REPORT

OF THE

TESTS OF METALS

AND

OTHER MATERIALS

MADE WITH THE

UNITED STATES TESTING MACHINE AT WATERTOWN ARSENAL, MASSACHUSETTS, DURING THE FISCAL YEAR ENDED JUNE 30

1910

WASHINGTON
1911

WAR DEPARTMENT,
Washington, December 6, 1910.

SIR: I have the honor to transmit herewith a letter from the Chief of Ordnance, United States Army, dated November 23, 1910, submitting, for transmission to Congress as required by law, the report of the commanding officer of Watertown Arsenal, of "Tests of Iron and Steel and Other Material for Industrial Purposes," made at that arsenal during the fiscal year ended June 30, 1910.

Very respectfully,

J. M. DICKINSON,
Secretary of War.

The SPEAKER OF THE HOUSE OF REPRESENTATIVES.

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ORDNANCE,
Washington, November 23, 1910.

SIR: I have the honor to submit, for transmission to Congress, as required by law, the report of the commanding officer of Watertown Arsenal of "Tests of Iron and Steel and other Material for Industrial Purposes," made at that arsenal during the fiscal year ended June 30, 1910 (O.O. file 18563).

Very respectfully,

WILLIAM CROZIER,
Brig. Gen., Chief of Ordnance.

The honorable the SECRETARY OF WAR.

WATERTOWN ARSENAL,
Watertown, Mass., November 19, 1910.

SIR: I have the honor to submit herewith the annual report of tests of iron, steel, and other materials made at this arsenal during the fiscal year ended June 30, 1910:

The total number of specimens tested during the year was 3,225, classified as follows:

Gun specimens	78
For Ordnance Department	2,370
Fo other Government departments	20
Tests for private parties	757
Total	3,225

The receipts and expenditures were as follows:

Amount appropriated for testing machine and testing work	$15,000.00
Received from private parties	2,452.32
Total received	17,452.32
Amount expended for services and labor	12,521.82
Amount expended for light, power, tools, implements, and material for test	4,029.94
Deposited to credit of Treasurer of United States	900.56
Total expended	17,452.32

Mr. James E. Howard, who has been engineer of tests at this arsenal for many years, severed his connection with it in March, 1910, by resignation. This position was filled by the appointment of Mr. H. L. Whittemore, who assumed his duties on June 20, 1910.

The tests made for the Ordnance Department consisted principally of those of the products of the arsenal foundry and smith shop and of materials purchased for the purposes of the department. Tests for private parties have been made in accordance with the provision of the law whereby any citizen of the United States may have tests made at this arsenal upon defraying the cost of the same. The names of parties who availed themselves of these facilities are appended to the report. The results of such tests are considered confidential and are not, therefore, published.

Respectfully,

C. B. WHEELER,
Lieut. Col., Ordnance Department,
United States Army, Commanding.

The CHIEF OF ORDNANCE UNITED STATES ARMY,
Washington, D. C.

[1] The stem in these specimens was only 1 in. long, instead of 2 in. as in the others.

6-INCH HOWITZER CARRIAGE, MODEL 1908.

TESTS OF CRADLE HEADS.

TESTS OF CRADLE HEADS.

Cradle heads, Types 1, 2, 3, and 4, were tested with stresses up to 17 000 lb. with circumferences unsupported and supported, except in the case of Head no. 1, which was tested in an unsupported condition only.

Loads were applied with increments of 1 000 lb. each and deflections measured in a longitudinal direction at 12 places on each head and measuring diameters at three places on two diameters taken at right angles to each other.

The maximum load applied, 17 000 lb., was within the elastic limit of each head.

The accompanying tables show the deflections in lengths and diameters as the loads were successively applied.

Tests of Cradle Heads for 6-Inch Howitzer Carriage, Model 1908.

After loading cradle head to 230 000 lb., with the regular fixtures, the cradle head was removed from the testing machine and a plug was fitted to the $2\frac{1}{4}$-in. hole in head. A steel pin 3.10 in. diameter was placed against the center of head and the test resumed. Micrometer readings on gaged length A were discontinued as this length was inaccessible.

Cradle head expanded between diameters D and E to 13.42 in.

Changed the shape of cone of the head from a right line to a concaved one.

Steel pin at center of head embedded itself in head about 0.02 in.

No well-defined elastic limit. Sets remained without material change up to 190 000 lb., but no decided sets occurred until loads reached 200 000 to 210 000 lb.

100 000	.....	.....	Ultimate strength.

Cradle head cracked (radially) between A2 and A3, also started a second crack on inside of head about 80° from first crack between A1 and A2.

Length of first or principal crack on the inside of head 2.12 in.

Center of cradle head permanently depressed 0.40 in.

There was a decided decrease in the final diameter as shown at the end of test. This was gradually reached after 70 000 lb.

No well defined elastic limit. Took decided set at 40 000 and showed marked increase after higher loads.

218 000	.1100	.0416	
219 000	.1132	.0427	
220 000	.1172 / .1197	.0444	Ultimate strength with fixture.
1 000	.0482	.0159	Micrometer readings discontinued on length A.
Fixture at center of cradle head was removed so as not to damage it for use in the other tests			
This fixture or bar had to be driven out of the 2¼ in. hole in cradle head, showing that the hole had become smaller.			
A pin 3⅜ in. diameter was used at center of head which was not inserted in the 2¼ in. hole and test resumed.			
1 000	.....	.0158	
188 000	.....	.....	Snapping sound.
189 200	Ultimate strength without fixture. Head yielding and load dropped to. (It would appear that fixture had supported the head.)		
135 000	.....	.....	
1 000	.....	.0473	
126 000	.....	.....	Sharp snapping sound.

Head removed from machine and test discontinued.

Cradle head cracked in seven places at edge of hole on inside of head.

Diameter at edge of hole at inside of head, 2.64 in.

Diameter at edge of hole at outside of head, 1.88 in.

No well-defined elastic limit. Sets remained without material change up to 140 000 lb., but no decided increase in sets occurred until loads reached 180 000 to 200 000 lb.

[2] Air chilled at 1 600° F.

CAST SHELL AND SHRAPNEL.

TENSILE TESTS OF SPECIMENS TAKEN FROM FRAGMENTS OF A RUPTURED CASE OF A 4.7-INCH HIGH EXPLOSIVE SHRAPNEL.

Marks.	Elastic limit per sq. in.	Tensile strength per sq. in.	Elongation in 2 in.	Contraction of area.	Elongation of inch sections.	Appearance of fracture.
	Lb.	*Lb.*	*Per cent.*	*Per cent.*	*In. In.*	
1	87 300	129 000	10.5	14.3	.13*, .08	Fine granular.
2	81 800	130 000	11.5	14.3	.14*, .09	Fine granular; gray spot.
3	56 400	129 000	13.0	19.1	.15*, .11	Fine granular; gray spot near center.
D	24 500	90 200	1.0	.98	.02*, .00	Fine granular.

TESTS UPON SPECIMENS FROM A 6-INCH CAST SHELL RECEIVED FROM FORT REVERE.

Tension Tests.

Marks.	Diameter.	Sectional area.	Tensile strength.		Appearance of fracture.
			Total.	Per sq. in.	
	In.	*Sq. in.*	*Lb.*	*Lb.*	
A6075	0.505	0.20	3 900	19 500	Medium coarse granular; dark gray.
B6075	.505	.20	3 400	17 000	Do.
C6075	.505	.20	3 800	19 000	Do.
D6075	.505	.20	3 900	19 500	Do.
E6075	.505	.20	3 300	16 500	Do.
F6075	.505	.20	3 700	18 500	Do.

Compression Tests.

These specimens were taken from cylindrical portion of shell, and had axes parallel to axis of shell.

Specimens X and Y were taken from diametrically opposite sides about midway between the base and the point.

Specimen Z was taken close to the base, in line with Y.

Marks.	Length.	Diameter.	Sectional area.	Ultimate strength.	
				Total.	Per sq. in.
	In.	*In.*	*Sq. in.*	*Lb.*	*Lb.*
X	1.504	0.798	0.50	32 200	64 400
Y	1.505	.798	.50	31 500	63 000
Z	1.507	.798	.50	28 800	57 600

Oblique shearing fractures.

STEEL CASTINGS FOR ORDNANCE WORK.

TENSILE TESTS OF BOLTS.

Marks.	Diameter at root of thread.	Sectional area.	Tensile strength.		Appearance of fracture.
			Total.	Per sq. in.	
	In.	*Sq. in.*	*Lb.*	*Lb.*	
1	0.625	0.306	22 100	72 200	Silky.
2	.625	.306	23 200	75 800	Fine granular, 90 per cent; silky, 10 per cent.
3	.625	.306	22 600	73 900	Silky; with trace of granulation.
4	.625	.306	22 000	71 900	Silky, 95 per cent; granular, 5 per cent.
5	.625	.306	21 500	70 300	Silky; with trace of granulation.
6	.625	.306	22 600	73 900	Do.

Three of these bolts were $4\frac{5}{16}$ in. long and three were $4\frac{13}{16}$ in. long. Length measured from underside of head to the end of bolt.

The nominal diameter was $\frac{3}{4}$ in.

The specimens were tested by means of a special fixture to take the bolthead and the other end was screwed into a threaded socket about the length of the thread.

All specimens fractured at root of thread.

The elastic limits were vague and indefinite.

The total elongation was measured on the wire after testing and shows the permanent set which the metal received.

STEEL CHAIN.

TENSILE TEST OF CHAIN FOR WATERTOWN ARSENAL.

No. of links.	Length of links.	Width of links.	Thickness of wire.	Tensile strength.	Parted.	Appearance of fracture.
7	*In.* 1.69	*In.* 1.18	*In.* 0.37	*Lb.* 9 600	3 links from end.....	Silky.

THREE LINKS OF WROUGHT-IRON CHAIN FOR ENGINEER CORPS, WILMINGTON, N. C.

Diameter of iron, 1 65 in.

Sample prepared for testing with end links welded in. On first test the maximum load reached was 166 200 pounds tension. An end link fractured, the three links of chain remaining unbroken.

The fractured end link was replaced and test resumed. At the second test the end link again fractured under a reduced load.

The triplet was returned to the testing machine, using special loops to secure the same in the machine. At the third test one of the outside links of the triplet fractured in the quarter on the opposite end from the weld under a tensile stress of 161 000 pounds. Appearance of fracture, fibrous.

STEEL FOR COMPARISON OF TESTING MACHINES.

STEEL COLUMN PROGRAM.

BUILT I COLUMNS.

General.

The sectional area was computed from the total weight and length of the column after deducting the estimated weight of all rivet heads.

Columns with flat ends were tested by compression blocks having plane surfaces. One of these was provided with a ball and socket bearing which was adjusted to secure uniform loading over the milled ends of the column.

Columns with pin ends were tested by special fixtures shown in figures 9 and 10, two being used for each specimen. The one shown in figure 9, however, was not used for any of the tests contained in this report. The pins, 3 inches in diameter, were placed with their axes vertically in the plane of the web.

Columns marked 60 000 or 70 000-lb. steel were made of material having approximately that ultimate strength.

The longer columns were counterweighted at the middle to neutralize the weight of the column which would produce an initial deflection, due to the horizontal position of the column during the test.

[1] West.

At this load the column deflected rather suddenly to the west, throwing compressometers 1 and 4 from their gaged lengths and extending compressometers 2 and 3 beyond the range of micrometers.

No. 2121.

Built I column.
Figure 1. Nickel steel.
Length of column, 13 ft., 8.73 in.
Weight, 633.5 lb.
Sectional area, 13.18 sq. in.
Gaged lengths of 50 in. taken at middle of length of column on the four angles or flanges 0.20 in. from the outer edge.
Compressometer No. 1, on top, east side.
Compressometer No. 2, on top, west side.
Compressometer No. 3, on bottom, west side.
Compressometer No. 4, on bottom, east side.
Initial deflections: Horizontal, 0.10 in. to east bottom angle; vertical, 0.
On web plate: Horizontal, 0; vertical, 0.
Flat ends. Ends of column not perfectly square.
Counterweighted at middle.

RAILROAD MATERIAL.

SPECIMENS FROM STEEL RAILS.

TENSION SPECIMENS TAKEN FROM RAILS SUPPLIED BY MR. P. H. DUDLEY.

Specimens A, B, and C, all from one rail, had their axes in a vertical plane through the center of the web. A was taken from the upper portion of the head of the rail. B was taken from the junction of head and web, while C was from the junction of the base and web.

Specimens X, Y, and Z were all from one rail. Specimen X was taken from one side of head of the rail and Y from the other side. Specimen Z was taken from the bottom of the base of the rail in the plane of the web.

No. 9154.

Marks, A. O. H., 490.

TENSILE TESTS OF ITALIAN HEMP CORD FOR WATERTOWN ARSENAL.

Kind of cord.	Log line.	Lanyard coil.	Braided cord.
Diameter	0.25 in.	0.18 in.	
Lay, 1 turn in	0.73 in.	0.61 in.	
Number of strands	3	3	
Threads in each strand	10	5	
Length of sample	16 ft.	16 ft.	16 ft.
Length between heads	26 in.	26 in.	26 in.
Tensile strength, total	947 lb.	510 lb.	277 lb.
Parted	3 strands in head.	3 strands 8 in. from the head.	In middle.

TENSILE TESTS OF USED LANYARDS OF ITALIAN HEMP LOG LINE.

1 to 10, inclusive. Lanyards used about three years, or approximately 400 times, and have been subjected to both oil and moisture to a considerable extent.

11 and 12. Used two years, or about 300 times. Not subjected to oil or moisture to any extent.

Received from Fort Adams, R. I., February 26, 1910:

13. Used one year and nine months, or about 150 times. Not subjected to moisture but to some extent has come in contact with oil.

14 and 15. Used one year and nine months, or about 200 times. Subjected to oil but not to moisture.

Received from Fort Strong, Boston, February 14, 1910:

16 to 19, inclusive. Used at about 900 drills. Subjected to both oil and moisture.

Received from Fort Revere, Mass., February 9, 1910:

20 to 23, inclusive. Used at 214 drills. Not subjected to oil or moisture.

Received from Fort Revere, Mass., February 9, 1910:

24 to 25, inclusive. Used about 75 times. Subjected to contact with oil and moisture.

26. Used only a few times. Subjected to oil and moisture.

Received from Fort Heath, Boston, February 15, 1910:

27. Used one year, or about 150 times.
28. Used one year, or about 150 times.
29. Used five months, or about 100 times.
30. Used five months, or about 100 times.
31. Used one month, or about 10 times.

27 to 31, inclusive, have not been subjected to moisture but to some extent have come in contact with oil.

Received from Fort Andrews, Mass.:

32 to 35, inclusive. Used about 60 times. Subjected to oil and moisture.

Received from Fort Michie, N. Y.:

36. Used about one week. Not subjected to oil or moisture.

Received from Fort Warren, Boston:

37 and 38. Used about 60 times. Not subjected to oil or moisture.
39 and 40. Used about 80 times. Subjected to oil and moisture.
41 and 42. Used about 60 times. Subjected to oil but not to moisture.
43 and 44. Used about 100 times. Subjected to oil and moisture.
45 and 46. Used about 2 years.

Tensile tests of used lanyards of Italian hemp log line—Continued.

TENSILE TESTS OF ITALIAN HEMP LOG LINE USED FOR MAKING LANYARDS.

Loads were applied by means of dead weights.

Bowline knots, eye splices, and clove hitches were used for fastening the ends.

Length of samples between knots, splices, or hitches ranged from 12 in. to 40 in.

Where there are two tests under the same number the second test was made on the same sample as the first, a new hitch being made at the parted end, thus shortening the sample.

No.	Style of hitch.	Diameter.	Number of strands.	Number of threads in each strand.	Tensile strength.	Parted.
		In.			*Lb.*	
1	Eye splices....	0.15 to 0.18	4	8	290	4 strands at the splice.

[1] Elongation in 1 in. due to No. 21 being a retest of No. 20.
[2] Open seams on side of this sample before testing.
[3] Samples not broken.

TESTS OF RUBBER FOR INSULATION OF CONDUCTOR WIRE.

Length of samples over all, 5 in.
Gaged lengths of 2 in. taken.
Sample No. 1:
Sample stretched until gaged length was 6 in., then load was released. After one minute rest the gaged length was $2\frac{3}{8}$ in.
The sample was then stretched until gaged length was 9 in. and did not break.
Sample No. 2:
Sample stretched until gaged length was 6 in., then load was released. After one minute rest the gaged length was $2\frac{3}{16}$ in.
The sample was then stretched until the gaged length was $9\frac{1}{8}$ in., when it broke.
Sample No. 3:
This sample broke before gaged length was stretched to 6 in. at a point where the rubber had been injured in stripping from the wire.

TESTS OF ¾-IN. GARDEN HOSE.

Friction test:

First layer of fabric with cover removed and test made on next layer, a 10-lb. weight being used.

2⅛ in. of fabric was removed during 5 minutes.

Tube test:

Four tubes were prepared by cutting off inch sections of hose, and stripping the fabric from the tube. As 2-in. gaged lengths could not be obtained by cutting them open, these rings were tested by pulling on wire fixtures.

Rupture occurred at the following values of distance between gage marks: 2 in., 2.25 in., 2.5 in., and 2.25 in.

Other specimens about 6 in. long were then stripped from the fabric, running lengthwise of hose. These were pulled with results as follows: (*a*) Width $\frac{15}{16}$ in., gaged length 2 in., stretched to 8 in. and released. New gaged length of 2 in. stretched to 7 in. and broke. (*b*) Width ⅝ in., gaged length 2 in., stretched to 7.5 in. and broke. (*c*) Width 1⅛ in., gaged length 2 in., stretched to 7 in. and broke.

BROWN AND BLUE PRINT PAPER.

BROWN-PRINT PAPER.

Samples 1 in. wide taken out lengthwise from paper.
Length between jaws, 3 in.
Thickness, 0.003 in.
Sectional area, 0.003 sq. in.
First test: 12 lb.[1]
Second test: 9 lb.[1]
Third test: 13 lb.
Fourth test: 12 lb.
Fifth test: 21 lb.
Mean: 13.4 lb.
Tensile strength, 4 467 lb. per sq. in.

REMARKS.—The sample submitted for test had several creases in it where the paper had been folded. The presence of these creases was detrimental to the tests, and it is believed they vitiated the results.

Samples 1 in. wide taken out lengthwise from paper.
Length between jaws, 3 in.
Thickness, 0.003 in.
Sectional area, 0.003 sq. in.
First test: 24 lb.
Second test: 21 lb.
Third test: 25 lb.
Fourth test: 25 lb.
Fifth test: 20 lb.
Mean, 23 lb.
Tensile strength, 7 700 lb. per sq. in.

[1] These fractures occurred at creases.

PRIVATE TESTS.

PRIVATE TESTS MADE DURING THE FISCAL YEAR ENDED JUNE 30, 1910.

Date.	Material.	Name.	City and State.
1909.			
July 1	Cast iron	Richmond Iron Works	Richmond Furnace, Mass.
8	Steel latch	Planter Compress	Boston, Mass.
9	Piers of building blocks.	Lyth Tile Co	Buffalo, N. Y.
9	Steel	Wyman & Gordon Co	Worcester, Mass.
13	Canvas belting	Boston Woven Hose & Rubber Co.	Cambridgeport, Mass.
13	Steel	Wyman & Gordon Co	Worcester, Mass.
13	Steel wire	American Steel & Wire Co	Do.
16	Rail anchors	The Robinson Co	Boston, Mass.
17	Steel	Wyman & Gordon Co	Worcester, Mass.
17	Steel bolts	Waltham Watch Co	Waltham, Mass.
21	Bronze	The Portland Co	Portland, Me.
23	Rails	American Railway Engineering & Maintenance of Way Association, R. Trimble, Secretary.	Pittsburg, Pa.
24	do	do	Do.
26	do	do	Do.
27	do	do	Do.
26	Steel	Wyman & Gordon Co	Worcester, Mass.
26	do	J. W. Mitchell	Boston, Mass.
28	Rails	American Railway Engineering & Maintenance of Way Association.	Pittsburg, Pa.
29	do	do	Do.
30	Cotton duck	Hood Rubber Co	East Watertown, Mass.
Aug. 3	Concrete cubes	Bridgeport Brass Co	Bridgeport, Conn.
3	Concrete building blocks.	Alfred Vosseller	Buffalo, N. Y.
3	Bronze	Isthmian Canal Commission, United States Engineer Office.	Boston, Mass.
4	Cast-iron shelf supports.	Snead & Co. Iron Works	Jersey City, N. J.
5	Cast-iron connections and bars.	Golding Manufacturing Co	Franklin, Mass.
6	Rails	American Railway Engineering & Maintenance of Way Association.	Pittsburg, Pa.
7	do	do	Do.
7	Steel	Wyman & Gordon Co	Worcester, Mass.
9	do	do	Do.
