RESULTS OF SPIRIT LEVELING IN OHIO FOR THE YEARS 1898 TO 1908, INCLUSIVE.

Compiled by S. S. GANNETT and D. H. BALDWIN.

INTRODUCTION.

Scope of work.—The elevations herein given are based on mean sea level. They are determined by precise and primary spirit leveling, adjusted to accord with the adjustment of 1907 by the Coast and Geodetic Survey of the entire net of precise-level lines in the United States. The precise-level net in Ohio is composed of the Coast and Geodetic Survey lines from Belpre west via Cincinnati to the state line, from Toledo south to Cincinnati, from Deshler to Chicago Junction, and from Alliance to Youngstown; the Army Engineers' lines along Ohio and Muskingum rivers; the Baltimore and Ohio Railroad lines from near Lowellville to Chicago Junction and from Warwick to Wheeling; the Pittsburg, Fort Wayne and Chicago Railroad line from East Palestine to Massillon; and lines run by the United States Geological Survey, record of which is given in this bulletin, from Cleveland to Canton, from Ottawa via Roselm and Evansport to Haskins, from Chillicothe to Portsmouth, from Chillicothe to Columbus, and from Columbus to Uhrichsville and Station Fifteen. In the adjustment made by the Coast and Geodetic Survey the weights assigned to the various links of the net were dependent on their length, the method of leveling used, and the comparative results. The recent precise leveling by the Coast and Geodetic Survey, and by the Geological Survey, received the greatest weight and were very little distorted by adjustment, but the railroad lines were considerably altered. The best theoretical value for the junction-point elevations were in most cases not actually adopted, the heights by the 1903 adjustment being allowed to stand where the difference was within the range of uncertainty, thus making less correction to lists already prepared and published. Thus the former elevations on lines from Toledo to Cincinnati, and from Cleveland to Canton, are retained by the Coast and Geodetic

Survey as the adopted elevations by the 1907 adjustment. The elevations adopted in this bulletin for Uhrichsville and points thence to Massillon, Zanesville, and Wheeling differ also from those adopted by the Coast and Geodetic Survey, the result of an easement made to give greater weight to the Baltimore and Ohio Railroad line between Uhrichsville and Wheeling, which was checked by primary circuits of 1908. Descriptions and corrected elevations are given in this bulletin for all standard bench marks previously published for Ohio in Bulletin 185, and in the Appendixes to the Reports of the Director of the United States Geological Survey.

Personnel.—The field work during 1898 to 1902, inclusive, was done under the direction of Messrs. H. M. Wilson and J. H. Renshawe, geographers in charge of eastern and central divisions of topography, respectively, Ohio being then apportioned half to each; that during 1903 to 1906, inclusive, was done under Mr. H. M. Wilson, geographer; that during 1907 was done under Mr. Frank Sutton, geographer; and that during 1908 was done under Mr. W. H. Herron, geographer. The work since January, 1908, was done under the general direction of Mr. R. B. Marshall, chief geographer. Credit is given in the heading of each list to the various levelmen.

The office work of computation and adjustment was principally done by Mr. D. H. Baldwin, topographer, under the immediate supervision of Mr. S. S. Gannett, geographer, and since 1907 under the general direction of Mr. E. M. Douglas, geographer.

Arrangement of lists.—The lists are separated into two classes, precise and primary, distinguishing the degree of refinement in the method of leveling employed, and each list is subdivided so that the results for each quadrangle are combined. The elevations under precise leveling were determined by lines run either in both forward and backward directions or by simultaneous double-rodded lines, a high-grade level and rated rods being used and special precautions being taken in observation and reduction to correct error and make the results continuously good; elevations under primary leveling were determined mostly by single lines run with the Y level, precautions being taken against only the principal sources of error and depending upon the closure of circuits for a check. The allowable limit of error observed on the double simultaneous precise line from Cleveland to Canton, by the Geological Survey, is represented in feet by $0.04/\sqrt{D}$ and the limit observed on the other precise lines run by the forward and backward method was $0.017/\sqrt{D}$, in which D is the distance between bench marks in miles. The limit in feet on primary work is $0.05/\sqrt{D}$, in which D is the length of circuit in miles.

Bench marks.—The bench marks described in the following lists are of three general forms: First, a circular bronze or aluminum

tablet $3\frac{1}{2}$ inches in diameter and one-fourth inch thick, appropriately lettered, having a 3-inch stem cemented into a drill hole, generally in the vertical walls of public buildings, bridge abutments, or other substantial masonry structures. The second form, employed where masonry or rock is not accessible, consists of a hollow wrought-iron post, 4 feet in length and $3\frac{1}{2}$ inches in outer diameter, split at the bottom and expanded to 10 inches, so as to prevent both the easy subsidence of the post and the malicious pulling of it out of the ground. These posts are generally sunk 3 feet in the ground, the iron is heavily coated with asphalt, and over the top of the post is riveted a bronze tablet similar to that described above. The third form consists of a copper bolt 1 inch in diameter and 4 inches long, which is split at one end and expanded in a drill hole in masonry by driving on a brass wedge. But few of this class have been used in this State, and their use has now been discontinued.

The numbers stamped upon the bench marks described in these lists represent the elevations to the nearest foot above mean sea level, as determined by unadjusted levels in the field. The notes have been subjected to changes resulting from the adjustments necessary to close circuits and to those resulting from reduction to mean sea level through readjustment of the precise-level net of the United States. Some of the finally accepted elevations as printed herein therefore differ from those submitted as bench-mark numbers by 1 or 2 feet. This method of numbering bench marks has been adopted where many levelmen are working in the same area at the same time as less liable to lead to confusion in identification of bench marks than any attempt at serial numbering, and because the bench-mark number at the same time gives an approximate statement of the elevation. It is assumed that engineers and others finding these bench marks so stamped in the field will communicate with the Director of the United States Geological Survey in order to obtain the accepted elevation to hundredths or thousandths of a foot. Bench marks established under cooperation are stamped with the state name.

For a complete list of standard bench marks in any quadrangle refer to both precise and primary lists. Descriptions of bench marks in adjoining States, but within the border quadrangles herein listed, are not given in this bulletin, neither are the lists of bench marks of other organizations, though the latter furnish a considerable portion of the main control.

Any person finding bench marks in the following lists mutilated or destroyed will confer a favor by notifying the Director, United States Geological Survey, Washington, D. C.

PRECISE LEVELING.

CANTON, CLEVELAND, AND KENT QUADRANGLES.

CUYAHOGA, STARK, AND SUMMIT COUNTIES.

The elevations in the following list are the result of a line of precise leveling connecting the Lake Survey gage bench mark at Cleveland with bench mark at bridge No. 77 of the Pittsburg, Fort Wayne and Chicago Railroad at Canton. This line and that of the railroad company between Pittsburg, Pa., and Lima, Ohio, were included in the precise-level net adjusted in 1903 by the Coast and Geodetic Survey, and these elevations result from that adjustment, which lowers the original elevation by this line 0.095 foot at Canton with respect to Cleveland. The 1907 adjustment retains these values. The corrections distributed are in proportion to the mileage. The total length of the line is 59.7 miles and the total divergence between the two component lines is 0.076.

The outfit consisted of a Buff & Berger precise level, a light umbrella, two double-faced 10-foot nonextensible double-targeted rods, and four steel turning-point pins. On each rod the target on one face was red with a white strip, and on the other black with a white strip, and they were controlled for rapid setting by steel tapes passing over drums at either end and for fine setting by clamp and tangent screw.

The double-simultaneous method was used. By this method two lines are carried along on separate turning points as follows: The rodmen occupy alternate positions, each setting two pins; the notes on one line are taken by the red targets and those on the other line by the black, and recorded on opposite pages of level book. On one line the foresights are always read first, and on the other the backsights first, and the readings on all four faces are completed before backsight pegs are advanced.

The limit of divergence in feet which this line was required not to exceed was set at $0.04 \sqrt{D}$, in which D represents distance between bench marks in miles.

The leveling was done during part of October and November, 1902, by D. H. Baldwin.

Standard bench marks were recovered in Cleveland and Canton quadrangles and three tablets set by this line in the Kent quadrangle.

BOWLING GREEN, CONTINENTAL, DEFIAE, McCLURE, NAPOLEON, AND OTTAWA QUADRANGLES.

DEFIAE, HENRY, PAULDING, PUTNAM, AND WOOD COUNTIES.

The following are the adjusted results of a precise-level line, beginning at bench mark N_1 at Ottawa and closing on bench mark B_1 at Haskins, bench marks on the precise-level line of the Coast and Geodetic Survey from Toledo to Cincinnati, the elevations of which are accepted as 729.338 feet and 667.702 feet, respectively, as determined by the 1903 adjustment of precise leveling and retained by the adjustment of 1907. The line runs west from Ottawa along the Cincinnati, Hamilton and Dayton Railway to Roselms, thence north along highways to Ridgeville, thence east to Haskins. The total divergence between direct and reverse lines was 0.042 foot in a total distance of 88.7 miles, and the closure at Haskins was +0.025 foot.

The methods of leveling, type of level, and limit of error are those now used by the Coast and Geodetic Survey. To facilitate computation, nonextensible self-reading rods 3.5 yards in length, graduated to hundredths of a yard, were used, instead of metric rods, and these were read by estimation to thousandths, the sum of three thread readings being a mean reading in feet.

The line was leveled independently in both forward and backward directions, broken by temporary bench marks into sections 0.5 mile to 1.25 miles long, and on all sections upon which the forward and backward measures in feet differed more than $0.017\sqrt{D}$ (in which D is the distance between bench marks in miles) forward and backward measures were repeated until a pair run in opposite directions checked within limits. All other requirements necessary to obtain accurate results were closely adhered to.

The leveling was done in 1906 by C. H. Semper. The party consisted of 5 men—1 levelman, 2 rodmen, 1 umbrella man, and 1 recorder.

CHILLICOTHE, OTWAY, PIKETON, SCIOTO, AND WAVERLY QUADRANGLES.

PIKE, ROSS, AND SCIOTO COUNTIES.

The following elevations are the result of a line of precise levels run from Chillicothe south along the Norfolk and Western Railway to Portsmouth, Ohio. The line connects bench mark "Q" of the Coast and Geodetic Survey transcontinental line with a bench mark of the Ohio River survey precise leveling, and, as a result of the 1907 adjustment, the elevation at Portsmouth by this line has been lowered only 0.001 with respect to Chillicothe, but the elevation now accepted at Chillicothe is 0.181 foot less than that formerly computed. The total distance is 49.6 miles.

The method and limit of error used on this line were those adopted by the Coast and Geodetic Survey elsewhere described, but yard rods were substituted for metric, the computation being made in feet. The leveling was done in 1906 by N. A. Campbell and W. H. Monahan in two sections, 21.0 and 28.6 miles, respectively.

CHILLICOTHE, CIRCLEVILLE, AND EAST COLUMBUS QUADRANGLES.

FRANKLIN, PICKAWAY, AND ROSS COUNTIES.

The following are the results of a line of precise levels run from United States Coast and Geodetic Survey bench mark "Q" at Chillicothe along the Norfolk and Western Railway to Columbus. Old bench marks of the double-rodded line of 1899 were recovered and new ones established. As a result of the 1907 adjustment the elevation at Columbus by this line has been increased only 0.001 foot with respect to Chillicothe, the corrections at that place and at Columbus being -0.181 foot and -0.180 foot, respectively, to the unadjusted list based upon the 1903 adjustment elevation at Chillicothe.

The method of leveling, limit of error, and type of level were the same as now used by the Coast and Geodetic Survey. Two self-reading rods were used, 3.2 meters in length, graduated to centimeters and reading by estimation to millimeters; and one large shade umbrella.

The line was leveled independently in both forward and backward directions, broken by temporary bench marks into sections 2 to 3 kilometers long. On all sections upon which the backward and forward measures differed more than $4.0 \text{ mm.} \sqrt{K}$, in which K is the distance between adjacent bench marks in kilometers, both the forward and backward measures were repeated until they came within limits, and all the other requirements necessary to obtain accurate results were closely adhered to. The leveling was done in 1905 by E. L. McNair.

CAMBRIDGE, CUMBERLAND, EAST COLUMBUS, NEW COMERSTOWN, PHILO, THORNVILLE, THURSTON, UHRICHSVILLE, AND ZANESVILLE QUADRANGLES.

FAIRFIELD, FRANKLIN, GUERNSEY, MUSKINGUM, PERRY, AND TUSCARAWAS COUNTIES.

The following are the results of a line of precise leveling from Valley Crossing, near Columbus, to Uhrichsville and Station Fifteen post-office. The line extends from a bench mark on the precise line from Chillicothe to Columbus, and checks at Uhrichsville upon bench mark 48 on the Baltimore and Ohio Railroad precise line from Warwick to Wheeling, a connection also having been made to levels of the Muskingum River Survey of the U. S. Engineer Corps at Zanesville. The introduction of these lines into the precise-level net in the 1907 adjustment had resulted in changing the unadjusted elevations by this line with respect to Chillicothe, +0.001 foot at Columbus, +0.002 foot at Zanesville, and -0.005 foot at Uhrichsville, all in addition to the constant correction of -0.181 foot to the 1903 adjustment at Chillicothe. In preparing this list, however, the correction found thus for bench mark 48 at Uhrichsville has not been accepted, because primary levelings of 1908 and prior years show that greater weight should have been given the Baltimore and Ohio precise levels between this point and Wheeling, and as an easement the adjustment placed in that line has been reduced to 0.632 foot by accepting the Baltimore and Ohio line unadjusted from Massillon based upon the 1907 adjustment value there. The corrections then given to the original elevations by the line here listed are as above stated, except that between Zanesville and Uhrichsville the corrections vary between -0.179 and -0.432 foot, an adjustment of 0.253 foot.

The method and limit of error used on this line are those adopted by the Coast and Geodetic Survey elsewhere described, but yard rods were substituted for metric, the computations being made in feet.

The leveling was done in 1906 by W. H. Monahan.

RAVENNA, WARREN, AND YOUNGSTOWN QUADRANGLES.

MAHONING, PORTAGE, AND TRUMBULL COUNTIES.

The elevations in the following list are controlled principally by precise leveling of the Baltimore and Ohio Railroad, crossing each quadrangle, and a precise line of the Coast and Geodetic Survey crossing Warren and part of Youngstown quadrangles. A checked primary connection was obtained in 1907 at Niles between these lines which proved a previously supposed error to exist in the Baltimore and Ohio Railroad levels between Youngstown and Niles, and this error has been taken account of in adjustment, placing it between bench marks 381 and 382, which removed errors in primary circuit from Youngstown to Struthers.

The leveling in Youngstown and Ravenna quadrangles was done in 1905 by R. C. Seitz, in Warren and Ravenna quadrangles in 1905 by W. H. Peabody, and in Ravenna quadrangle in 1903 by C. I. Shea, and in 1905 by G. M. Dimmick.

GREENUP, IRENTON, JACKSON, OAKHILL, AND SCIOTO QUADRANGLES.

GALLIA, JACKSON, LAWRENCE, AND SCIOTO COUNTIES.

The descriptions in the following list are republished from Appendix to the Nineteenth Annual Report of the Director, pp. 229-242. A correction of 1.201 feet has been subtracted from the elevations previously published, excepting on line from Hamden Junction to Oakhill crossing. The Coast and Geodetic Survey elevation for bench mark LIII near Hamden was not accepted, additional connections made in 1904 showing the bench mark to have been disturbed, probably by reconstruction of bridge. The leveling was done in 1897 and 1898, mostly by E. L. McNair; but some work in the Ironton quadrangle was done by Melville Gillett.
