other outdoor enthusiasts have places to hike, watch birds, photograph, and explore. Moreover, these protected wetlands help purify water supplies, store floodwater, reduce soil erosion and sedimentation, and provide spawning areas for fish important to sport and commercial anglers.

Comment 3a: i do not support this unnatural plan to turn our national land into grasslands and believe letting the land grow naturally is much more important for natural biological diversity which is essential for safe and healthful birds and animals. this plan and site uses NATIONAL TAXPAYER FUNDS SO IT SHOUDL BE A PLAN THAT ENHANCES THE LAND FOR NATIONAL CITIZENRY/TAXPAYERS. this shoudl not be a specific plan to grow birds to shoot to death for local wildlife murderers. that is a misuse of national tax dollars. you are settiing up an unnatural producin system of growing birds to kill them. is that because dan ashe, a known wildlife killer is now in charge of fws that every animal and bird is grown to be murdered by slime human beings with a blood lust to kill. the majority of america and our taxpayer citizens are not of that ilk. this plan also seems to have elements of iowa factory farms - growing in profusion instead of in the natural ecological system. All americans have had their fill of those factory farms situations. this unnatural plan and maulling of the land does not help natural biodiversity.

Response 3a: Most of the land acquired for the Iowa WMD is land that has been farmed and drained with no natural cover left. The goal for the acquired land is to put it back into some form of natural cover, preferably native cover.

Duck hunters provide the primary source of funding for acquiring land for the district through their purchase of a federal Duck Stamp. Therefore, the primary purpose of the district is for waterfowl production, and thereby the primary use of the district is waterfowl hunting.

With the approval of this plan, the district has a goal of converting all the existing land in agriculture to a natural/native cover and converting any new acquisitions into natural/native cover within two years of purchase (unless there is some outstanding circumstance such as a legal farming lease, etc.).

Comment 3b: pg 10 - i do not support "farming" which is diametrically different than natural systems. this is also not a "state" project so tell teh iowa dnr to butt out. This plan needs to satisfy nnational taxpayers, whose money/tax dollars you plan to tax them for.

NO GMO corn should be grown on this national site. Fact is use of glyphosate by agribusiness is killing birds. I do not support national tax dollars going to private farms or lands because the opportunity for huge corruption is present in that. much corruption takes place when govt has "pals" they pay money to. private property owners love to get tax dollars for doing nothing. there is no "improved water quality" when agribusiness is loading the land with glyphosate, nitrogen etc. why is this agency writing such lies?

Response 3b: In 2011, the Service's Midwest Region completed an EA for row crop farming and the use of genetically-modified, glyphosate-tolerant (GMGT) corn and soybeans on refuge/district land (FWS, 2011c). Under the selected alternative, and having begun in calendar

year 2012, the use of GMGT corn and soybeans on Refuge System land in the Midwest Region will continue only for the purpose of habitat restoration. According to the EA, the use of GMGT corn and soybeans will be limited to five years on any individual tract being prepared for habitat restoration. Farming could continue to be used as a management tool for achieving multiple objectives; however, it will be limited to non-GMGT crops for objectives other than habitat restoration. Multiple objectives include but are not limited to the following:

- Habitat restoration
- Habitat management
- Supplemental food for wildlife
- Providing lure crops on public lands to reduce wildlife depredation on private lands
- Enhancing opportunities to hunt, view, and photograph wildlife for the visiting public

Similarly, the Service's ecological integrity policy specifies that GMGT crops cannot be used on Refuge System land unless they are "essential to accomplishing refuge [district] purposes." Habitat restoration is a core objective of most refuges (districts) in achieving their purpose and in some circumstances, the use of GMGT crops could be essential. However, habitat management, supplemental food, and wildlife viewing objectives can more readily be accomplished without the use of GMGT seeds, and thus, their use is not likely essential.

Improved water quality will come from seeding down the existing bare soil in the agricultural fields. Regardless of what is applied to the soil, if it is held in place, other nutrients and chemicals will stay with the soil and not be as likely to run-off to a water supply.

Comment 3c: the conservation reserve program is a "crap" program which is useless. the employees in this agency do nothing and get paid for doing nothing and the waste from this program is enormous. it needs to be shut down. it is bankrupting national taxpayers for producing zero results. Iowa is a rich state. If they have the only input, they should put up 100% of the entire money for this project instead of bankrupting national taxpayers and giving them no voice.

Response 3c: This comment is beyond the scope of this project. While the Conservation Reserve Program (CRP) is mentioned in this plan as providing additional natural/native cover and thereby habitat for wildlife, this plan does not serve to address the CRP program itself.

Comment 3d: You cannot assume the birds are gone only because of loss of habitat when climate change, hunters killign everything in sight, huge use of toxic chemicals by agribusiness, and aphis killing animals and birds with abandon and sneakiness also has an effect on birds among other impacts like prescribed burning which is major air contamination for all of America. Lead kills birds, as does mercury. Contamination is a major factor and saying land change is the only factor is stupid. The assumptions for bird population decline is one sided as if nature exists in a vacuum for one thing only. Ban all use of lead shot and lead sinkers. This failure to act shows negligence on the part of this agency for 40 years! the lead shot is killing the birds yet you continue to allow it while gouging taxpayers to grow birds. makes no sense.

Response 3d: All of these other stressors (pesticide use, hunting, climate change, etc.) on the environment and its associated wildlife are recognized and discussed in the plan. Many of these stressors lead to loss or deterioration of habitat for wildlife.

Currently the only hunting in the district that is not required by law to use non-toxic shot is turkey hunting and slug deer hunting. A ban on the use of lead shot for waterfowl hunting was phased-in starting with the 1987–88 hunting season. The ban became nationwide in 1991. Many refuges and, per state regulations, most counties within the Iowa WMD also ban the use of toxic shot for upland game hunting for such species as squirrel, rabbit, quail, pheasant, and/or partridge. The Service continues to look at options and ways to reduce the direct and indirect impacts of toxic shot to scavengers and other wildlife. The Service is and has been phasing out the use of lead shot by hunters on Refuge System land. This plan proposes to eliminate the use of lead shot for turkey hunting in the following manner:

Within two years of CCP approval, it will be proposed through the federal rulemaking process to implement the following regulation on the Service's fee title property within the Iowa WMD: "You may only use or possess approved nontoxic shot shells while in the field, including shot shells used for hunting wild turkey." This requirement would be in line with current regulations at 50 CFR 32.2(k).

As for fishing tackle, there are nontoxic fishing weights, such as split shots, for use in nontidal waters that are readily available on the marketplace. Many anglers use fishing tackle made from nontoxic materials such as tin, bismuth, steel, and tungsten alternatives, which are found in all 50 states. Many refuges/districts have banned lead sinkers for years. The issue of using all nontoxic shot and tackle for all hunting and fishing in the district is a larger agency decision that is beyond the scope of this EA.

Comment 3e: why is iowa dnr making rules for this land when they pay zero on it and you gouge national taxpayers to pay for this land? decisions on this are essential to this project.

Response 3e: In Iowa, with the signing of a Memorandum of Understanding (MOU) in 1978, it was decided that while the Service would provide federal Duck Stamp funds for land acquisitions, the Iowa Department of Natural Resources (DNR) would supply the personnel necessary to restore and manage those acquisitions (Waterfowl Production Areas [WPAs]). Therefore, the Iowa DNR works in close partnership with the Service to acquire, restore, and manage the land for the district.

Comment 3f: pg 36 - less "mgt" should be the goal for this land. the public sees no improvement in the land when there is intense "mgt" when the "mgt" is the problem.

pg 37 that awful picture of prescribed burning loading the air with fine particulate matter shows stupid mgt at work killing everything. this burning causes lung cancer, heart attacks, strokes, allergies, pneumonia, and asthma - you are contaminating the air. no living thing that breathes can stand that assault. Plans for sites should come from the public. the employees at fws seem to make up plans that enhance their jobs or their influence. this "mgt" seems to regard itself as the lord of the manor and the public as "serfs" who they can disrespect in planning.

Response 3f: Prairie vegetative productivity declines and extensive invasion of woody and other invasive plant species occur in the absence of disturbances such as prescribed fire, grazing, haying, or mowing (Herkert, 1994). In addition, there is evidence that there is a positive relationship between plant species diversity and ecological stability in response to climatic stressors like drought, flooding, and climate change (Tillman and Downing, 1994). Various management tools must be used to manipulate grasslands to achieve the mosaic of habitat conditions needed to attract a diversity of grassland bird species. Management actions such as

haying, mowing, burning, grazing, tree removal, and rest will all have positive influences for some bird species while simultaneously having negative influences for other bird species. The careful application of these management actions across the lands in the Iowa WMD will help to ensure that a wide variety of grassland-dependent bird species can find appropriate habitat throughout the Iowa prairie pothole landscape.

The public was given ample opportunity to be involved in the development of this plan. Initial conversations about comprehensive planning for the district began mid-year of 2009; however, the official kick-off was in December 2011. The public scoping period began on January 30, 2012 and lasted for 30 days. The public was contacted through letters, news releases, and four open house meetings. The open houses gave the public an opportunity to discuss issues with district and Iowa DNR staff and regional planners. Thirty-nine people attended the open houses, and 25 written comments were received during the public scoping period. All of this input was considered during the development of the plan. The public was also given 30 days to review and comment on the EA and Draft CCP document. This review period began on Monday August 19th, 2013 and was announced through postcards, news releases, and two open house meetings.

Comment 3g: alt c is best with banning hunting/trapping/new roads and catering to the majority of visitors who come for passive safe enjoyment of these lands.

Response 3g: WPAs differ from refuges in that they are open to hunting, fishing, and trapping in accordance with state law. Therefore, WPAs are "open until closed" by state or federal law for hunting, fishing, and trapping. Refuges on the other hand are "closed until opened" to these uses. However, WPAs can be opened to other uses if determined to be appropriate and compatible with the mission of the Refuge System and the purposes of the district.

Hunting, in particular, has a long history with WPAs. When Congress amended the Duck Stamp Act in 1958, it authorized the acquisition of wetlands and uplands as WPAs and waived the usual "inviolable sanctuary" provisions. Thus, WPAs were intended to be open to waterfowl hunting, in part because waterfowl hunters, through the purchase of federal Duck Stamps and support for price increases of the stamp, played a major role in acquisition of these areas. Hunting, for both waterfowl and resident game species accounts for more than half of the visits to WPAs.

Alternative C does not ban hunting, trapping, and new roads. Alternative C would include the following:

- Public use facilities (kiosks, trails, pull-offs, etc.) would be provided at three locations across the district
- Other recreational opportunities would be provided in addition to hunting, fishing, and trapping

Since migrating waterfowl are better suited for observation, strategically located additional public use facilities (i.e., kiosks, trails, pull-offs) and opportunities are appropriate for such a focus. The public has requested additional wildlife-dependent and non-wildlife-dependent use opportunities in the district. Alternative C would allow for many of these uses to occur, which have been found to be appropriate and compatible. Environmental education, interpretation, and outreach, however, would remain at current levels with public use information being

provided through Union Slough NWR and Iowa DNR offices and websites. More effort would be placed on distributing a consistent message for the entire district.

Comment 3h: pg 108 i am very much opposed to paying private farmers for grassland mowing. The value of what they provide is highly suspect and also subject to corruption.

Response 3h: The Iowa WMD does occasionally use private entities to complete mowing of grasslands for habitat management. This is typically done due to the constraints and logistics and infeasibility of moving large equipment great distances. The Iowa WMD contains fee title lands currently in 18 Iowa counties, creating difficulty in using station equipment at remote locations. For this reason contractors are used in some cases to complete the prescribed habitat management. Mowing by contractors is done to manage new native tallgrass seedings, reducing the burden of annual weeds that prohibit the grassland establishment.

Comment 3i: The bibliography you used to plan is antique and obsolete and represents a complete loss of taxpayer dollars and time. ten years ago is an eternity in this rapidly changing world. no references from 1974 have any impact on what is going on with this land. Jean Public

Response 3i: Nearly all of the literature cited in the bibliography of the CCP is from peer-reviewed scientific publications. Other citations are for well-respected agency publications and policies. The year of publication is usually irrelevant to an article's merit once it clears the peer-review process. Many basic principles of ecology and biology published decades ago are still very relevant today.

Comment 4a: On behalf of Public Employees for Environmental Responsibility (PEER) and Center for Food Safety (CFS), I submit the following comments on the Iowa Wetland Management District (Iowa WMD) Environmental Assessment and Draft Comprehensive Conservation Plan (Draft EA/CCP). The preferred alternative in the Draft EA/CCP is Alternative D, which combines the alternatives and primarily focusses on breeding waterfowl and restoring cropland to perennial grassland and wetlands in order to accomplish the breeding goal. While PEER and CFS support the Draft EA/CCP's focus on converting croplands to grasslands and wetlands, as explained below, it inadequately addresses the use of genetically engineered (GE) crops and pesticides, particularly neonicotinoids.

By way of overview, it should also be noted that the Iowa WMD has been operating without a CCP or an EA that appropriately evaluates the myriad of impacts from refuge farming operations. PEER and CFS appreciate that the WMD has now attempted to come into compliance with the National Wildlife Refuge System Administration Act, National Wildlife Refuge Improvement Act and National Environmental Policy Act, but these commenters believe that more work needs to be done before WMD operations are compliant with federal law.

Response 4a: Thank you for your support of the preferred alternative for the Iowa WMD. Further responses regarding the use of genetically engineered (GE) crops and pesticides in the Iowa WMD can be found under the [Cooperative Farming](#) section in chapter 2 and in appendix K in the Iowa WMD Environmental Assessment and Draft Comprehensive Conservation Plan available online at <http://www.fws.gov/midwest/planning/iowawetlands/index.html>.

Comment 4b: 1. FWS Improperly Considered Its Own Biological Integrity Policy. The Draft EA/CCP properly recognizes that FWS's own policy on Biological Integrity, Diversity and Environmental Health for the National Wildlife Refuge System states that the use of GE crops is only permitted when "essential" to the wildlife refuge. The Merriam-Webster

dictionary defines essential as “necessary” or indispensable.” Even if it could be shown for argument’s sake that GE crops may have certain advantages over non-GE crops, it cannot be shown that GE crops are necessary or indispensable to accomplishing a legitimate refuge purpose that could not be accomplished by other means. This is especially true when the purpose the use of manmade GE crops is to serve is restoring natural habitat.

In fact, FWS has conceded that GE crops are used because they are more available and cheaper for cooperative farmers than farming with non-GE crops. Thus, FWS’ justification for GE crops is not necessity but cheapness – hardly a sufficient justification for subverting the biological integrity of refuges or agency policy. Because of litigation, the Southeast Region ceased farming with GE crops in 2013 and is currently farming with conventional seed. Southeast farming reports indicate that significant acreage is planted with conventional corn and soybeans undercutting FWS’ claim that farming without GE seed is impractical. Cultivating GE crops due to farmers’ convenience rather than essentiality to a refuge purpose cannot meet the Service policy. If the WMD plans to restore habitat through GE crop farming, it should carefully consider these factors in the Draft EA/CCP as to whether GE crops are “essential” for accomplishing refuge goals.

Response 4b: See the [Description of the Farming Program for the Iowa Wetland Management District section](#) and bullet number 3 under the Site-specific Effects Analysis for the Farming Program for the Iowa Wetland Management District section in appendix K of the Iowa WMD Environmental Assessment and Draft Comprehensive Conservation Plan available online at <http://www.fws.gov/midwest/planning/iowawetlands/index.html>.

Comment 4c: 2. The Draft EA/CCP fails to include site-specific analysis of GE crops impacts. The Draft EA/CCP briefly mentions that GE corn and soybeans cultivation was addressed in 2011 when the Midwest Region completed an EA for GE row crop farming and that GE corn and soybeans cultivation could continue on Refuge lands only for the purpose of habitat restoration. Draft EA/CCP at 10. In the context of litigation challenging the Midwest Programmatic by these commenters, FWS stated that the Programmatic EA does not itself authorize planting on refuges and that site-specific analysis would occur at the CCP level. However, this Draft EA/CCP does not analyze the refuge specific impacts of GE crops and GE crop cultivation continues on the WMD

While it is unclear from the Draft EA/CCP the extent to which GE crops will be used to convert cropland to grasslands, presumably GE crops will be used in the habitat restoration process. Draft EA/CCP at 121; 132 (noting intent to acquire more land). The WMD hopes to accomplish converting row crops to grassland by planting native grasses. Planting native grasses is limited however by budget and resources and thus the likely default will be using GE crops for habitat restoration.

In order for GE crops to be used on the WMD, the WMD must analyze the myriad of impacts from GE crop cultivation in the EA/CCP. The Draft EA/CCP only engages in a cursory discussion of GE crops and appears to punt site specific analysis to cooperative farming agreements or other processes like Pesticide Use Proposals or Compatibility Determinations. However, such documents are not NEPA documents and cannot be used to comply with NEPA. Moreover, despite purported reliance on such documents for environmental analysis, CFAs, PUPs and CDs do not actually contain the level of analysis required by NEPA, and in fact often contain little or no analysis of the environmental impacts of the use of GE crops on specific refuge environments. FWS must consider the refuge specific environmental impacts at the

outset of the process because beginning to cultivate GE crops without conducting site specific analysis violates NEPA.

Response 4c: See bullet number one under the Site-specific Effects Analysis for the Farming Program for the Iowa Wetland Management District section in appendix K of the Iowa WMD Environmental Assessment and Draft Comprehensive Conservation Plan available online at <http://www.fws.gov/midwest/planning/iowawetlands/index.html>.

Comment 4d 3. The Preferred Alternative has significant environmental impacts that the Draft EA/CCP failed to analyze and that warrant the preparation of an environmental impact statement (EIS). The National Environmental Policy Act of 1969 sets forth substantive environmental quality goals for the government and the nation. See 42 U.S.C. §4331. Under NEPA, every agency of the United States Government must include an EIS in every “recommendation or report on proposals for legislation and other major Federal actions significantly affecting the quality of the human environment.” 42 U.S.C. § 4332(2)(C).

NEPA’s implementing regulations, promulgated by the Council on Environmental Quality (CEQ), provide that if the action is not covered by a categorical exclusion from NEPA, the agency must prepare an EA to determine whether or not an EIS is required. 40 C.F.R. § 1501.4(a)–(c). If the action is one that normally requires an EIS, the agency is to prepare an EIS without first preparing an EA. *Id.*, § 1501.4(a) and (b); §1501.3(a).

The CEQ regulations define the term “significantly” as used in NEPA to determine when an EIS is required, to require consideration of the unique characteristics of the geographical area impacted, such as park lands, wetlands, ecologically critical areas, or prime farmland, *id.* § 1508.27(b)(3); “the degree to which the effects on the quality of the human environment are likely to be highly controversial,” *id.* § 1508.28(b)(4); “the degree to which the possible effects on the environment are highly uncertain or involve unique or unknown risks,” *id.* § 1508.27(b)(5); and “whether the action threatens a violation of Federal, State, or local law or requirements imposed for the protection of the environment.” *Id.* § 1508.28(b)(10).

NEPA requires that agencies “study, develop, and describe alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources,” even where an EIS is not required. 42 U.S.C. § 4332(E); 40 C.F.R. § 1508.9(a)(3)(b).

NEPA’s implementing regulation at 40 C.F.R. §§ 1500.1(b) provides in part that:

“NEPA procedures must ensure that environmental information is available to public officials and citizens before decisions are made and before actions are taken. The information must be of high quality. Accurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEPA...”

The CEQ regulations at 40 C.F.R. § 1506.1 further provide that:

- (a) Until an agency issues a record of decision [on an EIS] ... no action concerning the proposal shall be taken which would:
 - (1) Have an adverse environmental impact; or
 - (2) Limit the choice of reasonable alternatives.

The Draft EA/CCP failed to address a number of significant environmental impacts at the refuge level regarding GE crop cultivation, including transgenic contamination and volunteers,

increased weed and insect resistance, adverse impacts on threatened and endangered species and increased pesticide use. An EIS is required when, as here, an activity may have significant environmental impacts. 42 U.S.C. § 4332(C).

1. **Transgenic Contamination & Volunteers:** Transgenic contamination is a critical risk arising from GE crops that FWS biologists acknowledge may adversely affect refuges, and that two federal courts have found to be a legally cognizable and significant environmental risk. Transgenic contamination is the process by which genes from GE crops transfer to natural and wild plants, resulting from both human error and natural events, including pollen drift, seed mixing, flooding, seeds in machinery, and seed spillage. Unlike other forms of pollution, there is no way to prevent transgenic contamination or to stop it once it has begun. As a living form of pollution, it is self-propagating and pollutes both non-GE crops and natural ecosystems. A single incident of transgenic contamination can cost farmers hundreds of millions of dollars nationwide.

Because a main purpose of wildlife refuges is to preserve functioning ecosystems to conserve wildlife and to create native grassland suitable for bird breeding habitat, FWS must carefully consider the effects of transgenic contamination by GE crops and that the harms associated with it are unavoidable and virtually irremediable. FWS should also consider transgenic contamination on the surrounding private farmers cultivating conventional and organic crops.

Volunteers—GE seeds that have re-germinated—are another threat posed by GE crops on wildlife refuges. Indeed, on the thirty-four wildlife refuges in the Southeast Region that planted GE crops in 2012, fourteen reported volunteers in the following season. Volunteers may interfere with management of the wildlife refuge by extending the effects of GE crops past their planting season and into places not intended for crops. Moreover, they are increasingly harder to manage with herbicides. The Draft EA/CCP failed to analyze these impacts on the WMD.

2. **GE Crops Foster Evolution of Resistant Weeds and Insects:** FWS should consider that GE glyphosate resistant and Bt crops have spurred the evolution of herbicide resistant weeds and Bt-toxin resistant insects.

The major current use of genetic engineering in agriculture is to make crops herbicide-tolerant, primarily to the weed-killing chemical glyphosate and Monsanto's proprietary formula, Roundup. Extensive evidence, including warnings from FWS biologists, demonstrates that greatly increased reliance on glyphosate associated with Roundup Ready crops has fostered a dramatic increase in acreage infested with glyphosate-resistant and glyphosate-tolerant weeds.

Many experts in the field recognize the escalating problem of weed resistance, and at least nine different weed species have been confirmed as glyphosate-resistant in 20 states. For example, glyphosate-tolerant horseweed has been reported in annual row crops in 13 states, including Arkansas, Mississippi, Kentucky and Tennessee.

Farmer response to glyphosate-resistant weeds is often to spray them with higher concentrations of glyphosate, more often; and to mix in other potent herbicides, with attendant impacts to wildlife. The response of biotechnology companies has been to develop a score of "next-generation" GE crops that are resistant to glyphosate as well as one to several other herbicides, like glufosinate, 2,4-D and/or dicamba. These new GE crops – likely to be introduced soon – will facilitate much greater use of these additional herbicides to kill glyphosate-resistant weeds, together with continued heavy spraying of glyphosate. Non-target organisms are at particular risk from drift with dicamba and 2,4-D, volatile herbicides that cause harm to wildflowers and other organisms a long ways from where they are applied.

FWS has stated in the Southeast Region that its GMC policy requiring that farmed acres are to be rotated to non-Glyphosate GMC/non-GMC crop seed every four years will reduce weed resistance. However, there are no studies that this policy actually reduces weed resistance or that the policy is enforced at each refuge or applied in the Midwest Region. We encourage FWS to specifically analyze the efficacy of this policy if it intends to rely on it to mitigate environmental impacts.

It is unclear from the Draft EA/CCP the extent to which Bt crops are used on WMD land (or if they are allowed due to the WMD's policy of no insecticide use), but FWS should consider that GE Bt crops have led to the rapid development of insects resistant to Bt in just a few years and will likely spawn new pesticide development to deal with this problem. Cry proteins in GE crops are made in most cells of the plants, and are expressed throughout the growing season. Constant exposure of insects to these Cry proteins in GE corn elevates the risk of target insects developing resistance to the insecticide, leading to more use of insecticides.

For example, Bt corn engineered to resist Western corn rootworm (WCR) is rapidly losing effectiveness as Bt-resistant WCR populations develop in response to the engineered Cry protein.³ This is already leading to increased use of insecticides in addition to the Bt within the corn plants⁴ and portends what will happen when insect pests eventually become resistant to other Cry proteins in corn.

3. Threatened and Endangered Wildlife in the Iowa WMD: The Iowa WMD is home to many threatened and endangered species, including: Indiana bat (*Myotis sodalists*), Topeka shiner (*Notropis topeka*), prairie bush clover (*Lespedeza leptostachya*), western prairie fringed orchid (*Platanthera praeclara*), as well as other state listed species. FWS should consider at the WMD the specific impacts of GE crops and concomitant herbicide use on each of these threatened and endangered species. 40 C.F.R. § 1508.27(b)(9). Because GE crops and concomitant herbicide use alter the weed and plant communities, they may also impact the habitat and feeding patterns of threatened and endangered species. For example, studies have shown that consumption of soybeans on wildlife refuges is actually harmful to migratory fowl.⁵ Furthermore, threatened and endangered aquatic wildlife may be impacted by the increased water pollution that results from greater herbicide use.

Response 4d: See the concluding paragraph under the Site-specific Effects Analysis for the Farming Program for the Iowa Wetland Management District section in appendix K of the Iowa WMD Environmental Assessment and Draft Comprehensive Conservation Plan available online at <http://www.fws.gov/midwest/planning/iowawetlands/index.html>.

Comment 4e: 4. The Draft EA/CCP fails to include an analysis concerning the effects of pesticides. Despite discussing the impacts of pesticides used on neighboring lands, the Draft EA/CCP fails to analyze the effects of pesticides used on the WMD through cooperative farming. Rather, the draft EA/CCP merely states “[c]hemicals used on food plots must be approved through the pesticide use proposals. No insecticides will be allowed on food plots.” Draft EA/CCP at 130. Not only does this provide no analysis of the impacts of pesticides, it only applies to use of pesticides for food plots and not for other activities like GE crop farming for habitat restoration. FWS should consider the significant environmental impacts from pesticide applications at the WMD.

1. The Draft EA/CCP recognizes the harm posed by pesticides, but fails to analyze their effects when used on Refuge lands. In its section entitled “Drainage and Pesticides,” (Draft EA/CCP at

68) the Draft EA/CCP acknowledges the adverse effects that pesticides applied on neighboring lands have on Waterfowl Protection Areas (WPAs). FWS should consider that these same effects will occur when the pesticides are applied directly to WPAs through cooperative farming or food plots.

2. Increased Use of Herbicides and Associated Impacts Harm Refuge Wildlife.

FWS should also consider that GE crops cause a significant increase in the use of herbicides. Since GE crops were introduced in 1996, herbicide use increased by 527 million pounds.⁶ Increased herbicide use harms the very wildlife that refuges were created to protect.

Iowa issued twelve PUPs in 2013, including ones authorizing 2,4-D, dicamba, and glyphosate. 2,4-D and dicamba are particularly harmful pesticides. 2,4-D is a World War II-era pesticide and is the third most commonly used herbicide in North America. Forty-six million pounds of 2,4-D are applied every year in the United States. 2,4-D was also the major ingredient in Agent Orange. It is highly volatile and prone to spray drift that damages neighboring crops and wild plants. 2, 4-D remains contaminated with dioxins that are toxic to human health and is listed by the EPA as the seventh largest source of dioxin pollution in the United States. Exposure is linked to many negative health impacts including cancer, liver disease, reduced sperm count and Parkinson's disease, as well as other health problems.⁷ 2,4-D has also been linked to adverse impacts on threatened and endangered species.

Dicamba is a mobile and persistent herbicide and is thus found in surface and groundwater. Wetland plants are especially vulnerable to dicamba and spray drift and volatilization of dicamba impacts vegetation near application sites and also distant sites. Dicamba can volatilize from plant surfaces days after application and move long distances, damaging neighboring fields and plants. Dicamba has been tentatively linked to a variety of cancers, developmental and mutagenic problems. Endangered species and their habitat are particularly at risk¹ from dicamba because of its high drift and volatile capacity.

Glyphosate resistant GE crops can harm and kill amphibians. Studies show that certain amphibian species exposed to low, field-relevant usage rates of the glyphosate-based Roundup herbicide experience much higher mortality than unexposed amphibians. Studies also indicate an adverse effect of GE crops on birds because the farming system associated with herbicide tolerant GE crops alters the plant and weed communities in farmed areas, thus affecting the diets of birds. Herbicides also harm aquatic ecosystems by killing some algae and water plants, with effects that can ripple through the food web.

Such impacts will only increase with the dramatically rising use of herbicides in GE crops. For example, from 1994 to 2005 USDA data demonstrates that aggregate use of glyphosate on soybeans, corn and cotton has risen from 7.9 million lbs. to 119.1 million lbs. – a 15-fold increase. Dramatically increased herbicide exposure to wildlife and the ecosystems contravenes the purpose of the refuge system to protect the ecosystem. In the past, FWS has relied on outdated studies by other agencies like APHIS and EPA to find that glyphosate does not harm wildlife. Reliance on old studies does not meet NEPA's hard look requirement nor does it negate FWS' duty to analyze the current impacts itself. Despite approving pesticides for use on the WMD, the Draft EA/CCP fails to analyze their impacts on the refuge.

3. Mitigation Premised on Compliance with Other Processes is Unrealistic.

In other FWS regions where cooperative farmers are permitted to use GE crops, FWS states that the array of harms associated with GE crop cultivation is mitigated by cooperative farmers following pesticide label instructions to the letter and obeying all conditions laid out in the FWS

cooperative farming agreement. FWS further states that FWS Pesticide Use Proposals are faithfully executed, that its Integrated Pest Management Policy is implemented and that Integrated Pest Management Plans are designed and implemented for each refuge unit. In the Southeast Region, FWS has already stated its intent to rely on its crop rotation policy to mitigate herbicide resistance.

Such statements presuppose that this complete array of requirements and protocols will be carried out on every refuge unit without a lapse. This presupposition is not backed by any information about whether these measures are currently being implemented as envisioned. In addition, FWS policy does not lay out clear enforcement mechanisms to make sure that safeguards in cooperative agreements, IPM plans or refuge Pesticide Use Proposals are enforced. Without enforcement, confidence in compliance is misplaced. Any assertion that crop rotation will greatly reduce the development of resistant weeds must be supported by proven effectiveness and enforcement if it is to be relied upon as a mitigation measure. The WMD failed to address any of this and should consider these facts if it includes mitigation measures to limit environmental impacts from pesticides.

Response 4e: See bullets number 2, 4 and 5 under the Site-specific Effects Analysis for the Farming Program for the Iowa Wetland Management District section in appendix K of the Iowa WMD Environmental Assessment and Draft Comprehensive Conservation Plan available online at <http://www.fws.gov/midwest/planning/iowawetlands/index.html>.

Comment 4f: 4. The Draft EA/CCP fails to consider the impacts of Neonicotinoids. The Draft EA/CCP claims that insecticides are not used on the WMD. Draft EA/CCP at 130. However, almost all of the corn seed planted in North America, except for the 0.2% of total corn seed used for organic production, is coated with neonicotinoids. While the Draft EA/CCP does not specify that corn planted on NWR lands is treated with neonicotinoids, its pervasiveness leads PEER and CFS to conclude that, if, as the Draft EA/CCP permits, non-organic corn is used, the insecticides neonicotinoids are being used at the WMD. The Draft EA/CCP fails to acknowledge or address neonicotinoids despite their likely use on the WMD. Indeed, in order to comply with the no insecticide rule, the WMD should institute a policy of not growing corn at all.

Neonicotinoids insecticides may be causing a decline in pollinators. Neonicotinoids are systemic, that is, they are taken up by the plant's vascular system as the seed grows and get expressed through its tissues, including flowers, pollen and nectar.¹¹ Essentially, the whole plant is poisonous to insects. Once treated with neonicotinoids, a plant can become highly toxic to invertebrates such as bees. Furthermore, the damage caused by neonicotinoids are not limited to the treated plant. Neonicotinoids are persistent with extremely long half-lives that vary widely according to soil type and weather conditions, ranging from 148 days to 1,155 days. The main exposure pathways for neonicotinoids are residues in pollen and nectar, dust from treated seeds and soils, planter exhaust, untreated but contaminated non-crop plants adjacent to treated fields, guttation droplets on both treated and untreated but contaminated plants and residues from foliar uses.

Neonicotinoids have been shown to adversely impact the survival, growth and health of pollinators vital to U.S. agriculture and the rising use of neonicotinoids coincides with dying honey-bee populations in a phenomenon known as Colony Collapse Disorder.¹⁵ Clothianidin and its parent compound thiamethoxam—the two most widely used neonicotinoids—are documented to be highly toxic to other bee species like the common Eastern bumble bee, alfalfa leafcutter bee, and blue orchard bee, all of which are valuable plant pollinators. More than fifteen threatened or endangered insects, ranging from beetles to butterflies to grasshoppers

and other taxa, are potentially directly affected by the use of clothianidin and thiamethoxam products. A recent study also found that neonicotinoids adversely impact a broad suite of birds and aquatic invertebrates.

Although neonicotinoids are extensively used in corn seed, FWS has not examined their impact on the refuge environment nor are they listed as an approved pesticide on the Pesticide Use Proposal Field Approved lists. Nor are they banned from use as they should be.

Response 4f: The Chief of Refuges in Region 3 has directed refuge managers to start the transition away from neonicotinoid treated seed in calendar year 2014 and be "neonicotinoid seed free" in calendar year 2016.

Comment 4g: 5. The Draft CPP/EA improperly permits farming on refuge lands as farming will not meet the WMD's stated purposes. The Preferred Alternative's purpose is to encourage waterfowl breeding and restoring native grasslands. GE crops and farming generally are not required for either of these purposes. Indeed, the Draft EA/CCP seems to recognize this by setting goals of planting native grasses as a means to restore habitat. As noted previously, it is unclear the extent to which the WMD plans to rely upon GE crops for habitat restoration because the Draft EA/CCP does not discuss it. However, if the WMD plans to use GE crops at all for restoring grasslands, it must carefully consider alternatives that would be much better at accomplishing this purpose at the WMD specific level.

The Draft EA/CCP states that the WMD is a haven for wildlife in a sea of row crops and notes the impacts surrounding row crop farming has had on the grasslands and wetlands needed for breeding and habitat, noting that row-crop farming decreased grassland habitat for birds resulting in a decrease in bird populations and suitable habitat for nesting birds (Draft EA/CCP at 33). Given this admittance regarding the unsuitability of farmed land for refuge purposes, the WMD should consider alternatives to farming in the CCP. Such alternatives should include no farming at all.

Response 4g: See the [Description of the Farming Program for the Iowa Wetland Management District section](#) and bullet number 5 under the Site-specific Effects Analysis for the Farming Program for the Iowa Wetland Management District section in appendix K of the Iowa WMD Environmental Assessment and Draft Comprehensive Conservation Plan available online at <http://www.fws.gov/midwest/planning/iowawetlands/index.html>.

Comment 4h: 6. Refuge Crops Illegally Bait Birds.

Furthermore, the Draft EA/CCP characterizes some harmful effects of farming, such as the baiting effect of cooperative farming, as positive effects. The draft EA/CCP states that food plots encourage activities such as hunting, but fails to discuss the underlying, harmful effects of farming that cause food plots to encourage hunting or that such baiting practices could violate the Migratory Bird Treaty Act, which makes it illegal to bait birds.

FWS should consider that the cooperative farming practices condition ducks and other waterfowl to feed on the bait of waste crops and then allow hunters to shoot them. Hunters refer to birds exposed to bait as "daffy ducks," so blinded by the quest for food that these wild creatures ignore instinct by acting tame. Ducks have been known to fly into buckshot to reach grain to which they have become hooked.

Under the Migratory Bird Treaty Act, baiting is the illegal practice of using feed to attract game. A baited area is essentially no different than a bird feeder. As hunting is allowed, FWS should

analyze the impact on migratory birds which become hooked on “high-calorie” crops in the range of refuge-based hunters.

Response 4h: The EA and Draft CCP for the Iowa WMD contains a “Food plot Cultivation for Wildlife” Compatibility Determination. One of the stipulations included in that determination is: “Food plot farming and maintenance will comply with the Migratory Bird Treaty Act 16 U.S.C. 703–712 P.L. 105–312 and 50 CFR 20.11–21 and not constitute baiting.” Furthermore, the Iowa WMD project leader works closely with both state and federal law enforcement officers to ensure food plot practices on WPAs comply with state and federal hunting regulations. Food plots have the intent of providing fall and winter food resources and will be left standing or un-manipulated until harvested in early spring.

Comment 4i: CONCLUSION: NEPA requires a “hard look” at the environmental impacts of a proposed action before it is taken. And, where an action may significantly impact the environment, an environmental impact statement is required. PEER and CFS urge FWS to withdraw this Draft EA/CCP and engage in a robust, rigorous and high-quality scientific analysis to decide whether GE crops are essential to accomplishing refuge purposes and should be permitted at the Iowa WMD. FWS should also draft an EIS rather than an EA as it is evident that the Preferred Alternative may significantly impact the human environment. Kathryn Douglass, Public Employees for Environmental Responsibility (PEER)

Response 4i: See the concluding paragraph under the Site-specific Effects Analysis for the Farming Program for the Iowa Wetland Management District section in appendix K of the Iowa WMD Environmental Assessment and Draft Comprehensive Conservation Plan available online at <http://www.fws.gov/midwest/planning/iowawetlands/index.html>.

Comment 5: This letter responds to your request for comments concerning the Draft Environmental Assessment (EA) and Comprehensive Conservation Plan (CCP) for the Iowa Wetland Management District (WMD), which covers 35 counties in north-central and northwest Iowa. Thank you for involving the Environmental Protection Agency (EPA) during the consideration of environmental impacts either to or from this project.

The Draft EA adequately outlines the purpose, need, and general conservation plan. The overall benefit of implementing an adaptive management plan to the WMD and Prairie Pothole Region (PPR) is sufficiently stated in this document. Though environmental impacts included in the EA & CCP were overall minimal, EPA offers the following comments for additional considerations of potential environmental impacts and a focus on minimization and mitigation of these impacts:

We would like to thank you for addressing the potential direct, indirect, and cumulative effects, as well as providing specific measurable objectives for the life of the CCP. EPA continues to support avoiding and minimizing adverse impacts to air, land, and water quality, including wildlife and their habitat. We would like to suggest that any potential effects or disturbance of fish and wildlife species be minimized to the extent possible through the use of BMPs for such activity.

We commend your coordination efforts with various other agencies and entities throughout the development of this project. We would encourage continued coordination with local, state, and federal agencies to ensure that all laws, ordinances, and regulations are followed and all necessary permits acquired. Amber Tucker, US Environmental Protection Agency Region 7

Response 5: Thank you for your comment and support of the EA and Draft CCP. Great effort will be invested to assure that coordination with local, state, and federal agencies continues into implementation of the Final CCP. Best management practices will be applied whenever and wherever possible during plan implementation.

For example, as properties are acquired in the Iowa WMD, WPA plans will be developed by the unit managers in coordination with the project leader. These plans will make every effort to use restoration practices that reduce soil erosion and disturbance to wildlife and habitat. These practices include habitat management such as haying, burning, grazing, and farming. Timing of these activities can reduce the disturbance and displacement of wildlife. For example with haying and mowing, the nesting period from April 1 to July 15 is avoided.

Typically the lands that are acquired in the Iowa WMD are in need of restoration to be completed by contractors or staff. Requirements that reduce pollution are stipulated in contracts including silt barriers and buffer zones.

Farming is used on the Iowa WMD to accomplish habitat and wildlife goals and purposes. Both the Service and Iowa DNR strive to use the best management practices when implementing farming as a habitat management strategy. Examples of items that are considered in habitat management plans include: slope, distance to wetlands and ground water, habitat buffers, and disturbance of wildlife. When farming is used to prepare the seed bed of a newly acquired property (typically in row crop agriculture), both the Service and the Iowa DNR typically use farming cooperators and Habitat Management Lease Agreements or Special Use Permits. In these documents the Service articulates through stipulations the best management practices that will be used on the district property. Examples of agreement stipulations include the following:

Note: These stipulations may change over time to reflect new information.

- Use of chemicals must be approved through a Pesticide Use Proposal.
- Manure applications are prohibited.
- Fall tillage is prohibited unless its use is specified in the management plan for the year of prairie seeding.
- Habitat management plan must be followed.
- Glyphosate tolerant corn and soybean seed may only be used for habitat restoration purposes.
- Farming for wildlife food production or other purposes will utilize non-genetically modified crop seed.
- No insecticides may be used.

Best management practices are also used when applying herbicides to district properties. They include the following:

- Allow pesticide application buffers around sensitive areas,
- Follow pesticide labels,

- Spray only when winds are 12 mph or less (but not inversions),
- Control drift through use of low pressure and nozzles that create larger droplets,
- Monitor current and predicted winds,
- Monitor predicted rainfall,
- Be cautious around shallow groundwater, and
- Maintain a buffer around water and wetlands.

Appendix K: Finding of No Significant Impact

Environmental Assessment and Comprehensive Conservation Plan for the Iowa Wetland Management District, Iowa

An Environmental Assessment (EA) and Comprehensive Conservation Plan (CCP) have been prepared to identify management strategies to meet the conservation goals of the Iowa Wetland Management District (WMD). The EA examined the environmental consequences that each management alternative could have on the quality of the physical, biological, and human environment, as required by the National Environmental Policy Act of 1969 (NEPA). The EA evaluated four alternatives for the future management of the Iowa Wetland Management District.

The alternative selected for implementation in the district is *Alternative D*. Breeding waterfowl, primarily represented by Mallard and Blue-winged Teal, will be the focus for management activities. The dominant activity will be restoring cropland to perennial grassland and wetlands. Restoration efforts will be the same as current management with a focus on a variety of prairie pothole wetlands, in particular temporary and seasonal types, many of which will complement shallow lake restoration by the Iowa Department of Natural Resources. More diverse habitat will allow for more diversity in wildlife, in particular other grassland/wetland birds. Acquisition of the potholes will initially be the same as current management, working with partners to pursue perpetual protection of wetland and grassland of up to 112,000 acres in the Prairie Pothole Region, but may be modified by new landscape-level planning tools and models developed. Food plot use will be at levels that do not materially detract from breeding waterfowl. Additional public use opportunities found to be appropriate and compatible will occur. Environmental education, interpretation, and outreach, however, will remain similar to current levels with more effort placed on distributing a consistent message for the entire district through coordination meetings, additional kiosks, trails, pull-offs, etc., and an informational and regulatory brochure.

Furthermore, the portions of three Waterfowl Production Areas—Jemmerson Slough (Dickinson County), Elk Creek Marsh (Worth County), and Rice Lake (Winnebago and Worth Counties)—currently closed by state regulation as waterfowl refuges will remain closed. Also, within two years of CCP approval, it will be proposed through the federal rulemaking process to implement the following regulation on the Service's fee title property within the Iowa WMD: "You may only use or possess approved nontoxic shot shells while in the field, including shot shells used for hunting wild turkey." This requirement would be in line with current regulations at 50 CFR 32.2(k).

For reasons presented above and below, and based on an evaluation of the information contained in the EA, we have determined that the action of adopting Alternative D as the management alternative for Iowa WMD is not a major federal action, which would significantly affect the quality of the human environment, within the meaning of Section 102 (2)(c) of the National Environmental Policy Act of 1969.

Additional Reasons:

- Future management actions will have a neutral or positive impact on the local economy.
- This action will not have an adverse impact on threatened or endangered species.

Appendix L: Standard Eligibility Questionnaire for the use of Genetically Modified Crops on National Wildlife Refuge System Lands

Standard Eligibility Questionnaire for the Use of Genetically Modified Crops on National Wildlife Refuge System Lands

The Biological Integrity, Diversity, and Environmental Health Policy (601 FW 3), as amended, states, "We do not use genetically modified organisms in refuge management unless we determine their use is essential to accomplishing refuge purpose(s) and the Regional Chief or the Assistant Manager, California/Nevada Operations Office (CNO), National Wildlife Refuge System, approves the use." Therefore, in order to approve the use of genetically modified crops (GMCs), the Regional Chief must concur that GMCs are "essential" for fulfilling refuge purposes.

However, several other factors may prevent a Regional Chief from approving the use of GMCs, even when GMCs are considered essential for fulfilling refuge purposes. For example, if a state or local law prohibits the use of GMCs, the Regional Chief may not approve the use of GMCs.

From 2004-2006 the FWS GMC Team developed an eligibility questionnaire for use by two primary parties: 1) Refuge managers, to determine the appropriateness of requesting approval for GMC use; and, 2) Regional Chiefs in considering the merits of requests for using GMCs. The intent now is to provide an eligibility questionnaire that will be used in all Regions, providing greater consistency and accountability throughout the Refuge System.

If GMCs are to be used, they must be addressed (along with farming in general) in refuge NEPA documents and compatibility determinations. However, once farming is determined to be an appropriate and compatible use, the eligibility questionnaire is the key document for determining whether GMCs will be used on refuges. Conversely, the process of filling out the questionnaire will also be useful to refuge staff in preparing NEPA documents and compatibility determinations in addition to determining whether to seek approval for the use of GMCs.

In general, 601 FW 3 clearly sets a high bar for the use of GMCs as well as farming and pesticides in general. This was intentional and is something to keep in mind when considering the content of the eligibility questionnaire and subsequently when considering requests for the use of GMCs.

Following is a revised eligibility questionnaire, based upon a combination of features from the GMC Team and comments from regions.

2. Is it possible to grow conventional crops (non-GMCs) in a quantity sufficient to achieve refuge purposes without using pesticides or herbicides?

Yes? Stop here. Pesticides, herbicides, and GMCs are not permitted. Conventional crops may be used without the use of pesticides or herbicides.

No? Describe why and go to Question 3.

see attached sheet

3. Are there any federal or state laws or regulations that prohibit the planting or production of GMCs on the refuge or in the area in which the refuge is located? (Contact the local County Extension Service in your area for updated information pertaining to this question.)

Yes? Stop here. GMCs are not permitted. (Please identify the law(s) or regulation(s) below for FWS informational purposes.)

No? Go to Question 4.

4. Which GMCs do you seek approval for using?

see attached sheet

5. Are there any known wild relatives of the GMCs listed above on or within 6 miles of the refuge?

Yes? Stop here. GMCs are not permitted. (Please identify the known wild relatives below for FWS informational purposes.)

No? Go to Question 6.

6. Is the use of the GMCs listed under Question 4 considered essential for achieving refuge purposes?

Yes? Go to Question 7.

No? Stop here. GMCs are not permitted. Conventional crops may be used, with or without the use of pesticides.

7. Describe briefly how and where on the refuge(s) you would use the GMCs listed under Question 4, and why these GMCs are considered essential for fulfilling refuge purposes. (Include detailed information on refuge purposes. Also include information on how the use of these GMCs would assist with accomplishing habitat and population objectives. Attach another page if necessary.)

see attached sheet

8. Do federally listed threatened or endangered species (or species proposed for listing) inhabit the refuge or does critical habitat (proposed or designated) as described in the Endangered Species Act occur on the refuge in and around the immediate areas in which GMC's will be grown?

Yes? Identify the species and critical habitat proposals and designations here and go to Question 9.

No? Go to Question 11.

**Notes on threatened and endangered species, listing proposals, and critical habitat:
see attached sheet**

9. Will the use of the GMCs listed under Question 4 potentially affect listed species (or species proposed for listing) and/or critical habitat (designated or proposed) directly or indirectly?

Yes? Initiate Section 7 consultation as required by the Endangered Species Act and go to Question 10.

No? Go to Question 11.

10. Do Section 7 consultations indicate that using the GMCs listed under Question 4 is likely to adversely impact or adversely modify a listed species or critical habitat in and around the immediate area in which GMCs will be planted? (Attach the biological opinion to the questionnaire.)

Yes? GMCs are not permitted.

No? Go to Question 11.

11. Is the use of the GMCs listed under Question 4 addressed in final NEPA documents?

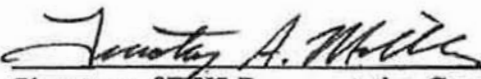

Yes? Go to Question 12.

No?. Approval for the use of GMCs may be requested after NEPA documentation is finalized. See also Question 12.

12. Is the use of the GMCs listed under Question 4 addressed in a published compatibility determination?

Yes? Regional Chief's approval for the use of GMCs may be requested. The request must be in writing (hardcopy or email) and must include this questionnaire.

No? Approval for the use of GMCs may be requested after a compatibility determination is published or in press.

US Fish and Wildlife Service, National Wildlife Refuge System
Genetically Modified Crops (GMC) Eligibility Questionnaire

Iowa Wetland Management District

Refuge Purpose(s):

Waterfowl Production Areas - "...as Waterfowl Production Areas" subject to "...all of the provisions of such Act [Migratory Bird Conservation Act]...except the inviolate sanctuary provisions..." and "...for any other management purpose, for migratory birds."

FmHA fee title transfer properties - "for conservation purposes..."

Question 1.

Farming with the use of genetically modified crops (GMCs) on the Iowa WMD occurs solely to prepare fields for grassland restoration. In most cases these fields are crop fields recently purchased by the Service. In other situations the fields contain exotic grasses or other invasive/noxious plants and need to be farmed for several years to break up the weed cycle. Depending on the situation, we typically utilize cooperative farmers to farm the fields for 1 to 5 years and then the field is seeded to a local ecotype native grass/forb mixture. The Iowa WMD Comprehensive Conservation Plan allows for up to 3% of the upland acreage to be farmed to provide supplemental food for wildlife. All farming for supplemental food is conducted using conventional (non-GMC) crops.

Question 2.

If we did find someone to farm organically, we would probably have to farm the area for a much longer time period - thereby lengthening the time to meet our habitat goals and wildlife objectives. Also, some cover crops used in organic farming (such as sweet clover and red clover) consist of the invasive plants we are trying to control/remove with farming in the first place and are detrimental to establishment of native forb species.

Question 4.

Glyphosate-tolerant corn and soybeans.

Question 7.

Farming would occur on WPA tracts located in priority wetland complexes within the Iowa WMD. The Iowa WMD currently consists of 75 WPAs in 18 counties.

The use of farming provides a management tool that allows the WMD staff to meet wildlife and habitat goals and objectives. Service policy calls for maintaining or restoring WMD habitats to historic conditions if doing so does not conflict with refuge purposes (U. S. Fish and Wildlife Service 2001). Cooperators are limited to using only FWS approved herbicides. The use of glyphosate-tolerant corn and soybeans will be used on Service lands as authorized by current Regional policy.

The WMD will allow use of GMC crops only for the purpose of habitat restoration on Waterfowl Production Areas in north-central Iowa. This use will only be performed on previously disturbed areas such as previously farmed land which have unacceptable levels of chemical residue, noxious weeds, or invasive plant species or ecotypes.

This activity is implemented to prepare a quality seed bed for the establishment of native prairie species. Without the use of farming as a management tool, we would not be able to restore these areas back to native grasslands.

Question 8.

The endangered Indiana Bat, *Myotis sodalist*, Least Tern, *Sterna antillarum*, and Topeka Shiner, *Notropis topeka*; threatened Prairie Bush Clover, *Lespedeza leptostachya*, and Western Prairie Fringed Orchid, *Platanthera praeclara*; and candidate species the Dakota Skipper, *Hesperia dacotae*, Poweshiek Skipperling, *Oarisma poweshiek*, can be found within the affected counties. No critical habitat is found on current WPAs.

Although the WMD is within the range of these species, because of the location and type of activity proposed, the use of glyphosate-tolerant corn and soybeans will have no effect on these species. Farming will not be done near any streams or rivers to affect the Topeka shiner or least tern. The prairie bush clover, western prairie fringed orchid, Dakota skipper and Poweshiek skipperling are found in native prairie. Farming will only be allowed on crop fields or sites that were previously dominated by exotic cool season grasses and/or undesirable vegetation. The Indiana bat uses riparian forests along the river systems in the southern portion of the WMD. WPAs do not occur near these riparian forests.

Appendix M: U. S. Fish and Wildlife Service Region 3 2014 Pesticide Use Policy

1) This document provides updated Region 3 guidance for the preparation and submission of Pesticide Use Proposals (PUPs), delegates approval authority for some pesticide uses to Project Leaders of National Wildlife Refuges and other Service Programs, and describes measures that provide health protection for Service employees and their families.

2) The policies contained in this memorandum are effective immediately and will remain in effect until terminated or amended by new guidance.

3) All use of chemical pesticides on U.S. Fish and Wildlife Service lands and facilities must conform to Environmental Protection Agency regulations, chemical labels, Material Safety Sheets, and Service and Department of the Interior policies and directives including 517 DM 1, 569 FW 1, and 242 FW 7.

4) These policies and directives are available at:

<http://www.nature.nps.gov/biology/ipm/Documents/DOI517DM1.pdf>

<http://www.fws.gov/policy/569fw1.html>

<http://www.fws.gov/policy/242fw7.html>

5) PUPs are required for all pesticide applications the Service conducts, approves or funds; on or off Service lands.

6) A complete PUP, containing an endangered species review, must be prepared by the station and electronically approved at the appropriate supervisory level before the pesticide can be applied or distributed.

7) All PUPs will be prepared and reported utilizing the on-line system found at:

<https://systems.fws.gov/pups/>

8) A list of chemicals and application methods that can be approved by Project Leaders at the field station level is included in the *2014 Attachment 1 PUP Uses Granted to Field*.

9) To assist Project leaders with endangered species reviews, the Intra-Service Section 7 biological evaluation form is provided as *2014 Attachment 2 R3 Section 7 form*.

10) Point source discharges of biological and chemical pesticide residues into “waters of the United States” may require a National Pollutant Discharge Elimination System (NPDES) permit. The Environmental Protection Agency has delegated the authority to issue these permits to each of the states in Region 3. The states vary considerably in their interpretation of what actions require an NPDES permit. Please check with the state agency issuing these permits for any over water or near water pesticide applications.

11) Any PUP that includes a pesticide or application method that cannot be approved by the Project Leader via the authorities delegated to them in the *2014 Attachment 1 PUP Uses Granted to Field*, must be forwarded to the Regional Office with a detailed explanation in the comments section of the PUP explaining why the chemicals on the Field Approval list will not meet station needs.

12) National guidelines require Headquarters review of all PUPs for insecticide and fungicide seed treatments unless the Region ensures that all treated seed is incorporated beneath the soil surface and no treated seed remain on the ground. The Headquarters guidance is included as *2014 Attachment 7 Headquarters PUP Guidance*.

13) To comply with Headquarters requirements, all Region 3 PUPs authorizing plantings of insecticide or fungicide treated seed must include Best Management Practices that describe monitoring activities and field stations must complete a Treated Seed Incorporation Monitoring Statement (*2014 Attachment 6 Treated Seed Monitoring Form*) that documents the monitoring activity.

14) Annual Pesticide Use Reports for CY 2014 should be submitted by February 28, 2015 utilizing the PUPs on-line system.

15) Project Leaders and other supervisors are responsible for ensuring that all FWS employees who are applying or overseeing the application of pesticides are properly trained and certified. State Certification is required for many applicators.

16) A decision tree providing R3 guidance on certification requirements is provided as *2014 Attachment 3 Pesticide Certification Tree*. A general summary of these guidelines is that anyone who applies pesticides, or supervises the application of pesticides must have a State Certificate unless all of the following conditions are met:

1. The pesticide is a general purpose pesticide, and
2. The person only makes infrequent application, and
3. The person is supervised by someone who holds a State Certificate, and
4. The person is in compliance with the State's specific certification requirements

17) Some states may require Certification or Licensure of anyone who applies pesticides. The *2014 Attachment 4 State Pesticide Certification Info* provides general information and links to state licensing agencies.

18) Mandatory measures that help protect Service employees and their families are listed in 242 FW 7. These measures include:

- a) Personnel must change clothing they wear during applications before using vehicles or entering office locations.
- b) If personnel wear non-disposable clothing (i.e., uniforms or coveralls) when applying pesticides, they must keep that clothing separate from the clothing they take home, and they must not wash that clothing at home.
- c) Instructions for washing of contaminated clothing are provided in *2014 Attachment 5 Laundering Procedures*.
- d) If suitable laundry equipment is not provided, then personnel who conduct pesticide-related activities must use disposable clothing.

19) Personnel that handle, mix, or apply pesticides (with a Health Hazard Rating of 3 or higher) for 8 or more hours in any week or 16 or more hours in any 30-day period, or use a pesticide in a manner that requires a respirator, will be evaluated for medical examination and monitoring.

- a) All PUPs that are submitted with a Health Hazard Rating of 3 or higher will automatically be forwarded to Rob McGinn, R3 Division of Safety for review and coordination with the Project Leader for appropriate compliance with medical examination and monitoring requirements.
- b) A decision tree providing R3 guidance on medical monitoring is included: *2014 Attachment 8 Medical Surveillance*.

If you have any questions please contact the Regional PUPs coordinator.

Pesticide Uses Granted Field Station Level Approval for CY 2014 in Region 3

1) All pesticide uses on national wildlife refuges, national fish hatcheries, and private lands projects that are conducted, approved, or funded by the Service must have an approved pesticide use proposal (PUP) before pesticide applications can be made. A completed PUP approved at the appropriate supervisory level, consistent with applicable Service and Department of Interior policies (i.e., 517 DM 1, 569 FW 1) and appropriate environmental compliance (e.g., NEPA and ESA), is required prior to the application or distribution of pesticides.

2) In accordance with 569 FW 1, PUPS are created, submitted, reviewed and approved/disapproved via the intranet-based Pesticide Use Proposal System (PUPS) database (<https://systems.fws.gov/pups/>). Pesticide use must be reported annually for approved PUPs. CY 2014 Pesticide Usage Reports must be completed by February 28, 2015.

3) The following Best Management Practices (BMPs) are recommended for all pesticide applications on areas greater than 0.1 acre that are to be approved at the field station level by the field (dis)approver in the PUPS database:

- Ground-based application only (e.g., ground-propelled hydraulic sprayers, backpack sprayers, hand sprayers, wick applicators, etc.).
- During treatment of grass or herbaceous targets, documented review of the label for herbicide activity on trees or other non-target woody plants prior to use under their drip line.
- Do not apply pesticides to slopes >5% if significant rainfall is predicted within 24 hours.
- Do not apply pesticides when wind velocity exceeds 7 mph or when inversion conditions exist.

4) Project leaders are authorized to approve Pesticide Use Proposals for ground applications of one year duration of products containing the active ingredients listed on Page two of this document so long as all label instructions and station BMPs are followed.

5) Project Leaders are also authorized to approve PUPs for:

- a) Pest management solely related to controlling fish and wildlife pathogens and their vectors in hatchery situations or captive breeding programs.
- b) Routine protection of Refuge buildings, structures, and facilities, so long as not involving Restricted Use chemicals.
- c) Use of common household pesticides to curb flies, mosquitoes, ants, cockroaches, hornets, houseplant aphids, clothes moths, and similar situations in offices and residences
- d) Use of livestock protection devices and veterinary techniques applied off-site to animals utilized in a grazing program including but not limited to ear tags and insecticide or insect repellent applications.

6) All other types of applications or pesticide products not authorized to be approved by Project Leaders in Sections 4 or 5 of this policy require the PUP to be submitted, reviewed and approved at the Regional level prior to use. Some products and applications may also require review and approval at the Headquarters level.

Pesticide Uses Granted Field Station Approval for CY 2014*				Caution! Please ensure that all applicators read and comply with label instructions. Disposable clothing must be used when applying pesticides unless suitable laundry arrangements have been made. Use of pesticides with a Health Hazard rating of 3 or higher may require medical monitoring.				
#	Active Ingredient	Common Registered Trade Names	Human Health Hazard #	Weed Spectrum		Crop		Comments/Application timing for non-GMO crops

¹PPI = pre-plant incorporated: Soil applied prior to planting and mechanically incorporated into the soil. The objective for incorporation is to prevent dissipation through photodecomposition and/or volatility.
²PRE = pre-emergent: These herbicides typically do not control established weeds.
³POST = post-emergent: Applied after the crop has emerged.

#	Active Ingredient	Common Registered Trade Names	Concerns	Precautions
1	2,4-D (amine)	Weedar 64, 2,4-D Amine 4, and many others	High potential for vapor drift. Highly mobile in water. Moderately toxic to fish and aquatic invertebrates.	Do not apply directly to water. Do not apply to sites where groundwater is less than 10 feet from the surface. Be very aware of current and predicted winds and stay well away from forbes, soybeans & other desirable broadleaf species.
2	2,4-D (ester)	2,4-D LV4, Weed One LV 6, and many others	High potential for vapor drift. Highly toxic to fish and aquatic invertebrates.	Do not apply directly to water. Do not apply to sites where groundwater is less than 10 feet from the surface. Be very aware of current and predicted winds and stay well away from forbes, soybeans & other desirable broadleaf species.
3	Aminopyralid	Milestone	Highly mobile in water. Hay or manure from animals grazing on treated areas may cause injury to sensitive plants.	Maintain adequate buffer around water. Do not treat areas that will be hayed or grazed.
4	Clethodim	Select 2EC, Arrow 2 EC, Shadow	Highly persistent in water.	Do not apply directly to water.
5	Clopyralid	Transline, Stinger	Highly mobile in water.	Do not apply directly to water.
6	Dicamba	Banvel, Clarity	Highly mobile in water. High potential for vapor drift.	Maintain adequate buffer around water. Do not apply to gravel, sand, or sandy loam soils. Do not apply to sites where groundwater is less than 10 feet from the surface. Be very aware of current and predicted winds and stay well away from forbes, soybeans & other desirable broadleaf species.
7	Flumiclorac pentyl ester	Resource	Slightly to moderately toxic to fish and invertebrates. Practically non-toxic to bees.	Do not apply this product within 70 feet of streams, wetlands, marshes, ponds, lakes and reservoirs.
8	Glufosinate ammonium	Finale, Rely, Ignite, Liberty	"Persistent and mobile" in water.	Do not apply directly to water.
9	Glyphosate	Roundup, Rodeo, Accord	An unlisted ingredient (POEA) present in some formulations and commonly added surfactants appears to be quite harmful to aquatic invertebrate and amphibian populations.	Use surfactant free products or products labeled for aquatic use such as Accord, Roundup Custom, Rodeo, Aqua-Master, Aqua-Neat, Eagre, Glypro, Glyphos-Aquatic or equivalent products. If surfactants are added use those that are labeled no more than slightly toxic (LC50>10mg/L) to fish and aquatic invertebrates. Some surfactants to avoid include: Activate Plus, Induce, Timberland90, Aqua King, Aqua King Plus, Optima, Entry II, No Foam A, R-11, Orthox-77, X-77 Spreader, and Cide-Kick.
10	Imazethapyr	Pursuit	Slow degradation in some soils. Some formulations highly mobile in water.	Maintain adequate buffer around water. Do not apply to gravel, sand, or sandy loam soils.
11	Imidazolinones (other): including Imazapic, Imazaquin, Imazethapyr, Imazamox & Imazamethabenz	Plateau, Habitat, Stalker, Assert	Slow degradation in some soils. Some formulations highly mobile in water.	Maintain adequate buffer around water. Do not apply to gravel, sand, or sandy loam soils.
12	Nicosulfuron	Steadfast; Steadfast Q	Causes moderate eye irritation. Harmful if absorbed through skin.	Do not apply directly to water.
13	Rimsulfuron	Resolve	Causes moderate eye irritation. Harmful if absorbed through skin.	Do not apply directly to water.
14	Sethoxydim	Poast, Poast Plus	Toxic to aquatic organisms.	Do not apply directly to water.
15	Triclopyr (amine)	Garlon 3A	Highly mobile in water.	Be aware of potential for groundwater contamination in porous soils.
16	Triclopyr (ester)	Garlon 4	Highly mobile in water. The major metabolite (TCP) is toxic to fish.	Do not apply directly to water.

Intra-Service Section 7 Biological Evaluation Form Region 3

Originating Person: _____ Date Submitted: _____

Telephone Number: _____

For assistance with section 7 reviews, go to Region 3's Section 7 Technical Assistance website:
<http://www.fws.gov/midwest/endangered/section7/s7process/>

I. Service Program and Geographic Area or Station Name:

II. Location: Location of the project including County, State and TSR (township, section & range):

III. Species/Critical Habitat: List federally-listed, proposed, and candidate species or designated or proposed critical habitat that may occur within the action area:

IV. Project Description: Describe the proposed project or action, including all conservation elements. If referencing other documents, prepare an executive summary. Include map and photos of site, if possible. (Attach additional pages as needed):

V. Determination of Effects:

A. Description of Effects: Describe how the action(s) will affect the species and critical habitats listed in item III, including how Part IV conservation elements benefit or avoid adverse effects. Your rationale for the Section 7 determinations made below (VB.) should be fully described here.

B. Determination: Determine the anticipated effects of the proposed project on species and critical habitats listed in item III. Check all applicable boxes and list the species (or attach a list) associated with each determination. **For assistance with making appropriate Section 7 determinations, go to Region 3's Section 7 Technical Assistance website:**

<http://www.fws.gov/midwest/endangered/section7/s7process/>

Determination

No Effect: This determination is appropriate when the proposed project will not directly or indirectly affect (neither negatively nor beneficially) individuals of listed/proposed/candidate species or designated/proposed critical habitat of such species. No concurrence from ESFO required.

May Affect but Not Likely to Adversely Affect: This determination is appropriate when the proposed project is likely to cause insignificant, discountable, or wholly beneficial effects to individuals and designated critical habitat. Concurrence from ESFO required.

May Affect and Likely to Adversely Affect: This determination is appropriate when the proposed project is likely to adversely impact individuals of listed species or designated critical habitat of such species. Concurrence from ESFO required.

Not Likely to Jeopardize candidate or proposed species/critical habitat: This determination is appropriate when the proposed project is not expected to jeopardize the continued existence of a species proposed for listing or a candidate species, or adversely modify an area proposed for designation as critical habitat. Concurrence from ESFO required.

Likely to Jeopardize candidate or proposed species/critical habitat: This determination is appropriate when the proposed project is reasonably expected to jeopardize the continued existence of a species proposed for listing or a candidate species, or adversely modify an area proposed for designation as critical habitat. Concurrence from ESFO required.

Certification decision tree for Fish and Wildlife Service employees and volunteers who apply pesticides.

*As identified on product label. EPA classifies pesticides into two categories: General use pesticides and restricted use pesticides. Restricted use pesticides may be applied only by or under the direct supervision of trained and certified applicators.

Example 1 – Frequent or Routine: A Refuge Operations Specialist spends a minimum 8 hours each week during the field season, mixing, loading and applying herbicides using backpack spray, tractor/ATV mounted boom spray and other methods. The ROS is exposed weekly to a variety of herbicides. In addition to applying herbicides, the ROS is responsible for supervision of other employees and volunteers who occasionally are tasked with application of herbicides. This supervision includes briefing employees and volunteers on safety and the responsible use of herbicides.

Example 2 – Infrequent: A Biologist carries a spray bottle of Roundup® with them during a weekly survey of the refuge boundary for invasive plants. The Biologist has been previously briefed by an ROS who is a State Certified Pesticide Applicator on the safe and appropriate uses of Roundup®. If the Biologist encounters an invasive plant, she sprays it with Roundup®.

Example 3 – Infrequent: Once a month a group of volunteers under the supervision of a Biologist who is a State Certified Pesticide Applicator are briefed on the appropriate use of Roundup® and are provided the appropriate personal protective equipment to apply Roundup®. The volunteers are directed to a portion of the refuge, and under the supervision of the Biologist they spend the day cutting and stump treating buckthorn using handheld spray bottles.

R3 STATE PESTICIDE APPLICATOR CERTIFICATION INFORMATION

Service and Regional policy require State Pesticide Applicator certification for employees or volunteers who frequently apply pesticides or who supervise the application of pesticides by others. State certification regulations vary considerably however. In some states, all applicators may require certification. In others, certification may not be required by state regulations or the regulations regarding refuge applications may be somewhat vague.

To best address these variations and to potentially improve the safety and effectiveness of their invasive species program, Project Leaders, in consultation with their Area Supervisor, are authorized to require State certification for all applicators at their field station(s).

A general guide to the individual state certifications that comprise Region 3 and a few appropriate links are provided below. Please be sure to consult current state regulations for specific information.

1. ILLINOIS

Specific state certification requirement for all applicators: YES

- *“Persons applying general-use or restricted-use pesticides in the course of employment must have a commercial applicator's license.”*

WEBSITE: <http://www.agr.state.il.us/Environment/Pesticide/training/privappl.html>

2. INDIANA

Specific state certification requirement for all applicators: NO

- *“A person who is not a licensed public applicator may use a pesticide if the person is under the direct supervision of a licensed public applicator.”*

WEBSITE: <http://www.in.gov/legislative/ic/code/title15/ar16/ch5.html>

3. IOWA

Specific state certification requirement for all applicators: YES

- *“A license is required for any state or county agency, municipal corporation, or any other governmental entity which during regular operating procedures performs or supervises pesticide applications (either non-restricted or restricted pesticides).”*

WEBSITE: http://www.iowaagriculture.gov/Pesticide/forms/001_A_REV.pdf

4. MICHIGAN

Specific state certification requirement for all applicators: YES

- Requirement for individuals *“to be either a certified pesticide applicator or registered applicator to apply a pesticide for a commercial purpose or in the course of his or her employment.”*

WEBSITE: http://www.michigan.gov/mda/0,1607,7-125-1569_16988_35289-11999--,00.html

5. MINNESOTA

Specific state certification requirement for all applicators: No

Misc. Information:

- Two types offered:
- *“Commercial pesticide applicator licenses are for pesticide applicators who apply any pesticide (including herbicides) “for hire”. For hire means you charge or invoice for the service.”*
- *“Noncommercial licenses are for all pesticide applicators that apply restricted use pesticides (RUP) as part of their job on property owned or contracted by their employer.”*

WEBSITE: <http://www.mda.state.mn.us/licensing/licensetypes/pesticideapplicator/licreqs.aspx>

6. MISSOURI

Specific state certification requirement for all applicators: Perhaps

Misc. Information:

- *“General-use pesticides may be used by anyone, so long as the pesticide is used only on lands owned or rented by that person or that person's employer. Pesticides that are classified as general use are not expected to cause adverse effects to humans or the environment if they are used in accordance with label directions.”*
- Six different types of licenses

WEBSITES: <http://extension.missouri.edu/publications/DisplayPub.aspx?P=G855>

<http://mda.mo.gov/plants/pesticides/licensing.php>

7. OHIO

Specific state certification requirement for all applicators: No

Misc. Information:

- *“Ohio law allows nonlicensed users to operate if they are under the direct supervision of a licensed applicator. The licensed applicator must work for the same business or agency and have a supervisory role. However, the nonlicensed applicator must be a trained serviceperson.”*

WEBSITE: <http://pested.osu.edu/commfaq.html>

8. WISCONSIN

Specific state certification requirement for all applicators: Ground: No

Aquatic: Yes

Misc. Information:

- *“You must be certified if you apply or direct the use of restricted-use pesticides, pesticides on a for-hire basis, pesticides in public schools or on school grounds, or pesticides in aquatic environments”*
- Two types offered, Private and Commercial Applicator.

WEBSITE: <http://ipcm.wisc.edu/pat/Certification/tabid/94/Default.aspx>

Laundrying Procedures for Pesticide Contaminated Clothing

1. **Label/MSDS** - Always be aware of the pesticide that was used and ALWAYS read the label prior to laundrying.
2. **Pesticide-Soiled Clothing** shall be removed outdoors and away from traffic paths to prevent the transfer of chemicals on shoes.
3. **Heavily contaminated** pesticide-soiled clothing shall be disposed of and not washed.
4. If a **granular pesticide** was used, all pockets and cuffs should be emptied. Remove as much of the pesticide as possible from garments at this time to lessen the chance of contaminating the washing machine.
5. **Storage** - Store Pesticide Clothing in a sealed labeled container and not with any other materials to be washed.
6. **Gloves** - Unlined rubber gloves shall always be worn when handling and laundrying pesticide-soiled clothing. Carefully wash the gloves in hot water after each use and store and use them ONLY for this purpose.
7. **Pre-rinsing** is a very important step as it helps to remove pesticide residue. Pre-rinsing can be done by:
 - a. Presoaking in a suitable container before washing;
 - b. Pre-rinsing with agitation in an automatic washing machine;
 - c. Spraying or hosing garment(s) outdoors.
8. **Load Size** - Wash **small loads** of pesticide contaminated clothing with the washer setting on **large load/high level**. The more water used the better. Large amounts of water aid in thoroughly flushing pesticides from fabrics. Using a full washer also decreases the possibility that a pesticide would be redeposited back on the fabric.
9. **Use hot water**. Washing in hot water removes more pesticides from clothing. Avoid cold-water washing! Although cold-water washing might save energy, research has shown that cold water is relatively ineffective in removing pesticides from clothing.
10. **Laundry Detergent** – Most Laundry detergents are similarly effective in removing pesticides from fabric in the pesticide is not oil based. Oil based (emulsifiable concentrate) pesticides should use a Heavy-Duty liquid detergent.
11. **Washer Cleaning** – Small amounts of pesticides residue will remain in the washing machine after the cycle is over, so it's important to rinse the washing machine setting the cycle used for laundrying the soiled clothing and run the machine an extra cycle.
12. **Line Drying** – Line dry the clothes to keep from contaminating the dryer. Sunlight and air movement will aid in decomposing or breaking down any pesticide residue not removed during laundrying.

13. **Other equipment** – Wash hard hat, goggles, respirator, gloves and neoprene boots in hot, soapy water after each use. Store the clean articles away from where pesticides are stored.

Appendix A

Region 3 Treated Seed

Incorporation Monitoring Statement

Refuge or WMD:

Name of FWS representative inspecting the field(s):

Title of FWS representative inspecting the field(s):

Description and acreage of area to be planted with treated seed:

Purpose of the planting:

Trade and Active Ingredient Name(s) of seed treatment:

Pesticide Use Proposal number(s):

Date(s) of planting:

Date(s) of inspections:

Date and time of final comprehensive inspection:

I certify: (check all that apply)

a) ___ refuge staff conducted random field spot checks when the treated seeds were being planted

b) ___ all crop seeds were planted in-furrow or picked-up and removed or replanted underground immediately.

c) ___ a final comprehensive inspection was made after planting was completed and no uncovered treated seeds remain on Refuge/WMD lands.

U.S. Fish and Wildlife
Service
Headquarters Guidance for Pesticide Use
Proposals

Pesticides are one tool to manage pests on U.S. Fish and Wildlife Service (Service) facilities. Pesticides may also be used by Service staff when working cooperatively to restore habitat off- refuge. Some pesticides can potentially cause adverse effects to non-target resources. The Service uses Pesticide Use Proposals (PUPs) to document pesticide use and to help ensure we select and use pesticides with the least risk to non-target resources while still achieving pest management objectives. The Service Director has delegated approval for most pesticide use to the Regions. For those pesticide uses that pose the greatest risk of causing adverse effects to non-target resources, PUPs are submitted to the Service’s National Integrated Pest Management (IPM) Coordinator for review/(dis)approval. For more information, consult the Service’s Integrated Pest Management Policy, 569 FW 1 and the Departmental IPM Policy 517 DM 1.

Restricted Use Pesticides The U.S. Environmental Protection Agency (EPA) classifies pesticides into two categories: restricted use pesticides (RUP) and general use pesticides. A RUP is a pesticide that is available for purchase and use only by certified pesticide applicators or persons under their direct supervision. The EPA classifies a pesticide as a RUP when it has determined that the pesticide may generally cause unreasonable adverse effects on the environment, including injury to the applicator, even when used in accordance with the label. RUPs require Headquarters review/(dis)approval, except where the National IPM Coordinator has worked with Regional IPM Coordinator and adequate documentation is provided to ensure that site-specific mitigation for potential adverse effects to non-target resources is implemented at the time of application.

Specific pesticide use cases:

Chlorophacinone and Diphacinone: When used in full accordance with the label(s) for the following uses:

- endangered species protection,
- near facilities, new tree plantings, and
- on lawns using bait bars or a trigger-equipped bait applicator that places the
- pesticide in the mammal’s main tunnel,

may be approved at the Regional level if IPM control methods including but not limited to flooding, exclusion devices, and barn owl housing, are considered as alternatives and implemented, if appropriate. Applicators must immediately seal probe holes used to place bait with sod, rock, or other material to exclude entry by non-target animals.

Rotenone used as a pesticide in closed loop, impermeable layer lined, artificial

systems in full accordance with all registration label requirements may be approved at the Field station level.

Zinc Phosphide placed within rodent burrows using drip-proof methods (1) when there is a documented human safety or human health concern and (2) staff cannot safely or feasibly achieve rodent control with non-pesticide methods and may be approved at the Regional level.

Other RUPs that require National IPM Coordinator review/(dis)approval:

Any proposed uses (includes all ground and aerial) of **acetochlor, atrazine, bentazon, bromacil, diuron, EPTC, metolachlor, metribuzin, norflurazon, prometon, simazine, and trifluralin** due to their high leaching potentials, toxicological profiles, and/or frequent detections in surface or groundwater;

Tank Mixes: All tank mixes of two or more restricted use insecticides, nematicides, or miticides or any other non-herbicide combinations.

General Use Pesticides

EPA classifies a pesticide, or the particular use or uses of the pesticide, as a General Use Pesticide, if the pesticide generally will not cause unreasonable adverse effects on the environment. In many cases, EPA does not require a certified applicator to purchase or apply a General Use Pesticide (agencies' policies and individual states may differ on this). The Service encourages Service staff to become Certified Pesticide Applicators. All who apply pesticides on Service lands must have training and certification as required by federal and state laws.

General Use Pesticides that require National IPM Coordinator Review:

Mosquito Management. PUPs for mosquito management with the following proposed uses must receive National IPM Coordinator, or designee, review and (dis)approval:

- 1). Larvicide temephos (Abate®)
- 2) Adulticides (malathion, naled, all pyrethrins, and pyrethroids)
- 3) Applications of surface films (e.g., Agnique® MMF) to areas that are 1,000 square meters (0.1 ha) or larger.

General Use Pesticides “exempt” from National IPM Coordinator Review/(Dis)Approval:

Ground and Aerial Applications. If Regions have implemented documented, quantitative IPM approaches including no-spray buffers around sensitive habitats and non-target organisms, then ground and aerial applications of general use pesticides do not require National IPM Coordinator review/(dis)approval.

Tank Mixes: If label requirements are followed, including and appropriate compatibility testing, tank mixes of General Use Pesticides do not require National IPM Coordinator review/(dis)approval.

General Use Aquatic Herbicides. All general use aquatic herbicides with a LC₅₀ greater than 50 mg/L toxicity to aquatic life are exempt from National IPM Coordinator review/(dis)approval. For example, some herbicides that are harmful to aquatic life at labeled application rates, like 2, 4-D ester formulations, require Headquarters review. *Warning:* Aquatic pesticides, particularly herbicides, have the potential to create low dissolved oxygen conditions, which can cause fish kills.

Mosquito Management. Larvicides containing *Bacillus thuringiensis israelensis* (Bti), *Bacillus sphaericus* (e.g., VectoLex®), and methoprene (e.g., Altosid®) are exempt from National IPM Coordinator review/(dis)approval

General:

Pesticides with a High Leaching or Runoff Potential. All pesticides with a high potential to leach to groundwater or runoff to surface waters or which have been frequently found in surface or groundwater (listed in Table 1 in this document) require Headquarters review/(dis)approval if the proposed use is in any one of the following conditions:

- leachable soils (less than 2% organic matter)
- the depth to water table 10 feet or less
- the underlying bedrock has high infiltration (e.g., limestone bedrock).

Elevated Pesticide Concentrations in Surface Waters. If a refuge has drinking or surface waters with reported pesticides at possible risk levels to humans, aquatic plants, animals or other wildlife future use of these pesticides will require Headquarters review. Refuges can generally learn of elevated pesticide concentrations in their waters through Clean Water Act section 303(d) lists, U.S. Geological Survey reports, and literature searches conducted by the National Conservation Training Center (NCTC) or searching using the names of water, their state and/or county, plus "pesticide OR herbicide."

High Probability of Adverse Impacts to Non-Target Organisms. Pesticides (see Table 1) with a high probability of adversely impacting non-target organisms based on toxicity, persistence, exposure potential, or site-specific conditions of the proposed applications require Headquarters review/(dis)approval, unless regions document an IPM approach and impose site-specific mitigation

Petroleum-Based Pesticides and Solvents. All petroleum-based pesticides applied to water or wetlands and all pesticides with benzene, ethyl benzene, toluene, xylene, or polycyclic aromatic hydrocarbons (e.g., naphthalene) listed as active, inert, or other ingredients require Headquarters review/(dis)approval.

Insecticide and Fungicide Seed Treatments. Insecticide and fungicide seed treatments require Headquarters review/(dis)approval unless the Region ensures that all treated seed is incorporated beneath the soil surface and no treated seeds remain on the ground.

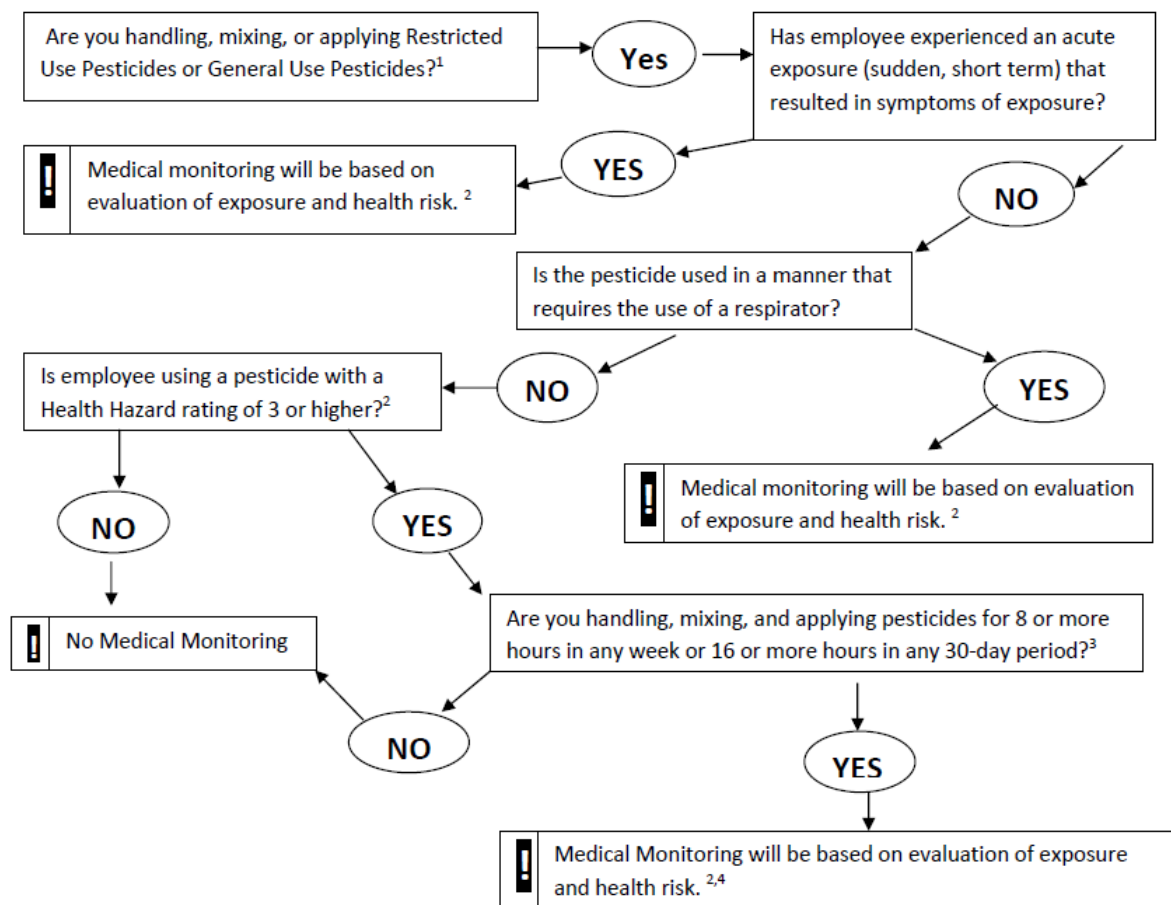

- It is a violation of the Federal Insecticide, Fungicide, and Rodenticide Act to use a product in a manner inconsistent with its labeling. The conditions in this document do not substitute for pesticide registration label instructions or state specific regulations.
- Regions always have the option to submit any PUP to Headquarters review/(dis)approval. Regions can confer with the Headquarters on any PUP under development, regardless of whether that PUP requires Headquarters review/(dis)approval.
- Any mention of specific products does not constitute endorsement by the U.S. Fish and Wildlife Service.
- Factors to consider when analyzing any pesticide use proposal are the persistence and toxicity of the product and the potential for exposure to non-target organisms.

TABLE 1*. HERBICIDES, FUNGICIDES, AND GROWTH REGULATORS OFTEN FOUND IN SURFACE AND/OR GROUND WATER AND/OR HIGHLY LIKELY TO LEACH AND PERSIST UNDER SOME CIRCUMSTANCES OR CAUSE NON-TARGET IMPACTS.

2,4-D	Daminozide	Molinate
Acetochlor	Dicamba	Napropamide
Acifluorfen	Dichlorprop, 2,4 -DP	Napthalam
Alachlor	Diclofop	Norflurazon
Ametryn	Diethatyl-ethyl	Pebulate
Amitrole	Diphenamide	Pendimethalin
Asulam	Diuron	Picloram
Atrazine	EPTC	Prometon
Bensulide	Ethofumesate	Prometryn
Bentazon	Hexazinone	Propachlor
Brodifacoum	Imazapyr	Propazine
Bromacil	Imazaquin	Pyrazon
Butylate	Imazethapyr	Siduron
Chloramben	Linuron	Simazine
Chlorpropham	Maleic Hydrazide	Sulfometuron
Chlorsulfuron	MCPA	Tebuthiuron
Clomazone	MCPB	Terbacil
Clopyralid	Metalaxyl or Mefenoxam	Thibencarb
Clothianidin	Metolachlor	Triclopyr
Cyanazine	Metsulfuron	Trifluralin
Cycloate	Metribuzin	Vernolate

* Table 1 should guide Regions to develop site-specific application restrictions as needed to protect against potential ground and surface water contamination or non-target impacts.

Medical Surveillance of Fish and Wildlife Service pesticide applicators and volunteers decision tree

1. Pesticides with a health hazard rating of 1 or 2 have no restrictions other than what the manufacture requires on the label/MSDS. Employees are not placed in a medical monitoring program. They may be entered into program if they experience an acute exposure that results in symptoms.

2. The Regional Safety Manager, Project Leader/Supervisor/Manager, and occupational health professional(s) shall make decision about medical monitoring based on pesticide specific health risks, how pesticide is being applied, potential route of entry, potential risks from other pesticide-related activities and individuals' health and fitness.

3. Frequent Pesticide Use means when a person applying pesticides handles, mixes, or applies pesticide, with a Health Hazard rating of 3 or higher, for 8 hours in any week or 16 or more hours in any 30-day period. We consider any less frequent pesticide use to be infrequent use and employees are not placed in a medical monitoring program. They may be entered into program if they results in experience an acute exposure that symptoms.

4. Employees that are not recommended for medical monitoring can request a review of the decision. This request must be made in a written or e-mail format and sent to their Supervisor with a copy to the Regional Safety Office. Requests should include a brief explanation as to why the employee feels medical monitoring is necessary.

Appendix N: 2014 Region 3 Farm Program Guidance

I. Farming Program Plan

1. The use of farming as a management tool must be justified and managed as defined within a specific Farming Program Management Plan (FPMP) that supports the biological purposes for that unit and the biological integrity, diversity, and environmental health policy of the National Wildlife Refuge System and incorporates the current Region 3 Farm Program Guidance.
 - A. Each station's FPMP will be completed and submitted to the Area Supervisor for approval by January 1, 2015. This plan will remain in effect until significant changes in the station's farm program trigger an update.
 - B. This station-specific plan may be a stand-alone plan or incorporated as an appendix into a draft Comprehensive Conservation Plan (CCP) or Habitat Management Plan (HMP).
 - i. All HMPs currently in the development process for stations with a farming program will have an associated station-specific FPMP included.
 - C. Stations utilizing force account farming (without the use cooperators) must follow the sections of the Farm Program Guidance pertaining to their farming program and must still complete a FPMP as described in I.1.

II. Selection of Farming Permittees

The Region 3 farming team recognizes the fact that the Refuge Manual (5 RM 17 Administration of Special Uses) addresses the following selection processes. However, the following recommendations are more restrictive to ensure a regionally consistent and transparent farming program.

1. Beginning in calendar year 2015, selection of farming permittees will be from one of the following three options:
 - A. Competitive Bid Process (recommended over other solicitation methods)
 - i. All parameters and special conditions/requirements shall be included in the announcement. This will preclude the need for any deductions as applicants for the farming opportunity will be offering their sealed bid based on the known special use conditions and other requirements.
 - ii. The announcement shall ensure that the opportunity to farm on USFWS lands is fairly distributed.
 - iii. All sealed bids will be opened on the same day at a time and place open to the public.
 - iv. The Refuge or District reserves the right to reject any or all bids. Appropriate justification and documentation is required if this action is pursued.
 - B. Lottery Process

- i. All parameters and special conditions/requirements shall be included in the announcement.
- ii. The announcement shall ensure that the opportunity to farm on USFWS lands is fairly distributed.
- iii. See Section III for establishment of farming rates.
- iv. Specific deductions that would deviate from the determined prevailing rate that will apply to the individual USFWS farm unit must be determined prior to and be part of the announcement for the farming opportunity. (See Section IX In-Kind Services for further guidance.)
- v. The actual drawing for the permittee will be conducted at a time and place open to the public.
- vi. The Refuge or District reserves the right to reject any or all permittee selections. Appropriate justification and documentation is required if this action is pursued.

C. Priority System

- i. After completing the bid or lottery process and a permittee has not been obtained, the refuge manager may utilize a priority system as described in Refuge Manual Chapter 5 RM 17 – Administration of Specialized Uses.
 - ii. In certain site-specific situations, the priority system may be utilized initially with sufficient justification and prior approval (concurrence) from the Area Supervisor.
 - iii. See Section III for establishment of farming rates.
2. The selection process will be conducted at least once every five years, after the initial selection process is completed.

III. Establishment of Farming Rates

1. Through a Competitive Bid Process, the local market sets the farming rates.
2. The USFWS office shall establish the farming rate by consultation with other public agencies or agricultural extension agents within that county. This includes crop share rates and average cash rental rates. Documentation of this process is required.
3. Coordination with public agencies or agricultural extension agents to determine farming rates will be made prior to Special Use Permit renewal to reflect rate changes.

IV. FSA Program Guidance

1. Cooperative farmers (permittees) operating on NWR's/WMD's may enroll and participate in Farm Service Agency (FSA) programs.

2. Project Leaders are responsible for knowing if permittees are enrolled in any FSA programs for refuge system lands and, if enrolled, are receiving appropriate payments.
3. Project Leaders should provide local FSA office(s) with a copy of each farming special use permit for each crop year to use when calculating benefits based on the share split agreed upon in the special use permit.
4. Project Leaders have the option of working with the FSA office to eliminate/reduce base acres to take all/some refuge system tracts out of FSA programs.

V. Special Use Permits Required for Administering Farming Programs

The Region 3 team acknowledges that there is a farming agreement form in the Refuge Manual but we are striving for consistency among commercial activities on refuge lands.

1. A Special Use Permit (SUP) (FWS Form 3-1383-C) will be used to administer farming agreements on Region 3 FWS stations. The following site can be used to access the appropriate SUP:
<http://www.fws.gov/refuges/visitors/permits.html>
2. The SUP will be signed by the refuge manager.
3. All attachments to the SUP must be signed and dated by the permittee.
4. Any changes to the existing original SUP must have prior approval by the refuge manager and permittee and must have a signed and dated addendum to document such changes.
5. Issuance of SUPs on annual basis is recommended.
6. The refuge manager is authorized to issue SUPs for multiple years if warranted under the following stipulations.
 - A. Refuge manager **will not** be required to get Refuge Supervisor approval for multiple year permits up to three years.
 - B. Refuge manager **will** be required to get Refuge Supervisor approval for permits proposed to last four or five years.
7. If SUPs are issued for multiple years, the permits will be reviewed annually.
8. If the SUP is written for multiple years, then specific language **will be** required in the special conditions of the permit, as indicated in Section XI.7.
9. Refuge manager should take measures to ensure that permittees understand general conditions and requirements prior to issuing the SUP.
10. Refuge manager is responsible for monitoring activities of the permittee to assure adherence to the SUP conditions and take corrective actions if needed.

VI. Farming on newly acquired properties with land use rights in purchase agreements

1. Upon approval of the Region 3 Farm Program Guidance (2014) , the following will apply to newly acquired lands in R3.
 - A. When the Service is purchasing either fee title or easements, Realty negotiations with willing sellers for all new lands will include the following in reference to agricultural land use rights. (This will require the realty specialist and refuge manager to work closely together to make sure the landowner understands the requirements of the policy.)
 - i. The landowner/tenant is exempt from Region 3 farming policy through December 31 of the acquisition year.
 - ii. If the purchase agreement allows the landowner agricultural land use rights beyond December 31 of the purchase year then the former landowner/tenant will be required to follow all Region 3 Farming Policies. In this case, the refuge manager **will not** be required to get Area Supervisor approval to select the former landowner/tenant as the cooperative farmer, since the agricultural land use provision is in the purchase agreement. However, the refuge manager will be required to inform the Area Supervisor that the former landowner/tenant is the permittee.
 - iii. If the purchase agreement does not state the landowner retains agricultural land use rights into subsequent years, but the refuge manager wants to have the former landowner/tenant farm the property, then the refuge manager can use the Priority System for selection with Area Supervisor approval.
 - B. In the case that the land is being donated or transferred to the Service from another agency (federal or state), NGO or other partner, either in fee title, lease, easement, cooperative agreement or other legal instrument, existing agricultural agreements with the cooperator/farmer will be honored. The permittee will be exempt from Region 3 Farm Program Guidance through December 31 of the acquisition year. R3 Farming Policies will apply in the subsequent years covered by the initial farming agreement.

VII. Pesticide Use

The term pesticide is inclusive of both herbicides and insecticides.

1. Refuge managers must adhere to the current Region 3 Pesticide Use Policy.
2. Refuge managers are encouraged to minimize number and quantity of pesticides used.
3. An approved Pesticide Use Proposal (PUP) is required for every pesticide used prior to application.
4. Refuge managers are authorized to approve PUPs of one-year duration for ground applications of pesticides containing the active ingredients on the current field station approval list according to current regional guidelines and all label conditions.
5. Pesticide use will be limited to the Field Station Approval List unless refuge manager provides justification to the Area Supervisor and receives written concurrence prior to initiating a PUP for pesticides not on the current Field Station Approval List.

6. A valid Intra-Service Section 7 Consultation Form (coordinate with Ecological Services office as appropriate) must be completed and attached to the current year's PUP for each pesticide used.
7. A copy of the approved PUP must be provided to permittee prior to application of that pesticide.
8. Neonicotinoid treated seed guidance:
 - A. Refuge Managers will exhaust all alternatives before allowing the use of neonicotinoid treated seeds on National Wildlife Refuge System Lands in 2014 and 2015.
 - B. Refuge managers need to eliminate the use of neonicotinoid treated seed on National Wildlife Refuge System Lands in Region 3. The strategy is to start the transition in calendar year 2014 and be "neonicotinoid seed free" in calendar year 2016. In 2014 and 2015 there will be some flexibility for the transition and take in to account the availability of non-treated seed. During the two transition years refuge managers will need to have an approved PUP before allowing the planting of neonicotinoid treated seed on refuge lands under their management. Please give special attention to the "justification" section of the PUP. The PUP will become part of the official record and should clearly state the need to use treated seed during this transition period. Refuge Managers must provide justification to the Area Supervisor and receive written concurrence prior to initiating a PUP for the use of neonicotinoid treated seeds (see VII.5.).
 - C. All crop seeds treated with neonicotinoid chemicals must be planted (incorporated) beneath the soil surface due to having a high toxicity to birds. No residue seeds can be left above ground. Any treated seeds that are spilled and/or left above ground at the time of planting must be picked-up and removed or replanted underground immediately. The refuge/district must conduct random field spot checks at the time in which these treated seeds are planted in order to best ensure that the treated seeds are planted beneath the soil surface. To accommodate this process, any Region 3 field station that uses neonicotinoid treated seed must complete a Region 3 Treated Seed Incorporation Monitoring Statement (Appendix A). This Statement will document that all treated seed has been incorporated beneath the soil surface, thus adhering to Service policy. This guidance also applies to fungicide treated seed as indicated in the Region 3 Pesticide Use Policy.
 - D. Seeds treated with neonicotinoid chemicals are listed as toxic to aquatic invertebrates. Therefore, field stations using neonicotinoid treated seeds must develop specific Best Management Practice guidelines to be included in the submitted PUP and implemented in the special use conditions of the SUP.
 - E. Seed treatment chemicals cannot be mixed or applied to the crop seeds on refuge/district lands. Seeds must be treated off-site.
 - F. Neonicotinoids are a class of insecticides chemically similar to nicotine. They are marketed and distributed in various forms including sprays, powders and seed treatments. Trade names containing neonicotinoids may include (but are not limited to) Acceleron®, Acetamiprid®, Actara®, Adage®, Adjust®, Admire®, Advantage®, Alpine®, Arena®, Assail®, Belay®, Calypso®, Celero®, Centric®, Clutch®, Confidor®, Cruiser®, Dinotefuran®, Encore®, Flagship®, Gaucho®, Helix®, Inside®, Intruder®, Legend®, Merit®, Meridian®, Nipsit®,

Platinum[®], Poncho[®], Pravado[®], Premise[®], Regent[®], Safari[®], Scorpion[®], Titan[®], Touchstone[®], Tristar[®], and Venom[®].

Active ingredients include: *acetamiprid, clothianidin, dinotefuran, imidacloprid, nithiazine, sulfoxaflor, thiacloprid, and thiamethoxam.*

9. Refuge manager may require permittee to provide notification prior to all pesticide applications.
10. Refuge manager should evaluate posting of fields after pesticide application.

VIII. Use of Genetically- Modified (GMO) Crops

1. All use of genetically-modified crops will occur under the guidance of the 2011 Regional Environmental Assessment (Use of Row Crop Farming and Genetically-modified, Glyphosate-tolerant Corn and Soybeans on National Wildlife Refuges and Wetland Management Districts)
2. The use of genetically-modified crops will be limited to genetically-modified, glyphosate-tolerant (GMGT) corn and soybeans.
3. The use of GMGT corn and soybeans will be allowed only for the purpose of habitat restoration.
4. The use of GMO crops is not allowed for any other farming purposes, including, habitat management, supplemental food, and attracting wildlife for viewing and photography.
5. The use of GMGT corn and soybeans would be limited to five years for any individual tract in preparation for habitat restoration.
6. Refuge Managers are required to demonstrate that their proposed use of GMGT crops is essential for habitat restoration.
 - A. Refuge Managers proposing to use GMGT crops must complete an Eligibility Questionnaire for Genetically Modified Crops.
 - B. The Regional Chief of Refuges will review all requests for authorization to use GMGT corn and soybeans and will approve or deny requests based on the Questionnaire.
7. Refuge Managers proposing to use GMGT crops must have a current farming compatibility determination that addresses the use of GMGT crops for habitat restoration.

IX. In-Kind Services

1. Definition of in-kind services: Actions required of the permittee outside of the actual farming process of site preparation, planting, tending, and harvesting of crops that would typically be covered by station funds.
2. In-kind services are only allowed if related to the farming program on the specific unit in which the farming activity occurs as defined in the station's FPMP.

3. These are acceptable in-kind services:
 - A. Routine maintenance of refuge farm fields such as mowing or spraying field edges to reduce noxious weed encroachment (IPM technique).
 - B. Routine maintenance of refuge farm roads and access points that are associated with the specific farm field, which are only open to refuge staff and the cooperative farmer(s).
 - C. BMPs such as establishment of grass waterways, buffer strips, and/or fire breaks in order to better manage refuge agricultural fields.
4. Consult with Area Supervisor on other proposed in-kind services.
5. In-kind services will be identified in the SUP and the station FPMP.
6. Stations that wish to utilize in-kind services as part of their farming operations are required to have Standard Operating Procedures (SOP) for administering in-kind services included in their FPMP and must use one of the two following methods;
 - A. In the lottery or priority permittee selection methods, the acceptable in-kind services may be identified in the SUP and the refuge manager may choose to allow appropriate deductions for these services.
 - B. The competitive bid process for permittee selection is recommended if the cost for in-kind services resulting from IX.4. is to be considered in an SUP. However, with Regional Chief approval, the refuge manager may also apply appropriate deductions for these in-kind services for SUPs associated with lottery or priority system permittee selections.
7. Refuge manager will document the process (see 5 RM 17 and 6 RM 4).

X. Best Management Practices (BMPs)

1. The goal of Region 3 field stations should be to provide leadership in the implementation and demonstration of BMPs and other conservation practices in the farming program.
2. Each station with a farming program must document BMPs for their station in a habitat management plan, farm plan, or station SOP and must identify BMPs in special conditions of SUPs.
3. Refuge managers must coordinate with local extension office to develop site-specific BMPs.
4. Refuge managers are encouraged to implement sustainable agricultural practices.

XI. Standard Special Conditions to Be Included in All SUPs:

1. Permittees are required to implement and/or maintain site specific BMPs:
 - A. *[INSERT LIST]*
2. An approved Pesticide Use Proposal is required before pesticide application and permittee is required to follow the associated guidelines.

3. Managers must use one of the statements below:
 - A. **For habitat restoration:** The only GMO crops allowed are glyphosate-tolerant corn and soybeans.
 - B. **For all other purposes:** GMO crop use is not allowed.
4. No neonicotinoid-treated seed can be used (this statement to be included when the use of neonicotinoid treated seeds has actually ceased on the station in 2014, 2015, or 2016).
5. Permittee is required to report pesticide use by [INSERT DATE].
6. Permittees are required to notify refuge manager if enrolled in FSA program(s).
7. If the SUP is written for multiple years then the following language is required:
 - A. The permittee agrees that agricultural crops of the type and acreages must be planted, cultivated, and harvested in accordance with special conditions specified above during the first year of operation. If this agreement is for more than one year the conditions (to include but not limited to) type of crop, acreage, herbicide use, approved seed treatment, etc. may be altered or modified annually, following the first year of operation. Changes in the agreement must be made prior to planting season by an addendum, which is attached to and becomes part of the agreement.
 - i. The Service must provide the permittee those changes to the agreement prior to [INSERT DATE] by a written addendum.
 - ii. The permittee then has until [INSERT DATE] to accept or turn down those changes.
 - iii. If the changes are agreed upon by the permittee, the addendum is signed and attached to the SUP and becomes part of the agreement. If the changes are not accepted, the selection process will begin again.
8. **Suggested:** Permittee may be required to post fields after pesticide application.
9. **Suggested:** Permittee will provide notification prior to pesticide application.
10. **Suggested:** A seed label for all crops planted must be provided to the refuge manager no later than two weeks prior to planting.

XII. Regional Office Support and Monitoring

1. Regional Office will provide an Annual Pesticide Use Policy and associated field approval list in January of each year even if there are no changes.
2. Regional Office should conduct a certain level of monitoring of submitted field station PUPs.
3. Regional Office will disseminate newly acquired lands farming guidance to realty specialists to include in purchase agreements and initial discussion with landowners.

4. Pursue allocating appropriate proportions of collection receipts to the field stations where the collections originated.
5. Regional Office will conduct station farming program reviews on a regular basis to evaluate Regional implementation of the farming guidelines (similar to safety audits).
6. Regional Office will conduct a yearly Project Leader call concerning farming issues at the close of each farming season, preferably in November.
7. Regional Office will evaluate whether there are contracting issues associated with in-kind services
8. The Farm Team is to remain intact and the team charter extended and reconvene at least annually to:
 - A. Address new/additional farming issues
 - B. Amend farming guidelines and provide needed amended language to Regional Management Team by December 31 of each calendar year.
 - C. Assist the Regional Management Team as needed with pertinent farming issues, field reviews and Project Leader conference calls.
9. Regional Office will pursue any needed Solicitor review of suggested guideline that may be required.
10. Regional Office will develop a permanent Sharepoint site to store all pertinent farming documents.

Appendix A
Region 3 Treated Seed
Incorporation Monitoring Statement

Refuge or WMD:

Name of FWS representative inspecting the field(s):

Title of FWS representative inspecting the field(s):

Description and acreage of area to be planted with treated seed:

Purpose of the planting:

Trade and Active Ingredient Name(s) of seed treatment:

Pesticide Use Proposal number(s):

Date(s) of planting:

Date(s) of inspections:

Date and time of final comprehensive inspection:

I certify: (check all that apply)

a) ___ refuge staff conducted random field spot checks when the treated seeds were being planted

b) ___ all crop seeds were planted in-furrow or picked-up and removed or replanted underground immediately.

c) ___ a final comprehensive inspection was made after planting was completed and no uncovered treated seeds remain on Refuge/WMD lands.

Field Inspector Signature:

Date:

Project Leader Signature:
