LETTER OF TRANSMITTAL

UNITED STATES TARIFF COMMISSION,
Washington, June 9, 1932.

SIR: I have the honor to transmit herewith a statement with respect to the ad valorem equivalent of specific duties, in compliance with that part of Senate Resolution No. 156 which directs the commission to report "the ad valorem equivalents of specific duties imposed by said tariff act as of the date of passage of said act and as of April 1, 1932."

The ad valorem equivalent of a specific duty can be computed only by ascertaining the average unit value of the article concerned, computed by dividing the value of imports by the quantity. The Department of Commerce does not report imports for individual days. Even if it did so, there would be many articles of which no imports took place on a specified day. For this reason the commission has deemed it a proper compliance with the resolution to ascertain the average ad valorem equivalents for one month immediately after the passage of the tariff act and one month preceding April 1, 1932. The accompanying report therefore covers the months of July, 1930, and March, 1932.

In the case of many commodities there are variations from time to time in the character of the imports, so that the average unit value, on which the ad valorem equivalent of the specific duty depends, for a single month may not be closely comparable with that for another single month. The commission has therefore supplemented the data for the months mentioned by more comprehensive averages based on the quarterly periods July 1-September 30, 1930, and January 1-March 31, 1932.

Respectfully,

ROBERT L. O'BRIEN, *Chairman.*

The PRESIDENT OF THE SENATE,
Washington, D. C.

AD VALOREM EQUIVALENTS OF SPECIFIC RATES OF DUTY UNDER THE TARIFF ACT OF 1930

SECTION I

INTRODUCTION AND SUMMARY

Preliminary statement of general conclusion.

The evident purpose of the Senate resolution was to ascertain the effect of the recent general decline in prices upon the ad valorem equivalent of the specific duties.

The method of analysis required to determine that effect is somewhat elaborate and must be explained in considerable detail. Before proceeding to this discussion, a brief statement of the conclusions may be of convenience.

The most important class of specific duties consists of those which are "straight"; that is, unmodified by value brackets or by minimum or maximum ad valorem provisions. Moreover, the effect of price changes is more direct in the case of the "straight" duties than of other duties. The analysis shows that on the average the ad valorem equivalents of the "straight" specific rates of duty in March, 1932, the last month preceding the date, April 1, mentioned in the Senate resolution, were approximately 41 per cent higher than in July, 1930, the first complete month following the passage of the present tariff act. This means that there had been a decrease of nearly 30 per cent in the average unit values of the several items; this change in unit values is chiefly or wholly due to the fall in prices.

The imports of a single month, particularly the first month following the passage of a tariff act, may not be representative as regards ad valorem equivalents. The report shows that on the average the ad valorem equivalents of the "straight" specific rates in the first quarter of 1932 were approximately 30 per cent higher than in the quarter July-September, 1930, reflecting a decrease of about 23 per cent in the average unit values.

In addition to the effect of this decline in unit values, a very considerable influence has been exercised by shifts in the relative importance of the commodities imported. Commodities bearing relatively high rates of duty constituted a larger proportion of the imports subject to "straight" specific rates in March, 1932, than in July, 1930, and articles subject to relatively low rates constituted a smaller proportion. This shift caused an increase in the average ad valorem equivalent computed on the actual imports of all articles at "straight" specific rates in March, 1932, as compared with the average computed

on the actual imports of July, 1930, additional to the increase due to the decline in prices. The actual average ad valorem equivalent for March, 1932, was 70.1 per cent and for July, 1930, it was 43.3 per cent; the increase was thus, in ratio, 62 per cent. The actual average ad valorem equivalent for the first quarter of 1932 was 71.9 per cent as compared with 48.0 per cent in the quarter July-September, 1930, the increase being about 50 per cent. In both of the above comparisons, duties changed by presidential proclamation are excluded.

Months and periods compared.

The Senate resolution under which this investigation has been conducted called for the ad valorem equivalent of the specific rates as of the date of the passage of the tariff act of 1930 and as of April 1, 1932. The data which most nearly correspond with the specified dates are those for the month of July, 1930, and the month of March, 1932, and the ad valorem equivalents are therefore shown for these two months. By reason of the fact that the average unit value, on which the average ad valorem equivalent of the duty depends, for a single month may not be representative, comparisons are also presented between the period July 1-September 30, 1930, and the period January 1-March 31, 1932, being, respectively, the first quarter under the new tariff act and the latest quarter for which data are available. This was considered the more desirable because the imports during the first month after the passage of any tariff act are likely to be abnormal in their nature.

Changes by presidential proclamation.

The effect of the decline in the prices upon the ad valorem equivalent of the specific duties is, of course, obscured for commodities where there has been, by presidential proclamation, an increase or a decrease in the rate of duty since the passage of the tariff act. In such cases the changed rates of duty are shown in the tables and the data for the different periods compared are shown on separate lines. Where summary totals are shown, the data for articles on which the rates have been changed by presidential proclamation are listed separately or excluded.

Forms of specific duties.

The ad valorem equivalent of a "straight" specific rate of duty, unmodified by value brackets or by minimum or maximum ad valorem provisions, varies, of course, in precise inverse proportion to the average unit value of the commodity imported. If the average unit value falls 20 per cent, for example, the ad valorem equivalent will increase precisely 25 per cent. The same direct relationship, however, does not hold in the case of specific rates of duty which are modified by value provisions. In some cases a series of specific duties based on value brackets may have very nearly the same effect as an ad valorem duty. In some cases the average unit values of imports may be such that a duty consisting of a specific rate with an ad valorem minimum, may, in fact, be exclusively or chiefly an ad valorem duty, the bulk of the imports coming in at the ad valorem rate. It is evident that in the case of such modified specific duties the effect of a price change upon the ad valorem equivalent may be entirely different from that resulting from a similar change in the case of an article subject to a

"straight" specific duty. For this reason the ad valorem equivalents of the "straight" specific duties, designated as Group A, are presented in separate tables in this report from those for the various classes of modified specific rates, designated as Groups B, C, D, E, and F.

ARTICLES SUBJECT TO "STRAIGHT" SPECIFIC DUTIES

Method of determining average change in ad valorem equivalents.

Since the purpose of the Senate resolution was to ascertain the effect of price declines on the ad valorem equivalent of specific duties, any summary comparison between July, 1930, and March, 1932 (or for the two quarterly periods compared), must eliminate, so far as possible, the effect of any other factor or factors which cloud the significance of the comparison.

The influence of price changes can not be correctly determined by merely comparing the average ad valorem equivalent of the duties collected on the actual imports of the earlier month with the average ad valorem equivalent based on the actual imports of the later month. These averages are affected not merely by price changes but also by shifts in the relative importance of different commodities in the imports. Even if the ad valorem equivalent for every individual commodity subject to specific duty should be the same in the two months compared, yet the average ad valorem equivalent for all articles combined might rise or fall. Thus, had there been a greater increase, or a less decrease, in the imports of commodities bearing relatively high rates of duty (in terms of ad valorem equivalent) than in commodities bearing low rates, the average ad valorem equivalent would rise simply by reason of these shifts.

It is necessary, in order to eliminate the effect of these shifts, to compute the average change in the ad valorem equivalents for the several articles separately, and to combine these results into an average. Such an average must, of course, be weighted by the relative importance of the items, but the weights must be the same for both periods of time compared.

In order to determine this average change the commission has selected, from among the 1,200 or more tariff items subject to straight specific rates, the 160 which are most important, either with respect to the imports as a whole or with respect to those under certain of the tariff schedules. (Table 6, p. 240, shows the ad valorem equivalents for these items individually.) The ad valorem equivalents of the duties on these articles during each of the two months—July, 1930, and March, 1932—have been weighted by the mean value of the imports of the several items during the two quarterly periods July–September, 1930, and January–March, 1932. A similar calculation has been made for the change in the average between these two quarterly periods themselves. These 160 commodities together make up, in value, about seven-eighths of the imports subject to straight specific rates and are thus fairly representative of the totals.

Average change in ad valorem equivalent for 160 leading commodities subject to straight specific rates.

The following table shows the results of these calculations.

TABLE 1.—*Ad valorem equivalents of "straight" specific rates of duty: Summary for all schedules combined*

	Monthly comparison			Quarterly comparison		
	July, 1930	March, 1932	Ratio of increase	July-September, 1930	January-March, 1932	Ratio of increase
For 160 major commodities:						
Weighted average of ad valorem equivalents (each equivalent for the specified month or period weighted by mean value of imports for July-September, 1930, and January-March, 1932)-----	<i>Per cent</i> 52.2	<i>Per cent</i> 73.8	<i>Per cent</i> 41.4	<i>Per cent</i> 54.2	<i>Per cent</i> 68.5	<i>Per cent</i> 26.3
Average ad valorem equivalent on the actual imports of the specified month or period-----	43.1	72.6	68.5	50.2	74.1	47.6
For all commodities at straight specific rates:						
Average ad valorem equivalent on the actual imports of the specified month or period-----	43.3	70.1	61.9	48.0	71.9	49.8

This table shows that the weighted average of the several ad valorem equivalents for these 160 items was 52.2 per cent in July, 1930, and 73.8 per cent in March, 1932. There was thus an average increase of about 41½ per cent in the ad valorem equivalents (computed as a ratio, not as a difference between the two percentages). It follows that on the average the unit values of the items had decreased by a little less than 30 per cent (100 divided by 141.4 = 70.7 per cent; 100 per cent minus 70.7 per cent = 29.3 per cent, the average decline in unit values). This decline in unit values represents substantially the fall in the prices of these commodities; some little influence may have been exerted by changes in the nature of the imports of certain of the individual items, but in an average covering so large a number of commodities these changes tend to counterbalance one another. (This point is discussed more fully below.) The general wholesale price index of the United States fell from 84.4 in July, 1930 (base 1926 as 100) to 66.0 in March, 1932, a decline of 22 per cent. The decline in the prices of these leading import commodities subject to straight specific duties was thus considerably greater than that in the general wholesale price index.

Similarly, the table shows that the weighted average of the ad valorem equivalents for these 160 commodities during the quarter July-September, 1930, was 54.2 per cent, and during the first quarter of 1932, 68.5 per cent, an increase (in ratio) of 26½ per cent; this represents a decline in the average unit values of the commodities of about 21 per cent. The average wholesale price index of the United States shows the same per cent of decrease between these two quarterly periods.

The table brings out clearly the fact that an important influence has been exerted on the average ad valorem equivalent, as computed on the actual imports in the months or periods compared, by the shift in the relative importance of commodities. The average ad valorem equivalent of the duties on these 160 commodities as applied to the actual imports of July, 1930, was 43.1 per cent, and as applied to the actual imports of March, 1932, 72.6 per cent, an increase (in ratio)

of 68½ per cent, much exceeding the true weighted average increase of 41½ per cent shown to have taken place in the ad valorem equivalents for the several commodities. A similar disparity appears between the two sets of figures for the quarterly periods compared. Examination of the details in Table I shows that in the case of a number of important commodities bearing relatively high rates of duty there was, between July (or July–September), 1930, and March (or January–March), 1932, only a moderate decrease in imports or even an increase; sugar and raw tobacco are examples. On the other hand, marked decreases occurred in the imports of a number of major items carrying relatively low duties; lumber and jute are examples. A direct comparison of the actual average ad valorem equivalents for the two months or periods is thus decidedly misleading as regards the influence of the decline in prices upon the specific duties.

It is also possible from these calculations to determine approximately the average quantitative change which has taken place between 1930 and 1932 in the imports of major commodities subject to straight specific rates of duty. The actual value of the 160 selected commodities during the quarter July–September, 1930, was \$72,264,000 and during the quarter January–March, 1932, \$50,408,000. The imports of the later quarter were thus equal, in value, to 69.7 per cent of those of the earlier quarter. Since on the average the unit values of these commodities in the later quarter were equal to 79.2 per cent of the corresponding unit values during the period July–September, 1930, it follows that on the average there was a decline in the quantities imported of about 12 per cent (69.7 divided by 79.2 = 88 per cent; 100 per cent minus 88 per cent = 12 per cent). This result is substantially the same as would have been obtained if, for each of the 160 principal commodities, the percentage of increase or decrease in the quantity imported had been computed and if these percentages had been combined into a general average, weighting each according to the importance of the commodity as measured by the mean value of imports during the two quarters compared.

A similar computation with respect to the months of July, 1930, and March, 1932, shows a quantitative decline in the imports of these 160 principal commodities amounting to about 8 per cent.

Adjusted average ad valorem equivalent for all articles at straight specific rates.

Since the 160 articles for which data have just been presented represent the great bulk of the imports at straight specific rates of duty, the average ad valorem equivalents given for them might be taken as a sufficient measure of the changes for all articles combined. For the sake of completeness, however, an estimate has been made covering all articles of this group. The method is to combine the adjusted data for the 160 articles with unadjusted data for the remaining articles in the group; this involves the assumption that changes in the relative importance of individual items in the case of these remaining articles have been of such a minor character as to exercise no appreciable influence on the general totals.¹

¹ More precisely the method used was as follows: The mean total value, for the two quarters July–September, 1930, and January–March, 1932, of the imports of the articles for which no detailed adjustment was made was ascertained. Instead of multiplying the average ad valorem equivalent for each individual item into the mean value of the imports of that item, the actual average ad valorem equivalent for all the items combined (obtained simply by dividing the total amount of duties during the given month or period by the total value of the imports during that month or period) was multiplied into this combined mean value of imports. The resulting totals were added to the weighted totals for the 160 commodities computed in the manner above described, and the weighted average ad valorem equivalents computed from these aggregates.

For all articles subject to straight specific duties, other than the 160 principal articles, the actual average ad valorem equivalent in July, 1930, was 38.3 per cent; in March, 1932, it was 53.1 per cent, an increase of 39 per cent, or nearly the same as the adjusted percentage of increase for the 160 principal articles. It follows that the combined totals for the two groups must present about the same change.

This calculation shows that, eliminating the effect of shifts in the relative importance of the imports of the principal individual items, the weighted average of the ad valorem equivalents for all items at straight specific rates would have been approximately 50.3 per cent in July, 1930, and approximately 71.0 per cent in March, 1932, an increase of 41 per cent (in ratio). The corresponding average for July-September, 1930, was 51.2 per cent and for January-March, 1932, 66.7 per cent, an increase of 30 per cent.

Without any adjustment to eliminate the effect of shifts in the relative importance of items, the actual average ad valorem equivalent for all articles at straight specific rates (see Table 1) rose from 43.3 per cent in July, 1930, to 70.1 per cent in March, 1932, or by 62 per cent. The corresponding increase between the two quarters compared was 50 per cent.

Relation of price changes to average ad valorem equivalent of duties in earlier years.

The statistics above summarized show the very important effect which may be exercised upon the average ad valorem equivalent of specific rates of duty by changes in the prices of commodities. Under the present tariff act approximately half of the dutiable imports, in value, are subject to straight specific rates of duty, and a considerable additional value of imports represents articles dutiable at modified specific rates or at compound rates, the ad valorem equivalents of which are also affected by price changes. It follows that the general average ad valorem equivalent for all classes of duties combined (including straight ad valorem duties) will increase or decrease materially if there is a marked decline or a marked advance in prices of imported articles, though, of course, the effect on this general average will be less conspicuous than the effect in the case of specific duties alone.

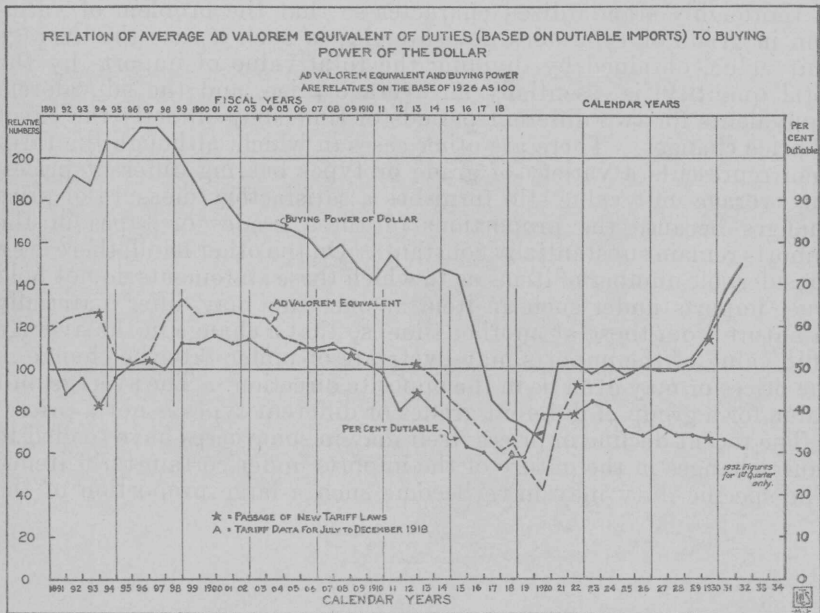

The commission has deemed it worth while in this connection to present a tabulation comparing the average ad valorem equivalent of the duties from year to year under the various tariff acts with the wholesale price index of the United States. This general wholesale price index is based chiefly on commodities of domestic origin, but during periods where general price levels are changing rapidly domestic and imported commodities, considered as groups, move at least roughly in parallel.

Table 2 and the accompanying chart show for each year since 1891 this relation between the average ad valorem equivalent of duties and the wholesale price index. For convenience the price index has been inverted so as to represent the buying power of money (that is, the index figures have been divided into 100); to the extent, therefore, that a causal relation exists between prices and the average ad valorem equivalents, the movements will tend to be parallel. The average ad valorem equivalent has been reduced to the form of a relative number taking as 100 the average for the year 1926, the same year on which the wholesale price index is based.

TABLE 2.—Relation of average ad valorem equivalent of duties (based on dutiable imports) to buying power of the dollar

¹ Reciprocal of Department of Labor wholesale price index; for calendar years throughout.
² Based on relation of amount of duties to value of dutiable imports; represents fiscal years prior to 1918, calendar years thereafter.
³ Emergency tariff on certain agricultural products, effective May 28, 1921.

It should be noted that prior to 1918 the average ad valorem equivalent is based on fiscal years, whereas the wholesale price index is based on calendar years. In the chart the lines have been so placed as to take account of this difference.

The table shows clearly that, entirely apart from tariff legislation, price changes have, at various times, exercised an important influence on the ad valorem equivalent of duties. The table and chart show also the percentage of the total value of imports consisting of dutiable commodities. Naturally no direct relation exists between the general movement of prices and the changes in this percentage. The principal cause of the changes in the percentage dutiable, apart from tariff legislation, is the shifts in the relative importance of commodities in the imports. These shifts are, however, to some extent due to differences between free commodities and dutiable commodities with respect to increases and decreases in price. One of the most conspicuous instances of the effect of price changes on the proportion of dutiable imports appears in the year 1925, when the very marked advance in the price of rubber increased greatly the total value of the imports of that commodity, causing the proportion of imports free of duty to become materially larger, as compared with 1924, than it would have been if the prices of rubber had been more normal. The great variations in the price of sugar, which is dutiable, during and following the war also affected the proportion of dutiable imports.

Significance of changes in ad valorem equivalents of specific duties on individual items.

Before proceeding to the summary statistics for the several tariff schedules and the details for individual tariff items, it is important to give further consideration to the point, already mentioned above, of the effect of changes in the character and quality of the imports under a given item.

In many cases, of course, a given tariff rate relates to an article of thoroughly standardized character so that the problem of variation in grade or type does not enter in; in such a case the average unit value, obtained by dividing the total value of imports by the total quantity, is essentially an average price, and the ad valorem equivalents for two different periods of time show directly the effect of price changes. There are other cases in which, although the tariff item represents a variety of grade or types bearing different prices, the average unit value still furnishes a satisfactory measure of price changes because the proportions of these grades or types in the imports remain substantially constant. On the other hand, there are a considerable number of items as to which these statements do not hold true; imports under such an item at one time may differ materially in nature from those at another time, so that a change in the average unit value of the imports may overstate or understate the change in the prices or may even be in the opposite direction. The average unit value for a group of different grades or different types is not a price.

The recent decline in prices itself may in some cases have tended to cause changes in the nature of the imports under certain tariff items. The specific duty may have become such a large proportion of the

value of the lower grades of a commodity as to cause the imports of those grades to fall greatly, while imports of the higher grades have been better maintained, or even increased, with the result that little decrease, or even in some instances an increase, may appear in the average unit value.

A change in the nature of the imports under a given tariff item is particularly likely to have occurred when the quantity imported has fallen from a large to a very small figure, or vice versa. Such great changes in quantity appear in a considerable number of cases in the comparison between July, 1930, and March, 1932; they appear occasionally, though less often, in the data for the two 3-month periods compared.

There may be some instances in the tables in which abnormal relationships between the unit values and the ad valorem equivalents for the two months or the two periods compared are the result of errors in the import statistics. The monthly data of imports are unrevised, such corrections as are found necessary being carried into the annual totals only.

Attention may be called to a few individual tariff items which illustrate the effect of changes in grade and type upon unit values and thus upon the average ad valorem equivalent:

During the period July–September, 1930, the imports of barium chloride amounted to only 133 pounds, and the average value per pound was 10.5 cents, so that the duty of 2 cents per pound was equal to 19 per cent ad valorem. During the first quarter of 1932, the imports were about one hundred and forty times greater, amounting to 18,338 pounds, and the average unit value was only 1.34 cents, so that the ad valorem equivalent was nearly 150 per cent. It is probable that the prices of the different grades of barium chloride had actually fallen materially, but it is scarcely possible that they should have fallen by more than 85 per cent; it is more likely either that the average grade of the imports had greatly changed or that there was some error in the original data.

In contrast with this case, where the decline in prices has apparently been greatly exaggerated, there is the instance of poppy-seed oil. The imports of this product during the first quarterly period compared amounted to 11,377 pounds and during the second period to only 16 pounds. The average unit value rose from 18 to 75 cents per pound, with a corresponding drop in the average ad valorem equivalent (the duty being 2 cents per pound) from 11 per cent to less than 3 per cent; it seems highly probable that the small imports of the later period were of much higher grade.

Another illustration is afforded by castor oil. The imports during the July–September quarter, 1930, were less than one-twentieth as large as in the first quarter of 1932, but nevertheless they were sufficiently large to make a comparison of unit values and duty rates which appears not unreasonable, the average ad valorem equivalent rising from 34.1 per cent to 40.6 per cent. On the other hand, the figures for the individual month of July, 1930, seem entirely unreliable as a guide to the change in prices. The imports during that month were only 149 pounds, and the average unit value was \$1.13 per pound, whereas for the quarter including this same month the average was less than 9 cents per pound. Consequently, the increase in the average ad valorem equivalent of the specific duty from 2.6 per cent in July, 1930, to 52 per cent in March, 1932, was probably due chiefly to the change in the quality of the product imported.

The number of instances in which the average ad valorem equivalents fail entirely to indicate the effect of price changes by reason of variations in the nature of the imports is comparatively small. There are, however, a fairly large number of tariff items in which less marked changes in the character of the imports have affected appreciably the unit values and consequently the ad valorem equivalents. It is probable that for the most part these disparities counterbalance one another in the aggregates for all imports under "straight" specific duties combined. They also largely offset one another in the averages for those schedules in which there are numerous straight specific rates, but this is probably not true in some of the other schedules.

Average ad valorem equivalents of "straight" specific duties, by schedules.

Table 3 shows a comparison of the ad valorem equivalents of straight specific rates of duty in July, 1930, and March, 1932, summarized by schedules. In order to show as nearly as possible the true average change in the ad valorem equivalents, the method used with respect to all schedules combined, as already described, has been employed also for each schedule separately. The selected commodities, totaling 160 for all schedules combined, represent much the greater part of the total value of imports at straight specific rates under each of the schedules (apart from rates which have been changed by presidential proclamation). The proportion represented by the selected commodities is smallest in the case of Schedule 7, where these commodities represented 65 per cent of the total value of the imports at straight specific rates of duty during July-September, 1930, and 76 per cent during January-March, 1932. For most of the schedules the proportion exceeds 80 per cent, and for several it exceeds 90 per cent.

¹ No items at straight specific rates

² No important comparable items.

The two columns show that for these major items the weighted average of the ad valorem equivalents for March, 1932, was higher than the average for July, 1930, in the case of every schedule except Schedule 8, spirits, wines, and beverages, and Schedule 15, sundries. In the case of Schedule 8 there was at least an apparent increase in the prices of the major items; this may have been due to changes in the character of the imports under these items severally. The apparent decline in the average ad valorem equivalent for Schedule 15 is due to a marked increase in the average unit value of the large item of matches; this probably represents a change in grade rather than an actual advance in prices.

The table also brings out the fact that in a few of the schedules there have been important shifts in the relative magnitude of the imports at different ad valorem equivalent rates of duty, which have caused a disparity between the comparable weighted averages shown in the first two columns and the averages shown in the third and fourth columns, which are based on the actual imports of each of the months compared. In Schedule 2, earths, earthenware, and glassware, and Schedule 3, metals and manufactures thereof, these shifts brought about a decline in the actual average ad valorem equivalents, notwithstanding the fact that the average unit values of the great majority of the important items subject to straight specific rates under these schedules had fallen materially. On the other hand, in Schedule 8 the shifts were of such a character as to cause an increase in the actual averages, notwithstanding the advances already mentioned in the average unit values of the principal items. A similar situation appears in Schedule 15, where the marked rise in the actual average ad valorem equivalent was due to a great reduction in the imports of bristles, on which the rate of duty is very low.

The table also shows the actual average ad valorem equivalents based on the imports of all commodities at straight specific rates during July, 1930, and March, 1932, respectively. In most cases the selected major commodities are so dominant that there is little difference between these averages in the last two columns of the table and those in the two preceding columns; in other words, the selected commodities are representative of the entire importation. Schedule 15 is more or less exceptional in this respect.

Table 4 is similar to Table 3, summarizing the data for straight specific rates of duty by schedules, for the quarter July-September, 1930, and the first quarter of 1932. For nearly all schedules the movements shown by this quarterly comparison are parallel with those shown by the comparison between July, 1930, and March, 1932, but, as might be expected, the changes are somewhat less marked in the case of most schedules.

TABLE 4.—Ad valorem equivalents of "straight" specific rates of duty: Summary by individual schedules, July–September, 1930, and January–March, 1932

¹ No items at straight specific rates.² No important comparable items.

Table 5 is an expansion of the last two columns of Table 3 and the last two columns of Table 4. It shows by schedules the actual value of the imports at straight specific rates of duty (exclusive of those changed by presidential proclamation) during the two months and the two periods compared, the actual amount of the duties thereon, and the calculated average ad valorem equivalent.

It will be noted from Table 5 that, notwithstanding the marked decline in the total value of the imports at straight specific rates of duty, the amount of duties collected was considerably greater in March, 1932, than in July, 1930, and there was also an appreciable increase in the duties for January–March, 1932, as compared with July–September, 1930. It should not be assumed from this fact that there has been no average quantitative decline in imports at straight specific rates of duty. The quantitative decline has been very much less than the decline in value, but it has nevertheless been appreciable (see p. 231). The fact that the amount of duties has increased is due to an increase in the imports of a limited number of articles bearing relatively high rates of duty, whereas many of the decreases in imports were of articles at lower rates. For example, the imports of sugar were much larger, for seasonal reasons, in March, 1932, than in July, 1930.

TABLE 5.—Ad valorem equivalents of "straight" specific rates of duty (rates unmodified by value brackets or minimum or maximum ad valorem limits)

GROUP A—SUMMARY

	July-Sep- tember, 1930	January- March, 1932	July, 1930	March, 1932

Duties changed by presidential proclamation:				
Value-----	2,315,127	2,132,377	767,226	718,445
Duty-----	1,542,044	1,604,893	489,944	530,700
Average ad valorem equivalent... per cent-----	66.6	75.3	63.9	73.9

1 Exclusive of duties changed by presidential proclamation.

2 No "straight" specific rates in this schedule.

Ad valorem equivalents for principal individual commodities at straight specific rates.

Table 6 shows for the two months and the two quarterly periods the average ad valorem equivalent of the duty for each of the 160 leading commodities subject to straight specific rates. It should be noted particularly that the designations of many of these individual commodities are abbreviated (the full designation appearing in Table I, Sec. II) and that in certain cases there are imports of grades or types of the commodity, at a different rate of duty, which are not shown here.

TABLE 6.—Average ad valorem equivalents during specified periods for 160 principal articles subject to straight specific rates of duty

ARTICLES SUBJECT TO MODIFIED SPECIFIC RATES

Ad valorem equivalents of specific rates based on value brackets.

Table II, Section II, shows, by items, the average ad valorem equivalents of the specific rates of duty in the tariff act of 1930 which are based on value brackets (Group B). In most of the schedules the number of items subject to duties of this character is very small or nil; for Schedule 3, metals, however, this arrangement is common. Table 7 summarizes the data.

TABLE 7.—Ad valorem equivalents of specific rates of duty based on value brackets

GROUP B—SUMMARY

	July-Sep- tember, 1930	January- March, 1932	July, 1930	March, 1932
Total, all schedules:				
Value-----	\$1,344,103	\$1,073,365	\$8,423,349	\$8,352,319
Duty-----	348,284	341,384	102,541	115,003
Average ad valorem equivalent...per cent..	25.9	31.8	24.2	32.6
Schedule 3 (Metals):				
Value-----	1,141,068	812,749	363,004	258,533
Duty-----	279,996	252,447	85,060	84,984
Average ad valorem equivalent...per cent..	24.5	31.1	23.4	32.9
All other schedules:				
Value-----	203,035	260,616	60,345	93,786
Duty-----	68,288	88,937	17,481	30,019
Average ad valorem equivalent...per cent..	33.6	34.1	29.0	32.0

For all tariff items subject to duties of this character the average ad valorem equivalent in July, 1930, was 24.2 per cent; for March, 1932, it was 32.6 per cent. The increase was thus much less marked than in the case of straight specific duties. This was to be expected.

In the case of an article subject to specific duties which are graded into a series of several brackets according to the unit value, the tendency of a reduction in the price level is to push the imports downward in the series. A grade which, say, in July, 1930, was of such a unit value as to be placed in the highest bracket may have so fallen in price by March, 1932, that it is included in the next lower bracket or even in one still further down the scale. The result is likely to be an actual increase in the quantity of imports under the lowest of the value brackets, or at least a smaller relative decrease in that bracket than in the other brackets.

When such a shift as this occurs in the quantities imported under the several value brackets little change may occur in the average ad valorem equivalent of the duties in any of the value brackets taken individually. There is some probability that the average unit value of the articles in the upper bracket will decline with a corresponding increase in the average ad valorem equivalent, and the same may be true of the lowest bracket, whereas in the intermediate brackets there is less probability of any material change in unit values or the ad valorem equivalent.

The effect of the downward shift in imports upon the average ad valorem equivalent for the group of value brackets taken together will depend largely on whether the specific rates for the several brackets represent substantially the same ad valorem equivalent, or whether they represent a higher, or a lower, ad valorem equivalent on the upper value brackets than on the lower brackets. If the specific

rates were graded in close proportion to the value limits of the brackets, the shift in imports from the upper to the lower brackets would leave the average ad valorem equivalent for the group as a whole substantially unchanged, except so far as the highest bracket and the lowest bracket might be affected, as above pointed out. If the rates on the higher brackets were higher in ad valorem equivalent than those on the lower brackets, the shift would tend toward a decrease in the average ad valorem equivalent, whereas it would tend toward an increase if the gradation were in the opposite direction.

A more or less typical instance of the value bracket arrangement is afforded by the rates on muck bars, in paragraph 303 of the metals schedule. The rates in this case are graded fairly closely in proportion to the value (for example, the rate on muck bars valued between $3\frac{1}{2}$ and 5 cents per pound is precisely double the rate on those valued at $1\frac{1}{2}$ to $2\frac{1}{2}$ cents per pound). The lowest bracket consists of those valued at not over $1\frac{1}{2}$ cents per pound, but there were no imports of such muck bars during the periods under comparison. The total imports of muck bars (not cold-rolled, cold-drawn, cold-hammered, polished, or galvanized) during the first quarter of 1932 were approximately the same in quantity as during the quarter from July to September, 1930 (157 tons compared with 155 tons), but the total value had fallen from \$11,598 to \$10,108 on account of the decline in prices. Computing the duties on each bracket separately, the amount of duties during the earlier period was \$2,950 and during the first quarter of 1932, \$2,531, the average ad valorem equivalent thus having changed but little, 25.4 per cent as compared with 25 per cent. There had, however, been a decided shift in the relative importance of the different value brackets. In both periods most of the importations were in the value bracket over $2\frac{1}{2}$ cents but not over $3\frac{1}{2}$ cents per pound, but in the July-September period of 1930 there were considerable imports valued at over $3\frac{1}{2}$ cents per pound and very little valued at less than $2\frac{1}{2}$ cents, whereas in the first quarter of 1932 the imports valued at over $3\frac{1}{2}$ cents per pound were very small and those valued at less than $2\frac{1}{2}$ cents had multiplied about thirty-fold. The average ad valorem equivalent of the duty for the higher bracket, 5 cents per pound, fell from 26.7 to 19.4 per cent, but the average ad valorem equivalent for the other three brackets under which imports occurred showed very little change.

The detailed table brings out the fact that in numerous instances the imports of a given commodity are largely concentrated in some one or two of several tariff brackets provided by law. Thus, in the case of steel concrete reinforcement bars (par. 304) very nearly all the imports during the July-September quarter of 1930 were in the bracket valued not over $1\frac{1}{2}$ cents per pound and in the first quarter of 1932 all the imports fell in that bracket. Naturally in this case the decline in prices which took place resulted in a corresponding increase of the average ad valorem equivalent not only in this particular bracket but also in the group of value brackets as a whole.

Ad valorem equivalents of specific rates of duty with minimum ad valorem rates.

Table III, Section II, shows, by items, the ad valorem equivalents of the specific rates of duty which are modified by minimum ad valorem provisions (Group C). Under this form of duty, of course, the specific rate on that part of the imports to which it applies represents

a higher ad valorem equivalent than the minimum ad valorem rate provided. The following table summarizes these data:

TABLE 8.—*Ad valorem equivalents of specific rates of duty with minimum ad valorem rates*

GROUP C—SUMMARY

¹ Exclusive of duties changed by presidential proclamation.

This table shows that the proportion of the imports under rates of this character which took the specific part of the duty was much larger in 1932 than in 1930, as the result of the decline in prices. For July, 1930, 42 per cent of the total imports in value were assessed at

the specific rates, whereas the proportion in March, 1932, was 55 per cent. As might be expected, the average ad valorem equivalent of the specific rates increased (the decline in the average for the ad valorem rates, due to shifts in the relative importance of different items in the imports, partly offsets this increase). This increase, together with the shift from the ad valorem to the specific rates, resulted in an increase of the average ad valorem equivalent, for specific and ad valorem rates taken together, from 48 per cent in July, 1930, to 51 per cent in March, 1932. Schedule 7 and Schedule 15 show changes approximately parallel to the general average.

This increase in the average ad valorem equivalent, which was due wholly to the decline in prices, is much less marked than in the case of commodities subject to straight specific rates. The difference may be due partly to differences in the extent of the decline in prices. It is further caused, in part, by the fact that in Group C, which comprises relatively few items, there was a decidedly greater decrease in imports of certain items bearing relatively high rates than in those bearing lower rates. A difference between Group C and Group A was, however, to be expected in any case, for the reason that for any article subject to a specific rate with an ad valorem minimum (provided there were in the earlier period any imports at the ad valorem rate) the full decline in the prices will not normally be reflected in the increase in the average ad valorem equivalent, since the minimum ad valorem rate served to prevent the ad valorem equivalent for the item as a whole from falling as low in the earlier period as it would have done if the specific rate had applied to the entire quantity.

An examination of the details in Table III shows that for many of the individual items the effect of the decline in prices has been what would be expected; it has caused an increase in the average ad valorem equivalent for the specific rate and the ad valorem rate taken together but less than would have occurred at a straight specific rate. There are, however, a considerable number of articles for which a minimum ad valorem feature is provided by the tariff act but of which there were few or no imports at the ad valorem rate in either of the periods compared; for these the decline in prices has its full effect on the average ad valorem equivalent. In a few other cases all or most of the imports were already at the ad valorem rate in 1930 and continued at the ad valorem rate in 1932; for such items the decline in prices has no effect on the rate of duty.

A typical example of the effect of the decline in prices on duties of this character is afforded by cheese, which is subject to a duty of 7 cents per pound with a minimum of 35 per cent ad valorem. For varieties of cheese not reported separately (that is to say, all except Emmenthaler, Romano or Pecorino, Provoloni, Provolette, and Roquefort) the total imports in the quarter July-September, 1930, amounted to 3,046,000 pounds, valued at \$667,000, or an average of 22 cents per pound. The imports during the first quarter of 1932 were about one seventh larger in quantity, amounting to 3,469,000 pounds, but the value had fallen to \$607,000, or an average of 17½ cents per pound. Because of the decline in prices the imports valued at over 20 cents per pound (the limit above which the 35 per cent rate applies) had declined by about one-third in quantity, whereas those valued at less than 20 cents per pound had increased by over 60 per cent. In the 1930 period substantially half of the imports came in at the specific rate of 7 cents; in the first quarter of 1932 over two-thirds

came in at that rate. The average price per pound of the imports at the specific rate was 15.6 cents in the 1930 quarter and 13.9 cents in the 1932 quarter, the ad valorem equivalent thus rising from about 45 to about 50 per cent.¹ The average unit value of the cheese at the minimum rate fell from 28 to 26.3 cents per pound. By reason of (a) the larger proportion coming in at the specific rate, and (b) the increase in the ad valorem equivalent under the specific rate, the ad valorem equivalent under both rates combined rose from 38.5 to 44.6 per cent. If there has been no minimum ad valorem rate fixed, the average ad valorem equivalent in the earlier period would have been 32 per cent, whereas in the later period it would have been 39.9 per cent. The presence of the minimum thus restricted somewhat the increase in the ad valorem equivalent for the imports as a whole.

Specific duties with maximum ad valorem rates.

There is only one tariff item in the act of 1930 which provides a specific rate with a maximum ad valorem limit (Group D), and there were no imports under that item during the individual months or the 3-month periods compared. This item is that of jute yarns, singles, 5-pound and finer.

A decline in prices of an article subject to a rate of this character would throw a larger proportion of the imports under the maximum rate. This would tend to reduce the average ad valorem equivalent based on the specific and the maximum rate together, but this tendency might be offset by the increase in the average ad valorem equivalent on the imports remaining at the specific rate.

Ad valorem equivalents of specific rates with both minimum and maximum ad valorem rates.

Table IV, Section II, shows the data for the limited number of cases in which under the tariff act of 1930 a specific rate is provided with both a minimum and a maximum ad valorem limit (Group E). Such duties apply only to certain ceramic products under paragraph 202 and to cotton sewing thread and crochet, darning, embroidery, and knitting cottons under paragraph 902. The data are summarized in Table 9.

TABLE 9.—*Ad valorem equivalents of specific rates of duty with both minimum and maximum ad valorem rates—all schedules combined*

GROUP E—SUMMARY

	July-September, 1930	January-March, 1932	July, 1930	March, 1932
At specific rates:				
Value.....	\$44,420	\$12,250	\$14,446	\$4,891
Duty.....	21,886	6,589	5,140	2,745
Average ad valorem equivalent...per cent..	49.3	53.8	35.6	56.2

At maximum ad valorem rate:				
Value.....	10,777	16,107	3,913	5,655
Duty.....	6,007	8,592	1,790	3,271
Average ad valorem equivalent...per cent..	55.7	53.3	45.7	57.8
Specific, minimum, and maximum combined:				
Value.....	269,300	256,418	104,144	94,469
Duty.....	90,228	65,567	34,125	24,566
Average ad valorem equivalent...per cent..	33.5	25.6	32.8	26.0

¹ It is possible that the actual prices of a given kind of cheese of a given grade had fallen by a greater percentage than these figures show, but that the fall in the average unit value was limited by the pushing downward of higher priced cheeses from the minimum rate group to the specific rate group.

The average ad valorem equivalent based on all three forms of duty combined, for such imports under these two paragraphs amounted to 32.8 per cent in July, 1930, and to 26 per cent in March, 1932. It is impossible, however, to draw any conclusions from these figures as to the effect of price changes, for the reason that shifts in the relative importance of the items have exercised a greater influence than price changes. The one item of crochet, darning, embroidery and knitting cottons accounted in both months for much more than half of the total value of the imports covered by Table IV, and in the case of this commodity there were in neither of the two months compared (and also in neither of the two 3-month periods compared) any imports at the maximum rate; moreover, there was a marked increase in the total imports of this item, the rate on which is lower than those on the ceramic products in the group.

Under a duty of this type the minimum rate of course applies to the higher priced articles, the specific rate to the intermediate priced, and the maximum rate to the lowest priced. A decline in prices will tend to reduce the quantity at the minimum rate and increase the quantity at the maximum rate; the quantity at the specific rate may remain more or less unchanged, or it may increase or decrease materially. The tendency will be toward a rise in the ad valorem equivalent of the group of duties considered together, but a rise less marked than in the case of a specific rate with ad valorem minimum and still less marked than in the case of a "straight" specific rate. The increase in the ad valorem equivalent is limited (a) by the fact that when prices were higher the ad valorem equivalent on the item as a whole was prevented, by the minimum provision, from falling as low as it would under a "straight" specific rate, and (b) by the fact that in the period of lower prices the ad valorem equivalent was prevented, by the maximum provision, from rising as high as under a "straight" specific rate.

The most nearly typical illustration of a duty of this character afforded by Table IV is that of cotton sewing thread. The data for the 3-month periods are less affected by accidental conditions than those for July, 1930, and March, 1932. The imports of cotton sewing thread under the minimum rate in the 1930 period amounted, in quantity, to about 3 per cent of the total; those under the specific rate to about 60 per cent; and those under the maximum rate to about 37 per cent of the total. In the 1932 period, prices having fallen materially and thus causing a shift toward the maximum rate, approximately 90 per cent of the total came in under the maximum provision. The decrease, however, had been confined to the imports at the specific rate, there being, contrary to the normal tendency, an increase in the relatively small imports at the minimum rate. The average ad valorem equivalent of the specific rate fell slightly, but for the three forms of duty together the average ad valorem equivalent rose from 27.6 per cent in the 1930 period to 31.3 per cent in the 1932 period.

Ad valorem equivalents of duties on articles at ad valorem rates with minimum specific rates.

Table V, Section II, shows the ad valorem equivalents of duties of this class, by items. This form is applied to one item in the ceramics schedule, to several items in the rayon schedule, and to cotton cloth,

not bleached, printed, dyed, or colored, the last comprising a large number of subitems based on the yarn count.

An ad valorem duty with a specific minimum is precisely the same thing as a specific duty with an ad valorem minimum. It may have been the thought of those framing the law to express the duty as ad valorem with a specific minimum when the price adjustment is such that it is expected that the bulk of importations will come in under the ad valorem provision, and to express it as a specific rate with an ad valorem minimum in the opposite case. In practice, under both of these arrangements, the relation of imports at specific to imports at ad valorem rates varies widely for different items.

The average ad valorem equivalent of the duty on that part of the imports of an article which takes the specific minimum rate will, of course, be somewhat higher than the basic ad valorem rate.

Table 10 summarizes the data regarding commodities subject to this form of duty. However, the number of items of any importance is so limited that averages for the single months compared are misleading, being much affected by accidental changes in the magnitude of the imports. The 3-month periods furnish a somewhat more significant comparison. The average ad valorem equivalent for the 1930 period was 51.2 per cent and for the first quarter of 1932, 55.6 per cent.

TABLE 10.—*Ad valorem equivalents of duties on articles dutiable at ad valorem rates with minimum specific rates*

¹ No part of the imports took the specific minimum.

Just as in the case of the specific rates with ad valorem minimum so also in the case of the ad valorem rates with specific minimum, the relative importance of the imports at the ad valorem rate was much less in the second period, when prices were lowered, than in the first period. There was a decline in the value of imports of both, but imports at minimum specific rates represented about five-eighths of the total, in value, during the first period, whereas they represented over four-fifths of the total in the later period.

The totals for all schedules containing rates of Group F, as shown in the above table, furnish no satisfactory measure of the effect of price changes, for the reason that shifts in the relative importance of commodities imported at different average ad valorem equivalents have exercised an even greater influence. The average ad valorem equivalent of the Group F duties on rayon products is considerably higher than in the case of those on cotton goods; the total value of the imports of the former has declined much more than that of the latter, and this shift has tended to check the increase in the average ad valorem equivalent for the two combined. More significant figures are those for each schedule separately.

In the case of Schedule 9 about 70 per cent of the total value of imports at Group F rates had come in on the ad valorem basis in the earlier quarterly period, but in the first quarter of 1932 only about 14 per cent came in on that basis. Since the minimum specific rates represented a higher ad valorem equivalent than the ad valorem rates, this shift resulted in an increase in the average ad valorem equivalent for both combined. Moreover, for each of the two forms separately there was an increase in the average ad valorem equivalent due, in the case of the imports at ad valorem rates, to a change in the relative importance of the items. Consequently, for the Schedule 9 items, as a group, the combined ad valorem equivalent of the ad valorem

and the specific rates rose from 31.4 per cent in the earlier period to 53.6 per cent in the later period.

AD VALOREM EQUIVALENTS FOR THE SEVERAL CLASSES OF SPECIFIC DUTIES—SUMMARY TABLE

Table 11 summarizes the data for the several classes of specific duties which have been presented in greater detail in the preceding tables. It is important to note that the average ad valorem equivalents shown for each of the groups in this table are entirely without adjustment for shifts in the relative importance of the commodities imported. For this reason the data for Group A (straight specific rates) in Table 11 are much less significant, as regards the effect of price changes on the ad valorem equivalent, than the weighted figures in Table 1. The principal use of Table 11 is to show the relative importance of the different classes of specific duties.

TABLE 11.—*Ad valorem equivalents of specific rates of duty*
ALL GROUPS—SUMMARY

	July-September, 1930	January-March, 1932	July, 1930	March, 1932
Group A. Straight specific rates unmodified:				
Value-----	\$86,884,417	\$59,585,202	\$27,681,759	\$19,109,287
Duty-----	41,733,554	42,856,220	11,946,546	13,388,394
Average ad valorem equivalent... per cent..	48.0	71.9	43.3	70.1
Group B. Specific rates with value brackets:				
Value-----	1,344,103	1,073,365	423,349	352,319
Duty-----	348,284	341,384	102,541	115,003
Average ad valorem equivalent... per cent..	25.9	31.8	24.2	32.6
Group C. Specific rates with minimum ad valorem provisions:				
Value-----	10,287,009	6,708,044	2,997,810	2,223,893
Duty-----	4,964,510	3,541,170	1,443,042	1,138,523
Average ad valorem equivalent... per cent..	48.3	52.8	48.1	51.2
Group D. Specific rates with maximum ad valorem provisions. ¹				
Group E. Specific rates with both minimum and maximum ad valorem provisions:				
Value-----	269,300	256,418	104,144	94,467
Duty-----	90,228	65,567	34,125	24,566
Average ad valorem equivalent... per cent..	33.5	25.6	32.8	26.0
Group F. Ad valorem rates with minimum specific provisions:				
Value-----	779,421	325,368	230,903	110,592
Duty-----	399,146	180,836	114,754	66,989
Average ad valorem equivalent... per cent..	51.2	55.6	49.7	60.6

¹ One item in this group, with no imports reported.

SECTION II

AD VALOREM EQUIVALENTS OF SPECIFIC RATES OF DUTY ON INDIVIDUAL ITEMS, BY SCHEDULES

Tables I to VI, which follow, show, for July, 1930, and March, 1932, and for the quarter July-September, 1930, and the first quarter of 1932, the average ad valorem equivalent of the specific rate of duty on each tariff item. Table I includes the items which are subject to "straight" specific rates of duty, unmodified by value provisions. The other tables cover, respectively, the various forms of modified specific duties.

In considering the unit values and the average ad valorem equivalents for the individual items, it should be borne in mind that there may have been changes in the nature of the imports which have caused variations in unit values out of line with actual price movements. This point is discussed on page 234.

TABLE I.—Group A—Ad valorem equivalents of "straight" specific rates of duty (rates unmodified by value brackets, or minimum or maximum ad valorem limits)

SCHEDULE I.—CHEMICALS, OILS, AND PAINTS

Tariff act of 1930, paragraph	Commodity	Rate and unit	July–September, 1930, compared with January–March, 1932						July, 1930, compared with March, 1932						
			Average ad valorem equivalent per cent		Quantity imported		Average unit value		Average ad valorem equivalent per cent		Quantity imported		Average unit value
