Medicare Program; CY 2020 Revisions to Payment Policies Under the Physician Fee Schedule and Other Changes to Part B Payment Policies; Medicare Shared Savings Program Requirements; Medicaid Promoting Interoperability Program Requirements for Eligible Professionals; Establishment of an Ambulance Data Collection System; Updates to the Quality Payment Program; Medicare Enrollment of Opioid Treatment Programs and Enhancements to Provider Enrollment Regulations Concerning Improper Prescribing and Patient Harm; and Amendments to Physician Self-Referral Law Advisory Opinion Regulations Final Rule; and Coding and Payment for Evaluation and Management, Observation and Provision of Self-Administered Esketamine Interim Final Rule

AGENCY: Centers for Medicare & Medicaid Services (CMS), HHS.

ACTION: Final rule and interim final rule.

SUMMARY: This major final rule addresses: Changes to the physician fee schedule (PFS); other changes to Medicare Part B payment policies to ensure that payment systems are updated to reflect changes in medical practice, relative value of services, and changes in the statute; Medicare Shared Savings Program quality reporting requirements; Medicaid Promoting Interoperability Program requirements for eligible professionals; the establishment of an ambulance data collection system; updates to the Quality Payment Program; Medicare enrollment of Opioid Treatment Programs and enhancements to provider enrollment regulations concerning improper prescribing and patient harm; and amendments to Physician Self-Referral Law advisory opinion regulations. In addition, we are issuing an interim final rule with comment period (IFC) to establish coding and payment for evaluation and management, observation and the provision of self-administered Esketamine to facilitate beneficiary access to care for treatment-resistant depression as efficiently as possible.

DATES:

Effective date: These regulations are effective on January 1, 2020.

Comment date: Comments will be accepted/considered ONLY on the Interim Rule “Coding and Payment for Evaluation and Management, Observation and Provision of Self-Administered Esketamine” contained in section V. of the preamble of this document. To be assured consideration, comments must be received at one of the addresses provided below, no later than 5 p.m. on December 31, 2019.

ADDRESSES: In commenting, please refer to file code CMS–1715–IFC. Because of staff and resource limitations, we cannot accept comments by facsimile (FAX) transmission.

Comments, including mass comment submissions, must be submitted in one of the following three ways (please choose only one of the ways listed):

1. *Electronically.* You may submit electronic comments on this regulation to <http://www.regulations.gov>. Follow the “Submit a comment” instructions.

2. *By regular mail.* You may mail written comments to the following address ONLY: Centers for Medicare & Medicaid Services, Department of Health and Human Services, Attention: CMS–1715–IFC, P.O. Box 8016, Baltimore, MD 21244–8016.

Please allow sufficient time for mailed comments to be received before the close of the comment period.

3. *By express or overnight mail.* You may send written comments to the following address ONLY: Centers for Medicare & Medicaid Services, Department of Health and Human Services, Attention: CMS–1715–IFC, Mail Stop C4–26–05, 7500 Security Boulevard, Baltimore, MD 21244–1850.

For information on viewing public comments, see the beginning of the **SUPPLEMENTARY INFORMATION** section.

FOR FURTHER INFORMATION CONTACT:

Jamie Hermansen, (410) 786–2064, for any issues not identified below.

Michael Soracoe, (410) 786–6312, for issues related to practice expense, work RVUs, conversion factor, and impacts.

Geri Mondowney, (410) 786–1172, or Tourette Jackson, (410) 786–4735, for issues related to malpractice RVUs and geographic practice cost indices (GPCIs).

Larry Chan, (410) 786–6864, or Geri Mondowney, (410) 786–1172, for issues related to potentially misvalued services under the PFS.

Lindsey Baldwin, (410) 786–1694, Emily Yoder, (410) 786–1804, or Patrick Sartini, (410) 786–9252, for issues related to telehealth services.

Pierre Yong, (410) 786–8896, or Lindsey Baldwin, (410) 786–1694, for

issues related to Medicare coverage of opioid use disorder treatment services furnished by opioid treatment programs (OTPs).

Lindsey Baldwin, (410) 786–1694, for issues related to bundled payments under the PFS for substance use disorders.

Emily Yoder, (410) 786–1804, or Christiane LaBonte, (410) 786–7237, for issues related to the comment solicitation on opportunities for bundled payments under the PFS.

Regina Walker-Wren, (410) 786–9160, for issues related to physician supervision for physician assistant (PA) services and review and verification of medical record documentation.

Ann Marshall, (410) 786–3059, Emily Yoder, (410) 786–1804, Liane Grayson, (410) 786–6583, or Christiane LaBonte, (410) 786–7237, for issues related to care management services.

Terry Simananda, (410) 786–8144, for issues related to interim final rule with comment period (payment for self-administered esketamine).

Kathy Bryant, (410) 786–3448, for issues related to coinsurance for colorectal cancer screening tests and global surgery data collection.

Pamela West, (410) 786–2302, for issues related to therapy services.

Ann Marshall, (410) 786–3059, Emily Yoder, (410) 786–1804, or Christiane LaBonte, (410) 786–7237, for issues related to payment for evaluation and management services.

Thomas Kessler, (410) 786–1991, for issues related to ambulance physician certification statement.

Felicia Eggleston, (410) 786–9287, or Amy Gruber, (410) 786–1542, for issues related to the ambulance fee schedule and the requirements related to the Medicare ground ambulance data collection system.

Linda Gousis, (410) 786–8616, for issues related to intensive cardiac rehabilitation.

David Koppel, (303) 844–2883, or Elizabeth LeBreton, (202) 615–3816, for issues related to the Medicaid Promoting Interoperability Program.

Fiona Larbi, (410) 786–7224, for issues related to the Medicare Shared Savings Program (Shared Savings Program) Quality Measures.

Katie Mucklow, (410) 786–0537, or Diana Behrendt, (410) 786–6192, for issues related to open payments.

Cheryl Gilbreath, (410) 786–5919, for issues related to home infusion therapy benefit.

Joseph Schultz, (410) 786–2656, for issues related to Medicare enrollment of opioid treatment programs, and enhancements to provider enrollment regulations concerning improper prescribing and patient harm.

Jacqueline Leach, (410) 786-4282, for issues related to Deferring to State Scope of Practice Requirements: Ambulatory Surgical Centers (ASC).

Mary Rossi-Coajou, (410) 786-6051, for issues related to Deferring to State Scope of Practice Requirements: Hospice.

1877AdvisoryOpinion@cms.hhs.gov, for issues related to Advisory Opinions on Application of the Physician Self-referral law.

Molly MacHarris, (410) 786-4461, for inquiries related to Merit-based Incentive Payment System (MIPS).

Brittany LaCouture, (410) 786-0481, for inquiries related to Alternative Payment Models (APMs).

Patricia Taft, (410) 786-4561, for issues related to Physician Self-Referral Law: Annual Update to the List of CPT/HCPCS Codes Annual Update.

SUPPLEMENTARY INFORMATION:

Inspection of Public Comments: All comments received before the close of the comment period are available for viewing by the public, including any personally identifiable or confidential business information that is included in a comment. We post all comments received before the close of the comment period on the following website as soon as possible after they have been received: <http://regulations.gov>. Follow the search instructions on that website to view public comments.

Addenda Available Only Through the Internet on the CMS Website: The PFS Addenda along with other supporting documents and tables referenced in this final rule are available on the CMS website at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/index.html>. Click on the link on the left side of the screen titled, “PFS Federal Regulations Notices” for a chronological list of PFS **Federal Register** and other related documents. For the CY 2020 PFS final rule, refer to item CMS-1715-F. Readers with questions related to accessing any of the Addenda or other supporting documents referenced in this final rule and posted on the CMS website identified above should contact Jamie Hermansen at (410) 786-2064.

Defense Federal Acquisition Regulations (DFAR) apply.

I. Executive Summary

A. Purpose

This major final rule revises payment policies under the Medicare PFS and makes other policy changes, including provisions to implement certain provisions of the Bipartisan Budget Act of 2018 (BBA of 2018) (Pub. L. 115-123, February 9, 2018) and the Substance Use-Disorder Prevention that Promotes Opioid Recovery and Treatment (SUPPORT) for Patients and Communities Act (the SUPPORT Act) (Pub. L. 115-271, October 24, 2018), related to Medicare Part B payment, applicable to services furnished in CY 2020 and thereafter. In addition, this final rule includes provisions related to other payment policy changes that are addressed in section III. of this final rule.

To facilitate beneficiary access to treatment for treatment-resistant depression (TRD) as using esketamine, we are creating two new HCPCS G codes, G2082 and G2083, effective January 1, 2020 on an interim final basis. For 2020, we are establishing RVUs for these services that reflect the relative resource costs associated with the evaluation and management (E/M), observation and provision of the self-administered esketamine product.

1. Summary of the Major Provisions

The statute requires us to establish payments under the PFS based on national uniform relative value units (RVUs) that account for the relative resources used in furnishing a service. The statute requires that RVUs be established for three categories of resources: Work; practice expense (PE); and malpractice (MP) expense. In addition, the statute requires that we establish by regulation each year’s payment amounts for all physicians’ services paid under the PFS, incorporating geographic adjustments to reflect the variations in the costs of furnishing services in different geographic areas.

In this final rule, we are establishing RVUs for CY 2020 for the PFS to ensure that our payment systems are updated to reflect changes in medical practice and the relative value of services, as well as changes in the statute. This final rule also includes discussions and provisions regarding several other Medicare Part B payment policies, Medicare Shared Savings Program quality reporting requirements, Medicaid Promoting Interoperability Program requirements for eligible

professionals, the establishment of a ground ambulance data collection system, updates to the Quality Payment Program, Medicare enrollment of Opioid Treatment Programs and enhancements to provider enrollment regulations concerning improper prescribing and patient harm; and amendments to Physician Self-Referral Law advisory opinion regulations. Specifically, this final rule addresses:

- Practice Expense RVUs (section II.B.)
- Malpractice RVUs (section II.C.)
- Geographic Practice Cost Indices (GPCIs) (section II.D.)
- Potentially Misvalued Services under the PFS (section II.E.)
- Telehealth Services (section II.F.)
- Medicare Coverage for Opioid Use Disorder Treatment Services Furnished by Opioid Treatment Programs (section II.G.)
- Bundled Payments Under the PFS for Substance Use Disorders (section II.H.)
- Physician Supervision for Physician Assistant (PA) Services (section II.I.)
- Review and Verification of Medical Record Documentation (section II.J.)
- Care Management Services (section II.K.)
- Coinsurance for Colorectal Cancer Screening Tests (section II.L.)
- Therapy Services (section II.M.)
- Valuation of Specific Codes (section II.N.)
- Comment Solicitation on Opportunities for Bundled Payments under the PFS (section II.O.)
- Payment for Evaluation and Management (E/M) Services (section II.P.)
- Ambulance Coverage Services—Physician Certification Statement (section III.A.)
- Ambulance Fee Schedule—Medicare Ground Ambulance Data Collection System (section III.B.)
- Intensive Cardiac Rehabilitation (section III.C.)
- Medicaid Promoting Interoperability Program Requirements for Eligible Professionals (EPs) (section III.D.)
- Medicare Shared Savings Program Quality Measures (section III.E.)
- Open Payments (section III.F.)
- Home Infusion Therapy Benefit (section III.G.)
- Medicare Enrollment of Opioid Treatment Programs and Enhancements to Existing General Enrollment Policies Related to Improper Prescribing and Patient Harm (section III.H.)
- Deferring to State Scope of Practice Requirements (section III.I.)
- Advisory Opinions on the Application of the Physician Self-Referral Law (section III.J.)

- Updates to the Quality Payment Program (section III.K.)
- Physician Self-Referral Law: Annual Update to the List of CPT/HCPCS Codes (section IV.)
- Interim Final Rule with Comment Period: Coding and Payment for Evaluation and Management, Observation and Provision of Self-Administered Esketamine (HCPCS codes G2082 and G2083) (section V.)
- Collection of Information Requirements (section VI.)
- Regulatory Impact Analysis (section VII.)

2. Summary of Costs and Benefits

We have determined that this final rule is economically significant. For a detailed discussion of the economic impacts, *see* section VII. of this final rule.

II. Provisions of the Final Rule for the PFS

A. Background

Since January 1, 1992, Medicare has paid for physicians' services under section 1848 of the Act, "Payment for Physicians' Services." The PFS relies on national relative values that are established for work, practice expense (PE), and malpractice (MP), which are adjusted for geographic cost variations. These values are multiplied by a conversion factor (CF) to convert the relative value units (RVUs) into payment rates. The concepts and methodology underlying the PFS were enacted as part of the Omnibus Budget Reconciliation Act of 1989 (Pub. L. 101-239, enacted on December 19, 1989) (OBRA '89), and the Omnibus Budget Reconciliation Act of 1990 (Pub. L. 101-508, enacted on November 5, 1990) (OBRA '90). The final rule published in the November 25, 1991 **Federal Register** (56 FR 59502) set forth the first fee schedule used for payment for physicians' services.

We note that throughout this major final rule, unless otherwise noted, the term "practitioner" is used to describe both physicians and nonphysician practitioners (NPPs) who are permitted to bill Medicare under the PFS for the services they furnish to Medicare beneficiaries.

1. Development of the RVUs

a. Work RVUs

The work RVUs established for the initial fee schedule, which was implemented on January 1, 1992, were developed with extensive input from the physician community. A research team at the Harvard School of Public Health developed the original work

RVUs for most codes under a cooperative agreement with the Department of Health and Human Services (HHS). In constructing the code-specific vignettes used in determining the original physician work RVUs, Harvard worked with panels of experts, both inside and outside the federal government, and obtained input from numerous physician specialty groups.

As specified in section 1848(c)(1)(A) of the Act, the work component of physicians' services means the portion of the resources used in furnishing the service that reflects physician time and intensity. We establish work RVUs for new, revised and potentially misvalued codes based on our review of information that generally includes, but is not limited to, recommendations received from the American Medical Association/Specialty Society Relative Value Scale Update Committee (RUC), the Health Care Professionals Advisory Committee (HCPAC), the Medicare Payment Advisory Commission (MedPAC), and other public commenters; medical literature and comparative databases; as well as a comparison of the work for other codes within the Medicare PFS, and consultation with other physicians and health care professionals within CMS and the federal government. We also assess the methodology and data used to develop the recommendations submitted to us by the RUC and other public commenters, and the rationale for their recommendations. In the CY 2011 PFS final rule with comment period (75 FR 73328 through 73329), we discussed a variety of methodologies and approaches used to develop work RVUs, including survey data, building blocks, crosswalk to key reference or similar codes, and magnitude estimation. More information on these issues is available in that rule.

b. Practice Expense RVUs

Initially, only the work RVUs were resource-based, and the PE and MP RVUs were based on average allowable charges. Section 121 of the Social Security Act Amendments of 1994 (Pub. L. 103-432, enacted on October 31, 1994), amended section 1848(c)(2)(C)(ii) of the Act and required us to develop resource-based PE RVUs for each physicians' service beginning in 1998. We were required to consider general categories of expenses (such as office rent and wages of personnel, but excluding MP expenses) comprising PEs. The PE RVUs continue to represent the portion of these resources involved in furnishing PFS services.

Originally, the resource-based method was to be used beginning in 1998, but section 4505(a) of the Balanced Budget Act of 1997 (Pub. L. 105-33, enacted on August 5, 1997) (BBA of 1997) delayed implementation of the resource-based PE RVU system until January 1, 1999. In addition, section 4505(b) of the BBA of 1997 provided for a 4-year transition period from the charge-based PE RVUs to the resource-based PE RVUs.

We established the resource-based PE RVUs for each physicians' service in the November 2, 1998 final rule (63 FR 58814), effective for services furnished in CY 1999. Based on the requirement to transition to a resource-based system for PE over a 4-year period, payment rates were not fully based upon resource-based PE RVUs until CY 2002. This resource-based system was based on two significant sources of actual PE data: the Clinical Practice Expert Panel (CPEP) data; and the AMA's Socioeconomic Monitoring System (SMS) data. These data sources are described in greater detail in the CY 2012 PFS final rule with comment period (76 FR 73033).

Separate PE RVUs are established for services furnished in facility settings, such as a hospital outpatient department (HOPD) or an ambulatory surgical center (ASC), and in nonfacility settings, such as a physician's office. The nonfacility RVUs reflect all of the direct and indirect PEs involved in furnishing a service described by a particular HCPCS code. The difference, if any, in these PE RVUs generally results in a higher payment in the nonfacility setting because in the facility settings some resource costs are borne by the facility. Medicare's payment to the facility (such as the outpatient prospective payment system (OPPS) payment to the HOPD) would reflect costs typically incurred by the facility. Thus, payment associated with those specific facility resource costs is not made under the PFS.

Section 212 of the Balanced Budget Refinement Act of 1999 (Pub. L. 106-113, enacted on November 29, 1999) (BBRA) directed the Secretary of Health and Human Services (the Secretary) to establish a process under which we accept and use, to the maximum extent practicable and consistent with sound data practices, data collected or developed by entities and organizations to supplement the data we normally collect in determining the PE component. On May 3, 2000, we published the interim final rule (65 FR 25664) that set forth the criteria for the submission of these supplemental PE survey data. The criteria were modified in response to comments received, and

published in the **Federal Register** (65 FR 65376) as part of a November 1, 2000 final rule. The PFS final rules published in 2001 and 2003, respectively, (66 FR 55246 and 68 FR 63196) extended the period during which we would accept these supplemental data through March 1, 2005.

In the CY 2007 PFS final rule with comment period (71 FR 69624), we revised the methodology for calculating direct PE RVUs from the top-down to the bottom-up methodology beginning in CY 2007. We adopted a 4-year transition to the new PE RVUs. This transition was completed for CY 2010. In the CY 2010 PFS final rule with comment period, we updated the practice expense per hour (PE/HR) data that are used in the calculation of PE RVUs for most specialties (74 FR 61749). In CY 2010, we began a 4-year transition to the new PE RVUs using the updated PE/HR data, which was completed for CY 2013.

c. Malpractice RVUs

Section 4505(f) of the BBA of 1997 amended section 1848(c) of the Act to require that we implement resource-based MP RVUs for services furnished on or after CY 2000. The resource-based MP RVUs were implemented in the PFS final rule with comment period published November 2, 1999 (64 FR 59380). The MP RVUs are based on commercial and physician-owned insurers' MP insurance premium data from all the states, the District of Columbia, and Puerto Rico. For more information on MP RVUs, *see* section II.C. of this final rule, Determination of Malpractice Relative Value Units.

d. Refinements to the RVUs

Section 1848(c)(2)(B)(i) of the Act requires that we review RVUs no less often than every 5 years. Prior to CY 2013, we conducted periodic reviews of work RVUs and PE RVUs independently. We completed 5-year reviews of work RVUs that were effective for calendar years 1997, 2002, 2007, and 2012.

Although refinements to the direct PE inputs initially relied heavily on input from the RUC Practice Expense Advisory Committee (PEAC), the shifts to the bottom-up PE methodology in CY 2007 and to the use of the updated PE/HR data in CY 2010 have resulted in significant refinements to the PE RVUs in recent years.

In the CY 2012 PFS final rule with comment period (76 FR 73057), we finalized a proposal to consolidate reviews of work and PE RVUs under section 1848(c)(2)(B) of the Act and reviews of potentially misvalued codes

under section 1848(c)(2)(K) of the Act into one annual process.

In addition to the 5-year reviews, beginning for CY 2009, CMS and the RUC identified and reviewed a number of potentially misvalued codes on an annual basis based on various identification screens. This annual review of work and PE RVUs for potentially misvalued codes was supplemented by the amendments to section 1848 of the Act, as enacted by section 3134 of the Affordable Care Act, that require the agency to periodically identify, review and adjust values for potentially misvalued codes.

e. Application of Budget Neutrality to Adjustments of RVUs

As described in section VII. of this final rule, the Regulatory Impact Analysis, in accordance with section 1848(c)(2)(B)(ii)(II) of the Act, if revisions to the RVUs cause expenditures for the year to change by more than \$20 million, we make adjustments to ensure that expenditures do not increase or decrease by more than \$20 million.

2. Calculation of Payments Based on RVUs

To calculate the payment for each service, the components of the fee schedule (work, PE, and MP RVUs) are adjusted by geographic practice cost indices (GPCIs) to reflect the variations in the costs of furnishing the services. The GPCIs reflect the relative costs of work, PE, and MP in an area compared to the national average costs for each component. Please refer to the CY 2017 PFS final rule with comment period for a discussion of the last GPCI update (81 FR 80261 through 80270), and to the GPCI section of this current rule for the CY 2020 update.

RVUs are converted to dollar amounts through the application of a CF, which is calculated based on a statutory formula by CMS' Office of the Actuary (OACT). The formula for calculating the Medicare PFS payment amount for a given service and fee schedule area can be expressed as:

$$\text{Payment} = [(\text{RVU work} \times \text{GPCI work}) + (\text{RVU PE} \times \text{GPCI PE}) + (\text{RVU MP} \times \text{GPCI MP})] \times \text{CF}$$

3. Separate Fee Schedule Methodology for Anesthesia Services

Section 1848(b)(2)(B) of the Act specifies that the fee schedule amounts for anesthesia services are to be based on a uniform relative value guide, with appropriate adjustment of an anesthesia CF, in a manner to ensure that fee schedule amounts for anesthesia services are consistent with those for

other services of comparable value. Therefore, there is a separate fee schedule methodology for anesthesia services. Specifically, we establish a separate CF for anesthesia services and we utilize the uniform relative value guide, or base units, as well as time units, to calculate the fee schedule amounts for anesthesia services. Since anesthesia services are not valued using RVUs, a separate methodology for locality adjustments is also necessary. This involves an adjustment to the national anesthesia CF for each payment locality.

B. Determination of PE RVUs

1. Overview

Practice expense (PE) is the portion of the resources used in furnishing a service that reflects the general categories of physician and practitioner expenses, such as office rent and personnel wages, but excluding MP expenses, as specified in section 1848(c)(1)(B) of the Act. As required by section 1848(c)(2)(C)(ii) of the Act, we use a resource-based system for determining PE RVUs for each physician's service. We develop PE RVUs by considering the direct and indirect practice resources involved in furnishing each service. Direct expense categories include clinical labor, medical supplies, and medical equipment. Indirect expenses include administrative labor, office expense, and all other expenses. The sections that follow provide more detailed information about the methodology for translating the resources involved in furnishing each service into service-specific PE RVUs. We refer readers to the CY 2010 PFS final rule with comment period (74 FR 61743 through 61748) for a more detailed explanation of the PE methodology.

2. Practice Expense Methodology

a. Direct Practice Expense

We determine the direct PE for a specific service by adding the costs of the direct resources (that is, the clinical staff, medical supplies, and medical equipment) typically involved with furnishing that service. The costs of the resources are calculated using the refined direct PE inputs assigned to each CPT code in our PE database, which are generally based on our review of recommendations received from the RUC and those provided in response to public comment periods. For a detailed explanation of the direct PE methodology, including examples, we refer readers to the 5-year review of work relative value units under the PFS and proposed changes to the PE

methodology CY 2007 PFS proposed notice (71 FR 37242) and the CY 2007 PFS final rule with comment period (71 FR 69629).

b. Indirect Practice Expense per Hour Data

We use survey data on indirect PEs incurred per hour worked, in developing the indirect portion of the PE RVUs. Prior to CY 2010, we primarily used the PE/HR by specialty that was obtained from the AMA's SMS. The AMA administered a new survey in CY 2007 and CY 2008, the Physician Practice Expense Information Survey (PPIS). The PPIS is a multispecialty, nationally representative, PE survey of both physicians and NPPs paid under the PFS using a survey instrument and methods highly consistent with those used for the SMS and the supplemental surveys. The PPIS gathered information from 3,656 respondents across 51 physician specialty and health care professional groups. We believe the PPIS is the most comprehensive source of PE survey information available. We used the PPIS data to update the PE/HR data for the CY 2010 PFS for almost all of the Medicare-recognized specialties that participated in the survey.

When we began using the PPIS data in CY 2010, we did not change the PE RVU methodology itself or the manner in which the PE/HR data are used in that methodology. We only updated the PE/HR data based on the new survey. Furthermore, as we explained in the CY 2010 PFS final rule with comment period (74 FR 61751), because of the magnitude of payment reductions for some specialties resulting from the use of the PPIS data, we transitioned its use over a 4-year period from the previous PE RVUs to the PE RVUs developed using the new PPIS data. As provided in the CY 2010 PFS final rule with comment period (74 FR 61751), the transition to the PPIS data was complete for CY 2013. Therefore, PE RVUs from CY 2013 forward are developed based entirely on the PPIS data, except as noted in this section.

Section 1848(c)(2)(H)(i) of the Act requires us to use the medical oncology supplemental survey data submitted in 2003 for oncology drug administration services. Therefore, the PE/HR for medical oncology, hematology, and hematology/oncology reflects the continued use of these supplemental survey data.

Supplemental survey data on independent labs from the College of American Pathologists were implemented for payments beginning in CY 2005. Supplemental survey data from the National Coalition of Quality

Diagnostic Imaging Services (NCQDIS), representing independent diagnostic testing facilities (IDTFs), were blended with supplementary survey data from the American College of Radiology (ACR) and implemented for payments beginning in CY 2007. Neither IDTFs, nor independent labs, participated in the PPIS. Therefore, we continue to use the PE/HR that was developed from their supplemental survey data.

Consistent with our past practice, the previous indirect PE/HR values from the supplemental surveys for these specialties were updated to CY 2006 using the Medicare Economic Index (MEI) to put them on a comparable basis with the PPIS data.

We also do not use the PPIS data for reproductive endocrinology and spine surgery since these specialties currently are not separately recognized by Medicare, nor do we have a method to blend the PPIS data with Medicare-recognized specialty data.

Previously, we established PE/HR values for various specialties without SMS or supplemental survey data by crosswalking them to other similar specialties to estimate a proxy PE/HR. For specialties that were part of the PPIS for which we previously used a crosswalked PE/HR, we instead used the PPIS-based PE/HR. We use crosswalks for specialties that did not participate in the PPIS. These crosswalks have been generally established through notice and comment rulemaking and are available in the file called "CY 2020 PFS Proposed Rule PE/HR" on the CMS website under downloads for the CY 2020 PFS proposed rule at <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html>.

For CY 2020, we have incorporated the available utilization data for two new specialties, each of which became a recognized Medicare specialty during 2018. These specialties are Medical Toxicology and Hematopoietic Cell Transplantation and Cellular Therapy. We proposed to use proxy PE/HR values for these new specialties, as there are no PPIS data for these specialties, by crosswalking the PE/HR as follows from specialties that furnish similar services in the Medicare claims data:

- Medical Toxicology from Emergency Medicine; and
- Hematopoietic Cell Transplantation and Cellular Therapy from Hematology/Oncology.

These updates are reflected in the "CY 2020 PFS Final Rule PE/HR" file available on the CMS website under the supporting data files for the CY 2020 PFS final rule at <http://www.cms.gov/>

Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html.

We did not receive any public comments on the use of the proposed PE/HR proxy values for Medical Toxicology and Hematopoietic Cell Transplantation and Cellular Therapy. Therefore, we are finalizing our PE/HR crosswalks as proposed.

c. Allocation of PE to Services

To establish PE RVUs for specific services, it is necessary to establish the direct and indirect PE associated with each service.

(1) Direct Costs

The relative relationship between the direct cost portions of the PE RVUs for any two services is determined by the relative relationship between the sum of the direct cost resources (that is, the clinical staff, medical supplies, and medical equipment) typically involved with furnishing each of the services. The costs of these resources are calculated from the refined direct PE inputs in our PE database. For example, if one service has a direct cost sum of \$400 from our PE database and another service has a direct cost sum of \$200, the direct portion of the PE RVUs of the first service would be twice as much as the direct portion of the PE RVUs for the second service.

(2) Indirect Costs

We allocate the indirect costs at the code level on the basis of the direct costs specifically associated with a code and the greater of either the clinical labor costs or the work RVUs. We also incorporate the survey data described earlier in the PE/HR discussion. The general approach to developing the indirect portion of the PE RVUs is as follows:

- For a given service, we use the direct portion of the PE RVUs calculated as previously described and the average percentage that direct costs represent of total costs (based on survey data) across the specialties that furnish the service to determine an initial indirect allocator. That is, the initial indirect allocator is calculated so that the direct costs equal the average percentage of direct costs of those specialties furnishing the service. For example, if the direct portion of the PE RVUs for a given service is 2.00 and direct costs, on average, represent 25 percent of total costs for the specialties that furnish the service, the initial indirect allocator would be calculated so that it equals 75 percent of the total PE RVUs. Thus, in this example, the initial indirect allocator would equal 6.00, resulting in a total PE RVU of 8.00

(2.00 is 25 percent of 8.00 and 6.00 is 75 percent of 8.00).

- Next, we add the greater of the work RVUs or clinical labor portion of the direct portion of the PE RVUs to this initial indirect allocator. In our example, if this service had a work RVU of 4.00 and the clinical labor portion of the direct PE RVU was 1.50, we would add 4.00 (since the 4.00 work RVUs are greater than the 1.50 clinical labor portion) to the initial indirect allocator of 6.00 to get an indirect allocator of 10.00. In the absence of any further use of the survey data, the relative relationship between the indirect cost portions of the PE RVUs for any two services would be determined by the relative relationship between these indirect cost allocators. For example, if one service had an indirect cost allocator of 10.00 and another service had an indirect cost allocator of 5.00, the indirect portion of the PE RVUs of the first service would be twice as great as the indirect portion of the PE RVUs for the second service.

- Then, we incorporate the specialty-specific indirect PE/HR data into the calculation. In our example, if, based on the survey data, the average indirect cost of the specialties furnishing the first service with an allocator of 10.00 was half of the average indirect cost of the specialties furnishing the second service with an indirect allocator of 5.00, the indirect portion of the PE RVUs of the first service would be equal to that of the second service.

(3) Facility and Nonfacility Costs

For procedures that can be furnished in a physician's office, as well as in a facility setting, where Medicare makes a separate payment to the facility for its costs in furnishing a service, we establish two PE RVUs: Facility and nonfacility. The methodology for calculating PE RVUs is the same for both the facility and nonfacility RVUs, but is applied independently to yield two separate PE RVUs. In calculating the PE RVUs for services furnished in a facility, we do not include resources that would generally not be provided by physicians when furnishing the service. For this reason, the facility PE RVUs are generally lower than the nonfacility PE RVUs.

(4) Services With Technical Components and Professional Components

Diagnostic services are generally comprised of two components: A professional component (PC); and a technical component (TC). The PC and TC may be furnished independently or by different providers, or they may be

furnished together as a global service. When services have separately billable PC and TC components, the payment for the global service equals the sum of the payment for the TC and PC. To achieve this, we use a weighted average of the ratio of indirect to direct costs across all the specialties that furnish the global service, TCs, and PCs; that is, we apply the same weighted average indirect percentage factor to allocate indirect expenses to the global service, PCs, and TCs for a service. (The direct PE RVUs for the TC and PC sum to the global.)

(5) PE RVU Methodology

For a more detailed description of the PE RVU methodology, we refer readers to the CY 2010 PFS final rule with comment period (74 FR 61745 through 61746). We also direct readers to the file called "Calculation of PE RVUs under Methodology for Selected Codes" which is available on our website under downloads for the CY 2020 PFS proposed rule at <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html>. This file contains a table that illustrates the calculation of PE RVUs as described in this proposed rule for individual codes.

(a) Setup File

First, we create a setup file for the PE methodology. The setup file contains the direct cost inputs, the utilization for each procedure code at the specialty and facility/nonfacility place of service level, and the specialty-specific PE/HR data calculated from the surveys.

(b) Calculate the Direct Cost PE RVUs

Sum the costs of each direct input.

Step 1: Sum the direct costs of the inputs for each service.

Step 2: Calculate the aggregate pool of direct PE costs for the current year. We set the aggregate pool of PE costs equal to the product of the ratio of the current aggregate PE RVUs to current aggregate work RVUs and the projected aggregate work RVUs.

Step 3: Calculate the aggregate pool of direct PE costs for use in ratesetting. This is the product of the aggregate direct costs for all services from Step 1 and the utilization data for that service.

Step 4: Using the results of Step 2 and Step 3, use the CF to calculate a direct PE scaling adjustment to ensure that the aggregate pool of direct PE costs calculated in Step 3 does not vary from the aggregate pool of direct PE costs for the current year. Apply the scaling adjustment to the direct costs for each service (as calculated in Step 1).

Step 5: Convert the results of Step 4 to a RVU scale for each service. To do

this, divide the results of Step 4 by the CF. Note that the actual value of the CF used in this calculation does not influence the final direct cost PE RVUs as long as the same CF is used in Step 4 and Step 5. Different CFs would result in different direct PE scaling adjustments, but this has no effect on the final direct cost PE RVUs since changes in the CFs and changes in the associated direct scaling adjustments offset one another.

(c) Create the Indirect Cost PE RVUs

Create indirect allocators.

Step 6: Based on the survey data, calculate direct and indirect PE percentages for each physician specialty.

Step 7: Calculate direct and indirect PE percentages at the service level by taking a weighted average of the results of Step 6 for the specialties that furnish the service. Note that for services with TCs and PCs, the direct and indirect percentages for a given service do not vary by the PC, TC, and global service.

We generally use an average of the 3 most recent years of available Medicare claims data to determine the specialty mix assigned to each code. Codes with low Medicare service volume require special attention since billing or enrollment irregularities for a given year can result in significant changes in specialty mix assignment. We finalized a policy in the CY 2018 PFS final rule (82 FR 52982 through 52983) to use the most recent year of claims data to determine which codes are low volume for the coming year (those that have fewer than 100 allowed services in the Medicare claims data). For codes that fall into this category, instead of assigning specialty mix based on the specialties of the practitioners reporting the services in the claims data, we instead use the expected specialty that we identify on a list developed based on medical review and input from expert stakeholders. We display this list of expected specialty assignments as part of the annual set of data files we make available as part of notice and comment rulemaking and consider recommendations from the RUC and other stakeholders on changes to this list on an annual basis. Services for which the specialty is automatically assigned based on previously finalized policies under our established methodology (for example, "always therapy" services) are unaffected by the list of expected specialty assignments. We also finalized in the CY 2018 PFS final rule (82 FR 52982 through 52983) a policy to apply these service-level overrides for both PE and MP, rather than one or the other category.

For CY 2020, we proposed to clarify the expected specialty assignment for a series of cardiothoracic services. Prior to the creation of the expected specialty list for low volume services in CY 2018, we previously finalized through rulemaking a crosswalk to the thoracic surgery specialty for a series of

cardiothoracic services that typically had fewer than 100 services reported each year (*see*, for example, the CY 2012 PFS final rule (76 FR 73188–73189)). However, we noted that for many of the affected codes, the expected specialty list for low volume services incorrectly listed a crosswalk to the cardiac surgery

specialty instead of the thoracic surgery specialty. We proposed to update the expected specialty list to accurately reflect the previously finalized crosswalk to thoracic surgery for these services. The affected codes are shown in Table 1.

identical MP risk factors for MP valuation. As a result, we noted that we did not anticipate the proposal having a discernible effect on the valuation of the codes listed above. The complete list of expected specialty assignments for individual low volume services, including the assignments for the codes identified in Table 1, is available on our website under downloads for the CY 2020 PFS final rule at <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html>.

We received public comments on the proposed updates to the expected specialty list. The following is a summary of the comments we received and our responses.

Comment: Several commenters stated that CMS had indicated that the expected specialty would be updated to include a column specifying if a service was identified as a low volume service for CY 2020, indicating if the service-level override was being applied for CY 2020. However, commenters noted that this additional column did not appear in the download version and asked for additional information.

Response: We thank the commenters for identifying this missing information and we apologize for the technical oversight that caused this information not to be displayed for the proposed rule. We will include this additional column in the public use files released with the final rule.

Comment: Several commenters disagreed with the CMS proposal to update the expected specialty list to accurately reflect the previously finalized crosswalk to thoracic surgery for these services. Commenters stated that when the expected specialty list was developed, the affected specialties specifically selected the cardiac surgery specialty for these codes. Commenters also stated that, for nearly all of the applicable codes, cardiac surgery was the dominant provider in the 2018 Medicare claims data. Commenters acknowledged that the MP risk factor for both cardiac surgery and thoracic surgery is naturally very similar, but still asked that CMS assign the codes listed in Table 1 to the cardiac surgery specialty.

Response: As we stated in the proposed rule, we did not propose to assign the codes listed in Table 1 to the cardiac surgery specialty. Instead, we proposed to update the incorrect

documentation in our expected specialty list to accurately reflect the previously finalized crosswalk to thoracic surgery for these services. The previously finalized assignment of the cardiac specialty to these services has been in place since the CY 2012 rule cycle, and we believe that the expected specialty list should be updated to reflect the correct specialty assignment.

Comment: Several commenters disagreed with the CMS methodology used to determine low volume service status; that is, codes that have fewer than 100 allowed services in the non-modified 3-year average of Medicare claims data. Commenters stated that utilization frequencies are adjusted in the RUC database for certain codes based on the CPT modifiers that were appended to the code to ensure that certain services are not over- or underweighted, such as changes made for bilateral modifier 50, post-op only modifier 55 and anesthesia modifiers QK, QX and QY. Commenters stated that CMS does not discount the utilization when determining what constitutes a low volume service and instead uses the non-modified 3-year service count for this criterion. Commenters stated that this could lead to double-counting and overestimating utilization for the purposes of determining low volume status, and requested that CMS use discounted utilization for this purpose.

Response: We disagree that it would be more accurate to use a discounted form of utilization to determine low volume status. We finalized a policy in the CY 2018 PFS final rule (82 FR 52982 through 52983) to use claims data to determine which codes are low volume for the coming year, defining “low volume” as those that had fewer than 100 allowed services in the Medicare claims data. We did not finalize a policy to discount this utilization and we do not believe that it would be more accurate to do so, as a service is still performed even if a payment discount is applied to its billing. More importantly, we did not make any proposals concerning the methodology to determine what constitute a low volume service in the proposed rule, and therefore, we are not finalizing any changes to this methodology.

Comment: One commenter provided a list of 112 additional codes that the commenter stated were low volume procedures, with an expected specialty

for each code. The commenter recommended that CMS append this list to the anticipated specialty assignment for low volume services. Another commenter stated that gastroenterologists do not perform CPT code 96571 on a current basis, and recommended that CMS remove gastroenterology as the expected specialty for this code.

Response: We appreciate the list of additional services identified by the commenter. As we have stated in previous rulemaking (82 FR 52982), we consider recommendations from the RUC and other stakeholders on changes to this list on an annual basis. In reviewing the submitted list of 112 additional codes, we noted that they generally fell into two categories—codes with a restricted coverage status code (“R”) or codes that exceed 100 services in the claims data, and therefore, did not meet our criteria for low volume status. We are finalizing the addition of these 112 codes to the low volume services list with the recommended expected specialty; however, we caution that many of these codes will continue to have utilization too high to meet the criteria for expected specialty assignment. We are adding these codes to the list in the interest of maintaining payment stability, such that, if they were to fall below 100 annual services at a future date, then an expected specialty would be assigned. We do not have indirect PE data for two of the specialties on the recommended list, and as a result we are substituting the established PE/HR crosswalk for these specialties. (The full list of all established PE/HR crosswalks is available on our website under downloads for the CY 2020 PFS final rule at <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html>.) The two affected specialties are Interventional Cardiology (crosswalked to Cardiology) and Surgical Oncology (crosswalked to General Surgery). We are also finalizing a change to the expected specialty for CPT code 96571 in response to the information supplied by the commenter, which we are changing to Pulmonary Disease to match the dominant specialty in the claims data. The complete list of additional updates to the low volume services list is detailed in Table 2.

BILLING CODE 4120-01-C

Comment: Several commenters stated that the non-facility PE RVUs for CPT code 55874 (*Transperineal placement of biodegradable material, peri-prostatic, single or multiple injection(s), including image guidance, when performed*) are projected to decrease 13 percent for CY 2020, which the commenter believed to be attributed to the current specialty mix utilizing the code. The commenters stated that the projected decrease for CY 2020 was due to CMS using the first year of actual claims data, which had a different ratio of the urology and radiation oncology specialties than in the previously projected utilization crosswalk. The commenters requested that CMS address the proposed decreases for CPT code 55874 in the final rule.

Response: We agree with the commenters that the proposed decreases for CPT code 55874 were due to changes in the specialty mix, as the code shifted from projected utilization to reported claims data. However, we do not agree with the commenters that there is a need to address the valuation of this code, as we believe that it is important to use actual claims data as opposed to utilization projections once the data for new codes has become available. The specialty mix on reported claims will necessarily be more accurate than the utilization projections created in advance before claims data exists. We also note that the specialty mix associated with CPT code 55874 in the claims data is unrelated to the low volume list or the assignment of an expected specialty.

Comment: A commenter stated that CPT codes 33271 (*Insertion of subcutaneous implantable defibrillator electrode*) and 33273 (*Repositioning of previously implanted subcutaneous implantable defibrillator electrode*) are

low volume service codes that are proposed to have a service-level override to the anticipated specialty of cardiology. The commenter supported this expected specialty assignment.

Response: We appreciate the support for our proposals from the commenter.

After consideration of the public comments, we are finalizing our proposal to update the expected specialty list to accurately reflect the previously finalized crosswalk to thoracic surgery for these services. We are also finalizing the updates to the expected specialty list detailed above in Table 2; we reiterate again that we do not anticipate this finalized proposal having a discernible effect on the valuation of the codes in the table due to the similarity between the cardiac surgery and thoracic surgery specialties.

Step 8: Calculate the service level allocators for the indirect PEs based on the percentages calculated in Step 7. The indirect PEs are allocated based on the three components: The direct PE RVUs; the clinical labor PE RVUs; and the work RVUs.

For most services the indirect allocator is: Indirect PE percentage * (direct PE RVUs/direct percentage) + work RVUs.

There are two situations where this formula is modified:

- If the service is a global service (that is, a service with global, professional, and technical components), then the indirect PE allocator is: Indirect percentage (direct PE RVUs/direct percentage) + clinical labor PE RVUs + work RVUs.

- If the clinical labor PE RVUs exceed the work RVUs (and the service is not a global service), then the indirect allocator is: Indirect PE percentage (direct PE RVUs/direct percentage) + clinical labor PE RVUs.

(*Note:* For global services, the indirect PE allocator is based on both the work

RVUs and the clinical labor PE RVUs. We do this to recognize that, for the PC service, indirect PEs would be allocated using the work RVUs, and for the TC service, indirect PEs would be allocated using the direct PE RVUs and the clinical labor PE RVUs. This also allows the global component RVUs to equal the sum of the PC and TC RVUs.)

For presentation purposes, in the examples in the download file called "Calculation of PE RVUs under Methodology for Selected Codes", the formulas were divided into two parts for each service.

- The first part does not vary by service and is the indirect percentage (direct PE RVUs/direct percentage).
- The second part is either the work RVU, clinical labor PE RVU, or both depending on whether the service is a global service and whether the clinical PE RVUs exceed the work RVUs (as described earlier in this step).

Apply a scaling adjustment to the indirect allocators.

Step 9: Calculate the current aggregate pool of indirect PE RVUs by multiplying the result of step 8 by the average indirect PE percentage from the survey data.

Step 10: Calculate an aggregate pool of indirect PE RVUs for all PFS services by adding the product of the indirect PE allocators for a service from Step 8 and the utilization data for that service.

Step 11: Using the results of Step 9 and Step 10, calculate an indirect PE adjustment so that the aggregate indirect allocation does not exceed the available aggregate indirect PE RVUs and apply it to indirect allocators calculated in Step 8.

Calculate the indirect practice cost index.

Step 12: Using the results of Step 11, calculate aggregate pools of specialty-specific adjusted indirect PE allocators

for all PFS services for a specialty by adding the product of the adjusted indirect PE allocator for each service and the utilization data for that service.

Step 13: Using the specialty-specific indirect PE/HR data, calculate specialty-specific aggregate pools of indirect PE for all PFS services for that specialty by adding the product of the indirect PE/HR for the specialty, the work time for the service, and the specialty's utilization for the service across all services furnished by the specialty.

Step 14: Using the results of Step 12 and Step 13, calculate the specialty-specific indirect PE scaling factors.

Step 15: Using the results of Step 14, calculate an indirect practice cost index at the specialty level by dividing each specialty-specific indirect scaling factor by the average indirect scaling factor for the entire PFS.

Step 16: Calculate the indirect practice cost index at the service level to ensure the capture of all indirect costs. Calculate a weighted average of the practice cost index values for the specialties that furnish the service. (*Note:* For services with TCs and PCs, we calculate the indirect practice cost index across the global service, PCs, and TCs. Under this method, the indirect practice cost index for a given service (for example, echocardiogram) does not vary by the PC, TC, and global service.)

Step 17: Apply the service level indirect practice cost index calculated in Step 16 to the service level adjusted indirect allocators calculated in Step 11 to get the indirect PE RVUs.

(d) Calculate the Final PE RVUs

Step 18: Add the direct PE RVUs from Step 5 to the indirect PE RVUs from Step 17 and apply the final PE budget neutrality (BN) adjustment. The final PE BN adjustment is calculated by comparing the sum of steps 5 and 17 to the proposed aggregate work RVUs scaled by the ratio of current aggregate PE and work RVUs. This adjustment ensures that all PE RVUs in the PFS account for the fact that certain specialties are excluded from the calculation of PE RVUs but included in maintaining overall PFS budget neutrality. (See "Specialties excluded from ratesetting calculation" later in this final rule.)

Step 19: Apply the phase-in of significant RVU reductions and its associated adjustment. Section 1848(c)(7) of the Act specifies that for services that are not new or revised codes, if the total RVUs for a service for a year would otherwise be decreased by an estimated 20 percent or more as compared to the total RVUs for the previous year, the applicable adjustments in work, PE, and MP RVUs shall be phased in over a 2-year period.

In implementing the phase-in, we consider a 19 percent reduction as the maximum 1-year reduction for any service not described by a new or revised code. This approach limits the year one reduction for the service to the maximum allowed amount (that is, 19 percent), and then phases in the remainder of the reduction. To comply with section 1848(c)(7) of the Act, we adjust the PE RVUs to ensure that the total RVUs for all services that are not new or revised codes decrease by no more than 19 percent, and then apply a relativity adjustment to ensure that the total pool of aggregate PE RVUs remains relative to the pool of work and MP RVUs. For a more detailed description of the methodology for the phase-in of significant RVU changes, we refer readers to the CY 2016 PFS final rule with comment period (80 FR 70927 through 70931).

(e) Setup File Information

- *Specialties excluded from ratesetting calculation:* For the purposes of calculating the PE and MP RVUs, we exclude certain specialties, such as certain NPPs paid at a percentage of the PFS and low-volume specialties, from the calculation. These specialties are included for the purposes of calculating the BN adjustment. They are displayed in Table 2.

TABLE 3: Specialties Excluded from Ratesetting Calculation

Specialty Code	Specialty Description
49	Ambulatory surgical center
50	Nurse practitioner
51	Medical supply company with certified orthotist
52	Medical supply company with certified prosthetist
53	Medical supply company with certified prosthetist-orthotist
54	Medical supply company not included in 51, 52, or 53.
55	Individual certified orthotist
56	Individual certified prosthetist
57	Individual certified prosthetist-orthotist
58	Medical supply company with registered pharmacist
59	Ambulance service supplier, e.g., private ambulance companies, funeral homes, etc.
60	Public health or welfare agencies
61	Voluntary health or charitable agencies
73	Mass immunization roster biller
74	Radiation therapy centers
87	All other suppliers (e.g., drug and department stores)
88	Unknown supplier/provider specialty
89	Certified clinical nurse specialist
96	Optician
97	Physician assistant
A0	Hospital
A1	SNF
A2	Intermediate care nursing facility
A3	Nursing facility, other
A4	HHA
A5	Pharmacy
A6	Medical supply company with respiratory therapist
A7	Department store
A8	Grocery store
B1	Supplier of oxygen and/or oxygen related equipment (eff. 10/2/2007)
B2	Pedorthic personnel
B3	Medical supply company with pedorthic personnel
B4	Rehabilitation Agency
B5	Ocularist
C1	Centralized Flu
C2	Indirect Payment Procedure
C5	Dentistry

- *Crosswalk certain low volume physician specialties:* Crosswalk the utilization of certain specialties with relatively low PFS utilization to the associated specialties.

- *Physical therapy utilization:* Crosswalk the utilization associated with all physical therapy services to the specialty of physical therapy.

- *Identify professional and technical services not identified under the usual TC and 26 modifiers:* Flag the services that are PC and TC services but do not use TC and 26 modifiers (for example, electrocardiograms). This flag associates the PC and TC with the associated global code for use in creating the

indirect PE RVUs. For example, the professional service, CPT code 93010 (*Electrocardiogram, routine ECG with at least 12 leads; interpretation and report only*), is associated with the global service, CPT code 93000 (*Electrocardiogram, routine ECG with at least 12 leads; with interpretation and report*).

- *Payment modifiers:* Payment modifiers are accounted for in the creation of the file consistent with current payment policy as implemented in claims processing. For example, services billed with the assistant at surgery modifier are paid 16 percent of the PFS amount for that service;

therefore, the utilization file is modified to only account for 16 percent of any service that contains the assistant at surgery modifier. Similarly, for those services to which volume adjustments are made to account for the payment modifiers, time adjustments are applied as well. For time adjustments to surgical services, the intraoperative portion in the work time file is used; where it is not present, the intraoperative percentage from the payment files used by contractors to process Medicare claims is used instead. Where neither is available, we use the payment adjustment ratio to adjust the time

accordingly. Table 4 details the manner in which the modifiers are applied.

TABLE 4: Application of Payment Modifiers to Utilization Files

Modifier	Description	Volume Adjustment	Time Adjustment
80,81,82	Assistant at Surgery	16%	Intraoperative portion
AS	Assistant at Surgery – Physician Assistant	14% (85% * 16%)	Intraoperative portion
50 or LT and RT	Bilateral Surgery	150%	150% of work time
51	Multiple Procedure	50%	Intraoperative portion
52	Reduced Services	50%	50%
53	Discontinued Procedure	50%	50%
54	Intraoperative Care only	Preoperative + Intraoperative Percentages on the payment files used by Medicare contractors to process Medicare claims	Preoperative + Intraoperative portion
55	Postoperative Care only	Postoperative Percentage on the payment files used by Medicare contractors to process Medicare claims	Postoperative portion
62	Co-surgeons	62.5%	50%
66	Team Surgeons	33%	33%

We also make adjustments to volume and time that correspond to other payment rules, including special multiple procedure endoscopy rules and multiple procedure payment reductions (MPPRs). We note that section 1848(c)(2)(B)(v) of the Act exempts certain reduced payments for multiple imaging procedures and multiple therapy services from the BN calculation under section 1848(c)(2)(B)(ii)(II) of the Act. These MPPRs are not included in the development of the RVUs.

For anesthesia services, we do not apply adjustments to volume since we use the average allowed charge when simulating RVUs; therefore, the RVUs as calculated already reflect the payments as adjusted by modifiers, and no volume adjustments are necessary. However, a time adjustment of 33 percent is made only for medical direction of two to four cases since that is the only situation where a single practitioner is involved with multiple beneficiaries concurrently, so that counting each service without regard to the overlap with other services would overstate the amount of time spent by the practitioner furnishing these services.

- **Work RVUs:** The setup file contains the work RVUs from this final rule.

(6) Equipment Cost per Minute

The equipment cost per minute is calculated as:

$$(1/(\text{minutes per year} * \text{usage})) * \text{price} * ((\text{interest rate}/(1 - (1/(1 + \text{interest rate})^{\wedge} \text{life of equipment})))) + \text{maintenance})$$

Where:

minutes per year = maximum minutes per year if usage were continuous (that is, usage = 1); generally 150,000 minutes.
usage = variable, *see* discussion below in this final rule.
price = price of the particular piece of equipment.
life of equipment = useful life of the particular piece of equipment.
maintenance = factor for maintenance; 0.05.
interest rate = variable, *see* discussion below in this final rule.

Usage: We currently use an equipment utilization rate assumption of 50 percent for most equipment, with the exception of expensive diagnostic imaging equipment, for which we use a 90 percent assumption as required by section 1848(b)(4)(C) of the Act.

Stakeholders have often suggested that particular equipment items are used less frequently than 50 percent of the time in the typical setting and that CMS should reduce the equipment utilization rate based on these recommendations. We appreciate and share stakeholders' interest in using the most accurate assumption regarding the equipment

utilization rate for particular equipment items. However, we believe that absent robust, objective, auditable data regarding the use of particular items, the 50 percent assumption is the most appropriate within the relative value system.

Comment: A commenter stated that they disagreed with the 90 percent utilization metric for CT and MRI equipment, as the commenter did not believe it to be realistic in a typical outpatient imaging setting, but the commenter recognized that the percentage is dictated by statute. The commenter stated that the 90 percent equipment usage assumption for CT and MRI is inconsistent with actual imaging center practice and ignores scheduling in the "real world," such as lunch and other mandated breaks, complicated patients, and downtime for maintenance and quality control. The commenter stated that to achieve a 90 percent utilization rate under ideal conditions would require two employees per unit; one doing pre-service tasks while the other is setting up the machine as opposed to assumptions of one CT or MRI technologist per scanner.

Response: We disagree with the commenters regarding the equipment time assigned to highly technical equipment such as CT or MRI machines. We continue to believe that certain highly technical pieces of equipment

and equipment rooms are less likely to be used during all of the preservice or postservice tasks performed by clinical labor staff on the day of the procedure and are typically available for other patients even when one member of clinical staff may be occupied with a preservice or postservice task related to the procedure. For a more detailed description of this topic, we refer readers to the CY 2015 PFS final rule with comment period (79 FR 67639 through 67640).

Comment: One commenter stated that most ophthalmology diagnostic equipment is in use far less than 50 percent of the time. The commenter indicated that they had developed a survey instrument that asked ophthalmic technicians to provide time usage estimates for the 16 most-utilized pieces of diagnostic testing equipment. The commenter stated that their preliminary survey results produced a utilization rate of 22 percent, much lower than the 50 percent assumption currently used by CMS. The commenter suggested that CMS should work with the RUC to do a robust survey to help determine a more valid utilization rate, including the possibility of specialty-specific equipment utilization rates. The commenter also requested a meeting to discuss what options CMS would find acceptable in undertaking their own survey for ophthalmology services.

Response: We are always looking for more accurate information to improve our PE methodology. We appreciate and share stakeholders' interest in using the most accurate assumption regarding the equipment utilization rate for particular equipment items, and we will review any information that the RUC's PE subcommittee or other stakeholders are willing to submit through the public comment process. We concur with the

commenter that a wide-ranging survey or similar study designed to address the subject of equipment utilization rates would be an appropriate tool to investigate this subject in further detail. At the moment, we believe that absent robust, objective, auditable data regarding the use of particular items, the 50 percent assumption is the most appropriate within the relative value system. We welcome further submission of data that illustrates an alternative rate.

Maintenance: This factor for maintenance was finalized in the CY 1998 PFS final rule with comment period (62 FR 33164). As we previously stated in the CY 2016 PFS final rule with comment period (80 FR 70897), we do not believe the annual maintenance factor for all equipment is precisely 5 percent, and we concur that the current rate likely understates the true cost of maintaining some equipment. We also believe it likely overstates the maintenance costs for other equipment. When we solicited comments regarding sources of data containing equipment maintenance rates, commenters were unable to identify an auditable, robust data source that could be used by CMS on a wide scale. We do not believe that voluntary submissions regarding the maintenance costs of individual equipment items would be an appropriate methodology for determining costs. As a result, in the absence of publicly available datasets regarding equipment maintenance costs or another systematic data collection methodology for determining a different maintenance factor, we did not propose a variable maintenance factor for equipment cost per minute pricing as we noted that we did not believe that we have sufficient information at present to do so. We continue to

investigate potential avenues for determining equipment maintenance costs across a broad range of equipment items.

Comment: A commenter stated that they continue to believe that maintenance costs for imaging equipment are much higher than the current 5 percent assumption. The commenter stated that the maintenance costs for an MRI unit include servicing the scanner itself plus replacing cryogenics for a cost well in excess of 5 percent even using CMS' low assumptions of MRI and CT room cost.

Response: As detailed above, we continue to believe that the current 5 percent maintenance factor likely understates the true cost of maintaining some equipment and overstates the maintenance costs for other equipment. We continue at this time to lack publicly available datasets regarding equipment maintenance costs or another systematic data collection methodology for determining maintenance factor. We remind readers that when we solicited comments regarding sources of data containing equipment maintenance rates, commenters were unable to identify an auditable, robust data source that could be used by CMS on a wide scale.

Interest Rate: In the CY 2013 PFS final rule with comment period (77 FR 68902), we updated the interest rates used in developing an equipment cost per minute calculation (see 77 FR 68902 for a thorough discussion of this issue). The interest rate was based on the Small Business Administration (SBA) maximum interest rates for different categories of loan size (equipment cost) and maturity (useful life). We did not propose any changes to these interest rates for CY 2020. The Interest rates are listed in Table 5.

TABLE 5: SBA Maximum Interest Rates

Price	Useful Life	Interest Rate
<\$25K	<7 Years	7.50%
\$25K to \$50K	<7 Years	6.50%
>\$50K	<7 Years	5.50%
<\$25K	7+ Years	8.00%
\$25K to \$50K	7+ Years	7.00%
>\$50K	7+ Years	6.00%

Comment: A commenter stated that they did not support the continued use of the 2012 SBA maximum interest rates, which the commenter stated are

significantly lower than the 2019 rates. The commenter stated that CMS should also update the interest rates used to

calculate PE RVUs for such items based on current SBA data.

Response: We appreciate the additional information regarding SBA

maximum interest rates from the commenter. However, we did not propose any changes to these interest rates for CY 2020; we will consider potential changes to the interest rates used in the equipment cost per minute calculation for possible future rulemaking.

3. Changes to Direct PE Inputs for Specific Services

This section focuses on specific PE inputs. The direct PE inputs are included in the CY 2020 direct PE input public use files, which are available on the CMS website under downloads for the CY 2020 PFS final rule at <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html>.

a. Standardization of Clinical Labor Tasks

As we noted in the CY 2015 PFS final rule with comment period (79 FR 67640–67641), we continue to make improvements to the direct PE input database to provide the number of clinical labor minutes assigned for each task for every code in the database instead of only including the number of clinical labor minutes for the preservice, service, and postservice periods for each code. In addition to increasing the transparency of the information used to set PE RVUs, this level of detail would allow us to compare clinical labor times for activities associated with services across the PFS, which we believe is important to maintaining the relativity of the direct PE inputs. This information would facilitate the identification of the usual numbers of minutes for clinical labor tasks and the identification of exceptions to the usual values. It would also allow for greater transparency and consistency in the assignment of equipment minutes based on clinical labor times. Finally, we believe that the detailed information can be useful in maintaining standard times for particular clinical labor tasks that can be applied consistently to many codes as they are valued over several years, similar in principle to the use of physician preservice time packages. We believe that setting and maintaining such standards would provide greater consistency among codes that share the same clinical labor tasks and could improve relativity of values among codes. For example, as medical practice and technologies change over time, changes in the standards could be updated simultaneously for all codes with the applicable clinical labor tasks, instead of waiting for individual codes to be reviewed.

In the CY 2016 PFS final rule with comment period (80 FR 70901), we solicited comments on the appropriate standard minutes for the clinical labor tasks associated with services that use digital technology. After consideration of comments received, we finalized standard times for clinical labor tasks associated with digital imaging at 2 minutes for “Availability of prior images confirmed”, 2 minutes for “Patient clinical information and questionnaire reviewed by technologist, order from physician confirmed and exam protocol by radiologist”, 2 minutes for “Review examination with interpreting MD”, and 1 minute for “Exam documents scanned into PACS.” Exam completed in RIS system to generate billing process and to populate images into Radiologist work queue.” In the CY 2017 PFS final rule (81 FR 80184 through 80186), we finalized a policy to establish a range of appropriate standard minutes for the clinical labor activity, “Technologist QC images in PACS, checking for all images, reformats, and dose page.” These standard minutes will be applied to new and revised codes that make use of this clinical labor activity when they are reviewed by us for valuation. We finalized a policy to establish 2 minutes as the standard for the simple case, 3 minutes as the standard for the intermediate case, 4 minutes as the standard for the complex case, and 5 minutes as the standard for the highly complex case. These values were based upon a review of the existing minutes assigned for this clinical labor activity; we determined that 2 minutes is the duration for most services and a small number of codes with more complex forms of digital imaging have higher values.

We also finalized standard times for clinical labor tasks associated with pathology services in the CY 2016 PFS final rule with comment period (80 FR 70902) at 4 minutes for “Accession specimen/prepare for examination”, 0.5 minutes for “Assemble and deliver slides with paperwork to pathologists”, 0.5 minutes for “Assemble other light microscopy slides, open nerve biopsy slides, and clinical history, and present to pathologist to prepare clinical pathologic interpretation”, 1 minute for “Clean room/equipment following procedure”, 1 minute for “Dispose of remaining specimens, spent chemicals/other consumables, and hazardous waste”, and 1 minute for “Prepare, pack and transport specimens and records for in-house storage and external storage (where applicable).” We do not believe these activities would be dependent on number of blocks or batch size, and we

believe that these values accurately reflect the typical time it takes to perform these clinical labor tasks.

In reviewing the RUC-recommended direct PE inputs for CY 2019, we noticed that the 3 minutes of clinical labor time traditionally assigned to the “Prepare room, equipment and supplies” (CA013) clinical labor activity were split into 2 minutes for the “Prepare room, equipment and supplies” activity and 1 minute for the “Confirm order, protocol exam” (CA014) activity. We proposed to maintain the 3 minutes of clinical labor time for the “Prepare room, equipment and supplies” activity and remove the clinical labor time for the “Confirm order, protocol exam” activity wherever we observed this pattern in the RUC-recommended direct PE inputs. Commenters explained in response that when the new version of the PE worksheet introduced the activity codes for clinical labor, there was a need to translate old clinical labor tasks into the new activity codes, and that a prior clinical labor task was split into two of the new clinical labor activity codes: CA007 (“Review patient clinical extant information and questionnaire”) in the preservice period, and CA014 (“Confirm order, protocol exam”) in the service period. Commenters stated that the same clinical labor from the old PE worksheet was now divided into the CA007 and CA014 activity codes, with a standard of 1 minute for each activity. We agreed with commenters that we would finalize the RUC-recommended 2 minutes of clinical labor time for the CA007 activity code and 1 minute for the CA014 activity code in situations where this was the case. However, when reviewing the clinical labor for the reviewed codes affected by this issue, we found that several of the codes did not include this old clinical labor task, and we also noted that several of the reviewed codes that contained the CA014 clinical labor activity code did not contain any clinical labor for the CA007 activity. In these situations, we continue to believe that in these cases the 3 total minutes of clinical staff time would be more accurately described by the CA013 “Prepare room, equipment and supplies” activity code, and we finalized these clinical labor refinements. For additional details, we direct readers to the discussion in the CY 2019 PFS final rule (83 FR 59463 and 59464).

Historically, the RUC has submitted a “PE worksheet” that details the recommended direct PE inputs for our use in developing PE RVUs. The format of the PE worksheet has varied over time and among the medical specialties

developing the recommendations. These variations have made it difficult for both the RUC's development and our review of code values for individual codes. Beginning with its recommendations for CY 2019, the RUC has mandated the use of a new PE worksheet for purposes of their recommendation development process that standardizes the clinical labor tasks and assigns them a clinical labor activity code. We believe the RUC's use of the new PE worksheet in developing and submitting recommendations will help us to simplify and standardize the hundreds of different clinical labor tasks currently listed in our direct PE database. As we did in previous calendar years, to facilitate rulemaking for CY 2020, we are continuing to display two versions of the Labor Task Detail public use file: One version with the old listing of clinical labor tasks, and one with the same tasks crosswalked to the new listing of clinical labor activity codes. These lists are available on the CMS website under downloads for the CY 2020 PFS final rule at <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html>.

Comment: A commenter wrote to express their concerns with the manner in which data was displayed in the Proposed CY 2020 Direct PE Refinements table in the proposed rule (84 FR 40623–40666), specifically the common refinements to equipment time. The commenter stated that nearly 64 percent of the total PE refinements were related to equipment, and 59 percent of these refinements were listed as “E15: Refined equipment time to conform to changes in clinical labor time.” The commenter stated that they did not agree that these are separate refinements; rather, they are the formulaic result of the applying refinements to the clinical labor time. The commenter stated that including these instances as refinements adds a large quantity of rows to the PE refinement table and gives the impression that there are major inaccuracies in the RUC PE recommendations. The commenter provided an example of a single clinical labor refinement to a code family creating 32 rows of subsequent equipment refinements, and contended that articulating these edits was not necessary as they do not reflect either an error or a policy discrepancy with the RUC. The commenter requested that CMS no longer include refinements based on “E15: Refined equipment time to conform to changes in clinical labor

time” in the refinement table of the proposed rule.

Response: We agree with the commenter that these equipment time refinements generated in response to clinical labor time refinements are indeed the result of applying standard equipment time formulas, and they do not reflect errors in the equipment recommendations or policy discrepancies with the RUC. We also agree that these refinements add a significant number of rows to the table of direct PE refinements. However, we disagree with the commenter on the subject of whether these constitute separate refinements, and we believe that it is important to publish the specific equipment times that we are proposing (or finalizing in the case of the final rule) when they differ from the recommended values. We include the direct cost change in dollars resulting from our PE refinements on the aforementioned table, and if we were to avoid including these equipment refinements, it would not always be clear what effect they were having on the direct costs for the procedure. For example, a modest reduction of a few minutes in clinical labor time can result in a substantial decrease in direct costs for procedures that employ highly expensive equipment. We believe that it is more important to provide additional transparency regarding the changes in direct costs resulting from our equipment time refinements so that the public can better comment on our proposals, as opposed to limiting the total number of printed equipment refinements.

However, we agree with the commenter that the information displayed in the table of direct PE refinements can be confusing and overwhelming, and we believe that it could potentially be provided to the public in a more useful fashion. For this CY PFS 2020 final rule, we will separate out the “E15: Refined equipment time to conform to changes in clinical labor time” direct PE refinements and print them in a separate table of refinements. We believe that this will help to address the issues raised by the commenter while also retaining all of the data included in previous rules. We refer readers to Table 28 in section II.N. of this final rule, the Valuation of Specific Codes section, for additional details.

b. Equipment Recommendations for Scope Systems

During our routine reviews of direct PE input recommendations, we have regularly found unexplained inconsistencies involving the use of scopes and the video systems associated

with them. Some of the scopes include video systems bundled into the equipment item, some of them include scope accessories as part of their price, and some of them are standalone scopes with no other equipment included. It is not always clear which equipment items related to scopes fall into which of these categories. We have also frequently found anomalies in the equipment recommendations, with equipment items that consist of a scope and video system bundle recommended, along with a separate scope video system. Based on our review, the variations do not appear to be consistent with the different code descriptions.

To promote appropriate relativity among the services and facilitate the transparency of our review process, during the review of the recommended direct PE inputs for the CY 2017 PFS proposed rule, we developed a structure that separates the scope, the associated video system, and any scope accessories that might be typical as distinct equipment items for each code. Under this approach, we proposed standalone prices for each scope, and separate prices for the video systems and accessories that are used with scopes.

(1) Scope Equipment

Beginning in the CY 2017 PFS proposed rule (81 FR 46176 through 46177), we proposed standardizing refinements to the way scopes have been defined in the direct PE input database. We believe that there are four general types of scopes: Non-video scopes; flexible scopes; semi-rigid scopes, and rigid scopes. Flexible scopes, semi-rigid scopes, and rigid scopes would typically be paired with one of the scope video systems, while the non-video scopes would not. The flexible scopes can be further divided into diagnostic (or non-channeled) and therapeutic (or channeled) scopes. We proposed to identify for each anatomical application: (1) A rigid scope; (2) a semi-rigid scope; (3) a non-video flexible scope; (4) a non-channeled flexible video scope; and (5) a channeled flexible video scope. We proposed to classify the existing scopes in our direct PE database under this classification system, to improve the transparency of our review process and improve appropriate relativity among the services. We planned to propose input prices for these equipment items through future rulemaking.

We proposed these changes only for the reviewed codes for CY 2017 that made use of scopes, along with updated prices for the equipment items related to scopes utilized by these services. We did not propose to apply these policies

to codes with inputs reviewed prior to CY 2017. We also solicited comment on this separate pricing structure for scopes, scope video systems, and scope accessories, which we noted we could consider proposing to apply to other codes in future rulemaking. We did not finalize price increases for a series of other scopes and scope accessories, as the invoices submitted for these components indicated that they are different forms of equipment with different product IDs and different prices. We did not receive any data to indicate that the equipment on the newly submitted invoices was more typical in its use than the equipment that we were currently using for pricing.

We did not make further changes to existing scope equipment in CY 2017 to allow the RUC's PE Subcommittee the opportunity to provide feedback. However, we believed there was some miscommunication on this point, as the RUC's PE Subcommittee workgroup that was created to address scope systems stated that no further action was required following the finalization of our proposal. Therefore, we made further proposals in the CY 2018 PFS proposed rule (82 FR 33961 through 33962) to continue clarifying scope equipment inputs, and sought comments regarding the new set of scope proposals. We considered creating a single scope equipment code for each of the five categories detailed in this rule: (1) A rigid scope; (2) a semi-rigid scope; (3) a non-video flexible scope; (4) a non-channeled flexible video scope; and (5) a channeled flexible video scope. Under the current classification system, there are many different scopes in each category depending on the medical specialty furnishing the service and the part of the body affected. We stated our belief that the variation between these scopes was not significant enough to warrant maintaining these distinctions, and we believed that creating and pricing a single scope equipment code for each category would help provide additional clarity. We sought public comment on the merits of this potential scope organization, as well as any pricing information regarding these five new scope categories.

After considering the comments on the CY 2018 PFS proposed rule, we did not finalize our proposal to create and

price a single scope equipment code for each of the five categories previously identified. Instead, we supported the recommendation from the commenters to create scope equipment codes on a per-specialty basis for six categories of scopes as applicable, including the addition of a new sixth category of multi-channeled flexible video scopes. Our goal was to create an administratively simple scheme that would be easier to maintain and help to reduce administrative burden. In 2018, the RUC convened a Scope Equipment Reorganization Workgroup to incorporate feedback from expert stakeholders with the intention of making recommendations to us on scope organization and scope pricing. Since the workgroup was not convened in time to submit recommendations for the CY 2019 PFS rulemaking cycle, we delayed proposals for any further changes to scope equipment until CY 2020 in order to incorporate the feedback from the aforementioned workgroup.

(2) Scope Video System

We proposed in the CY 2017 PFS proposed rule (81 FR 46176 through 46177) to define the scope video system as including: (1) A monitor; (2) a processor; (3) a form of digital capture; (4) a cart; and (5) a printer. We believe that these equipment components represent the typical case for a scope video system. Our model for this system was the "video system, endoscopy (processor, digital capture, monitor, printer, cart)" equipment item (ES031), which we proposed to re-price as part of this separate pricing approach. We obtained current pricing invoices for the endoscopy video system as part of our investigation of these issues involving scopes, which we proposed to use for this re-pricing. In response to comments, we finalized the addition of a digital capture device to the endoscopy video system (ES031) in the CY 2017 PFS final rule (81 FR 80188). We finalized our proposal to price the system at \$33,391, based on component prices of \$9,000 for the processor, \$18,346 for the digital capture device, \$2,000 for the monitor, \$2,295 for the printer, and \$1,750 for the cart. In the CY 2018 PFS final rule (82 FR 52991 through 52993), we outlined, but did not finalize, a proposal to add an LED

light source into the cost of the scope video system (ES031), which would remove the need for a separate light source in these procedures. We also described a proposal to increase the price of the scope video system by \$1,000 to cover the expense of miscellaneous small equipment associated with the system that falls below the threshold of individual equipment pricing as scope accessories (such as cables, microphones, foot pedals, etc.). With the addition of the LED light (equipment code EQ382 at a price of \$1,915), the updated total price of the scope video system would be set at \$36,306.

We did not finalize this updated pricing to the scope video system in CY 2018, but we did propose and finalize the updated pricing for CY 2019 to \$36,306 along with changing the name of the ES031 equipment item to "scope video system (monitor, processor, digital capture, cart, printer, LED light)" to reflect the fact that the use of the ES031 scope video system is not limited to endoscopy procedures.

(3) Scope Accessories

We understand that there may be other accessories associated with the use of scopes. We finalized a proposal in the CY 2017 PFS final rule (81 FR 80188) to separately price any scope accessories outside the use of the scope video system, and individually evaluate their inclusion or exclusion as direct PE inputs for particular codes as usual under our current policy based on whether they are typically used in furnishing the services described by the particular codes.

(4) Scope Proposals for CY 2020

The Scope Equipment Reorganization Workgroup organized by the RUC submitted detailed recommendations to CMS for consideration in the CY 2020 rule cycle, describing 23 different types of scope equipment, the HCPCS codes associated with each scope type, and a series of invoices for scope pricing. We appreciate the information provided by the workgroup and continue to welcome additional comments and feedback from stakeholders. Based on the recommendations from the workgroup, we proposed to establish 23 new scope equipment codes as detailed in Table 6.

TABLE 6: Proposed CY 2020 New Scope Equipment Codes

CMS Code	Proposed Scope Equipment Description	Proposed Price	Number of Invoices
ES070	rigid scope, cystoscopy		0
ES071	rigid scope, hysteroscopy		0
ES072	rigid scope, otoscopy		0
ES073	rigid scope, nasal/sinus endoscopy		0
ES074	rigid scope, proctosigmoidoscopy		0
ES075	rigid scope, laryngoscopy	\$3,966.08	5
ES076	rigid scope, colposcopy	\$14,500.00	1
ES077	non-channeled flexible digital scope, hysteroscopy		0
ES078	non-channeled flexible digital scope, nasopharyngoscopy		0
ES079	non-channeled flexible digital scope, bronchoscopy		0
ES080	non-channeled flexible digital scope, laryngoscopy	\$21,485.51	7
ES081	channeled flexible digital scope, cystoscopy		0
ES082	channeled flexible digital scope, hysteroscopy		0
ES083	channeled flexible digital scope, bronchoscopy		0
ES084	channeled flexible digital scope, laryngoscopy	\$18,694.39	5
ES085	multi-channeled flexible digital scope, flexible sigmoidoscopy	\$17,360.00	1
ES086	multi-channeled flexible digital scope, colonoscopy	\$38,058.81	6
ES087	multi-channeled flexible digital scope, esophagoscopy gastroscopy duodenoscopy (EGD)		0
ES088	multi-channeled flexible digital scope, esophagoscopy	\$34,585.35	5
ES089	multi-channeled flexible digital scope, ileoscopy		0
ES090	multi-channeled flexible digital scope, pouchoscopy		0
ES091	ultrasound digital scope, endoscopic ultrasound		0
ES092	non-video flexible scope, laryngoscopy	\$5,078.04	4

We note that we did not receive invoices for many of the new scope equipment items. There also was some inconsistency in the workgroup recommendations regarding the non-channeled flexible digital scope, laryngoscopy (ES080) equipment item and the non-video flexible scope, laryngoscopy (ES092) equipment item. These scopes were listed as a single equipment item in some of the workgroup materials and listed as separate equipment items in other materials. We proposed to establish them as separate equipment items based on the submitted invoices, which demonstrated that these were two different types of scopes with distinct price points of approximately \$17,000 and \$5,000 respectively.

We noted a similar issue with the submitted invoices for the rigid scope, laryngoscopy (ES075) equipment item. Among the eight total invoices, five of them were clustered around a price point of approximately \$4,000 while the other three invoices had prices of

roughly \$15,000 apiece. The invoices indicated that these prices came from two distinct types of equipment, and as a result we proposed to consider these items separately. We proposed to use the initial five invoices to establish a proposed price of \$3,966.08 for the rigid scope, laryngoscopy (ES075) equipment item. We noted that this is a close match for the current price of \$3,178.08 used by the endoscope, rigid, laryngoscopy (ES010) equipment, which is the closest equivalent scope equipment. We also noted that the other three invoices appear to describe a type of stroboscopy system rather than a scope, and they have an average price of \$14,737. This is a reasonably close match for the price of our current stroboscopy system (ES065) equipment, which has a CY 2020 price of \$17,950.28 as it transitions to a final CY 2022 destination price of \$16,843.87 (see the 4-year pricing transition of the market-based supply and equipment pricing update discussed later in this section for more information). We stated that we believe

that these invoices reinforce the value established by the market-based pricing update for the stroboscopy system carried out last year, and we did not propose to update the price of the ES065 equipment. We also noted that we were open to feedback from stakeholders if they believe it would be more accurate to assign a price of \$14,737 to the stroboscopy system based on these invoice submissions, as opposed to maintaining the current pricing transition to a CY 2022 price of \$16,843.87.

For the eight new scope equipment items where we received submitted invoices for pricing, we proposed to replace the existing scopes with the new scope equipment. We noted that we received recommendations from the RUC's scope workgroup regarding which HCPCS codes make use of the new scope equipment items, and we proposed to make this scope replacement for approximately 100 HCPCS codes in total (see Table 7).

TABLE 7: Proposed Scope Equipment Replacement

HCPCS	Current CMS	Description	Price	New CMS	New Description	New Price

* See the discussion that follows.

In all but three cases (as identified with an asterisk (*) in Table 7), we proposed for the new scope equipment item to replace the existing scope with the identical amount of equipment time.

For CPT codes 92612 (*Flexible endoscopic evaluation of swallowing by cine or video recording*), 92614 (*Flexible endoscopic evaluation, laryngeal sensory testing by cine or video*

recording), and 92616 (*Flexible endoscopic evaluation of swallowing and laryngeal sensory testing by cine or video recording*), we noted the current scopes in use are the FEES video system

(ES027) and the FEESST video system (ES028). Since we proposed the use of a non-channeled flexible digital scope that requires a corresponding scope video system, we also proposed to add the ES080 equipment at the same equipment time to these three procedures rather than replacing the ES027 and ES028 equipment. In all other cases, we proposed to replace the current scope equipment listed in Table 7 with the new scope equipment, while maintaining the same amount of equipment time.

We identified inconsistencies with the workgroup recommendations for a small number of HCPCS codes. CPT code 45350 (*Sigmoidoscopy, flexible; with band ligation(s) (e.g., hemorrhoids)*) was recommended to include a multi-channeled flexible digital scope, flexible sigmoidoscopy (ES085); however, we noted that this CPT code does not include any scopes among its current direct PE inputs. CPT code 31595 was recommended to include a non-channeled flexible digital scope, laryngoscopy (ES080) but it no longer exists as a CPT code after having been deleted for CY 2019. CPT code 43232 (*Esophagoscopy, flexible, transoral; with transendoscopic ultrasound-guided intramural or transmural fine needle aspiration/biopsy(s)*) was recommended to include a multi-channeled flexible digital scope, esophagoscopy (ES088), but it does not include a scope amongst its direct PE inputs any longer following clarification from the same workgroup recommendations that CPT code 43232 is never performed in the nonfacility setting. In all three of these cases, we did not propose to add one of the new scope equipment items to these procedures.

We noted that we did not receive pricing information along with the workgroup recommendations for the other 15 new scope equipment items. Therefore, we proposed to establish new equipment codes for these scopes as detailed in Table 6. However, we noted that due to a lack of pricing information, we did not propose to replace existing scope equipment with the new equipment items as we did for the other eight new scope equipment items for CY 2020. We welcomed additional feedback from stakeholders regarding the pricing of these scope equipment items, especially the submission of detailed invoices with pricing data. We proposed to transition the scopes for which we did have pricing information over to the new equipment items for CY 2020, and we noted that we looked forward to engaging with stakeholders to assist in

pricing and then transitioning the remaining scopes in future rulemaking.

We received public comments on our scope equipment proposals. The following is a summary of the comments we received and our responses.

Comment: Several commenters stated that they appreciated the proposal of the recommended 23 new scope equipment codes and the proposed pricing of 8 of those new scope equipment codes. Commenters also stated that they appreciated the proposal of scope replacements for 100 CPT codes as recommended by the RUC utilizing the 8 scopes that CMS was able to price. One commenter encouraged CMS to continue to work with the RUC workgroup and other stakeholders to obtain detailed invoices for the scopes for which it did not have pricing data to assist in the correct pricing and transition of these equipment items.

Response: We appreciate the support for our proposals from the commenters. We welcome the submission of additional pricing data from the RUC scope workgroup and other stakeholders regarding the pricing of the remaining scope equipment items.

Comment: One commenter stated that they appreciated the recognition of the existing specialized equipment that is required in addition to the proposed scope equipment, and they supported the proposal to add ES080 and retain ES027 or ES028 at the same equipment time for CPT codes 92612, 92614, and 92616.

Response: We appreciate the support for our proposals from the commenter.

Comment: Several commenters stated it was their understanding that additional scope pricing information submitted now would be considered for the CY 2021 PFS proposed rule. These commenters asked for clarification that the CPT codes impacted by any scope proposals for CY 2021 will be outlined in a table just as the impacted codes for CY 2020 were outlined in Table 7, so that they will be subject to stakeholder review and comment prior to implementation.

Response: As we stated in the proposed rule, we welcome additional feedback from stakeholders regarding the pricing of these remaining scope equipment items, especially the submission of detailed invoices with pricing data. Any future proposals that we make regarding scope equipment will be subject to notice and comment rulemaking, including displaying information in a table similar Table 7, if it would be appropriate to do so.

Comment: A commenter stated that they had identified inconsistencies with the scope workgroup recommendations

for a small number of HCPCS codes. The commenter stated that CPT code 45350 (*Sigmoidoscopy, flexible; with band ligation(s) (e.g., hemorrhoids)*) was recommended by the workgroup to include a multi-channeled flexible digital scope, flexible sigmoidoscopy (ES085); however, CMS noted in the proposed rule that this CPT code does not include any scopes among its current direct PE inputs. The commenter stated that all codes in the flexible sigmoidoscopy family require a flexible sigmoidoscope in order to perform the procedure, and therefore, the commenter requested that CMS add the ES085 scope equipment to CPT code 45350.

Response: We appreciate the feedback from the commenter in pointing out this inconsistency in the direct PE inputs for CPT code 45350. Based on the information supplied by the commenter, we are finalizing the addition of the ES085 scope equipment to CPT code 45350. We are finalizing an equipment time of 59 minutes based on the use of our standard equipment time formula for scopes.

Comment: A commenter requested that the “rigid scope, hysteroscopy” (ES071) equipment be updated to read “rigid scope, channeled, hysteroscopy” and that the hysteroscopy codes (that is, CPT codes 58555, 58562, 58565) be valued with ES071. The commenter submitted an invoice with pricing information associated with the ES071 scope equipment.

Response: We appreciate the submission of an invoice from the commenter for use in pricing the ES071 scope. Based on the information provided by the commenter, we are finalizing a change in the name of the ES071 scope from “rigid scope, hysteroscopy” to “rigid scope, channeled, hysteroscopy.” We are also finalizing a price of \$6,795 for the ES071 scope based on the pricing data supplied by the commenter, and we are finalizing the replacement of the existing “endoscope, rigid, hysteroscopy” (ES009) scope with the new ES071 scope equipment. The CPT codes affected by this replacement are CPT codes 58555, 58562, and 58565 as identified by the commenter, as well as CPT code 58563 which is the only other code that previously employed the ES009 scope. These scope replacements are summarized below in Table 9.

Comment: One commenter provided a series of invoices for different types of rigid scopes in response to the comment solicitation.

Response: We appreciate the submission of additional invoices from the commenter. Based on the

information included in these invoices, we are finalizing prices for three scopes that did not previously have pricing data. We are finalizing a price of \$2,333.98 for the “rigid scope, otoscopy” (ES072) equipment, a price of \$3,004.75 for the “rigid scope, nasal/sinus endoscopy” (ES073) equipment, and a price of \$21,923.425 for the “non-channeled flexible digital scope, nasopharyngoscopy” (ES078) equipment. We are not finalizing the replacement of any of the old scope equipment codes with these three new scope equipment items for CY 2020, as the commenter did not identify the HCPCS codes in which this replacement would take place. We will consider additional scope pricing information for these three scope equipment codes, including the HCPCS codes in which they would typically be employed, as part of the CY 2021 PFS proposed rule.

The commenter also provided five new invoices for the pricing of the “non-video flexible scope, laryngoscopy” (ES092) equipment. These five invoices had an average price of \$5,105.97, which was nearly identical to our proposed price of \$5,078.04 for the ES092 scope. We believe that these invoices reinforce the accuracy of the proposed pricing. We are finalizing an

increase in the price of the ES092 scope to \$5,105.97, which will slightly increase the direct costs for the 14 HCPCS codes containing this scope listed above in Table 7.

Comment: Several commenters sent a series of additional invoices, and recommended crosswalks from existing equipment codes to the proposed equipment codes to ensure that the equipment currently listed for GI endoscopy procedures was appropriately attributed to the correct new scopes. Although the commenters did not provide information to update any of the proposed scope equipment prices, the commenters did clarify that several of the new scope equipment items which lacked proposed prices in fact shared the same current scope equipment codes as other new scope equipment items that did have proposed pricing. For example, CMS proposed to replace the “videoscope, gastroscopy” (ES034) scope equipment with the new “multi-channeled flexible digital scope, esophagoscopy” (ES088) scope equipment. The commenters clarified that this same ES034 equipment, when used in additional CPT codes, would be replaced by either the “multi-channeled flexible digital scope, esophagoscopy gastroscopy duodenoscopy” (ES087) or

the “multi-channeled flexible digital scope, ileoscopy” (ES089) equipment items, all of which should share the same proposed price of \$34,585.35. The commenter also explained that the same “Video Sigmoidoscope” (ES043) equipment which CMS proposed to replace with the “multi-channeled flexible digital scope, pouchoscopy” (ES090) new scope equipment would, in additional CPT codes, be replaced by the new “multi-channeled flexible digital scope, flexible sigmoidoscopy” (ES085) scope equipment, and that both ES085 and ES090 should share the same proposed price of \$19,308.56. Finally, the commenter also stated that the new “ultrasound digital scope, endoscopic ultrasound” (ES091) equipment item would only be used in the facility setting, and that none of the HCPCS codes that included this scope contained direct PE inputs.

Response: We appreciate the submission of additional invoices and the clarification of the relationship between the former scope equipment codes and the newly created scope equipment codes. After considering this additional information supplied by the commenters, we are updating Table 8 of CY 2020 new scope equipment codes.

TABLE 8: Final CY 2020 New Scope Equipment Codes

CMS Code	Proposed Scope Equipment Description	Proposed Price	Finalized Price
ES070	rigid scope, cystoscopy		
ES071	rigid scope, channeled, hysteroscopy		\$6,795.00
ES072	rigid scope, otoscopy		\$2,333.98
ES073	rigid scope, nasal/sinus endoscopy		\$3,004.75
ES074	rigid scope, proctosigmoidoscopy		
ES075	rigid scope, laryngoscopy	\$3,966.08	\$3,966.08
ES076	rigid scope, colposcopy	\$14,500.00	\$14,500.00
ES077	non-channeled flexible digital scope, hysteroscopy		
ES078	non-channeled flexible digital scope, nasopharyngoscopy		\$21,923.43
ES079	non-channeled flexible digital scope, bronchoscopy		
ES080	non-channeled flexible digital scope, laryngoscopy	\$21,485.51	\$21,485.51
ES081	channeled flexible digital scope, cystoscopy		
ES082	channeled flexible digital scope, hysteroscopy		
ES083	channeled flexible digital scope, bronchoscopy		
ES084	channeled flexible digital scope, laryngoscopy	\$18,694.39	\$18,694.39
ES085	multi-channeled flexible digital scope, flexible sigmoidoscopy	\$17,360.00	\$17,360.00
ES086	multi-channeled flexible digital scope, colonoscopy	\$38,058.81	\$38,058.81
ES087	multi-channeled flexible digital scope, esophagoscopy gastroscopy duodenoscopy (EGD)		\$34,585.35
ES088	multi-channeled flexible digital scope, esophagoscopy	\$34,585.35	\$34,585.35
ES089	multi-channeled flexible digital scope, ileoscopy		\$34,585.35
ES090	multi-channeled flexible digital scope, pouchoscopy		\$17,360.00
ES091	ultrasound digital scope, endoscopic ultrasound		\$0.00
ES092	non-video flexible scope, laryngoscopy	\$5,078.04	\$5,105.97

We note again that we are not finalizing changes to the pricing of the group of new scope equipment codes with previously proposed prices, aside from the minor increase in the price of the ES092 equipment, only newly pricing several scopes that previously lacked pricing, and extending proposed pricing such that the ES087 and ES089

scopes share the same price with the ES088 scope, and the ES090 scope shares the same price with the ES085 scope. The new scope equipment codes ES087, ES088, and ES089 all share the same price because they are replacing the same current scope equipment code (ES034), and similarly the new ES085 and ES090 scope equipment codes share

the same price because they are both replacing the same current scope equipment code (ES043). There are 21 HCPCS codes which are affected by the new scope replacements; these codes are detailed in Table 9.

BILLING CODE 4120-01-P

TABLE 9: Additional Scope Equipment Replacement in Response to Comments

HCPCS	Current CMS	Description	Price	New CMS	New Description	New Price
58555	ES009	endoscope, rigid, hysteroscopy	\$6,295.62	ES071	rigid scope, channeled, hysteroscopy	\$6,795.00
58562	ES009	endoscope, rigid, hysteroscopy	\$6,295.62	ES071	rigid scope, channeled, hysteroscopy	\$6,795.00

BILLING CODE 4120-01-C

Although we are updating the scope equipment pricing for CY 2020 such that the ES087 and ES089 scopes share the same price with the ES088 scope, and the ES090 scope shares the same price with the ES085 scope, we do not mean to suggest that these scopes that share pricing are identical with one another. We are assigning the same price to these scopes because they are replacing the same current scope equipment codes, and because we do not have individual pricing information for them at the moment. We are open to the submission of additional invoices in future rule cycles to establish individual pricing for these scopes, and we continue to welcome more data to help identify pricing for the remaining 7 scope equipment codes that still lack invoices.

After consideration of the public comments, we are finalizing pricing for the new scope equipment as detailed above in Table 8. We are also finalizing the scope equipment replacements as detailed in Tables 7 and 9.

c. Technical Corrections To Direct PE Input Database and Supporting Files

Subsequent to the publication of the CY 2019 PFS final rule, stakeholders alerted us to several clerical

inconsistencies in the direct PE database. We proposed to correct these inconsistencies as described below and reflected in the CY 2020 proposed direct PE input database displayed on the CMS website under downloads for the CY 2020 PFS proposed rule at <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html>.

For CY 2020, we proposed to address the following inconsistencies:

- The RUC's Scope Equipment Reorganization Workgroup recommended deletion of the non-facility inputs for CPT codes 43231 (*Esophagoscopy, flexible, transoral; with endoscopic ultrasound examination*) and 43232 (*Esophagoscopy, flexible, transoral; with transendoscopic ultrasound-guided intramural or transmural fine needle aspiration/biopsy(s)*). The gastroenterology specialty societies stated that these services are never performed in the non-facility setting. After our own review of these services, we agreed with the workgroup's recommendation, and we proposed to remove the non-facility direct PE inputs for these two CPT codes.

- In rulemaking for CY 2018, we reviewed a series of CPT codes describing nasal sinus endoscopy surgeries. At that time, we sought comments on whether the broader family of nasal sinus endoscopy surgery services should be subject to the special rules for multiple endoscopic procedures instead of the standard multiple procedure payment reduction. We received very few comments in response to our solicitation. In the CY 2018 PFS final rule (82 FR 53043), we indicated that we would continue to explore this option for future rulemaking. We proposed to apply the special rule for multiple endoscopic procedures to this family of codes beginning in CY 2020. We noted this proposal would treat this group of CPT codes consistently with other similar endoscopic procedures when codes within the CPT code family are billed together with another endoscopy service in the same family. Similar to other similar endoscopic procedure code families, we proposed that CPT code 31231 (*Nasal endoscopy, diagnostic, unilateral or bilateral (separate procedure)*) would be the base procedure for the remainder of nasal sinus endoscopies. The codes affected by the proposal are detailed in Table 10.

TABLE 10: Proposed Nasal Sinus Endoscopy Codes Subject to Special Rules for Multiple Endoscopic Procedures

CPT Code	Short Descriptor
31231	Nasal endoscopy dx
31233	Nasal/sinus endoscopy dx
31235	Nasal/sinus endoscopy dx
31237	Nasal/sinus endoscopy surg
31238	Nasal/sinus endoscopy surg
31239	Nasal/sinus endoscopy surg
31240	Nasal/sinus endoscopy surg
31241	Nsl/sins ndsc w/artery lig
31253	Nsl/sins ndsc total
31254	Nsl/sins ndsc w/prtl ethmdct
31255	Nsl/sins ndsc w/tot ethmdct
31256	Exploration maxillary sinus
31257	Nsl/sins ndsc tot w/sphendt
31259	Nsl/sins ndsc sphn tiss rmvl

CPT Code	Short Descriptor
31267	Endoscopy maxillary sinus
31276	Nsl/sins ndsc frnt tiss rmvl
31287	Nasal/sinus endoscopy surg
31288	Nasal/sinus endoscopy surg
31290	Nasal/sinus endoscopy surg
31291	Nasal/sinus endoscopy surg
31292	Nasal/sinus endoscopy surg
31293	Nasal/sinus endoscopy surg
31294	Nasal/sinus endoscopy surg
31295	Sinus endo w/balloon dil
31296	Sinus endo w/balloon dil
31297	Sinus endo w/balloon dil
31298	Nsl/sins ndsc w/sins dilat

Special rules for multiple endoscopic procedures would apply if any of the procedures listed in Table 10 are billed together for the same patient on the same day. We apply the multiple endoscopy payment rules to a code family before ranking the family with other procedures performed on the same day (for example, if multiple endoscopies in the same family are reported on the same day as endoscopies in another family, or on the same day as a non-endoscopic procedure). If an endoscopic procedure is reported together with its base procedure, we do not pay separately for the base procedure. Payment for the base procedure is included in the payment for the other endoscopy. For additional information about the payment adjustment under the special rule for multiple endoscopic services, we refer readers to the CY 1992 PFS final rule where this policy was established (56 FR 59515) and to Public Law 100–04, Medicare Claims Processing Manual, Chapter 23 (available on the CMS website at [https://www.cms.gov/Regulations-and-Guidance/Manuals/Downloads/clm104c23.pdf](https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/Downloads/clm104c23.pdf)).

We received public comments on the proposed technical corrections to the direct PE input database and supporting files. The following is a summary of the comments we received and our responses.

Comment: One commenter agreed with the RUC workgroup's recommendation and the CMS proposal to remove the non-facility direct PE inputs from CPT code 43231 and 43232.

Response: We appreciate the support for our proposals from the commenter.

Comment: One commenter stated that the proposed approach for nasal sinus endoscopy procedure better reflects the work RVU associated with the different levels of sinus endoscopy procedures and stated their support for this payment change. The commenter requested clarification regarding the application of the bilateral adjustment in conjunction with the special rules for multiple endoscopic procedures. The commenter stated that it was their understanding that if the CPT code is reported as a bilateral procedure and is reported with other procedure codes on the same day, the guidance is to apply the bilateral adjustment before applying any form of multiple procedure rules.

Response: The special rule for multiple endoscopic procedures has been described correctly in general terms by the commenter, although we encourage readers once again to refer to the CY 1992 PFS final rule where this policy was established (56 FR 59515) and to Public Law 100–04, Medicare Claims Processing Manual, Chapter 23. This manual text states that special rules for multiple endoscopic procedures apply if the procedure is billed with another endoscopy in the same family (*i.e.*, another endoscopy that has the same base procedure). The base procedure for each code with this indicator is identified in the endoscopic base code field. In these situations, we apply the multiple endoscopy rules to a family before ranking the family with other procedures performed on the same day (for example, if multiple endoscopies in the same family are

reported on the same day as endoscopies in another family or on the same day as a non-endoscopic procedure). If an endoscopic procedure is reported with only its base procedure, we do not pay separately for the base procedure. Payment for the base procedure is included in the payment for the other endoscopy.

Comment: A commenter requested clarification regarding the proposal to apply the special rule for multiple endoscopic procedures to the family of codes listed in Table 10. The commenter stated that it was their understanding that that the diagnostic endoscopy described by CPT code 31231 is included in the valuation of all of the surgical procedure codes on the list (for example, CPT codes 31254, 31256, 31276, etc.), and therefore, CPT Code 31231 would not be billed on the same side that any nasal endoscopic surgical code(s) are performed. However, the commenter stated that it was their understanding that CPT code 31231 could be billed for one side of the nose if it was the only procedure performed and there was no surgical intervention on that side. Assuming that this interpretation was correct, the commenter stated that they supported the application of the special rules for endoscopy to the nasal endoscopy family.

Response: We reiterate that the special rule for multiple endoscopic procedures has been described correctly in general terms by the commenter, although we encourage readers once again to refer to the CY 1992 PFS final rule where this policy was established (56 FR 59515) and to Public Law 100–

04, Medicare Claims Processing Manual, Chapter 23. We encourage stakeholders to contact their local Medicare Administrative Contractor (MAC) for information regarding proper billing instructions for CPT code 31231.

Comment: One commenter stated that they were troubled by the proposal to apply the multiple endoscopy payment methodology to the CPT codes included in Table 10 without further clarification in the regulatory language or the Medicare Carriers Manual about the number of multiple procedure modifiers CMS can append to one claim. The commenter questioned whether these 27 codes will be assigned a multiple procedure indicator of “3” and if that would override the prior multiple procedure indicator of “4”. The commenter stated that they did not support the application of multiple endoscopy payment rules if CMS intended to assign reductions for both multiple endoscopy and multiple procedures, as application of both payment rules would result in inappropriate reductions to this set of services.

Response: In response to the commenter’s question, only one multiple procedure indicator can be applied to each HCPCS code. We also clarify that our proposal would assign a multiple procedure indicator of “3” to all of the codes listed in Table 10 aside from CPT code 31231, which would be the endoscopic “base code” and would be assigned a multiple procedure indicator of “2”. We also note that none of these codes previously contained a multiple procedure indicator of “4”, which is associated with certain diagnostic imaging services. We encourage readers once again to refer to the CY 1992 PFS final rule where this policy was established (56 FR 59515) and to Pub. 100–04, Medicare Claims Processing Manual, Chapter 23.

Comment: One commenter stated that although they recognized that by including the nasal endoscopy family among the codes using the special rule for multiple endoscopies, CMS may be trying to harmonize endoscopic procedures, and they stated that the unique situation surrounding the nasal endoscopy code family should prohibit the application of this special rule. The commenter stated that the nasal endoscopy code family differed significantly from colonoscopy procedures in that there is not uniformity across the sites of service where these sinus procedures are performed, since these services could be performed in both the facility and non-facility settings. The commenter stated that applying the special rules for

multiple endoscopic procedures to this group would result in a significant inappropriate reduction in the value of the secondary and subsequent nasal surgical codes performed on the same patient on the same day when performed in the office setting, and the commenter stated that they opposed the application of the special rules for multiple endoscopies to the nasal endoscopy family in the non-facility setting.

Response: We disagree that this nasal endoscopy code family differs significantly from other colonoscopy families where the special rule for multiple endoscopic procedures has long been in place. Although the commenter stated that the nasal endoscopy codes were unique in the sense that they could be performed in both the facility and non-facility settings, and that the base code for the family, CPT code 31231, is typically an office-based procedure with significant PE built into the code, we note in response that there are many other groups of codes which utilize the special rule for multiple endoscopic procedures and are also performed in both the facility and non-facility settings. These include CPT codes 31573–31579 (base CPT code 31575), CPT codes 43220–43229 (base CPT code 43220), CPT codes 44389–44394 (base CPT code 44388), and CPT codes 45303–45320 (base CPT code 45300). There are dozens of these codes which can be performed in both the facility and non-facility settings, many of them with significant PE inputs built into their non-facility valuation. In light of this evidence, we disagree with the commenter that there is a unique situation regarding the nasal endoscopy family of codes.

Comment: Several commenters requested that CMS utilize the RUC-recommended direct PE inputs to publish PE relative value units for CPT code 90460, which was reviewed by the RUC in October 2009. Rather than finalize the RUC recommendations, CMS crosswalked CPT code 90460 from CPT code 90471, which is crosswalked from CPT code 96372 (formerly CPT code 90772 and then 90782). Commenters stated that the recent measles crisis spotlights the importance of immunization administration being appropriately valued, and that the crosswalk from CPT code 96372 to codes CPT codes 90471/90460 has brought about a 60 percent reduction in PE RVUs. Commenters stated that CMS typically only uses a crosswalk for work values, not PE values, and requested that CMS disconnect the codes after the initial crosswalk so that changes to the

source code no longer affect the crosswalked code. One commenter stated that CMS was proposing to reduce the non-facility PE RVUs for CPT code 90471 from 0.29 in 2019 to 0.22 in 2020, and while this may appear to be a relatively small change in RVUs, if finalized it would reduce the national unadjusted payment for CPT code 90471 (and consequently the payment rates for HCPCS codes G0008 and G0009) by 15 percent.

Response: We appreciate the feedback from the commenters and note that we finalized the crosswalks associated with CPT code 90460 in the CY 2011 final rule (75 FR 73306). However, we note that we are separately addressing the valuation of HCPCS codes G0008, G0009, and G0010 in the codes valuation section of this rule.

We also received comments regarding a variety of subjects about which we did not make proposals for CY 2020. These included comments regarding the proper specialty employed to determine indirect cost factors for home PT/INR monitoring services and the application of the multiple procedure payment reduction to physical therapist services. We will take the feedback from the commenters on these subjects into consideration for future rulemaking.

After consideration of the public comments, we are finalizing the proposal to remove the non-facility direct PE inputs from CPT code 43231 and 43232. We are also finalizing the proposal to apply the special rule for multiple endoscopic procedures to the family of codes listed in Table 10 without refinement.

d. Updates to Prices for Existing Direct PE Inputs

In the CY 2011 PFS final rule with comment period (75 FR 73205), we finalized a process to act on public requests to update equipment and supply price and equipment useful life inputs through annual rulemaking, beginning with the CY 2012 PFS proposed rule. For CY 2020, we proposed the following price updates for existing direct PE inputs.

We proposed to update the price of one supply and one equipment item in response to the public submission of invoices. As these pricing updates were each part of the formal review for a code family, we proposed that the new pricing take effect for CY 2020 for these items instead of being phased in over 4 years.

We also proposed to update the name of the EP001 equipment item from “DNA/digital image analyzer (ACIS)” to “DNA/Digital Image Analyzer” due to

clarification from stakeholders regarding the typical use of this equipment.

(1) Market-Based Supply and Equipment Pricing Update

Section 220(a) of the Protecting Access to Medicare Act of 2014 (PAMA) (Pub. L. 113–93) provides that the Secretary may collect or obtain information from any eligible professional or any other source on the resources directly or indirectly related to furnishing services for which payment is made under the PFS, and that such information may be used in the determination of relative values for services under the PFS. Such information may include the time involved in furnishing services; the amounts, types and prices of PE inputs; overhead and accounting information for practices of physicians and other suppliers, and any other elements that would improve the valuation of services under the PFS.

As part of our authority under section 1848(c)(2)(M) of the Act, we initiated a market research contract with StrategyGen to conduct an in-depth and robust market research study to update the PFS direct PE inputs (DPEI) for supply and equipment pricing for CY 2019. These supply and equipment prices were last systematically developed in 2004–2005. StrategyGen submitted a report with updated pricing recommendations for approximately 1,300 supplies and 750 equipment items currently used as direct PE inputs. This report is available as a public use file displayed on the CMS website under downloads for the CY 2019 PFS final rule at <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html>.

The StrategyGen team of researchers, attorneys, physicians, and health policy experts conducted a market research study of the supply and equipment items currently used in the PFS direct PE input database. Resources and methodologies included field surveys, aggregate databases, vendor resources, market scans, market analysis, physician substantiation, and statistical analysis to estimate and validate current prices for medical equipment and medical supplies. StrategyGen conducted secondary market research on each of the 2,072 DPEI medical equipment and supply items that CMS identified from the current DPEI. The primary and secondary resources StrategyGen used to gather price data and other information were:

- Telephone surveys with vendors for top priority items (Vendor Survey).

- Physician panel validation of market research results, prioritized by total spending (Physician Panel).

- The General Services Administration system (GSA).

- An aggregate health system buyers database with discounted prices (Buyers).

- Publicly available vendor resources, that is, Amazon Business, Cardinal Health (Vendors).

- **Federal Register**, current DPEI data, historical proposed and final rules prior to CY 2018, and other resources; that is, AMA RUC reports (References).

StrategyGen prioritized the equipment and supply research based on current share of PE RVUs attributable by item provided by CMS. StrategyGen developed the preliminary Recommended Price (RP) methodology based on the following rules in hierarchical order considering both data representativeness and reliability.

(1) If the market share, as well as the sample size, for the top three commercial products were available, the weighted average price (weighted by percent market share) was the reported RP. Commercial price, as a weighted average of market share, represents a more robust estimate for each piece of equipment and a more precise reference for the RP.

(2) If no data were available for commercial products, the current CMS prices were used as the RP.

GSA prices were not used to calculate the StrategyGen recommended prices, due to our concern that the GSA system curtails the number and type of suppliers whose products may be accessed on the GSA Advantage website, and that the GSA prices may often be lower than prices that are available to non-governmental purchasers. After reviewing the StrategyGen report, we proposed to adopt the updated direct PE input prices for supplies and equipment as recommended by StrategyGen.

StrategyGen found that despite technological advancements, the average commercial price for medical equipment and supplies has remained relatively consistent with the current CMS price. Specifically, preliminary data indicated that there was no statistically significant difference between the estimated commercial prices and the current CMS prices for both equipment and supplies. This cumulative stable pricing for medical equipment and supplies appears similar to the pricing impacts of non-medical technology advancements where some historically high-priced equipment (that is, desktop PCs) has been increasingly substituted with current technology

(that is, laptops and tablets) at similar or lower price points. However, while there were no statistically significant differences in pricing at the aggregate level, medical specialties would experience increases or decreases in their Medicare payments if CMS were to adopt the pricing updates recommended by StrategyGen. At the service level, there may be large shifts in PE RVUs for individual codes that happened to contain supplies and/or equipment with major changes in pricing, although we note that codes with a sizable PE RVU decrease would be limited by the requirement to phase in significant reductions in RVUs, as required by section 1848(c)(7) of the Act. The phase-in requirement limits the maximum RVU reduction for codes that are not new or revised to 19 percent in any individual calendar year.

We believe that it is important to make use of the most current information available for supply and equipment pricing instead of continuing to rely on pricing information that is more than a decade old. Given the potentially significant changes in payment that would occur, both for specific services and more broadly at the specialty level, in the CY 2019 PFS proposed rule we proposed to phase in our use of the new direct PE input pricing over a 4-year period using a 25/75 percent (CY 2019), 50/50 percent (CY 2020), 75/25 percent (CY 2021), and 100/0 percent (CY 2022) split between new and old pricing. This approach is consistent with how we have previously incorporated significant new data into the calculation of PE RVUs, such as the 4-year transition period finalized in CY 2007 PFS final rule with comment period when changing to the “bottom-up” PE methodology (71 FR 69641). This transition period will not only ease the shift to the updated supply and equipment pricing, but will also allow interested parties an opportunity to review and respond to the new pricing information associated with their services.

We proposed to implement this phase-in over 4 years so that supply and equipment values transition smoothly from the prices we currently include to the final updated prices in CY 2022. We proposed to implement this pricing transition such that one quarter of the difference between the current price and the fully phased-in price is implemented for CY 2019, one third of the difference between the CY 2019 price and the final price is implemented for CY 2020, and one half of the difference between the CY 2020 price and the final price is implemented for CY 2021, with the new direct PE prices

fully implemented for CY 2022. An example of the transition from the

current to the fully-implemented new pricing is provided in Table 11.

TABLE 11: Example of Direct PE Pricing Transition

Current Price	\$100	
Final Price	\$200	
Year 1 (CY 2019) Price	\$125	1/4 difference between \$100 and \$200
Year 2 (CY 2020) Price	\$150	1/3 difference between \$125 and \$200
Year 3 (CY 2021) Price	\$175	1/2 difference between \$150 and \$200
Final (CY 2022) Price	\$200	

For new supply and equipment codes for which we establish prices during the transition years (CYs 2019, 2020 and 2021) based on the public submission of invoices, we proposed to fully implement those prices with no transition since there are no current prices for these supply and equipment items. These new supply and equipment codes would immediately be priced at their newly established values. We also proposed that, for existing supply and equipment codes, when we establish prices based on invoices that are submitted as part of a revaluation or comprehensive review of a code or code family, they will be fully implemented for the year they are adopted without being phased in over the 4-year pricing transition. The formal review process for a HCPCS code includes a review of pricing of the supplies and equipment included in the code. When we find that the price on the submitted invoice is typical for the item in question, we believe it would be appropriate to finalize the new pricing immediately along with any other revisions we adopt for the code valuation.

For existing supply and equipment codes that are not part of a comprehensive review and valuation of a code family and for which we establish prices based on invoices submitted by the public, we proposed to implement the established invoice price as the updated price and to phase in the new price over the remaining years of the proposed 4-year pricing transition. During the proposed transition period, where price changes for supplies and equipment are adopted without a formal review of the HCPCS codes that include them (as is the case for the many updated prices we proposed to phase in over the 4-year transition period), we believe it is important to include them in the remaining transition toward the updated price. We also proposed to phase in any updated pricing we establish during the 4-year transition period for very commonly used supplies and equipment that are included in 100

or more codes, such as sterile gloves (SB024) or exam tables (EF023), even if invoices are provided as part of the formal review of a code family. We would implement the new prices for any such supplies and equipment over the remaining years of the proposed 4-year transition period. Our proposal was intended to minimize any potential disruptive effects during the proposed transition period that could be caused by other sudden shifts in RVUs due to the high number of services that make use of these very common supply and equipment items (meaning that these items are included in 100 or more codes).

We believed that implementing the proposed updated prices with a 4-year phase-in would improve payment accuracy, while maintaining stability and allowing stakeholders the opportunity to address potential concerns about changes in payment for particular items. Updating the pricing of direct PE inputs for supplies and equipment over a longer timeframe will allow more opportunities for public comment and submission of additional, applicable data. We welcomed feedback from stakeholders on the proposed updated supply and equipment pricing, including the submission of additional invoices for consideration.

We received many comments regarding the market-based supply and equipment pricing proposal following the publication of the CY 2019 PFS proposed rule. For a full discussion of these comments, we direct readers to the CY 2019 PFS final rule (83 FR 59475–59480). In each instance in which a commenter raised questions about the accuracy of a supply or equipment code's recommended price, the StrategyGen contractor conducted further research on the item and its price with special attention to ensuring that the recommended price was based on the correct item in question and the clarified unit of measure. Based on the commenters' requests, the StrategyGen contractor conducted an extensive

examination of the pricing of any supply or equipment items that any commenter identified as requiring additional review. Invoices submitted by multiple commenters were greatly appreciated and ensured that medical equipment and supplies were re-examined and clarified. Multiple researchers reviewed these specified supply and equipment codes for accuracy and proper pricing. In most cases, the contractor also reached out to a team of nurses and their physician panel to further validate the accuracy of the data and pricing information. In some cases, the pricing for individual items needed further clarification due to a lack of information or due to significant variation in packaged items. After consideration of the comments and this additional price research, we updated the recommended prices for approximately 70 supply and equipment codes identified by the commenters. Table 9 in the CY 2019 PFS final rule lists the supply and equipment codes with price changes based on feedback from the commenters and the resulting additional research into pricing (83 FR 59479–59480).

After consideration of the public comments, we finalized our proposals associated with the market research study to update the PFS direct PE inputs for supply and equipment pricing. We continue to believe that implementing the proposed updated prices with a 4-year phase-in will improve payment accuracy, while maintaining stability and allowing stakeholders the opportunity to address potential concerns about changes in payment for particular items. We continue to welcome feedback from stakeholders on the proposed updated supply and equipment pricing, including the submission of additional invoices for consideration.

For CY 2020, we received invoice submissions for approximately 30 supply and equipment codes from stakeholders as part of the second year of the market-based supply and

equipment pricing update. These invoices were reviewed by the StrategyGen contractor and the submitted invoices were used in many cases to supplement the pricing originally proposed for the CY 2019 PFS rule cycle. The contractor reviewed the invoices, as well as prior data for the relevant supply/equipment codes to make sure the item in the invoice was representative of the supply/equipment item in question and aligned with past research. Based on this research, we proposed to update the prices of the supply and equipment items listed in Table 9 of the CY 2020 PFS proposed rule.

For most supply and equipment items, there was an alignment between the research carried out by the StrategyGen contractor and the submitted invoice. The updated CY 2020 pricing was calculated using an average between the previous market research and the newly submitted invoices in these cases. In some cases the submitted invoices were not representative of market prices, such as for the centrifuge with rotor (EP007) equipment item where the invoice price of \$8,563 appeared to be an outlier. We did not use the invoices to calculate our pricing recommendation in these situations and instead continued to rely on our prior pricing data. In other

instances, such as for the kit, probe, cryoablation, prostate (Galil-Endocare) (SA099) supply item, our research indicated that the submitted invoice price was more representative of the commercial price than our CY 2019 research and pricing. We proposed the new invoice prices for these supply and equipment items due to our belief in their greater accuracy.

For some of the remaining supply and equipment items, such as the five-gallon paraffin (EP031) equipment and the Olympus DP21 camera (EP089) equipment, we maintained the extant pricing for CY 2019 due to a lack of sufficient data to update the pricing. In these situations where we did not have an updated price for CY 2019, we believe that the newly submitted invoices are more representative of the current commercial prices that are being paid on the market. We proposed the new invoice prices for these supply and equipment items due to our belief in their greater accuracy.

In addition, we were alerted by stakeholders that the price of the EM visit pack (SA047) supply did not match the sum of the component prices of the supplies included in the pack. After reviewing the prices of the individual component supplies, we agree with the stakeholders that there was a discrepancy in the previous pricing of this supply pack. We proposed to

update the price of the EM visit pack to \$5.47 to match the sum of the prices of the component supplies, and proposed to continue to transition towards this price over the remaining years of the phase-in period.

We finalized a policy last year to phase in the new supply and equipment pricing over 4 years so that supply and equipment values transition smoothly from their current prices to the final updated prices in CY 2022. We finalized our proposal to implement this pricing transition such that one quarter of the difference between the current price and the fully phased in price was implemented for CY 2019, one third of the difference between the CY 2019 price and the final price is implemented for CY 2020, and one half of the difference between the CY 2020 price and the final price is implemented for CY 2021, with the new direct PE prices fully implemented for CY 2022. An example of the transition from the current to the fully-implemented new pricing is provided in Table 11. For CY 2020, one third of the difference between the CY 2019 price and the final price will be implemented as per the previously finalized policy. Table 12 contains the list of proposed CY 2020 market-based supply and equipment pricing updates:

BILLING CODE 4120-01-P

TABLE 12: Proposed CY 2020 Market-Based Supply and Equipment Pricing Updates

CMS CODE	Description	CMS 2019 Price	Prior CMS 2022 Price	Prior CMS 2020 Price	Updated CMS 2022 Price	Updated CMS 2020 Price
SA047	pack, EM visit	\$4.176	\$7.750	\$5.367	\$5.468	\$4.606

BILLING CODE 4120-01-C

(2) Invoice Submission

The full list of updated supply and equipment pricing as it will be implemented over the 4-year transition period will be made available as a public use file displayed on the CMS website under downloads for the CY 2020 PFS proposed rule at <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html>.

We received public comments on updates to prices for existing direct PE inputs. The following is a summary of the comments we received and our responses.

Comment: Many commenters were supportive of the proposed update to supply and equipment pricing based on the submission of additional invoices as detailed in Table 12. One commenter thanked CMS for gathering additional pertinent information and proposing a more accurate price for the balloon sinus surgery kit (SA106) supply for CY 2020. Several commenters urged CMS to finalize the proposed updates to the direct PE supplies and equipment prices as listed in the table. One commenter encouraged CMS to continue to carefully consider all pricing data including invoices and other supporting evidence that they receive from the specialty societies throughout this comment period and the entirety of the 4-year transition period.

Response: We will continue to carefully consider all pricing data submitted from commenters throughout the 4-year transition period.

Comment: Several commenters stated that they were concerned that supply and equipment pricing will quickly become outdated once the transition to updated prices is complete in CY 2022. The commenters encouraged CMS to move to an ongoing update process for supplies and equipment, as well as for clinical labor staff costs, one that is open for public comment through the rulemaking process.

Response: We share the concerns from the commenters that the supply and equipment pricing will eventually become outdated again after the pricing transition is complete. We welcome additional feedback from stakeholders on potential solutions to this issue, and we will consider the possibility of different approaches to supply and equipment pricing for use in future rulemaking.

Comment: One commenter stated that they appreciated and supported recognition by CMS that the supplies and equipment associated with physician services were past due for review, but noted that there remains large numbers of supplies and equipment that are overdue for updates. The commenter stated that they supported a gradual transition of the pricing given the widespread impact on the PE values; however, doing so creates a situation in which items that have

seen dramatic increases over a short time are not being adequately compensated for several years. The commenter asked CMS to consider shortening the transition period from 4 years to 3 years for the supply and equipment pricing.

Response: Although we appreciate the feedback from the commenter, we finalized a policy last year to phase in the new supply and equipment pricing over 4 years so that supply and equipment values transition smoothly from their current prices to the final updated prices in CY 2022 (83 FR 59479–59480). We did not propose any changes to this transition period, and therefore, we decline to adopt a different approach.

Comment: One commenter stated that they supported the CMS proposal to update the price of the EM visit pack (SA047) supply to \$5.47 to match the sum of the prices of the component supplies. The commenter also stated that they had concerns over the pricing of the other bundled supply items (such as kits, trays, and packs) that may have been similarly mispriced by StrategyGen. The commenter stated that they could not assist CMS in correcting supply codes that may have been incorrectly priced without details about the pricing for individual component supplies.

Response: We appreciate the support for our proposed pricing of the EM visit pack (SA047) supply by the commenter. We encourage stakeholders to comment

upon and submit pricing information for any supply items that they believe may have been mispriced by StrategyGen. In the absence of alternative pricing information, we continue to believe that our proposed prices are the most accurate source of data.

Comment: One commenter recommended CMS consider only the best available evidence and market research data in proposing any changes to the pricing approach of the balloon sinus surgery kit (SA106). The commenter stated that the use of navigation instruments has increased for this supply kit, particularly in the lower cost office setting, which enhances the ability to navigate the complex sinus anatomy, resulting in improved safety and reliability of the procedure, which benefits the patient.

Response: We note that the commenter did not make any specific recommendations regarding the pricing of this supply or submit invoices with additional pricing information. In the absence of alternative pricing information, we continue to believe that our proposed prices are the most accurate source of data.

Comment: Several commenters stated that they supported and urged CMS to finalize the proposed prices for the general ultrasound room (EL015) and vascular ultrasound room (EL016) equipment. Commenters stated that the proposed prices more accurately reflected the costs faced by vascular ultrasound practitioners and would reduce health care costs by ensuring ultrasound services are readily available to the most vulnerable Medicare beneficiaries.

Response: We appreciate the support for our proposed pricing by the commenters.

Comment: One commenter disagreed with the proposed pricing of the general ultrasound room (EL015) equipment. The commenter stated that the proposed pricing would drastically reduce the general ultrasound room price by 65 percent, which would have a downstream impact on the vascular ultrasound room, resulting in a 57 percent reduction. The commenter stated that a 40 percent reduction in payment as a result of this pricing would significantly reduce patient access to ultrasound services across the board.

Response: We clarify for the commenter that we did not propose a reduction in the price of the general ultrasound room (EL015) equipment. We proposed to update the price of the general ultrasound room to \$410,303.32 and proposed to continue to transition towards this price over the remaining

years of the phase-in period, with a CY 2020 price of \$383,397.77. We note that this is a slight increase over the finalized CY 2019 price of \$369,945.00; we encourage readers to consult the full list of supply and equipment pricing as detailed in the public use files.

Comment: Several commenters disagreed with the proposed pricing of the “HDR Afterload System, Nucletron—Oldelft” (ER003) equipment, the “treatment planning system, IMRT (Corvus w-Peregrine 3D Monte Carlo)” (ED033) equipment, and the “SRS system, SBRT, six systems, average” (ER083) equipment. The commenters stated that all of these equipment items have proposed prices that are below industry standards, and that given the high cost of these items and their substantial utilization in certain radiation oncology delivery codes, it was imperative that the CMS inputs accurately reflect the marketplace pricing. The commenters recommended that CMS conduct additional research regarding fair and accurate market pricing for equipment items ER003, ED033 and ER083. Another commenter also disagreed with the proposed pricing of the ER003 equipment, and stated that StrategyGen may have included updated pricing for a less costly electronic brachytherapy system used to treat non-melanoma skin cancer, or alternatively the proposed price for ER003 may represent an equipment upgrade or refurbished equipment.

Response: We share the concerns of the commenters on the importance to ensure fair and accurate market-based pricing for supplies and equipment. However, the commenters did not submit invoices or other pricing data for the ER003, ED033, and ER083 equipment items, and, as previously stated, in the absence of alternative pricing information, we continue to believe that our proposed prices are the most accurate source of data. We continue to welcome feedback from stakeholders on the proposed updated supply and equipment pricing over the ongoing 4-year transition period, including the submission of additional invoices for consideration.

Comment: Several commenters stated that they supported the efforts by CMS to ensure accurate pricing for direct PE inputs and supported the updated valuation of the ultrasound room and vascular ultrasound room. However, the commenters stated that there was an inconsistency with the pricing for the CT room (EL007), PET room (EL009), and PET-CT room (EL010) equipment. The commenters stated that it did not follow logically that the EL009

equipment is increasing from \$1,328,996 to \$2,410,677 and the EL007 equipment is increasing from \$1,284,000 to \$1,429,967 while a room that is a combination of these two, EL010, is decreasing from \$2,136,283 to \$206,326. The commenters asked that CMS investigate this issue further while delaying any price change for this one item.

Response: With regards to the pricing of the PET-CT room (EL010) equipment, we share the desire of the commenters to ensure fair and accurate market-based pricing for this equipment item. However, as we noted in the previous comment response, the commenters did not submit invoices or other pricing data for the EL010 equipment, and, as previously stated, in the absence of alternative pricing information, we continue to believe that our proposed prices are the most accurate source of data. We remind stakeholders that the proposed pricing was based on market research carried out by the StrategyGen contractor during the prior rule cycle. We continue to welcome feedback from stakeholders on the proposed updated supply and equipment pricing over the ongoing 4-year transition period, and we are willing to revisit the subject of pricing for this equipment if provided with market-based pricing data.

Comment: Several commenters disagreed with the proposed price of the “stent, vascular, deployment system, Cordis SMART” (SA103) and “stent, balloon, implantable” (SD299) supplies. Commenters stated that the Cordis SMART stent (SA103) supply is not FDA approved to stent iliac veins in CPT codes 37238–37239 due to the markedly undersized diameters of the available stents, and that this supply is essentially never used in iliac veins due to its much smaller size. The commenter stated that they believe the proposed pricing of the SA103 supply to be inaccurate, and stated that they were submitting 10 invoices in the hopes of pricing a new supply code at \$2,537 which would replace the SA103 supply in these CPT codes. The commenters also stated a desire to work with CMS to reconsider pricing of the SD299 supply given the likely non-viability by CY 2022 of the services represented by CPT codes 37236 and 37237 in the office setting, and to resolve the lack of clarity surrounding the implantable stent balloon.

Response: We appreciate the desire on the part of the commenters to submit invoices with additional pricing data. However, despite an exhaustive search of the comments, we were unable to find the 10 invoices mentioned in the letters from the commenters, which

were not included along with the rest of the submitted text. Although we are willing to consider these invoices if they were to be submitted, as previously stated, in the absence of alternative pricing information, we continue to believe that our proposed prices are the most accurate source of data. We urge commenters submitting invoices to include them as part of their comment letter to avoid any potential for miscommunication. We also note for the commenters that we did not make any proposals regarding CPT codes 37238–37239 or CPT codes 37236–37237, and therefore, we decline to make changes to the supplies for these codes at this time.

Comment: Several commenters disagreed with the proposed price of the percutaneous neuro test stimulation kit (SA022) supply. The commenters stated that the proposed price of \$114.52 was insufficient to reflect the cost associated with the SA022 supply, and that there may have been some misunderstanding about what items comprise the sacral nerve test kit. The commenters stated that it appears that the line item reflecting the device that generates the neurostimulation, which is the most expensive component of the test kit, was not included in the proposed pricing for this supply, which instead reflects the costs of the test kit leads only. The commenters stated that they reviewed all of the paid invoices for kits sold during January and February 2019, which resulted in pricing that was more in line with the CY 2018 pricing of \$420 for the kit. One commenter submitted a random sample of 120 paid invoices (out of the 481 paid invoices that the commenter accumulated in total) for consideration by CMS.

Response: We appreciate the submission of a large quantity of additional invoices with pricing data from the commenter. After further review, we agree with the commenters that the proposed price failed to incorporate all of the components of the test kit. Based on the data submitted by the commenters, we are finalizing an update in the price of the percutaneous neuro test stimulation kit (SA022) supply to \$413.24, and we will continue to transition towards this price over the remaining years of the phase-in period.

Comment: One commenter stated that the proposed price of \$752.40 for the “plasma LDL adsorption column (Liposorber)” (SD186) supply did not accurately reflect the actual average prices paid by their provider customers. The commenter submitted copies of all U.S. customer invoices for purchases of the SD186 supply for the most recent three-month period from June 1 through August 30, 2019 and requested that the

price should be updated to reflect the average market pricing.

Response: We appreciate the submission of a large quantity of additional invoices with pricing data from the commenter. Based on the data submitted by the commenter, we are finalizing an update in the price of the “plasma LDL adsorption column (Liposorber)” (SD186) supply to \$1118.06, and we will continue to transition towards this price over the remaining years of the phase-in period.

Comment: The same commenter stated that the “plasma antibody adsorption column (Prosorba)” (SD185) supply was withdrawn from the market by its manufacturer more than 10 years ago, and the associated procedure code (CPT code 36515) has been deleted. The commenter also stated that the blood warmer tubing set (SC084) supply is not utilized to perform LDL apheresis with a Liposorber System, and therefore, recommended that this supply should be delisted as a direct PE input for CPT code 36516.

Response: We appreciate the additional information provided by the commenter regarding these supply items. After conducting our own review, we agree with the commenter that there is no longer any need for the “plasma antibody adsorption column (Prosorba)” (SD185) supply, which is not utilized by any HCPCS codes and has been withdrawn from the market. Therefore, we are finalizing the deletion of the SD185 supply code. We are not finalizing the removal of the blood warmer tubing set (SC084) supply at this time, as it is currently utilized in two codes (CPT codes 36514 and 36516), and we did not make any proposals on this issue. We welcome additional feedback from stakeholders regarding the use of the SC084 supply for potential future rulemaking.

Comment: One commenter stated that they appreciated recent efforts by CMS to update the price of supply and equipment inputs to better reflect current market rates. The commenter requested that CMS update the price inputs for three inputs: The Biodegradable Material Kit—PeriProstatic (SA126) supply, the Rezum delivery device kit (SA128) supply, and the water thermotherapy procedure generator (EQ389) equipment. The commenter submitted invoices with updated pricing data for consideration by CMS.

Response: Based on the data submitted by the commenters, we are finalizing an update in the price of all three of these direct PE inputs. We are finalizing an increase in the price of the Biodegradable Material Kit—

PeriProstatic (SA126) supply from \$2,850 to \$2,965 based on averaging the submission of eight invoices. We are finalizing an increase in the price of the Rezum delivery device kit (SA128) supply from \$1,150 to \$1,220 based on averaging the submission of ten invoices. Finally, we are finalizing an increase in the price of the water thermotherapy procedure generator (EQ389) equipment from \$27,538 to \$33,950 based on averaging the submission of two invoices.

Comment: One commenter disagreed with the proposed pricing for the “fluorescein inj (5ml uou)” (SH033) supply. The commenter stated that the proposed price for injectable fluorescein was concerning as it did not reflect the most recent price increase of nearly 60 percent. The commenter stated that for several months practices have been paying \$38.02 per vial and submitted four invoices to this effect.

Response: After reviewing the submitted invoices, we are finalizing an increase of the price of the SH033 supply to \$38.02 to match the information detailed by the commenter.

Comment: One commenter disagreed with the proposed pricing for HCPCS code G0166 (*External counterpulsation, per treatment session*) and stated that the reductions in the proposed pricing would decrease the availability of this service and have already impacted their ability to provide external counterpulsation (ECP) therapy. The commenter stated that the prior review of HCPCS code G0166 in the CY 2019 rule cycle contained major errors, including omissions that artificially deflated the cost of the equipment associated with ECP therapy, inappropriate valuation of the ECP therapy equipment, and a failure to reflect the clinical guidelines and requirements for delivering ECP therapy. The commenter requested that CMS reverse the CY 2019 RVU reductions such that ECP therapy would return to the CY 2018 payment rates, or alternately pause any future reductions until CMS considered and acted upon forthcoming RUC recommendations for HCPCS code G0166. The commenter also submitted a series of invoices for the EEC external counterpulsation system (EQ012) equipment and a number of additional equipment items that previously lacked pricing.

Response: We remind commenters that we nominated HCPCS code G0166 as potentially misvalued in the CY 2020 PFS proposed rule (84 FR 40516) due to concerns that the RVUs for this code did not fully reflect the total resources required to deliver the service. Aside from nominating HCPCS code G0166 as

potentially misvalued, we did not make any other proposals concerning this code. We are aware that the RUC plans to review HCPCS code G0166 for the CY 2021 PFS rule cycle, and we look forward to considering their recommendations for next year's rulemaking.

However, although we are not reviewing the work RVU or direct PE inputs for HCPCS code G0166 for CY 2020, we were able to consider the submission of invoices from the commenter as part of our market-based supply and equipment pricing transition. Based on the information provided by the commenters, we are finalizing an increase in the price of the EECF external counterpulsation system (EQ012) equipment from \$61,490.75 to \$117,495.00. For the additional equipment items submitted by the commenter, which are not currently included in the direct PE inputs for HCPCS code G0166, we are finalizing the use of a proxy item for equipment pricing. We are finalizing the addition of a medium instrument pack (EQ138) priced at \$1,500.00 at the same equipment time of 73 minutes used by the EECF external counterpulsation system as a proxy to represent the cost of these additional items. Although the medium instrument pack is a collection of surgical instruments and not table accessories, it contains 20 different small items which individually fall under our \$500 threshold for equipment pricing, much as the additional equipment items on the submitted invoices also failed to meet the typical \$500 threshold. We will further consider pricing for both the EECF external counterpulsation as part of the review process for this code along with the RUC recommendations when they arrive for CY 2021.

Comment: One commenter disagreed with the proposed pricing of the INR analysis and reporting system w-software (EQ312) equipment. The commenter stated that the finalized price for the INR analysis and reporting system during the CY 2019 rule cycle was orders of magnitude lower than the amount submitted by the home INR manufacturers and suppliers, and the commenter was under the belief that the pricing for this equipment was not reviewed and/or updated. The commenter urged CMS to review and update the price for the PT/INR analysis and reporting system based on current market invoices; the commenter also submitted additional invoices from the same vendor with their letter.

Response: We clarify for the commenter that we did review the invoices that they submitted during the

previous rule cycle in CY 2019. Those invoices, along with the additional invoices submitted for the current CY 2020 rule cycle from the same vendor, did not contain pricing information for the purchase of an INR analysis and reporting system (EQ312) equipment item. These invoices instead constituted a monthly service fee for "customization and management of provided applications" as detailed on the billing form. Under our PE methodology, monthly service fees are a form of administrative expense, and payment for these costs is included as part of our indirect PE allocation. We did not use these invoices for pricing in CY 2019 and we are not using them for pricing in CY 2020, as they detail a form of indirect PE under our methodology. We also note that the equipment per-minute cost formula includes maintenance costs, interest costs, and a useful life assumption; this formula already incorporates equipment costs that extend across multiple years. Taking a monthly service fee and multiplying it across 12 months and then again across 5 years, as the commenters suggested should take place for these invoices, would result in equipment costs that are inappropriately excessive, such as the \$6 million equipment price detailed on these invoices. We will continue to price the INR analysis and reporting system at \$19,325 and continue to transition towards this price over the remaining years of the phase-in period.

After consideration of the public comments, we are finalizing the market-based supply and equipment pricing updates listed in Table 12, along with the additional finalized pricing changes detailed in the preceding paragraphs. The full list of updated supply and equipment pricing as it will be implemented over the 4-year transition period will be made available as a public use file displayed on the CMS website under downloads for the CY 2020 PFS final rule at <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/Physician-FeeSched/PFS-Federal-Regulation-Notices.html>.

We routinely accept public submission of invoices as part of our process for developing payment rates for new, revised, and potentially misvalued codes. Often these invoices are submitted in conjunction with the RUC-recommended values for the codes. For CY 2020, we noted that some stakeholders have submitted invoices for new, revised, or potentially misvalued codes after the February 10th deadline established for code valuation recommendations. To be included in a given year's proposed rule, we generally

need to receive invoices by the same February 10th deadline we noted for consideration of RUC recommendations. However, we would consider invoices submitted as public comments during the comment period following the publication of the PFS proposed rule, and would consider any invoices received after February 10th or outside of the public comment process as part of our established annual process for requests to update supply and equipment prices.

(3) Adjustment to Allocation of Indirect PE for Some Office-Based Services

In the CY 2018 PFS final rule (82 FR 52999 through 53000), we established criteria for identifying the services most affected by the indirect PE allocation anomaly that does not allow for a site of service differential that accurately reflects the relative indirect costs involved in furnishing services in nonfacility settings. We also finalized a modification in the PE methodology for allocating indirect PE RVUs to better reflect the relative indirect PE resources involved in furnishing these services. The methodology, as described, is based on the difference between the ratio of indirect PE to work RVUs for each of the codes meeting eligibility criteria and the ratio of indirect PE to work RVU for the most commonly reported visit code. We refer readers to the CY 2018 PFS final rule (82 FR 52999 through 53000) for a discussion of our process for selecting services subject to the revised methodology, as well as a description of the methodology, which we began implementing for CY 2018 as the first year of a 4-year transition. For CY 2020, we proposed to continue with the third year of the transition of this adjustment to the standard process for allocating indirect PE.

We did not receive any public comments on the proposed adjustments to allocation of indirect PE for some office-based services. Therefore, we are finalizing the continuation of the third year of the transition as proposed.

e. Technical Evaluation Panel Related to Practice Expense

The RAND Corporation is currently studying potential improvements to CMS' PE allocation methodology and the data that underlie it. As part of this study, RAND will be convening a technical expert panel in late 2019 or early 2020 to obtain input from stakeholders including physicians, practice and health system managers, health care accountants, and health policy experts. The expert panel's recommendations will be discussed in a

report to be published by RAND in CY 2020.

C. Determination of Malpractice Relative Value Units (RVUs)

1. Overview

Section 1848(c) of the Act requires that each service paid under the PFS be composed of three components: Work, PE, and malpractice (MP) expense. As required by section 1848(c)(2)(C)(iii) of the Act, beginning in CY 2000, MP RVUs are resource based. Section 1848(c)(2)(B)(i) of the Act also requires that we review, and if necessary adjust, RVUs no less often than every 5 years. In the CY 2015 PFS final rule with comment period (79 FR 67591 through 67596), we implemented the third review and update of MP RVUs. For a comprehensive discussion of the third review and update of MP RVUs, *see* the CY 2015 PFS proposed rule (79 FR 40349 through 40355) and final rule with comment period (79 FR 67591 through 67596). In the CY 2018 PFS proposed rule (82 FR 33965 through 33970), we proposed to update the specialty-level risk factors, used in the calculation of MP RVUs, prior to the next required 5 year update (CY 2020), using the updated MP premium data that were used in the eighth Geographic Practice Cost Index (GPCI) update for CY 2017; however the proposal was ultimately not finalized for CY 2018.

We consider the following factors when we determine MP RVUs for individual PFS services: (1) Specialty-level risk factors derived from data on specialty-specific MP premiums incurred by practitioners; (2) service-level risk factors derived from Medicare claims data of the weighted average risk factors of the specialties that furnish each service; and (3) an intensity/complexity of service adjustment to the service-level risk factor based on either the higher of the work RVU or clinical labor portion of the direct PE RVU. Prior to CY 2016, MP RVUs were only updated once every 5 years, except in the case of new and revised codes.

As explained in the CY 2011 PFS final rule with comment period (75 FR 73208), MP RVUs for new and revised codes effective before the next 5-year review of MP RVUs were determined either by a direct crosswalk from a similar source code or by a modified crosswalk to account for differences in work RVUs between the new/revised code and the source code. For the modified crosswalk approach, we adjusted (or scaled) the MP RVU for the new/revised code to reflect the difference in work RVU between the source code and the new/revised work

RVU (or, if greater, the difference in the clinical labor portion of the fully implemented PE RVU) for the new code. For example, if the proposed work RVU for a revised code was 10 percent higher than the work RVU for its source code, the MP RVU for the revised code would be increased by 10 percent over the source code MP RVU. Under this approach, the same risk factor (RF) was applied for the new/revised code and source code, but the work RVU for the new/revised code was used to adjust the MP RVUs for risk.

In the CY 2016 PFS final rule with comment period (80 FR 70906 through 70910), we finalized a policy to begin conducting annual MP RVU updates to reflect changes in the mix of practitioners providing services (using Medicare claims data), and to adjust MP RVUs for risk for intensity and complexity (using the work RVU or clinical labor RVU). We also finalized a policy to modify the specialty mix assignment methodology (for both MP and PE RVU calculations) to use an average of the three most recent years of data instead of a single year of data. Under this approach, for new and revised codes, we generally assign a specialty-level risk factor to individual codes based on the same utilization assumptions we make regarding specialty mix we use for calculating PE RVUs and for PFS budget neutrality. We continue to use the work RVU or clinical labor RVU to adjust the MP RVU for each code for intensity and complexity. In finalizing this policy, we stated that the specialty-level risk factors would continue to be updated through notice and comment rulemaking every 5 years using updated premium data, but would remain unchanged between the 5-year reviews.

Section 1848(e)(1)(C) of the Act requires us to review, and if necessary, adjust the GPCIs at least every 3 years. For CY 2020, we are conducting the statutorily required 3-year review of the GPCIs, which coincides with the statutorily required 5-year review of the MP RVUs. We note that the MP premium data used to update the MP GPCIs are the same data used to determine the specialty-level risk factors, which are used in the calculation of MP RVUs. Going forward, we believe it would be logical and efficient to align the update of MP premium data used to determine the MP RVUs with the update of the MP GPCIs. Therefore, we proposed to align the update of MP premium data with the update to the MP GPCIs, that is, we proposed to review, and if necessary update the MP RVUs at least every 3 years, similar to our review and update

of the GPCIs. If we align the two updates, we would conduct the next statutorily-mandated review and update of both the GPCI and MP RVU for implementation in CY 2023. We proposed to implement the fourth comprehensive review and update of MP RVUs for CY 2020 and are seeking comment on these proposals.

We received no specific comment regarding our proposal to align the update of MP premium data with the update to the MP GPCIs. That is, to review, and if necessary update the MP RVUs at least every 3 years, similar to our review and update of the GPCIs; therefore, we are finalizing as proposed.

2. Methodology for the Proposed Revision of Resource-Based Malpractice (MP) RVUs

a. General Discussion

We calculated the proposed MP RVUs using updated MP premium data obtained from state insurance rate filings. The methodology used in calculating the proposed CY 2020 review and update of resource-based MP RVUs largely parallels the process used in the CY 2015 update; however, we proposed to incorporate several methodological refinements, which are described below. The MP RVU calculation requires us to obtain information on specialty-specific MP premiums that are linked to specific services, and using this information, we derive relative risk factors (RFs) for the various specialties that furnish a particular service. Because MP premiums vary by state and specialty, the MP premium information must be weighted geographically and by specialty. We calculated the proposed MP RVUs using four data sources: MP premium data presumed to be in effect as of December 31, 2017; CY 2018 Medicare payment and utilization data; higher of the CY 2020 proposed work RVUs or the clinical labor portion of the direct PE RVUs; and CY 2019 GPCIs. We used the higher of the CY 2020 final work RVUs or clinical labor portion of the direct PE RVUs in our calculation to develop the CY 2020 final MP RVUs while maintaining overall PFS budget neutrality.

Similar to the CY 2015 update, the proposed MP RVUs were calculated using specialty-specific MP premium data because they represent the expense incurred by practitioners to obtain MP insurance as reported by insurers. For CY 2020, the most current MP premium data available, with a presumed effective date of no later than December 31, 2017, were obtained from insurers with the largest market share in each

state. We identified insurers with the largest market share using the National Association of Insurance Commissioners (NAIC) market share report. This annual report provides state-level market share for entities that provide premium liability insurance (PLI) in a state. Premium data were downloaded from the System for Electronic Rates & Forms Filing Access Interface (SERFF) (accessed from the NAIC website) for participating states. For non-SERFF states, data were downloaded from the state-specific website (if available online) or obtained directly from the state's alternate access to filings. For SERFF states and non-SERFF states with online access to filings, the 2017 market share report was used to select companies. For non-SERFF states without online access to filings, the 2016 market share report was used to identify companies. These were the most current data available during the data collection and acquisition process.

MP insurance premium data were collected from all 50 States, and the District of Columbia. Efforts were made to collect filings from Puerto Rico; however, no recent filings were submitted at the time of data collection, and therefore, filings from the previous update were used. Consistent with the CY 2015 update, no filings were collected for the other U.S. territories: American Samoa, Guam, Virgin Islands, or Northern Mariana Islands. MP premiums were collected for coverage limits of \$1 million/\$3 million, mature, claims-made policies (policies covering claims made, rather than those covering losses occurring, during the policy term). A \$1 million/\$3 million liability limit policy means that the most that would be paid on any claim is \$1 million and the most that the policy would pay for claims over the timeframe of the policy is \$3 million. Adjustments were made to the premium data to reflect mandatory surcharges for patient compensation funds (PCF, funds used to pay for any claim beyond the state's statutory amount, thereby limiting an individual physician's liability in cases of a large suit) in states where participation in such funds is mandatory.

Premium data were included for all physician and nonphysician practitioner (NPP) specialties, and all risk classifications available in the collected rate filings. Although premium data were collected from all states, the District of Columbia, and previous filings for Puerto Rico were utilized, not all specialties had distinct premium data in the rate filings from all states. In previous updates, specialties for which premium data were not

available for at least 35 states, and specialties for which there were not distinct risk groups (surgical, non-surgical, and surgical with obstetrics) among premium data in the rate filings, were crosswalked to a similar specialty, either conceptually or based on available premium data. This resulted in not using those premium data because the 35 state threshold was not met. In the CY 2020 PFS proposed rule, we noted that the proposed methodological improvements discussed below expands the specialties and amount of filings data used to develop the proposed risk factors, which are used to develop the proposed MP RVUs.

b. Proposed Methodological Refinements

For the CY 2020 update, we proposed the following methodological improvements to the development of MP premium data:

(1) Downloading and using a broader set of filings from the largest market share insurers in each state, beyond those listed as "physician" and "surgeon" to obtain a more comprehensive data set.

We received public comments on the proposed methodological improvement to download and use a broader set of filings from the largest market share insurers in each state, beyond those listed as "physician" and "surgeon" to obtain a more comprehensive data. The following is a summary of the comments we received and our responses.

Comment: Commenters noted appreciation for CMS' efforts to improve the premium data collection process and the opportunity to provide comments on the new methodology. Commenters were supportive of our proposed methodological refinement to download and use a broader set of filings from the largest market share insurers in each state, beyond those listed as "physician" and "surgeon" to obtain a more comprehensive data set.

Response: We thank commenters for their feedback and support; we are finalizing as proposed.

(2) Combining minor surgery and major surgery premiums to create the surgery service risk group, which yields a more representative surgical risk factor. In the previous update, only premiums for major surgery were used in developing the surgical risk factor.

We received public comments on the proposed methodological improvement to combine minor surgery and major surgery premiums to create the surgery service risk group, which yields a more representative surgical risk factor. In the previous update, only premium data for major surgery were used in developing

the surgical risk factor. The following is a summary of the comments we received and our responses.

Comment: Commenters stated they appreciated that CMS considered methods to calculate surgical risk factors, but noted concerns with the method CMS used to classify surgeries as either minor or major, stating it was arbitrary and inconsistent with other CMS policy. Commenters further noted that the definition of minor surgeries and major surgeries should be consistent and developed with a consensus methodology among physician specialties. Commenters recommended that CMS work with the physician community to more accurately define major and minor surgeries.

Response: We thank commenters for their appreciation of our work to calculate a more representative surgical risk factor. We note that we did not propose definitions for minor and major surgery and will continue to work with all interested stakeholders on our proposals.

Comment: Commenters were not supportive of our proposal to categorize services between HCPCS 59000 and HCPCS 59899 as OB services and services between HCPCS 10000 and HCPCS 69999 (excluding the OB services) as surgical, with a physician work value greater than 5.00 as "major" surgery, for the purpose of the analysis. Commenters noted that in doing so, CMS selected an arbitrary and misguided definition of "minor" surgery for any code between the HCPCS 10000 and HCPCS 69999 section of the CPT code book with a physician work value less than 5.00. Commenters noted that if CMS intends to collect data at the minor vs major level, the data must reflect the different risk factors for those specialties and specifically be applied to codes defined as minor vs major surgery, and not broadly applied to an entire specialty. Commenters noted that the proposal could lead to an unfair valuation for certain specialties and services. The commenter further noted that CMS should hold off on moving to differentiating between minor and major surgeries until CMS is able to work with the RUC and impacted specialties to establish such definitions.

Response: We reiterate that we did not propose to define minor surgery and major surgery. The proposal leveraged an existing policy (64 FR 59834), that categorized services within the surgical range of HCPCS codes (and the list of invasive cardiology services outside the surgical range) as surgical. Building upon that existing policy, we proposed a methodological improvement to

combine minor surgery and major surgery premiums when both were delineated in rate filings for a specialty and to set a threshold of a physician work RVU greater 5.00 to categorize surgical services as major surgery, (surgical services under 5.00 would be categorized as minor surgery) for the purpose of the analysis. The methodological improvement would have developed a more representative surgical risk factor by combining minor surgery and major surgery premiums. We further note that this would have produced more data to use in the analysis and enabled the analysis to reflect a more representative risk factor for specialties that could have been applied to the code level for services categorized as minor surgery or major surgery. We note that in previous updates only major surgery premium data were used (when both minor surgery and major surgery are delineated on the rate filings for a specialty) to develop the surgical risk factors, this was based on a physician work RVU threshold of greater than 5.0, but was based on rate filings that delineated major surgery for a specialty.

In consideration of concerns from commenters, we are not finalizing our proposed methodological refinement to combine major surgery and minor surgery premiums when both are delineated on the rate filings for a specialty nor are we finalizing our proposal to use a physician work RVU greater than 5.00 as a threshold to categorize surgical services as major surgery (or to categorize surgical services under 5.00 as minor surgery), for the purpose of the analysis. Instead we are finalizing to maintain the current methodology and only use major surgery premium data when both minor surgery and major surgery are delineated in the rate filings for a specialty (minor surgery premium data are discarded in those cases) and to use minor surgery premium data when only minor surgery premium data are delineated in the rate filings for a specialty—to develop surgical risk factors. However, we note that the objective of our proposal was to develop a more representative surgical risk factor by refining our current methodology to allow for the use of rate filings data that delineated minor and major surgery. Our work to establish methods to categorize surgical services as minor and major surgery is ongoing, we look forward to working with and receiving feedback from stakeholders for consideration in future rulemaking.

(3) Utilizing partial and total imputation to develop a more comprehensive data set when CMS

specialty names are not distinctly identified in the insurer filings, which sometimes use unique specialty names.

In instances where insurers report data for some (but not all) specialties that explicitly corresponded to a CMS specialty, where those data were missing, we proposed to use partial imputation based on available data to establish what the premiums would likely have been had that specialty been delineated in the filing. In instances where there were no data corresponding to a CMS specialty in the filing, we proposed to use total imputation to establish premiums.

For example, if a specialty of Sleep Medicine is listed on some insurers' rate filings, this rate will be matched to the CMS specialty Sleep Medicine (C0)—partial imputation. However, if the Sleep Medicine specialty is not listed on the insurer's rate filing, under our proposed methodology, the insurer's rate filing for General Practice would be matched to the CMS specialty of Sleep Medicine (C0)—total imputation. In this example, we believe (consistent with the longstanding mappings of the regulatory impact table included in all PFS **Federal Register** notices) that the rate for General Practice is likely to be consistent with the rate that a Sleep Medicine provider would be charged by that insurer, this principle for mapping is used for the appropriate type of imputation. We note the proposed methodological improvement would mean that instead of discarding specialty-specific information from some insurers' filings because other insurers lacked that same level of detail, we would instead impute the missing rates at the insurer/specialty level to utilize as much of the information from the filings as possible.

We solicited comment on these proposed methodological improvements. Additional technical details about our proposal are available in our interim report, "Interim Report for the CY 2020 Update of GPCIs and MP RVUs for the Medicare Physician Fee Schedule," on our website. It is located under the supporting documents section for the CY 2020 PFS proposed rule located at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSchedule/index.html>.

We received public comments on the proposed methodological improvement to utilize partial and total imputation to develop a more comprehensive data set when CMS specialty names are not distinctly identified in the insurer filings, which sometimes use unique specialty names. The following is a

summary of the comments we received and our responses.

Comment: Several commenters disagreed with some of the proposed specialty mappings for partial and total imputation. Some of these commenters recommended that CMS use different mappings other than those that were proposed. A few commenters recommended that CMS publish impacts for all CMS specialties and not attempt to bundle or map specialties to what CMS believes are related specialties or professions.

Response: We note that the MP RVU calculation requires us to obtain information on specialty-specific MP premiums that are linked to specific services, and using this information, we derive relative risk factors for the various specialties that furnish a particular service. We reiterate that the proposed mappings for partial imputation parallel the longstanding mappings of the regulatory impact table included in all PFS **Federal Register** notices that group CMS specialties (present on Medicare claims) into clusters of related specialties (impact specialties) when CMS examines the potential impact of PFS payment policies on the distribution of payments by providers. This table is included in section VII. of this final rule, the Regulatory Impact Analysis.

Furthermore, the proposed mappings for total imputation (when a CMS specialty name is not listed on the insurer's rate filing) reflect the specialty-specific relationship of the underlying principle to identify the premium that an individual in a specialty would have been charged. The proposed mappings for total imputation, specifically for NPP specialties, parallel the proposal to crosswalk NPP specialties for which we do not have sufficient comparable professional liability data, to the lowest physician specialty, which was found to be allergy/immunology.

We note that partial and total imputation are necessary to expand the specialty specific filings data used to develop the proposed risk factors, which are used to develop the proposed MP RVUs. This improvement resulted in the development of a more comprehensive data set, when CMS specialty names were not distinctly identified in the insurer filings, which sometimes use unique specialty names; we are finalizing as proposed.

Comment: A commenter noted that they joined the RUC in urging CMS to collect premium data for specialties that are missing data or where data are not available, and in the meantime, to work

with the RUC to better identify appropriate crosswalks.

Response: We reiterate that we have, and will continue to work with the RUC and all interested stakeholders to improve the premium data collection. Moreover, we continue to make progress in this area as evidenced in the CY 2020 PFS proposed rule (84 FR 40506), where we determined that there were sufficient data for surgery and non-surgery premiums, as well as sufficient differences in rates between classes for 15 specialties, there were 10 such specialties in the CY 2015 update.

Comment: Commenters recommended that CMS utilize any and all premium data available to determine accurate crosswalks for specialties that cannot be directly matched to one of CMS' specialty names.

Response: We reiterate that we use all of the premium data collected to match CMS specialties to the rate that a provider in the specialty would have been charged under each filing, even though PLI insurers use their own distinctive specialty names.

Comment: One commenter recommended that CMS map RFs for cardiac electrophysiology to the risk factor for cardiology (surgery) and cardiology (no surgery). The commenter noted that they did not understand the rationale that CMS applied to determine that the RF should be set at 1.89 and ask CMS to detail how it arrived at that recommended RF. One commenter noted that electrophysiology is a distinct specialty of cardiology, with eligibility for board certification in clinical cardiac electrophysiology through the American Board of Internal Medicine, as well as in cardiology. Several commenters noted that cardiac electrophysiology is a relatively small specialty that may not clearly show in premium data. These commenters further noted that it would not make sense for services like pacemaker implantation that includes placing transvenous wires inside the heart or catheter ablations to treat cardiac arrhythmias inside the heart to receive a non-surgical PLI risk factor. Several commenters noted that cardiac electrophysiology currently has a surgery and non-surgery risk factor.

Response: We reiterate that details on the data sources and the methodological approach used to develop RFs are detailed in the CY 2020 PFS proposed rule (84 FR 40504) and the interim report for the CY 2020 Update of GPCIs and MP RVUs for the Medicare PFS. We also remind stakeholders that we are using updated premium data as reported in the SERFF for participating states and downloaded from the state-specific

website for non-SERFF states or obtained directly from the state's alternate access to filings to develop RFs. We were able to collect more data, and use those data to develop specialty-specific RFs for specialties that were previously entirely mapped to a different specialty out of necessity, because we did not have sufficient data. Therefore, we create a specialty-specific RF based on the distinct data of each specialty, as reflected in the rate filings, when sufficient. Thus, the RFs may be considerably different from the previous update, as a result of utilizing the specialty's own data and not that of a crosswalk to another specialty as was the case for cardiac electrophysiology in the proposed rule. Using these data, as reflected in the filings, more accurately reflects premiums associated with the specialty.

We appreciate the additional information provided by the commenters as to why cardiac electrophysiology should remain mapped to the RF for cardiology (surgery) and cardiology (no surgery). Upon additional review of the additional information provided by commenters, we are not finalizing our proposal to map cardiac electrophysiology to a RF of 1.89, and instead we are finalizing the mapping of RFs for cardiac electrophysiology to the risk factor for cardiology (surgery) and cardiology (no surgery).

Comment: One commenter stated that while the proposal maintains CMS' established policy of applying the cardiology surgical risk factor to the procedures identified in Table 15 of the CY 2015 PFS proposed rule (79 FR 40353 through 40354), it is inconsistent with the CY 2015 PFS final rule, wherein CMS finalized that the cardiology surgical risk factor would apply to a list of procedures (classified as injection procedures used in conjunction with cardiac catheterization) that are outside the code range that CMS considered surgical. This same commenter stated they are concerned that the proposal to have fewer subgroups for cardiac electrophysiology inadvertently undervalues many cardiology surgical procedures on the basis of subspecialty mix performing the procedure, rather than valuing the procedure on its surgical status.

Response: We believe the commenter may have misinterpreted both the CY 2015 PFS proposed rule (79 FR 40353) and CY 2015 PFS final rule (79 FR 67595), which led to a subsequently misinterpreting what CMS proposed to maintain in the CY 2020 PFS proposed rule (84 FR 40504). In CY 2015, we

finalized a policy to classify invasive cardiology services (cardiac catheterizations and angioplasties) that are outside of the surgical HCPCS code range as surgery for purposes of assigning specialty-specific risk factors, and to apply the higher cardiology surgical risk factor to the list of codes outside of the surgical HCPCS code range, when those services are performed by providers with a specialty of cardiology. To that end, this is not to imply that we apply the higher cardiology surgical risk factor to the cardiology services that are outside the surgical code range regardless of the provider specialty performing those services, as indicated by the commenter. We note that the higher surgical risk factor is applied to the list of codes outside of the surgical HCPCS code range only when performed by a provider with a specialty of cardiology.

We reiterate, we calculate service level risk factors based on the mix of specialties that furnish a given service as indicated by Medicare claims data. Medicare claims data reflect the service volume by Medicare primary specialty designations. For CY 2020, we continue to classify services that are outside of the surgical HCPCS code range as surgery for purposes of assigning specialty-specific risk factors, and when furnished by providers with cardiology as the Medicare primary specialty code on the Medicare claim, apply the higher cardiology surgical risk factor.

Comment: One commenter expressed concern with the statement that cardiac electrophysiology is not typically associated with the number and mix of surgical services of other surgical specialties. The commenter further noted that cardiac electrophysiology accounts for about 75 percent of the utilization, on average, across the cardiac ablation codes, with the specialty of cardiology accounting for most of the remainder.

Response: We note that the statement "cardiac electrophysiology is not typically associated with the number and mix of surgical services of cardiologists" was not made to imply that providers with a specialty of cardiac electrophysiology do not perform surgical procedures. We acknowledge that providers with the specialty of cardiac electrophysiology perform surgical procedures, as evidenced by our classification of codes outside of the surgical HCPCS code range as surgery for purposes of assigning specialty-specific risk factors, which are performed by providers with specialty of cardiac electrophysiology and other specialties.

Furthermore, in the case of the list of invasive cardiology services, classified as surgery for purposes of assigning service level risk factors, we note that the percentage of allowed services attributed to cardiology decreased for some of these service codes while the percentage of allowed services furnished by other specialties with risk factors lower than cardiology, such as cardiac physiology, increased.

Additionally, we received several general comments related to the proposed methodological refinements.

Comment: One commenter noted appreciation for CMS' attempt to improve the premium data collection process, stating that the Agency was successful in acquiring national premium data for 16 specialties that were formerly mapped entirely to another specialty, and that there is no longer a mention of the arbitrary 35 state threshold used in the previous update that triggered the CMS crosswalk methodology used to develop PLI RVUs for specialties for which there was not premium data for at least 35 states.

Response: We note that implementation of the methodological refinements noted above, no longer necessitated the 35 state threshold.

Comment: One commenter noted concerns about the percentage of market share premium data that was collected for Connecticut and Massachusetts, noting that only 30 percent of market share data were collected in that locality, even though Connecticut has relatively high PLI premiums, when compared to the rest of the country.

Response: As detailed in the "Final Report for the CY 2020 Update of GPCIs and MP RVUs for the Medicare PFS", which is available on the CMS website under the downloads section of the CY 2020 PFS final rule at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/index.html> medical professional liability insurance is issued at maximum coverage limits. Premiums were collected for coverage limits of \$1 million per occurrence and \$3 million aggregate. States with Patient Compensation Funds may have different coverage limits, which we accounted for, as noted in the aforementioned final report. Although data collection for a state may not have met the threshold of collecting filings until either cumulative market share met or exceeded 50 percent or filings had been collected for four groups or companies, it does not imply that premiums were collected for coverage limits below \$1 million per occurrence and \$3 million aggregate.

We note that the market share filings for Connecticut met the threshold,

because we collected data for four groups. In the case of Massachusetts, this is a non-SERFF state, so we were limited to the amount of data provided by the state in response to our request to the state for these data; we have revised Table 7.A in the final report to easily identify non-SERFF states.

Additionally, in our review of the findings reported in Table 7.A in the final report, we recognized the need for additional clarification for two states. We clarify that data collection for New York State did not meet either threshold, because some of the filings collected were incomplete and unusable, leaving data for three groups, accounting for 32 percent remaining for the market share analysis. In the case of Rhode Island, we identified a typographical error in the chart, which has been fixed.

Comment: Several commenters noted concerns with the data displayed in Table 8.B Volume-weighted Distribution of 2017 Physician Work RVUs by Service Type by CMS Specialty the final report.

Response: We thank commenters for noting their concerns. These data display the share of total work RVUs by service risk group used when combining or splitting premiums across service risk groups as reported by specialties on rate filings to match the final set of specialty/service risk groups used in the analysis. The data displayed in that table are solely for the purposes of the analysis. In consideration of the comments we received, we have provided additional details on the calculations in the "Final Report for the CY 2020 Update of GPCIs and MP RVUs for the Medicare PFS", which is available on the CMS website under the downloads section of the CY 2020 PFS final rule at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/index.html>. Additionally, the table has been revised to reflect that we are not finalizing our proposed methodological refinement to combine minor and major surgery premiums when both are present in the filings for a specialty.

c. Steps for Calculating Malpractice RVUs

Calculation of the proposed MP RVUs conceptually follows the specialty-weighted approach used in the CY 2015 PFS final rule with comment period (79 FR 67591), along with the above proposed methodological improvements. The specialty-weighted approach bases the MP RVUs for a given service on a weighted average of the risk factors of all specialties furnishing the service. This approach ensures that all

specialties furnishing a given service are reflected in the calculation of the MP RVUs. The steps for calculating the proposed MP RVUs are described below. We note that not all of the proposed methodological refinements are being finalized, and therefore, some of steps for calculating malpractice RVUs differ from the proposal.

Step (1): Compute a preliminary national average premium for each specialty.

Insurance rating area MP premiums for each specialty are mapped to the county level. The specialty premium for each county is then multiplied by its share of the total U.S. population (from the U.S. Census Bureau's 2013–2017 American Community Survey (ACS) 5-year estimates). This is in contrast to the method used for creating national average premiums for each specialty in the 2015 update; in that update, specialty premiums were weighted by the total RVU per county, rather than by the county share of the total U.S. population. We refer readers to the CY 2016 PFS final rule with comment period (80 FR 70909) for a discussion of why we have adopted a weighting method based on share of total U.S. population. This calculation is then divided by the average MP GPCI across all counties for each specialty to yield a normalized national average premium for each specialty. The specialty premiums are normalized for geographic variation so that the locality cost differences (as reflected by the 2019 GPCIs) would not be counted twice. Without the geographic variation adjustment, the cost differences among fee schedule areas would be reflected once under the methodology used to calculate the MP RVUs and again when computing the service specific payment amount for a given fee schedule area.

Step (2): Determine which premium service risk groups to use within each specialty.

Some specialties had premium rates that differed for surgery, surgery with obstetrics, and non-surgery. These premium classes are designed to reflect differences in risk of professional liability and the cost of MP claims if they occur. To account for the presence of different classes in the MP premium data and the task of mapping these premiums to procedures, we calculated distinct risk factors for surgical, surgical with obstetrics, and nonsurgical procedures where applicable. However, the availability of data by surgery and non-surgery varied across specialties. Historically, no single approach accurately addressed the variability in premium class among specialties, and we previously employed several

methods for calculating average premiums by specialty. These methods are discussed below.

Developing Distinct Service Risk Groups: We determined that there were sufficient data for surgery and non-surgery premiums, as well as sufficient differences in rates between classes for 15 specialties (there were 10 such specialties in the CY 2015 update). These specialties are listed in Table 13. Additionally, as described in the proposed methodological refinements, in some instances, we combined minor surgery and major surgery premiums to

create a premium to develop the surgery service risk group, rather than discard minor surgery premium data as was done in the previous update. We note that we are not finalizing the proposed methodological change to combine minor surgery and major surgery premium data when both are delineated the rate filings for a specialty. For all other specialties (those that are not listed in Table 13) that typically do not distinguish premiums as described above, a single risk factor was calculated, and that specialty risk factor

was applied to all services performed by those specialties.

This is consistent with prior practice; however, we have refined the nomenclature to more precisely describe that some specialties are delineated into service risk groups, as is the case for surgical, non-surgical, and surgical with obstetrics, and some specialties are not further delineated into service risk subgroups and are instead referred to as “All”—meaning that all services performed by that specialty receive the same risk factor.

TABLE 13: Specialties Subdivided into Service Risk Groups

Service Risk Groups	Specialties
Surgery/No Surgery	Otolaryngology (04), Cardiology (06), Dermatology (07), Gastroenterology (10), Neurology (13), Ophthalmology (18), Urology (34), Geriatric Medicine (38), Nephrology (39), Endocrinology (46), Podiatry (48), Emergency Medicine (93)
Surgery/No Surgery/OB	General Practice (01), Family Practice (08), OB/GYN (16)

Step (3): Calculate a risk factor for each specialty.

The relative differences in national average premiums between specialties are expressed in our methodology as a specialty-level risk factor. These risk factors are calculated by dividing the national average premium for each specialty by the national average premium for the specialty with the lowest premiums for which we had sufficient and reliable data, which remains allergy and immunology (03). For specialties with rate filings that are indicative of sufficient surgical and non-surgical premium data, we recognized those service-risk groups (that is, surgical, and non-surgical) as risk groups of the specialty and we calculated both a surgical and non-surgical risk factor. Similarly, for specialties with rate filings that distinguished surgical premiums with obstetrics, we recognized that service-risk subgroup of the specialty and calculated a separate surgical with obstetrics risk factor.

(a) Technical Component (TC) Only Services

We note that for determining the risk factor for suppliers of TC-only services in the CY 2015 update, we updated the premium data for independent diagnostic testing facilities (IDTFs) that we used in the CY 2010 update. Those data were obtained from a survey conducted by the Radiology Business Management Association (RBMA) in 2009; we ultimately used those data to calculate an updated TC specialty risk factor. We applied the updated TC specialty risk factor to suppliers of TC-only services. In the CY 2015 PFS final rule with comment period (79 FR 67595), RBMA voluntarily submitted updated MP premium information collected from IDTFs in 2014, and requested that we use those data to calculate the CY 2015 MP RVUs for TC-only services. We declined to utilize those data and stated that we believe further study is necessary and we would consider this matter and propose any changes through future rulemaking. We

continue to believe that data for a broader set of TC-only services are needed, and are working to acquire a broader set of data.

For CY 2020, we proposed to assign a risk factor of 1.00 for TC-only services, which corresponds to the lowest physician specialty-level risk factor. We assigned the risk factor of 1.00 to the TC-only services because we do not have sufficient comparable professional liability premium data for the full range of clinicians that furnish TC-only services. In lieu of comprehensive, comparable data, we propose to assign 1.00, the lowest physician specialty-level risk factor calculated using the updated premium data, as the default minimum risk factor. However, we seek information on the most comparable and appropriate proxy for the broader set of TC-only services for future use, as well as any empirical information that would support assignment of an alternative risk factor for these services.

Table 14 shows the risk factors by specialty type and service risk group.

BILLING CODE 4120-01-C

We received public comments on the steps for calculating MP RVUs. The following is a summary of the comments we received and our responses.

Comment: Commenters disagreed with our proposal to assign a risk factor of 1.00, which is the risk factor of the lowest physician specialty, to TC-only services because of insufficient comparable professional liability

premium data for the full range of health professionals that furnish TC-only services. The commenters recommended retaining the current RF for TC-only services until comprehensive data is acquired rather

than assigning the lowest physician specialty-level risk factor to these services. Commenters noted that we should continue to work with stakeholders to obtain these data.

Response: We reiterate that we have, and will continue to work in collaboration with all interested stakeholders to find sufficient comparable professional liability data for the full range of clinicians that furnish TC-only services. In general, we continue to make progress in acquiring premium data as evidenced by the fact that for the CY 2020 update we collected service-specific premium data for an increasing number of specialties, as compared to the CY 2015 update. We note that the current RF for TC-only services is 0.91. Although we were able to find some data for health professionals that furnish TC-only services, we were unable to find sufficient comparable professional liability premium data for the full range of health professionals that furnish TC-only services. We are finalizing our proposal to assign a RF of 1.00, which is the RF of the lowest physician specialty (allergy/immunology), to TC-only services.

Comment: Commenters noted that consistent with the previous update CMS continued to assign the RF of the lowest physician specialty to NPPs for which there were insufficient or no premium data. We received contrasting comments on this proposal. For instance, one commenter was supportive of our proposal to continue assigning the risk factor of the lowest physician specialty to NPPs for which CMS was unable to collect sufficient data. In contrast, a few commenters, including the RUC, stated that CMS should not crosswalk NPPs to the lowest physician specialty, which is allergy and immunology, and to continue to aggressively collect premium data on NPPs.

Response: Our efforts to improve the premium data collection for NPPs is ongoing. We have made progress in acquiring premium data as evidenced by the fact that for the CY 2020 update we collected service-specific premium data for an increasing number of specialties, as compared to the CY 2015 update, including some NPP specialties, for which we previously did not have data that were mapped entirely to another specialty. Although we were able to find data for several NPPs for which we previously did not have data, we were unable to find premium data for the full range of NPPs. Premium data collection for NPPs is ongoing and will continue ahead of the next MP RVU update. We are finalizing a policy to maintain the

current assignment of a RF of 1.00 for NPP specialties, which corresponds to the lowest physician specialty RF, allergy and immunology.

Comment: One commenter stated that an alternate option to crosswalking NPPs to the lowest physician risk factor of allergy and immunology would be to assign them the RF of another NPP specialty for which CMS was able to obtain data, the commenter recommended optometry.

Response: We reiterate that our proposal was to maintain the crosswalk of NPPs for which we had insufficient or no premium data to the lowest physician specialty, not to crosswalk NPPs to the RF of a NPP for which we were able to collect data. At this time, because we were unable to find premium data for the full range of NPPs, we do not believe it is appropriate, as suggested by commenters, to assign all NPPs for which we had insufficient or no premium data to the RF of optometry, another NPP specialty for which we were able to find some data. We reiterate that CMS' efforts to improve the premium data collection for all NPP specialties is ongoing and will continue ahead of the next MP RVU update.

Comment: One commenter suggested that the Agency assign codes performed predominantly by the select NPPs a 0.00 PLI as their premiums are so inconsequential that even a 0.01 PLI overcompensate them for their minimal PLI premiums.

Response: We disagree that NPPs should be assigned a 0.00 PLI and moreover, we disagree that even a 0.01 PLI overcompensate them for their minimal PLI premiums. This incorrectly implies that there is zero risk for NPPs to provide medical services. We reiterate that although we were able to find data for several NPP specialties for which we previously did not have data, we were unable to find premium data for the full range of NPP specialties. Premium data collection for NPP specialties is ongoing and will continue ahead of the next update.

Comment: One commenter noted that they previously referenced an insurance carrier, Health Providers Service Organization (HPSO) (www.hpso.com), as a source of potential premium data for most NPPs. This same commenter provided PLI premium data for several NPPs for a single state from this source, which ranged from \$153 to \$1,008.

Response: We thank the commenter for their feedback and potential data source, as CMS continues efforts to collect premium data on the full range of NPP specialties ahead of the next MP RVU update.

Step (4): Calculate MP RVUs for each CPT/HCPCS code.

Resource-based MP RVUs were calculated for each CPT/HCPCS code that has work or PE RVUs. The first step was to identify the percentage of services furnished by each specialty for each respective CPT/HCPCS code. This percentage was then multiplied by each respective specialty's risk factor as calculated in Step 3. The products for all specialties for the CPT/HCPCS code were then added together, yielding a specialty-weighted service specific risk factor reflecting the weighted MP costs across all specialties furnishing that procedure. The service specific risk factor was multiplied by the greater of the work RVU or clinical labor portion of the direct PE RVU for that service, to reflect differences in the complexity and risk-of-service between services.

Low volume service codes: As we discussed above in this final rule, for low volume services code, we finalized the proposal in the CY 2018 PFS final rule (82 FR 53000 through 53006) to apply the list of expected specialties instead of the claims-based specialty mix for low volume services to address stakeholder concerns about the year to year variability in PE and MP RVUs for low volume services (which also includes no volume services); these are defined as codes that have 100 allowed services or fewer. These service-level overrides are used to determine the specialty for low volume procedures for both PE and MP.

In the CY 2018 PFS final rule (82 FR 53000 through 53006), we also finalized our proposal to eliminate general use of an MP-specific specialty-mix crosswalk for new and revised codes. However, we indicated that we would continue to consider, in conjunction with annual recommendations, specific recommendations regarding specialty mix assignments for new and revised codes, particularly in cases where coding changes are expected to result in differential reporting of services by specialty, or where the new or revised code is expected to be low-volume. Absent such information, the specialty mix assumption for a new or revised code would derive from the analytic crosswalk in the first year, followed by the introduction of actual claims data, which is consistent with our approach for developing PE RVUs.

For CY 2020, we solicited public comment on the list of expected specialties. We also noted that the list has been updated to include a column indicating if a service is identified as a low volume service for CY 2020, and therefore, whether or not the service-level override is being applied for CY

2020. The proposed list of codes and expected specialties is available on our website under downloads for the CY 2020 PFS proposed rule at <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html>.

We received public comments on the proposed updates to the expected specialty list for low volume services. The following is a summary of the comments we received and our responses.

Comment: Several commenters stated that CMS had indicated that the expected specialty list would be updated to include a column specifying if a service was identified as a low volume service for CY 2020, indicating if the service-level override was being applied for CY 2020. However, commenters noted that this additional column did not appear in the download version and asked for additional information.

Response: We thank the commenters for identifying this missing information and we apologize for the technical oversight that caused this information not to be displayed for the proposed rule. We are finalizing a policy to include this additional column in the public use files released with the final rule. Additional comments on the proposed updates to the expected specialty list have been addressed in section II.B. of this final rule.

Step (5): Rescale for budget neutrality.

The statute requires that changes to fee schedule RVUs must be budget neutral. Thus, the last step is to adjust for relativity by rescaling the proposed MP RVUs so that the total proposed resource based MP RVUs are equal to the total current resource based MP RVUs scaled by the ratio of the pools of the proposed and current MP and work RVUs. This scaling is necessary to maintain the work RVUs for individual services from year to year while also maintaining the overall relationship among work, PE, and MP RVUs.

Specialties Excluded from Ratesetting Calculation: In section II.B. of this final rule, Determination of Practice Expense Relative Value Units, we discuss specialties that are excluded from ratesetting for the purposes of calculating PE RVUs. We proposed to treat those excluded specialties in a consistent manner for the purposes of calculating MP RVUs. We note that all specialties are included for purposes of calculating the final BN adjustment. The list of specialties excluded from the ratesetting calculation for the purpose of calculating the PE RVUs that we proposed to also exclude for the

purpose of calculating MP RVUs is available in section II.B. of this final rule, Determination of Practice Expense Relative Value Units. The resource-based MP RVUs are shown in Addendum B, which is available on the CMS website under the downloads section of the CY 2020 PFS rule at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/index.html>.

Because a different share of the resources involved in furnishing PFS services is reflected in each of the three fee schedule components, implementation of the resource-based MP RVU update will have much smaller payment effects than implementing updates of resource-based work RVUs and resource-based PE RVUs. On average, work represents about 50.9 percent of payment for a service under the fee schedule, PE about 44.8 percent, and MP about 4.3 percent. Therefore, a 25 percent change in PE RVUs or work RVUs for a service would result in a change in payment of about 11 to 13 percent. In contrast, a corresponding 25 percent change in MP values for a service would yield a change in payment of only about 1 percent. Estimates of the effects on payment by specialty type is detailed in section VII. of this final rule, the Regulatory Impact Analysis.

We received no specific comments regarding our proposal to treat excluded specialties in a consistent manner for the purposes of calculating MP RVUs, we are finalizing as proposed.

Additional information on our methodology for updating the MP RVUs is available in the “Final Report for the CY 2020 Update of GPCIs and MP RVUs for the Medicare Physician Fee Schedule,” which is available on the CMS website under the downloads section of the CY 2020 PFS final rule at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/index.html>.

After consideration of the comments, we are finalizing the CY 2020 update as proposed with minor modifications, as indicated above. We are finalizing our proposal to download and use a broader set of filings from the largest market share insurers in each state, beyond those listed as “physician” and “surgeon” to obtain a more comprehensive data set. We are not finalizing our proposal to combine minor and major surgery premiums when both are delineated on rate filings for a specialty nor are we finalizing our proposal to use a physician work RVU of greater than 5.00, as a threshold to identify surgical services as major surgery (or to categorize surgical

services under 5.00 as minor surgery). Instead, we are finalizing a policy to develop RFs by maintaining the current methodology to only use major surgery premium data when both minor surgery and major surgery are delineated on rate filings for a specialty, and to use the minor surgery premium data when it is the only premium type in the rate filings for a specialty. We are finalizing a policy to map risk factors for cardiac electrophysiology to the risk factor for cardiology (surgery) and cardiology (no surgery). We are finalizing our proposal to assign the RF of the lowest physician specialty (allergy/immunology) to TC-only services, which is a RF of 1.00. We are finalizing a policy to maintain assigning the current RF of the lowest physician specialty (allergy/immunology), which is a RF of 1.00 to NPP specialties. We are finalizing our proposal to include an additional column on the anticipated low volume specialty list which specifies if a service was identified as a low volume service for CY 2020, indicating if the service-level override was being applied for CY 2020. We are finalizing our proposal to treat excluded specialties in a consistent manner for the purposes of calculating MP RVUs.

D. Geographic Practice Cost Indices (GPCIs)

1. Background

Section 1848(e)(1)(A) of the Act requires us to develop separate Geographic Practice Cost Indices (GPCIs) to measure relative cost differences among localities compared to the national average for each of the three fee schedule components (that is, work, practice expense (PE), and malpractice (MP)). We discuss the localities established under the PFS below in this section. Although the statute requires that the PE and MP GPCIs reflect full relative cost differences, section 1848(e)(1)(A)(iii) of the Act requires that the work GPCIs reflect only one-quarter of the relative cost differences compared to the national average. In addition, section 1848(e)(1)(G) of the Act sets a permanent 1.5 work GPCI floor for services furnished in Alaska beginning January 1, 2009, and section 1848(e)(1)(I) of the Act sets a permanent 1.0 PE GPCI floor for services furnished in frontier states (as defined in section 1848(e)(1)(I) of the Act) beginning January 1, 2011. Additionally, section 1848(e)(1)(E) of the Act provided for a 1.0 floor for the work GPCIs, which was set to expire at the end of 2017. Section 50201 of the Bipartisan Budget Act of 2018 (BBA of 2018) (Pub. L. 115–123,

enacted February 9, 2018) amended the statute to extend the 1.0 floor for the work GPCIs through CY 2019 (that is, for services furnished no later than December 31, 2019).

Section 1848(e)(1)(C) of the Act requires us to review and, if necessary, adjust the GPCIs at least every 3 years. Section 1848(e)(1)(C) of the Act requires that, if more than 1 year has elapsed since the date of the last previous GPCI adjustment, the adjustment to be applied in the first year of the next adjustment shall be $\frac{1}{2}$ of the adjustment that otherwise would be made. Therefore, since the previous GPCI update was implemented in CYs 2017 and 2018, we proposed to phase in $\frac{1}{2}$ of the latest GPCI adjustment in CY 2020.

We have completed a review of the GPCIs and are finalizing new GPCIs in this final rule. We also calculate a geographic adjustment factor (GAF) for each PFS locality. The GAFs are a weighted composite of each PFS locality's work, PE and MP expense GPCIs using the national GPCI cost share weights. While we do not actually use GAFs in computing the fee schedule payment for a specific service, they are useful in comparing overall areas costs and payments. The actual effect on payment for any actual service would deviate from the GAF to the extent that the proportions of work, PE and MP RVUs for the service differ from those of the GAF.

As noted above, section 50201 of the BBA of 2018 extended the 1.0 work GPCI floor for services furnished only through December 31, 2019. Therefore, the final CY 2020 work GPCIs and summarized GAFs do not reflect the 1.0 work floor. However, as required by sections 1848(e)(1)(G) and (I) of the Act, the 1.5 work GPCI floor for Alaska and the 1.0 PE GPCI floor for frontier states are permanent, and therefore, applicable in CY 2020. See Addenda D and E to this final rule for the CY 2020 final GPCIs and summarized GAFs available on the CMS website under the supporting documents section of the CY 2020 PFS final rule at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/index.html>.

2. Payment Locality Background

Prior to 1992, Medicare payments for physicians' services were made under the reasonable charge system. Payments under this system largely reflected the charging patterns of physicians, which resulted in large differences in payment for physicians' services among types of services, physician specialties and geographic payment areas.

Local Medicare carriers initially established 210 payment localities, to reflect local physician charging patterns and economic conditions. These localities changed little between the inception of Medicare in 1967 and the beginning of the PFS in 1992. In 1994, we undertook a study that culminated in a comprehensive locality revision (based on locality resource cost differences as reflected by the GPCIs) that we implemented in 1997. The development of the current locality structure is described in detail in the CY 1997 PFS final rule (61 FR 34615) and the subsequent final rule with comment period (61 FR 59494). The revised locality structure reduced the number of localities from 210 to 89, and increased the number of statewide localities from 22 to 34.

Section 220(h) of the Protecting Access to Medicare Act (PAMA) (Pub. L. 113-93, enacted April 1, 2014) required modifications to the payment localities in California for payment purposes beginning with 2017. As a result, in the CY 2017 PFS final rule (81 FR 80265 through 80268) we established 23 additional localities, increasing the total number of PFS localities from 89 to 112. The current 112 payment localities include 34 statewide areas (that is, only one locality for the entire state) and 75 localities in the other 16 states, with 10 states having two localities, two states having three localities, one state having four localities, and three states having five or more localities. The remainder of the 112 PFS payment localities are comprised as follows: the combined District of Columbia, Maryland, and Virginia suburbs; Puerto Rico; and the Virgin Islands. We note that the localities generally represent a grouping of one or more constituent counties.

The current 112 fee schedule areas, also referred to as payment localities, are defined alternatively by state boundaries (statewide areas for example, Wisconsin), metropolitan areas (for example, Metropolitan St. Louis, MO), portions of a metropolitan area (for example, Manhattan), or rest-of-state areas that exclude metropolitan areas (for example, Rest of Missouri). This locality configuration is used to calculate the GPCIs that are in turn used to calculate locality adjusted payments for physicians' services under the PFS.

As stated in the CY 2011 PFS final rule with comment period (75 FR 73261), changes to the PFS locality structure would generally result in changes that are budget neutral within a state. For many years, before making any locality changes, we have sought consensus from among the professionals whose payments would be affected. We

refer readers to the CY 2014 PFS final rule with comment period (78 FR 74384 through 74386) for further discussion regarding additional information about locality configuration considerations.

3. GPCI Update

As required by the statute, we developed GPCIs to measure relative cost differences among payment localities compared to the national average for each of the three fee schedule components (that is, work, PE, and MP). We describe the data sources and methodologies we use to calculate each of the three GPCIs below in this section. Additional information on the CY 2020 GPCI update is available in a final report, "Final Report for the CY 2020 Update of GPCIs and MP RVUs for the Medicare PFS," on our website located under the supporting documents section for the CY 2020 PFS final rule at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/index.html>.

a. Work GPCIs

The work GPCIs are designed to reflect the relative cost of physician labor by Medicare PFS locality. As required by statute, the work GPCI reflects one quarter of the relative wage differences for each locality compared to the national average.

To calculate the work GPCIs, we use wage data for seven professional specialty occupation categories, adjusted to reflect one-quarter of the relative cost differences for each locality compared to the national average, as a proxy for physicians' wages. Physicians' wages are not included in the occupation categories used in calculating the work GPCI because Medicare payments are a key determinant of physicians' earnings. Including physician wage data in calculating the work GPCIs would potentially introduce some circularity to the adjustment since Medicare payments typically contribute to or influence physician wages. That is, including physicians' wages in the physician work GPCIs would, in effect, make the indices, to some extent, dependent upon Medicare payments.

The work GPCI updates in CYs 2001, 2003, 2005, and 2008 were based on professional earnings data from the 2000 Census. However, for the CY 2011 GPCI update (75 FR 73252), the 2000 data were outdated and wage and earnings data were not available from the more recent Census because the "long form" was discontinued. Therefore, we used the median hourly earnings from the 2006 through 2008 Bureau of Labor Statistics (BLS) Occupational

Employment Statistics (OES) wage data as a replacement for the 2000 Census data. The BLS OES data meet several criteria that we consider to be important for selecting a data source for purposes of calculating the GPCIs. For example, the BLS OES wage and employment data are derived from a large sample size of approximately 200,000 establishments of varying sizes nationwide from every metropolitan area and can be easily accessible to the public at no cost. Additionally, the BLS OES is updated regularly, and includes a comprehensive set of occupations and industries (for example, 800 occupations in 450 industries). For the CY 2014 GPCI update, we used updated BLS OES data (2009 through 2011) as a replacement for the 2006 through 2008 data to compute the work GPCIs; and for the CY 2017 GPCI update, we used updated BLS OES data (2011 through 2014) as a replacement for the 2009 through 2011 data to compute the work GPCIs.

Because of its reliability, public availability, level of detail, and national scope, we believe the BLS OES data continue to be the most appropriate source of wage and employment data for use in calculating the work GPCIs (and as discussed below, the employee wage component and purchased services component of the PE GPCI). Therefore, for the CY 2020 GPCI update, we used updated BLS OES data (2014 through 2017) as a replacement for the 2011 through 2014 data to compute the work GPCIs.

b. Practice Expense (PE) GPCIs

The PE GPCIs are designed to measure the relative cost difference in the mix of goods and services comprising PEs (not including MP expenses) among the PFS localities as compared to the national average of these costs. Whereas the physician work GPCIs (and as discussed later in this section, the MP GPCIs) are comprised of a single index, the PE GPCIs are comprised of four component

indices (employee wages; purchased services; office rent; and equipment, supplies and other miscellaneous expenses). The employee wage index component measures geographic variation in the cost of the kinds of skilled and unskilled labor that would be directly employed by a physician practice. Although the employee wage index adjusts for geographic variation in the cost of labor employed directly by physician practices, it does not account for geographic variation in the cost of services that typically would be purchased from other entities, such as law firms, accounting firms, information technology consultants, building service managers, or any other third-party vendor. The purchased services index component of the PE GPCI (which is a separate index from employee wages) measures geographic variation in the cost of contracted services that physician practices would typically buy. For more information on the development of the purchased service index, we refer readers to the CY 2012 PFS final rule with comment period (76 FR 73084 through 73085). The office rent index component of the PE GPCI measures relative geographic variation in the cost of typical physician office rents. For the medical equipment, supplies, and miscellaneous expenses component, we believe there is a national market for these items such that there is not significant geographic variation in costs. Therefore, the equipment, supplies and other miscellaneous expense cost index component of the PE GPCI is given a value of 1.000 for each PFS locality.

For the previous update to the GPCIs (implemented in CY 2017), we used 2011 through 2014 BLS OES data to calculate the employee wage and purchased services indices for the PE GPCI. As discussed previously in this section, because of its reliability, public availability, level of detail, and national scope, we continue to believe the BLS OES is the most appropriate data source

for collecting wage and employment data. Therefore, in calculating the CY 2020 GPCI update, we used updated BLS OES data (2014 through 2017) as a replacement for the 2011 through 2014 data for purposes of calculating the employee wage component and purchased service index component of the PE GPCI. In calculating the CY 2020 GPCI update, for the office rent index component of the PE GPCI we used the most recently available, 2013 through 2017, American Community Survey (ACS) 5-year estimates as a replacement for the 2009 through 2013 ACS data.

c. Malpractice Expense (MP) GPCIs

The MP GPCIs measure the relative cost differences among PFS localities for the purchase of professional liability insurance (PLI). The MP GPCIs are calculated based on insurer rate filings of premium data for \$1 million/\$3 million mature claims-made policies (policies for claims made rather than losses occurring during the policy term). For the CY 2017 GPCI update, we used 2014 and 2015 malpractice premium data. The CY 2020 MP GPCI update reflects premium data presumed in effect as of December 30, 2017. We note that we finalized a few technical refinements to the MP GPCI methodology in CY 2017, and refer readers to the CY 2017 PFS final rule (81 FR 80270) for additional discussion.

d. GPCI Cost Share Weights

For CY 2020 GPCIs, we proposed to continue to use the current cost share weights for determining the PE GPCI values and locality GAFs. We refer readers to the CY 2014 PFS final rule with comment period (78 FR 74382 through 74383), for further discussion regarding the 2006-based MEI cost share weights revised in CY 2014 that we also finalized for use in the CY 2017 GPCI update.

The GPCI cost share weights for CY 2020 are displayed in Table 15.

TABLE 15: Cost Share Weights for CY 2020 GPCI Update

Expense Category	Current Cost Share Weight	CY 2020 Cost Share Weight
Work	50.866%	50.866%
Practice Expense	44.839%	44.839%
- Employee Compensation	16.553%	16.553%
- Office Rent	10.223%	10.223%
- Purchased Services	8.095%	8.095%
- Equipment, Supplies, Other	9.968%	9.968%
Malpractice Insurance	4.295%	4.295%
Total	100.000%	100.000%

e. PE GPCI Floor for Frontier States

Section 10324(c) of the Affordable Care Act added a new subparagraph (I) under section 1848(e)(1) of the Act to establish a 1.0 PE GPCI floor for physicians' services furnished in frontier states effective January 1, 2011. In accordance with section 1848(e)(1)(I) of the Act, beginning in CY 2011, we applied a 1.0 PE GPCI floor for physicians' services furnished in states determined to be frontier states. In general, a frontier state is one in which at least 50 percent of the counties are "frontier counties," which are those that have a population per square mile of less than 6. For more information on the criteria used to define a frontier state, we refer readers to the FY 2011 Inpatient Prospective Payment System (IPPS) final rule (75 FR 50160 through 50161). There are no changes in the states identified as Frontier States for the CY 2020 PFS final rule. The qualifying states are: Montana; Wyoming; North Dakota; South Dakota; and Nevada. In accordance with statute, we will apply a 1.0 PE GPCI floor for these states in CY 2020.

f. Methodology for Calculating GPCIs in the U.S. Territories

Prior to CY 2017, for all the island territories other than Puerto Rico, the lack of comprehensive data about unique costs for island territories had minimal impact on GPCIs because we used either the Hawaii GPCIs (for the Pacific territories: Guam; American Samoa; and Northern Mariana Islands) or used the unadjusted national averages (for the Virgin Islands). In an effort to provide greater consistency in the calculation of GPCIs given the lack of comprehensive data regarding the validity of applying the proxy data used in the States in accurately accounting for variability of costs for these island territories, in the CY 2017 PFS final rule (81 FR 80268 through 80270), we finalized a policy to treat the Caribbean Island territories (the Virgin Islands and Puerto Rico) in a consistent manner. We do so by assigning the national average of 1.0 to each GPCI index for both Puerto Rico and the Virgin Islands. We refer readers to the CY 2017 PFS final rule for a comprehensive discussion of this policy.

g. California Locality Update to the Fee Schedule Areas Used for Payment Under Section 220(h) of the Protecting Access to Medicare Act

Section 220(h) of the PAMA added a new section 1848(e)(6) to the Act that modified the fee schedule areas used for payment purposes in California

beginning in CY 2017. Prior to CY 2017, the fee schedule areas used for payment in California were based on the revised locality structure that was implemented in 1997 as previously discussed. Beginning in CY 2017, section 1848(e)(6)(A)(i) of the Act required that the fee schedule areas used for payment in California must be Metropolitan Statistical Areas (MSAs) as defined by the Office of Management and Budget (OMB) as of December 31 of the previous year; and section 1848(e)(6)(A)(ii) of the Act required that all areas not located in an MSA must be treated as a single rest-of-state fee schedule area. The resulting modifications to California's locality structure increased its number of localities from 9 under the current locality structure to 27 under the MSA-based locality structure; although for the purposes of payment the actual number of localities under the MSA-based locality structure is 32. We refer readers to the CY 2017 PFS final rule (81 FR 80267) for a detailed discussion of this operational consideration.

Section 1848(e)(6)(D) of the Act defined transition areas as the fee schedule areas for 2013 that were the rest-of-state locality, and locality 3, which was comprised of Marin County, Napa County, and Solano County. Section 1848(e)(6)(B) of the Act specified that the GPCI values used for payment in a transition area are to be phased in over 6 years, from 2017 through 2022, using a weighted sum of the GPCIs calculated under the new MSA-based locality structure and the GPCIs calculated under the PFS locality structure that was in place prior to CY 2017. That is, the GPCI values applicable for these areas during this transition period are a blend of what the GPCI values would have been for California under the locality structure that was in place prior to CY 2017, and what the GPCI values would be for California under the MSA-based locality structure. For example, in CY 2020, which represents the fourth year, the applicable GPCI values for counties that were previously in rest-of-state or locality 3 and are now in MSAs are a blend of $\frac{2}{3}$ of the GPCI value calculated for the year under the MSA-based locality structure, and $\frac{1}{3}$ of the GPCI value calculated for the year under the locality structure that was in place prior to CY 2017. The proportions continue to shift by $\frac{1}{6}$ in each subsequent year so that, by CY 2021, the applicable GPCI values for counties within transition areas are a blend of $\frac{5}{6}$ of the GPCI value for the year under the MSA-based locality structure, and $\frac{1}{6}$ of the GPCI

value for the year under the locality structure that was in place prior to CY 2017. Beginning in CY 2022, the applicable GPCI values for counties in transition areas are the values calculated solely under the new MSA-based locality structure. For clarity, we reiterate that this incremental phase-in is only applicable to those counties that are in transition areas that are now in MSAs, which are only some of the counties in the 2013 California rest-of-state locality and locality 3.

Additionally, section 1848(e)(6)(C) of the Act establishes a hold harmless for transition areas beginning with CY 2017 whereby the applicable GPCI values for a year under the new MSA-based locality structure may not be less than what they would have been for the year under the locality structure that was in place prior to CY 2017. There are a total of 58 counties in California, 50 of which are in transition areas as defined in section 1848(e)(6)(D) of the Act. The eight counties that are not within transition areas are: Orange; Los Angeles; Alameda; Contra Costa; San Francisco; San Mateo; Santa Clara; and Ventura counties.

For the purposes of calculating budget neutrality and consistent with the PFS budget neutrality requirements as specified under section 1848(c)(2)(B)(ii)(II) of the Act, we finalized the policy to start by calculating the national GPCIs as if the localities that were in place prior to CY 2017 are still applicable nationwide; then, for the purposes of payment in California, we override the GPCI values with the values that are applicable for California consistent with the requirements of section 1848(e)(6) of the Act. This approach is consistent with the implementation of the GPCI floor provisions that have previously been implemented—that is, as an after-the-fact adjustment that is implemented for purposes of payment after both the GPCIs and PFS budget neutrality have already been calculated.

Additionally, section 1848(e)(1)(C) of the Act requires that, if more than 1 year has elapsed since the date of the last previous GPCI adjustment, the adjustment to be applied in the first year of the next adjustment shall be $\frac{1}{2}$ of the adjustment that otherwise would be made. However, since section 1848(e)(6)(B) of the Act provides for a gradual phase in of the GPCI values under the new MSA-based locality structure for California, specifically in one-sixth increments over 6 years, if we were to also apply the requirement to phase in $\frac{1}{2}$ of the adjustment in year 1 of the GPCI update then the first year increment would effectively be $\frac{1}{12}$.

Therefore, in CY 2017, we finalized a policy that the requirement at section 1848(e)(1)(C) of the Act to phase in 1/2 of the adjustment in year 1 of the GPCI update would not apply to counties that were previously in the rest-of-state or locality 3 and are now in MSAs that are subject to the blended phase-in as described above in this section. We reiterate that this is only applicable through CY 2021 since, beginning in CY 2022, the GPCI values for such areas in an MSA would be fully based on the values calculated under the new MSA-based locality structure for California. For a comprehensive discussion of this provision, transition areas, and operational considerations, we refer readers to the CY 2017 PFS final rule (81 FR 80265 through 80268).

h. Refinements to the GPCI Methodology

In the process of calculating GPCIs for the purposes of this final rule, we identified two technical refinements to the methodology that yield improvements over the current method; these refinements are applicable to the work GPCI and the employee wage index and purchased services index components of the PE GPCI. We proposed to weight by total employment when computing county median wages for each occupation code which addresses the fact that the occupation wage can vary by industry within a county. Additionally, we proposed to use a weighted average when calculating the final county-level wage index; this removes the possibility that a county index would imply a wage of 0 for any occupation group not present in the county's data. These methodological refinements yield improved mathematical precision. Additional information on the GPCI methodology and the refinements are available in the final report, "Final Report for the CY 2020 Update of GPCIs and MP RVUs for the Medicare PFS" on our website located under the supporting documents section of the CY 2020 PFS final rule at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/index.html>.

i. Proposed GPCI Update Summary

As explained above in the Background section above in this section, the periodic review and adjustment of GPCIs is mandated by section 1848(e)(1)(C) of the Act. At each update, the GPCIs are published in the PFS proposed rule to provide an opportunity for public comment and further revisions in response to comments prior to implementation. The

CY 2020 updated GPCIs for the first and second year of the 2-year phase-in, along with the GAFs, are displayed in Addenda D and E to this final rule available on our website under the supporting documents section of the CY 2020 PFS final rule web page at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/index.html>.

The following is a summary of the comments we received on the GPCI proposals and our responses.

Comment: A few commenters expressed concern over the expiring work GPCI floor of 1.0. Some of the commenters stated an objection to any proposals that could have a negative impact on rural areas such as the expiration of the work GPCI floor and stated that the GPCIs needs to account for the unique practice needs of rural providers.

Response: The 1.0 work GPCI floor is established by statute and expires on December 31, 2019. We do not have the authority to extend the 1.0 work GPCI floor beyond December 31, 2019. We note that 34 states have a statewide payment locality, which means that physicians, whether in urban or rural areas, receive the same geographic adjustment thus reducing rural/urban payment differentials within a state.

Comment: A few commenters expressed support for the elimination of all GAFs under the PFS, except those designed to achieve a specific public policy goal, such as to encourage physicians to practice in underserved areas. The commenters stated that GPCIs tend to favor urban localities over their rural counterparts and works at cross purposes to the health professional shortage area (HPSA) bonus and other incentives intended to encourage and support rural physicians. The commenters also stated that rural beneficiaries would be better served if the GPCIs were eliminated from the PFS so that the HPSA bonus and other incentives are not undermined in their efforts to sustain the rural physician workforce needed to care for those beneficiaries.

Response: As previously discussed, section 1848(e)(1)(A) of the Act requires us to develop separate GPCIs to measure resource cost differences among localities compared to the national average for each of the three GPCI components, and section 1848(e)(1)(C) of the Act requires us to review and, if necessary, adjust the GPCIs at least every 3 years; and based on new data GPCI values may increase or decrease. Additionally, as noted above, 34 states have a statewide locality, thus reducing

rural/urban payment differentials within a state.

Comment: One commenter stated that CMS uses salary data for individuals with 5 or more years of college, and should instead evaluate the feasibility of using salary data only from individuals with graduate degrees in the work GPCI calculations. The commenter also stated that CMS should also consider that physicians invest a portion of their compensation in the practice and that portion should not be counted as salary.

Response: We note that physicians are not one of the seven occupation groups used in the work GPCI calculation; therefore, we are unclear about the commenter's assertion that investments of a portion of a physician's salary back into the practice should not be counted as salary. As described above, and consistent with our longstanding practice, a set of occupation groups representing a variety of professionals are used in the calculation. We note that the proxy occupations currently used represent highly educated professional occupation categories, and therefore, we believe we are already including salary data for individuals with advanced degrees.

Comment: One commenter stated concern that the work GPCI does not utilize actual physician wage data, and states that CMS' statement that including physician wage data in calculating the work GPCI would potentially introduce some circularity to the adjustment since Medicare payments typically contribute to physician wages is flawed. The commenter stated that in the era of increasing physician employment, more physicians receive a salary dependent upon local market conditions and not the portion of their patient panel on Medicare. The commenter also stated that two of the proxy professional wage categories—pharmacists, and registered nurses—are professions whose wages are also comprised, in part, of income gained from participation in the Medicare program.

Response: We note that we have long maintained that including physicians' wages in the physician work GPCI would, in effect make the physician work GPCI to some extent dependent upon Medicare payments which in turn are impacted by the indices. We do not dispute the assertion that local market conditions may also play a role in determination of a physician's salary; however, we do not believe that mitigates the potential for circularity and maintain that, still, Medicare payment is a significant determinant of physician's earnings. We also recognize that the seven proxy professional wage

categories span several different industries, including pharmacists, and registered nurses which demonstrates that the healthcare industry is represented in those proxy wage categories; however, physicians in particular are not included in those categories as previously described. We continue to believe in the majority of instances, the earnings of physicians will vary among areas to the same degree that the earnings of other professionals across an array of industries vary. We reiterate that the work GPCI is not an absolute measure of physician earnings, rather it is a measure of the relative wage differences for each locality as compared to the national average. Additionally, the work GPCI reflects only one quarter of those relative wage differences consistent with the statutory requirement as discussed previously in this section.

Comment: A few commenters stated that CMS should re-evaluate existing databases to find or develop a nationwide measure of commercial office rents for use in calculating PE GPICs. One commenter stated that CMS should either collect true medical office expense data or alternatively use data sources available to federal agencies such as office expense data from the Federally Qualified Health Center Network.

Response: We appreciate the commenter's feedback. We note that our efforts are ongoing to identify a publicly-available, robust, nationally representative commercial rent data source that could be made available to CMS for this purpose. Further, we welcome opportunities to discuss such data sources with stakeholders and to incorporate such data, as appropriate in the GPCI calculation process, through our standard annual rulemaking process.

Comment: One commenter expressed support for the proposed methodological refinements and stated that it could yield improvements that would be beneficial to all fields of medicine.

Response: We thank the commenter for the support of our proposed methodological refinements.

Comment: A few commenters stated that the proposed refinement to the weighting of the physician work, employee wage, and purchased services indices results in inconsistent comparisons of occupational wages from one county to the next, because industry wages within an occupational group will vary from one county to the next based on employment. The commenters recommended using the previous methodology and also stated

that for counties with zero inputs that we use inputs from MSAs as is done for the rent index or use the national average as used in the previous update.

Response: The use of employment weights better captures variation in median wages themselves, which is exactly what the indices are meant to reflect. As the commenter indicated, the unweighted approach captures variation in wages reported by category in an index-like manner. This is undesirable both substantively and mathematically, since it makes the GPICs an index based on an index rather than on the underlying data of interest. We have reviewed the process for developing county-level median wages as described in the proposed rule, and continue to believe that the use of employment weights, as we proposed, is an improvement over the use of unweighted values as requested by the commenter. We intend to continue considering how measures are weighted and summarized throughout the GPCI development process and will invite public comment on any additional potential improvements we identify through future rulemaking.

Comment: A few commenters stated that they find it challenging to extract and collate the publicly-available BLS OES data (available from the BLS website), that are used for the work and PE GPICs in a manner that enables them to reproduce the data sets used in the work GPCI and the employee wages, and purchased services components of the PE GPCI; the commenters stated that CMS should provide more detailed information in the interest of transparency.

Response: We note that we provide web links to the publicly-available data sources used in this GPCI update, the methodological parameters, as well as an overview of how we develop each GPCI component in the final report for the CY 2020 Update of GPICs and MP RVUs for the Medicare PFS. This practice is consistent with previous updates. However, in consideration of the commenters' concerns that navigating the publicly-available BLS OES data on the BLS website is cumbersome, we have included more detailed steps in the aforementioned report to further assist interested parties in navigating these data.

Comment: One commenter stated that the GPICs in Hawaii do not account for the unique costs of providing medical services in Hawaii and that this will lead to an accelerating shortage of health care providers across the state of Hawaii. The commenter stated that Hawaii's unique geography makes providing care more expensive and that

the cost of living ranks amongst the highest in the nation, and the data used by CMS do not reflect the cost of living. The commenter stated that it disputes the assertion that the equipment, supplies, and miscellaneous expenses component of the PE GPCI do not vary by geographic area, and therefore, do not require updating. The commenter stated that the high cost of shipping equipment plays a major part in the high cost of healthcare in Hawaii and the PEs should reflect that additional cost that exists in Hawaii and not in the mainland United States. The commenter stated that the 1.5 work GPCI floor for Alaska, and the 1.0 PE GPCI floor for the frontier states should serve as a basis for reevaluating the cost of providing medical services in Hawaii. The commenter stated that the GPICs should be adjusted to reflect a factor at least equal to Alaska's work GPCI.

Response: We reiterate that the GPICs, in particular the work GPCI and the PE GPCI to which the commenter refers, are based on nationally-representative and publicly-available wage data from the BLS OES for the work GPCI and employee wage and purchased services components of the PE GPCI, and the Census Bureau's ACS data for the rent index component of the PE GPCI. The GPICs are a measure of relative resource cost differences among localities compared to the national average as informed by the data (not a measure of absolute costs). With regards to the supplies, equipment, and miscellaneous expense cost index component of the PE GPICs, we have stated that we believe there is a national market for these items and there is not significant geographic variation in those costs, and as such we assign a value of 1.00 for this component for each locality, consistent with the national average. Stakeholders have previously indicated that shipping and transportation expenses increase the cost of acquiring medical equipment and supplies in islands relative to the mainland. We have previously attempted to locate data sources specific to geographic variation in shipping costs, and we found no comprehensive national data source for this information, and therefore, we have not been able to quantify variation in costs specific to islands as indicated by the commenter (we refer readers to 78 FR 74387 through 74388 for a detailed discussion of this issue). The commenter did not provide any data to quantify the variation. We would encourage the commenter and other stakeholders to submit data supporting this assertion for consideration in future rulemaking; specifically, we would be

interested in information regarding potential data sources for shipping costs for medical equipment and supplies that are accessible to the public, available on a national basis for both urban and rural areas, and updated regularly. We remind commenters that the work GPCI value for Alaska is not based on the data for that state, instead section 1848(e)(1)(G) of the Act sets a permanent 1.5 work GPCI floor for Alaska. Similarly, section 1848(e)(1) of the Act sets a permanent PE GPCI floor of 1.0 for the frontier states. Additionally, we note that the GAF in Hawaii, displayed in Addendum D, which represents the weighted composite of each PFS localities GPCIs, is increasing in the GPCI update from CY 2019 to years 1 and 2 of the update (CY 2020 and CY 2021).

Comment: One commenter noted that the MP GPCIs changed more significantly than other GPCIs, but also acknowledged that MP accounts for a small share of average total payments so these swings generally translate into modest payment changes. The commenter urged CMS to give consideration to comments from state medical associations and other organizations representing physicians who practice in localities facing reductions to ensure that the data driving reductions are accurate.

Response: We note that larger changes in MP GPCI values in an update year are not unprecedented, and the commenter has correctly characterized that changes in MP will equate to minimal changes in payment because MP represents a small share of average total payments. As discussed in section ILC of this final rule, there were several proposed methodological refinements in the development of the MP premium data which underlies the MP risk factors used in determining both MP RVUs and MP GPCIs which has also contributed to some of the changes; we note that not all of those proposed methodological refinements were finalized for CY 2020, and the final MP GPCIs in Addendum E of this final rule are reflective of that.

We emphasize that we do give consideration to the public comments that we receive. We note that only a few comments were received with regards to the GPCI proposals, though during the process of developing the CY 2020 final rule GPCIs, which includes reviewing the underlying data (which are obtained from publicly-available sources as previously discussed) and reviewing our programming, we did observe the following issue. The work, PE, and MP GPCIs are based on the 2017 utilization data as described in the final report for the CY 2020 Update of GPCIs and MP

RVUs for the Medicare PFS. These data became available after the CY 2020 PFS proposed rule analytic programs had been written for these measures, but for the purposes of developing the analytic programs the CY 2016 utilization data were used as a placeholder. During the final rule development we realized an oversight whereby the 2016 utilization data had not been replaced with the 2017 utilization data for the work and PE GPCIs, though we note that for the MP GPCI, the 2017 utilization data were being used. We have resolved this issue for the final rule and all 3 GPCI components reflect the updated 2017 utilization data as described in the aforementioned report. We note that utilization data are highly correlated year to year so the effect of this change on final GPCI values was quite modest; specifically, the updated utilization data had virtually no effect on the resulting work, PE, and MP GPCIs and the GAFs. Outside of California (see below for a discussion regarding California), the correlation coefficient between each of the three GPCIs and the GAF in the proposed rule, and their corresponding values in the final rule is 0.999.

Comment: A few commenters expressed concern with regards to the county rent indices delineated in the county-level data public use file whereby they noted consistent discrepancies in New England states as compared to the rest of the country. The commenters stated that before finalizing the PE GPCIs, CMS should review the indices to ensure that the relative differences in the indices accurately reflect the relative differences in rents from the source data file. One of the commenters indicated that this issue is not observed in any areas outside of New England.

Response: We note that during the review of the underlying data and analytic programs for the final rule, we identified an issue with the data in New England (Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut) where the raw data values were defined at sub-county areas in New England, but were not summarized to the county-level in the development of the proposed CY 2020 GPCI values. This led to distorted office rent index values for the six states in New England, which in turn affected the proposed PE GPCIs in those states. The CY 2020 PFS final rule office rent index that underlies the PE GPCI has been corrected so that the input data element is now summarized at the county-level before being used to develop the index. Similar to the aforementioned update to the utilization data, the corrected mapping of raw data values in New

England as described above had virtually no effect on the resulting work, PE, and MP GPCIs and the GAFs. Outside of California (see below for a discussion regarding California), the correlation coefficient between each of the three GPCIs and the GAF in the proposed rule, and their corresponding values in the final rule is 0.999.

Comment: One commenter expressed concern with the implementation of the GPCI requirements in California consistent with section 1848(e)(6) of the Act which was implemented in the CY 2017 PFS final rule (81 FR 80261 through 80270). The commenter requested that CMS remedy any errors in the GPCI values. Specifically, the commenter indicated that CMS did not accurately implement the California MSA-based structure in the CY 2020 PFS proposed rule consistent with the methodology finalized in CY 2017 based on the requirements of the statute. The commenter specifically highlighted issues with the GPCIs for the San Francisco-Oakland-Hayward localities (localities 05, 06, 07, and 53); the San Jose-Sunnyvale-Santa Clara localities (localities 09, and 65); and the Los Angeles-Long Beach-Anaheim localities (localities 26, and 18). The commenter provided their analysis with their commenter letter, and stated that based on their findings, the proposed GPCIs for the nine counties contained in the eight aforementioned localities are inaccurate. The commenter also requested that CMS provide the traditional source data for the PE rent and wage indices or the relative value units (RVUs) by county that have been published in the past. Aside from the issues with these eight localities as described above, the commenter indicated that for the remaining California localities, they support and agree with the proposed GPCIs and commend CMS for accurately completing the difficult calculations as required by statute.

Response: We appreciate the analysis provided by the commenter with regards to the eight aforementioned localities and thank the commenter for bringing this to our attention. We agree with the commenter that there were issues with the calculation of the GPCI values reflected in the CY 2020 PFS proposed rule for California. In the programming, we inadvertently used the 32 MSA-based localities for which current GPCIs are defined to account for different treatment of some counties within MSAs when creating the new GPCIs, as opposed to using the 27 MSA-based localities to determine the new MSA-based payment area GPCI amounts. Additionally, we identified a

sequencing issue in our programming that led to issues in establishing the transition values and applying the hold harmless provision. We apologize for the confusion caused by these issues and have resolved these programming issues and recalculated the California GPCIs. The final CY 2020 GPCI values in California reflect the transition and hold harmless provisions executed in the proper order based on the requirements of the law. In summary, in California the issue was the level of aggregation used to create the proposed rule values, which erroneously resulted in different proposed rule values for counties within payment localities where there should not be any differences. Correcting this, along with other changes in the final rule relative to the proposed rule, led to GAFs that are higher in all but three of the 32 payment localities in California. In those three, the GAF is lower because it is now correctly equal among non-transition counties within the new MSA-based payment areas; these three counties had higher values when erroneously calculated as individual payment localities in the proposed rule than they have when correctly averaged within the MSA for the final rule GPCIs. The final rule GAFs for these three areas are lower than those published in the proposed rule by 0.1 percent in locality 26 (Los Angeles-Long Beach-Anaheim (Orange cnty)), 1.4 percent in locality 05 (San Francisco-Oakland-Hayward (San Francisco cnty)), and 1.8 percent in locality 06 (San Francisco-Oakland-Hayward (San Mateo cnty)), but all three localities have CY 2020 PFS final rule GAFs that are higher than their current CY 2019 values. In the other 29 California payment localities, the increase in final rule GAFs relative to the proposed rule values ranges from 0.5 percent to 6.2 percent, with 13 areas experiencing an increase of 1.2 percent.

Additionally, we note that we have provided a county-level GPCI data file as one of the GPCI public use files in the downloads section of the CY 2020 PFS final rule on the CMS website, that delineates the requested source data, as well as the RVUs by county, consistent with what has been published in the past. We reiterate that the county-level data file also reflects the correction to the oversight in the proposed rule whereby we inadvertently used the 2016 utilization data for the work and PE GPCIs (though we correctly used the 2017 utilization data for the MP GPCIs) as previously discussed.

Comment: One commenter stated that for CY 2020 in California there should be 29 distinct fee schedule areas and not 32 fee schedule areas as finalized when

this provision was implemented in CY 2017. The commenter stated that some of the distinct fee schedule areas that were used during the period between CY 2017 and CY 2018 are no longer necessary. The commenter stated that Orange and Los Angeles counties, which are both in the Los-Angeles-Long Beach-Anaheim MSA, should have the same GPCI values and be one locality number instead of two. Similarly, Alameda, Contra Cosa, San Francisco and San Mateo counties (all in the San Francisco-Oakland-Hayward MSA) should be identified by one locality number instead of three, and the San Francisco-Oakland-Hayward (Marin cnty) locality would remain its own distinct locality number.

Response: There are 27 MSAs in California, and when CMS implemented the MSA-based locality structure for California as discussed above, for operational considerations, we finalized 32 unique MSA-based locality numbers. We did not propose to make changes to the number of unique locality numbers for California for CY 2020. Since two of the MSAs that required multiple unique locality numbers (San Francisco-Oakland-Hayward, and San Jose-Sunnyvale-Santa Clara) to address operational considerations as described in the CY 2017 PFS final rule (81 FR 80265 through 80268) contain both transition and non-transition counties, we would still need to maintain some unique locality numbers. We remind the commenter that though starting in CY 2022, the applicable GPCIs for counties in transition areas will be calculated solely under the MSA-based locality structure as described above, the statutorily-required hold-harmless provision for counties in transition areas is permanent.

With regards to the Los Angeles-Long Beach-Anaheim MSA, which contains 2 counties (across two unique locality numbers: 18 and 26) that are not transition areas, we acknowledge that the Los Angeles-Long Beach-Anaheim MSA only needed separate unique locality numbers, for payment purposes, in year 1 (CY 2017) of the implementation of the MSA-based structure as neither of the counties in the MSA (Orange nor Los Angeles counties) are transition counties (and therefore, are not subject to aforementioned the one-sixth incremental phase-in nor hold-harmless provision). We will consider the feasibility of assigning one locality number for that MSA in future rulemaking since there will be no difference in the GPCI values, for payment purposes, for those localities going forward. Similarly, the San

Francisco-Oakland-Hayward MSA contains four counties (across three unique locality numbers: 05, 06, and 07) that are not transition areas and will receive the same GPCI values, for payment purposes, going forward (San Francisco, San Mateo, Alameda, and Contra Costa counties). As such, we will consider the feasibility of collapsing those three unique locality numbers and assigning one unique locality number in future rulemaking. If we determine that to be operationally feasible, we would propose any changes in future rulemaking. We note that it would ultimately change the number of distinct fee schedule areas needed, for payment purposes, in California from 32 to 29 as suggested by the commenter.

Additionally, during the development of the CY 2020 PFS final rule GPCIs, we identified typographical errors in the naming conventions of four of the California MSA-based localities in Addendum D and Addendum E: Locality 05-San Francisco-Oakland-Hayward (San Francisco cnty) was listed as San Francisco; locality 06-San Francisco-Oakland-Hayward (San Mateo cnty) was listed as San Mateo; locality 07-San Francisco-Oakland-Hayward (Alameda/Contra Costa cnty) was listed as Oakland/Berkeley; and San Jose-Sunnyvale-Santa Clara (Santa Clara cnty) was listed as Santa Clara. This display issue has been corrected in Addendum D and Addendum E for the final rule.

Comment: One commenter stated that it believes large cuts to rural and rest-of-state areas should be avoided or minimized, but locality boundaries with large payment differences should not be in the middle of urban areas, because they create payment cliffs where payment can change if an office is moved across a street or down a block. The commenter stated that CMS should create locality definitions that are not constrained by county boundaries, and advocated implementing locality definitions based on Metropolitan Statistical Areas.

Response: We appreciate the suggestions for revisions to the PFS locality structure; however, we did not propose any changes to the PFS locality structure and decline to do so at this time. Further, we clarify that just as the localities under the locality structure used in the PFS are comprised of one or more constituent counties, so are Metropolitan Statistical Areas. Therefore, the concept of a payment cliff between neighboring counties as described by the commenter would not necessarily be mitigated by a change from PFS fee schedule areas to Metropolitan Fee Schedule Areas.

After consideration of the comments, we are finalizing the CY 2020 GPCI update, and the methodological refinements as proposed. The final GPCIs and summarized GAFs in Addenda D and E to this final rule also reflect the correction of the underlying programming issues described above.

E. Potentially Misvalued Services Under the PFS

1. Background

Section 1848(c)(2)(B) of the Act directs the Secretary to conduct a periodic review, not less often than every 5 years, of the RVUs established under the PFS. Section 1848(c)(2)(K) of the Act requires the Secretary to periodically identify potentially misvalued services using certain criteria and to review and make appropriate adjustments to the relative values for those services. Section 1848(c)(2)(L) of the Act also requires the Secretary to develop a process to validate the RVUs of certain potentially misvalued codes under the PFS, using the same criteria used to identify potentially misvalued codes, and to make appropriate adjustments.

As discussed in section II.N. of this final rule, Valuation of Specific Codes, each year we develop appropriate adjustments to the RVUs taking into account recommendations provided by the RUC, MedPAC, and other stakeholders. For many years, the RUC has provided us with recommendations on the appropriate relative values for new, revised, and potentially misvalued PFS services. We review these recommendations on a code-by-code basis and consider these recommendations in conjunction with analyses of other data, such as claims data, to inform the decision-making process as authorized by law. We may also consider analyses of work time, work RVUs, or direct PE inputs using other data sources, such as Department of Veteran Affairs (VA), National Surgical Quality Improvement Program (NSQIP), the Society for Thoracic Surgeons (STS), and the Merit-based Incentive Payment System (MIPS) data. In addition to considering the most recently available data, we assess the results of physician surveys and specialty recommendations submitted to us by the RUC for our review. We also consider information provided by other stakeholders. We conduct a review to assess the appropriate RVUs in the context of contemporary medical practice. We note that section 1848(c)(2)(A)(ii) of the Act authorizes the use of extrapolation and other techniques to determine the RVUs for

physicians' services for which specific data are not available and requires us to take into account the results of consultations with organizations representing physicians who provide the services. In accordance with section 1848(c) of the Act, we determine and make appropriate adjustments to the RVUs.

In its March 2006 Report to the Congress (http://www.medpac.gov/docs/default-source/reports/Mar06_Ch03.pdf?sfvrsn=0), MedPAC discussed the importance of appropriately valuing physicians' services, noting that misvalued services can distort the market for physicians' services, as well as for other health care services that physicians order, such as hospital services. In that same report, MedPAC postulated that physicians' services under the PFS can become misvalued over time. MedPAC stated, "When a new service is added to the physician fee schedule, it may be assigned a relatively high value because of the time, technical skill, and psychological stress that are often required to furnish that service. Over time, the work required for certain services would be expected to decline as physicians become more familiar with the service and more efficient in furnishing it." We believe services can also become overvalued when PE declines. This can happen when the costs of equipment and supplies fall, or when equipment is used more frequently than is estimated in the PE methodology, reducing its cost per use. Likewise, services can become undervalued when physician work increases or PE rises.

As MedPAC noted in its March 2009 Report to Congress (<http://www.medpac.gov/docs/default-source/reports/march-2009-report-to-congress-medicare-payment-policy.pdf>), in the intervening years since MedPAC made the initial recommendations, CMS and the RUC have taken several steps to improve the review process. Also, section 1848(c)(2)(K)(ii) of the Act augments our efforts by directing the Secretary to specifically examine, as determined appropriate, potentially misvalued services in the following categories:

- Codes that have experienced the fastest growth.
- Codes that have experienced substantial changes in PE.
- Codes that describe new technologies or services within an appropriate time period (such as 3 years) after the relative values are initially established for such codes.
- Codes which are multiple codes that are frequently billed in conjunction with furnishing a single service.

- Codes with low relative values, particularly those that are often billed multiple times for a single treatment.
- Codes that have not been subject to review since implementation of the fee schedule.
- Codes that account for the majority of spending under the PFS.
- Codes for services that have experienced a substantial change in the hospital length of stay or procedure time.
- Codes for which there may be a change in the typical site of service since the code was last valued.
- Codes for which there is a significant difference in payment for the same service between different sites of service.
- Codes for which there may be anomalies in relative values within a family of codes.
- Codes for services where there may be efficiencies when a service is furnished at the same time as other services.
- Codes with high intraservice work per unit of time.
- Codes with high PE RVUs.
- Codes with high cost supplies.
- Codes as determined appropriate by the Secretary.

Section 1848(c)(2)(K)(iii) of the Act also specifies that the Secretary may use existing processes to receive recommendations on the review and appropriate adjustment of potentially misvalued services. In addition, the Secretary may conduct surveys, other data collection activities, studies, or other analyses, as the Secretary determines to be appropriate, to facilitate the review and appropriate adjustment of potentially misvalued services. This section also authorizes the use of analytic contractors to identify and analyze potentially misvalued codes, conduct surveys or collect data, and make recommendations on the review and appropriate adjustment of potentially misvalued services. Additionally, this section provides that the Secretary may coordinate the review and adjustment of any RVU with the periodic review described in section 1848(c)(2)(B) of the Act. Section 1848(c)(2)(K)(iii)(V) of the Act specifies that the Secretary may make appropriate coding revisions (including using existing processes for consideration of coding changes) that may include consolidation of individual services into bundled codes for payment under the PFS.

2. Progress in Identifying and Reviewing Potentially Misvalued Codes

To fulfill our statutory mandate, we have identified and reviewed numerous

potentially misvalued codes as specified in section 1848(c)(2)(K)(ii) of the Act, and we intend to continue our work examining potentially misvalued codes in these areas over the upcoming years. As part of our current process, we identify potentially misvalued codes for review, and request recommendations from the RUC and other public commenters on revised work RVUs and direct PE inputs for those codes. The RUC, through its own processes, also identifies potentially misvalued codes for review. Through our public nomination process for potentially misvalued codes established in the CY 2012 PFS final rule with comment period, other individuals and stakeholder groups submit nominations for review of potentially misvalued codes as well. Individuals and stakeholder groups may submit codes for review under the potentially misvalued codes initiative to CMS in one of two ways. Nominations may be submitted to CMS via email or through postal mail. Email submissions should be sent to the CMS mailbox MedicarePhysicianFeeSchedule@cms.hhs.gov, with the phrase “Potentially Misvalued Codes” in the subject line. Physical letters for nominations should be sent via the U.S. Postal Service to the Centers for Medicare and Medicaid Service, Mail Stop: C4–01–26, 7500 Security Blvd., Baltimore, Maryland 21244. Envelopes containing the nomination letters must be labeled “Attention: Division of Practitioner Services, Potentially Misvalued Codes”. Nominations for consideration in our next annual rule cycle should be received by our February 10th deadline. Since CY 2009, as a part of the annual potentially misvalued code review and Five-Year Review process, we have reviewed over 1,700 potentially misvalued codes to refine work RVUs and direct PE inputs. We have assigned appropriate work RVUs and direct PE inputs for these services as a result of these reviews. A more detailed discussion of the extensive prior reviews of potentially misvalued codes is included in the Medicare Program; Payment Policies Under the Physician Fee Schedule, Five-Year Review of Work Relative Value Units, Clinical Laboratory Fee Schedule: Signature on Requisition, and Other Revisions to Part B for CY 2012; Final Rule (76 FR 73052 through 73055) (hereinafter referred to as the “CY 2012 PFS final rule with comment period”). In the CY 2012 PFS final rule with comment period (76 FR 73055 through 73958), we finalized our policy to consolidate the review of physician

work and PE at the same time, and established a process for the annual public nomination of potentially misvalued services.

In the Medicare Program; Revisions to Payment Policies Under the Physician Fee Schedule, DME Face-to-Face Encounters, Elimination of the Requirement for Termination of Non-Random Prepayment Complex Medical Review and Other Revisions to Part B for CY 2013 (77 FR 68892) (hereinafter referred to as the “CY 2013 PFS final rule with comment period”), we built upon the work we began in CY 2009 to review potentially misvalued codes that have not been reviewed since the implementation of the PFS (so-called “Harvard-valued codes”). In the Medicare Program; Revisions to Payment Policies Under the Physician Fee Schedule and Other Revisions to Part B for CY 2009; and Revisions to the Amendment of the E-Prescribing Exemption for Computer Generated Facsimile Transmissions; Proposed Rule (73 FR 38589) (hereinafter referred to as the “CY 2009 PFS proposed rule”), we requested recommendations from the RUC to aid in our review of Harvard-valued codes that had not yet been reviewed, focusing first on high-volume, low intensity codes. In the fourth Five-Year Review (76 FR 32410), we requested recommendations from the RUC to aid in our review of Harvard-valued codes with annual utilization of greater than 30,000 services. In the CY 2013 PFS final rule with comment period, we identified specific Harvard-valued services with annual allowed charges that total at least \$10,000,000 as potentially misvalued. In addition to the Harvard-valued codes, in the CY 2013 PFS final rule with comment period we finalized for review a list of potentially misvalued codes that have stand-alone PE (codes with physician work and no listed work time and codes with no physician work that have listed work time).

In the Medicare Program; Revisions to Payment Policies under the Physician Fee Schedule and Other Revisions to Part B for CY 2016 final rule with comment period (80 FR 70886) (hereinafter referred to as the “CY 2016 PFS final rule with comment period”), we finalized for review a list of potentially misvalued services, which included eight codes in the neurostimulators analysis-programming family (CPT codes 95970–95982). We also finalized as potentially misvalued 103 codes identified through our screen of high expenditure services across specialties.

In the Medicare Program; Revisions to Payment Policies under the Physician

Fee Schedule and Other Revisions to Part B for CY 2017; Medicare Advantage Bid Pricing Data Release; Medicare Advantage and Part D Medical Loss Ratio Data Release; Medicare Advantage Provider Network Requirements; Expansion of Medicare Diabetes Prevention Program Model; Medicare Shared Savings Program Requirements final rule (81 FR 80170) (hereinafter referred to as the “CY 2017 PFS final rule”), we finalized for review a list of potentially misvalued services, which included eight codes in the end-stage renal disease home dialysis family (CPT codes 90963–90970). We also finalized as potentially misvalued 19 codes identified through our screen for 0-day global services that are typically billed with an evaluation and management (E/M) service with modifier 25.

In the CY 2018 PFS final rule, we finalized arthrodesis of sacroiliac joint (CPT code 27279) as potentially misvalued. Through the use of comment solicitations with regard to specific codes, we also examined the valuations of other services, in addition to, new potentially misvalued code screens (82 FR 53017 through 53018).

3. CY 2020 Identification and Review of Potentially Misvalued Services

In the CY 2012 PFS final rule with comment period (76 FR 73058), we finalized a process for the public to nominate potentially misvalued codes. In the CY 2015 PFS final rule with comment period (79 FR 67606 through 67608), we modified this process whereby the public and stakeholders may nominate potentially misvalued codes for review by submitting the code with supporting documentation by February 10th of each year. Supporting documentation for codes nominated for the annual review of potentially misvalued codes may include the following:

- Documentation in peer reviewed medical literature or other reliable data that demonstrate changes in physician work due to one or more of the following: Technique, knowledge and technology, patient population, site-of-service, length of hospital stay, and work time.
- An anomalous relationship between the code being proposed for review and other codes.
- Evidence that technology has changed physician work.
- Analysis of other data on time and effort measures, such as operating room logs or national and other representative databases.
- Evidence that incorrect assumptions were made in the previous valuation of the service, such as a

misleading vignette, survey, or flawed crosswalk assumptions in a previous evaluation.

- Prices for certain high cost supplies or other direct PE inputs that are used to determine PE RVUs are inaccurate and do not reflect current information.
- Analyses of work time, work RVU, or direct PE inputs using other data sources (for example, VA, NSQIP, the STS National Database, and the MIPS data).
- National surveys of work time and intensity from professional and management societies and organizations, such as hospital associations.

We evaluate the supporting documentation submitted with the nominated codes and assess whether the nominated codes appear to be potentially misvalued codes appropriate for review under the annual process. In the following year's PFS proposed rule, we publish the list of nominated codes and indicate for each nominated code whether we agree with its inclusion as a potentially misvalued code. The public has the opportunity to comment on these and all other proposed potentially misvalued codes. In that year's final rule, we finalize our list of potentially misvalued codes.

a. Public Nominations

We received three submissions that nominated codes for review under the potentially misvalued code initiative, prior to our February 10, 2019 deadline. In addition to three public nominations, CMS also nominated one additional code for review.

One commenter requested that CMS consider CPT code 10005 (*Fine needle aspiration biopsy, including ultrasound guidance; first lesion*) and CPT code 10021 (*Fine needle aspiration biopsy, without imaging guidance; first lesion*) for nomination as potentially misvalued. We note that these two CPT codes were recently reviewed within a family of 13 similar codes. Our review of these codes and our rationale for finalizing the current values are discussed extensively in the CY 2019 PFS final rule (83 FR 59517). For CPT code 10021, the RUC recommended a 32 percent reduction from its previous physician time and a 5 percent reduction in the work RVU. The commenter disagreed with this change and stated that there was a change in intensity of the procedure now as compared to what it was in 1995 when this code was last evaluated. The commenter also stated that there was a change in intensity of the work performed due to use of more complicated equipment, more stringent

specimen sampling that allow for extensive examination of smaller and deeper lesions within the body. The commenter disagreed with the CMS' crosswalked CPT code 36440 (*Push blood transfusion, patient 2 years or younger*) and presented CPT codes 40490 (*Biopsy of lip*) and 95865 (*Needle measurement and recording of electrical activity of muscles of voice box*) as more appropriate crosswalks.

Another commenter requested that CMS consider HCPCS code G0166 (*External counterpulsation, per treatment session*) as potentially misvalued. This code was reviewed for the CY 2019 PFS final rule (83 FR 59578), and the work RVU and direct PE inputs as recommended by the AMA RUC were finalized by CMS. We finalized the valuation of this code with no refinements. However, the commenter noted that the PE inputs that were considered for this code did not fully reflect the total resources required to deliver the service. We stated we would review the commenter's submission of additional new data and public comments received in combination with what was previously presented in the CY 2019 PFS final rule.

CMS nominated CPT code 76377 (*3D rendering with interpretation and reporting of computed tomography, magnetic resonance imaging, ultrasound, or other tomographic modality with image postprocessing under concurrent supervision; requiring image postprocessing on an independent workstation*) as potentially misvalued. CPT code 76376 (*3D rendering with interpretation and reporting of computed tomography, magnetic resonance imaging, ultrasound, or other tomographic modality with image postprocessing under concurrent supervision; not requiring image postprocessing on an independent workstation*) was reviewed by the AMA RUC at the April 2018 RUC meeting. However, CPT code 76377, which is very similar to CPT code 76376, was not reviewed, and is likely now misvalued, in light of the similarities between the two codes. The specialty societies noted that the two codes are different because they are utilized by different patient populations (as evidenced by the ICD-10 diagnoses); however, we view both codes to be similar enough that CPT code 76377 should be reviewed to maintain relativity in the code family.

We have received and reviewed all public comments to all these codes that were nominated as potentially misvalued. Below, we present the

summarizations of all these public comments.

Comment: One commenter provided information to CMS in which they stated that the work involved in furnishing services represented by the office/outpatient E/M code set (CPT codes 99201–99215) has changed sufficiently to warrant reevaluation. Specifically, the commenter stated that these codes have not been reviewed in over 12 years and in that time have suffered passive devaluation as more and more procedures and other services have been added to the CPT code set, which are subsequently valued in a budget neutral manner, through notice and comment rulemaking, on the Medicare PFS. The commenter also stated that re-evaluation of these codes is critical to the success of CMS' objective of advancing value-based care through the introduction of Advanced Alternative Payment Models (APMs) as these APMs rely on the underlying E/M codes as the basis for payment or reference price for bundled payments.

Response: We acknowledge the points made by the commenter regarding the valuation of E/M codes for office and outpatient visits. We agreed, in principle, that the existing set of office/outpatient E/M CPT codes may not be correctly valued. In recent years, we have specifically considered how best to update and revalue the E/M codes, which represent a significant proportion of PFS expenditures, and have also engaged in ongoing dialogue with the practitioner community. In the CY 2019 PFS proposed and final rules, in part due to these ongoing stakeholder discussions, we proposed and finalized changes to E/M payment and documentation requirements to implement policy objectives focused on reducing provider documentation burden (83 FR 59625).

As we stated in the proposed rule, concurrently, the CPT Editorial Panel, under similar policy objectives, convened a workgroup and proposed to refine the existing E/M office/outpatient code set. Shortly thereafter, the AMA RUC revalued these services and submitted recommendations to CMS for review. In the CY 2020 PFS proposed rule, we considered the RUC-recommended values for office/outpatient E/M codes in proposing new values for CY 2021. For more detail on our review and consideration of the revalued office/outpatient E/M services please refer to section II.P of this final rule.

Table 16 lists the HCPCS and CPT codes that we proposed as potentially misvalued.

TABLE 16: HCPCS and CPT Codes Proposed as Potentially Misvalued

CPT/HCPCS Code	Short Description
10005	Fna bx w/us gdn 1st les
10021	Fna bx w/o img gdn 1st les
76377	3d render w/intrp postproces
G0166	Extrnl counterpulse, per tx

We received public comments on the HCPCS and CPT codes that we proposed as potentially misvalued. The following is a summary of the comments we received and our responses.

Comment: Several commenters submitted comments about HCPCS code G0166 and claimed that in the CY 2019 PFS final rule, CMS did not have the complete list of inputs for this “Practice Expense only” code, which resulted in an under-valuation of its payment.

Response: We note that the AMA RUC in its comment letter to the proposed rule informed CMS that it would review this service and forward any recommendations to CMS for review. We will review the AMA RUC’s forthcoming recommendations and will consider any refinements to the valuation for this code through our standard rulemaking process for CY 2021.

Comment: Several commenters highlighted the payment reduction to code G0166 in CY 2019 relative to CY 2018 and requested that CMS revert back to the CY 2018 payment. Commenters also noted that the current and reduced payment may endanger continued offering of this service, particularly to beneficiaries with coronary artery disease with angina for whom surgical intervention may not be appropriate and where medications have proved to be ineffective.

Response: We acknowledge the receipt of all comments related to HCPCS code G0166 outlining that it may be inaccurately valued. We have reviewed the information included in the comments received, and look forward to reviewing the AMA RUC recommendations for this service. We will review the AMA RUC’s forthcoming recommendations and will consider any refinements to the valuation for this code through our standard rulemaking process for CY 2021.

We refer readers to section II.B of this final rule for details on the limited updates to the supply and equipment pricing for HCPCS code G0166.

Comment: Several commenters responded to the inclusion of CPT codes 10005 and 10021 on the potentially

misvalued codes list, with the majority urging CMS to revise the CY 2019 finalized RVUs by adopting the higher RUC recommended RVUs.

Response: We appreciate commenters’ perspective on the valuation of CPT codes 10005 and 10021 but refer the commenters to our CY 2019 PFS final rule for our review of the relevant inputs and RUC recommendations for these codes. We have reviewed the comments received, including any additional information in response to our discussion of these codes under the potentially misvalued code initiative. We believe our refinements to the valuations for these services continue to be valid, as no new compelling information has been presented.

Comment: Commenters disagreed with using the crosswalked CPT code 36440 as the reference code for valuing CPT code 10021, even though the physician work times for both codes are very similar. One commenter stated that the previous values for work time (1995) were also based on a crosswalk (CPT codes 88170 and 88171) and not a survey, and therefore, the decrease in work time did not warrant a proportional change in work RVU as the previous times were inaccurate. Also, as discussed in the CY 2019 PFS final rule with comment period (83 FR 59517), commenters stated that the work intensity for both codes are unequal as well their incongruous procedure descriptors, pointing out the fact that CPT codes 36440, 88170, and 88171 are clinically very different to CPT code 10021.

Response: As we have discussed in previous rules, we agree that it is important to use the most recent data available regarding time, and we note that when many years have passed between when time is measured, significant discrepancies can occur. However, we continue to believe that our operating assumption regarding the validity of the existing values as a point of comparison is critical to the integrity of the relative value system as currently constructed. The times currently associated with codes play a very important role in PFS ratesetting, both as points of comparison in establishing

work RVUs and in the allocation of indirect PE RVUs by specialty. If we were to operate under the assumption that previously recommended work times had routinely been overestimated, this would undermine the relativity of the work RVUs on the PFS in general, given the process under which codes are often valued by comparisons to codes with similar times, and it also would undermine the validity of the allocation of indirect PE RVUs to physician specialties across the PFS. Instead, we believe that it is crucial that the code valuation process take place with the understanding that the existing work times used in the PFS ratesetting processes are accurate. We recognize that adjusting work RVUs for changes in time is not always a straightforward process and that the intensity associated with changes in time is not necessarily always linear, which is why we apply various methodologies to identify several potential work values for individual codes. We continue to disagree with commenters’ distinction of different types of physician work times as being better or worse in their measure of validity in comparison to each other, and believe that CPT code 36440 is a good comparable code to CPT code 10021 in physician work and physician work times.

Comment: For CPT code 10021, one commenter disagreed with CMS maintaining the code’s global indicator of “XXX” (global concept does not apply) and recommended a change to “000” (minor surgery/zero day global).

Response: We did change the multiple procedure indicator for CPT code 10021 from a “0” (payment rules do not apply) to a “2” (standard payment adjustments do apply), but as we stated in CY 2019 PFS final rule (83 FR 59520), we do not agree that it would have been more accurate to use codes with a 0-day global period as references for the codes in this family, and the multiple procedure policy continues to apply for CPT code 10021.

In concluding our review of all the comments submitted for the nominated potentially misvalued CPT codes of 10005 and 10021, we do not believe we have received any additional

information to consider in the context of our previous review of these services. Therefore, we are not including CPT codes 10005 and 10021 on our final list of potentially misvalued codes for CY 2020.

Comment: One commenter noted on the CMS nominated CPT code 76377 (which we found to be very similar to CPT code 76376 that was AMA RUC reviewed for CY 2020), that although both code descriptors are similar, they have different clinical indications, different patients, different complexity in the work and require different resources and equipment, and that CPT code 76377 was not identified on any of the normal screens.

Response: CMS' nominated CPT code 76377 as potentially misvalued due to its similarity to CPT code 76376 (*3D rendering with interpretation and reporting of computed tomography, magnetic resonance imaging, ultrasound, or other tomographic modality with image postprocessing under concurrent supervision; not requiring image postprocessing on an independent workstation*), which is reviewed and finalized for 2020. Due to the refinements made to CPT code 76376, CPT code 76377 should be similarly reviewed to resolve the two codes' likely discrepancies. We will consider the valuation of this code in future rulemaking. During this review, we will determine if the clinical indications, the complexity of the work, and the resources that are required, are similar or different for both of these codes.

Comment: We received several comments regarding the AMA RUC's survey and recommended values for the E/M office/outpatient evaluation and management codes (99201–99015) for CY 2021.

Response: We refer readers to section II. P. of this final rule where we discuss these codes in detail.

After consideration of the comments received, in summary, we are including CPT code 76377 and HCPCS code G0166 on our final list of potentially misvalued codes for CY 2020. However, we are not including CPT codes 10005 and 10021 on our final list of potentially misvalued codes for CY 2020.

4. Insertion, Removal, and Removal and Insertion of Implantable Interstitial Glucose Sensor System (Category III CPT codes 0446T, 0447T, and 0448T)

Category III CPT codes 0446T, 0447T, and 0448T describe the services related to the insertion, removal, and removal and insertion of an implantable interstitial glucose sensor from subcutaneous pocket, in a subcutaneous

pocket via incision. The implantable interstitial glucose sensors are part of systems that can allow real-time glucose monitoring, provides glucose trend information, and signal alerts for detection and prediction of episodes of low blood glucose (hypoglycemia) and high blood glucose (hyperglycemia).

Diabetes is the sixth leading cause of death in the United States, and approximately 20 million Americans have diabetes with an estimated 20.9 percent of the senior population age 60 and older being affected. Millions of people have diabetes and do not know it. Left undiagnosed, diabetes can lead to severe complications such as heart disease, stroke, blindness, kidney failure, leg and foot amputations, and death related to pneumonia and flu. Scientific evidence now shows that early detection and treatment of diabetes with diet, physical activity, and new medicines can prevent or delay much of the illness and complications associated with diabetes. As with management of other chronic conditions, we believe innovative technologies that provide improved data to physicians and patients can be important tools in promoting patient-centered care.

The codes that describe the implantation, removal, and removal and implantation of implantable interstitial glucose sensors are currently contractor-priced. Since the publication of the CY 2020 PFS proposed rule, we have become aware that the contractor pricing for these services has contributed to significant confusion in the community with regards to Medicare payment rules for these kinds of monitoring systems. We understand that this confusion has led to inhibited access to these services for Medicare beneficiaries.

Given the immediate needs of Medicare beneficiaries with diabetes, including some who could benefit from these innovative technologies, we are seeking information from stakeholders to ensure proper payment for this important physician's service by establishing national payment rates in future rulemaking.

We are seeking information from stakeholders on the resources involved in furnishing the services described by Category III CPT codes 0446T (*Creation of subcutaneous pocket with insertion of implantable interstitial glucose sensor, including system activation and patient training*), 0447T (*Removal of implantable interstitial glucose sensor from subcutaneous pocket via incision*), and 0448T (*Removal of implantable interstitial glucose sensor with creation of subcutaneous pocket at different*

anatomic site and insertion of new implantable sensor, including system activation). We are specifically seeking recommendations, including the work RVUs, work time, and direct PE inputs, associated with the resources involved in inserting and removing the device, as well as the resource costs of the implantable device and disposable supplies (that is, the supply costs of the implantable device "implantable interstitial glucose sensor", and the smart transmitter).

Under our existing policies, we welcome recommendations on appropriate valuation for these services and any recommendations submitted by February 10, 2020 would be considered for CY 2021 PFS rulemaking.

F. Payment for Medicare Telehealth Services Under Section 1834(m) of the Act

As discussed in this rule and in prior rulemaking, several conditions must be met for Medicare to make payment for telehealth services under the PFS. For further details, see the full discussion of the scope of Medicare telehealth services in the CY 2018 PFS final rule (82 FR 53006) and in 42 CFR 410.78 and 414.65.

1. Adding Services to the List of Medicare Telehealth Services

In the CY 2003 PFS final rule with comment period (67 FR 79988), we established a process for adding services to or deleting services from the list of Medicare telehealth services in accordance with section 1834(m)(4)(F)(ii) of the Act. This process provides the public with an ongoing opportunity to submit requests for adding services, which are then reviewed by us. Under this process, we assign any submitted request to add to the list of telehealth services to one of the following two categories:

- *Category 1:* Services that are similar to professional consultations, office visits, and office psychiatry services that are currently on the list of telehealth services. In reviewing these requests, we look for similarities between the requested and existing telehealth services for the roles of, and interactions among, the beneficiary, the physician (or other practitioner) at the distant site and, if necessary, the telepresenter, a practitioner who is present with the beneficiary in the originating site. We also look for similarities in the telecommunications system used to deliver the service; for example, the use of interactive audio and video equipment.

- *Category 2:* Services that are not similar to those on the current list of

telehealth services. Our review of these requests includes an assessment of whether the service is accurately described by the corresponding code when furnished via telehealth and whether the use of a telecommunications system to furnish the service produces demonstrated clinical benefit to the patient. Submitted evidence should include both a description of relevant clinical studies that demonstrate the service furnished by telehealth to a Medicare beneficiary improves the diagnosis or treatment of an illness or injury or improves the functioning of a malformed body part, including dates and findings, and a list and copies of published peer reviewed articles relevant to the service when furnished via telehealth. Our evidentiary standard of clinical benefit does not include minor or incidental benefits.

Some examples of clinical benefit include the following:

- Ability to diagnose a medical condition in a patient population without access to clinically appropriate in-person diagnostic services.
- Treatment option for a patient population without access to clinically appropriate in-person treatment options.
- Reduced rate of complications.
- Decreased rate of subsequent diagnostic or therapeutic interventions (for example, due to reduced rate of recurrence of the disease process).
- Decreased number of future hospitalizations or physician visits.
- More rapid beneficial resolution of the disease process treatment.
- Decreased pain, bleeding, or other quantifiable symptom.
- Reduced recovery time.

The list of telehealth services, including the additions described later in this section, can be located on the CMS website at <https://www.cms.gov/Medicare/Medicare-General-Information/Telehealth/index.html>.

Historically, requests to add services to the list of Medicare telehealth services had to be submitted and received no later than December 31 of each calendar year to be considered for the next rulemaking cycle. However, beginning in CY 2019 we stated that for CY 2019 and onward, we intend to accept requests through February 10, consistent with the deadline for our receipt of code valuation recommendations from the RUC. For example, to be considered during PFS rulemaking for CY 2021, requests to add services to the list of Medicare telehealth services must be submitted and received by February 10, 2020. Each request to add a service to the list of Medicare telehealth services must

include any supporting documentation the requester wishes us to consider as we review the request. Because we use the annual PFS rulemaking process as the vehicle to make changes to the list of Medicare telehealth services, requesters should be advised that any information submitted as part of a request is subject to public disclosure for this purpose. For more information on submitting a request to add services to the list of Medicare telehealth services, including where to mail these requests, see our website at <https://www.cms.gov/Medicare/Medicare-General-Information/Telehealth/index.html>.

2. Requests To Add Services to the List of Telehealth Services for CY 2020

Under our current policy, we add services to the telehealth list on a Category 1 basis when we determine that they are similar to services on the existing telehealth list for the roles of, and interactions among, the beneficiary, physician (or other practitioner) at the distant site and, if necessary, the telepresenter. As we stated in the CY 2012 PFS final rule with comment period (76 FR 73098), we believe that the Category 1 criteria not only streamline our review process for publicly requested services that fall into this category, but also expedite our ability to identify codes for the telehealth list that resemble those services already on this list.

We did not receive any requests from the public for additions to the Medicare Telehealth list for CY 2020. We believe that the vast majority of services under the PFS that can be appropriately furnished as Medicare telehealth services have already been added to the list.

However, we proposed adding three new HCPCS G codes describing new bundled services for treatment of opioid use disorders in section II.H. of the CY 2020 PFS proposed rule which we noted are sufficiently similar to services currently on the telehealth list to be added on a Category 1 basis. Therefore, we proposed to add the face-to-face portions of the following services to the telehealth list on a Category 1 basis for CY 2020:

- HCPCS code G2086: *Office-based treatment for opioid use disorder, including development of the treatment plan, care coordination, individual therapy and group therapy and counseling; at least 70 minutes in the first calendar month.*
- HCPCS code G2087: *Office-based treatment for opioid use disorder, including care coordination, individual therapy and group therapy and*

counseling; at least 60 minutes in a subsequent calendar month.

- HCPCS code G2088: *Office-based treatment for opioid use disorder, including care coordination, individual therapy and group therapy and counseling; each additional 30 minutes beyond the first 120 minutes (List separately in addition to code for primary procedure).*

We note that in the CY 2020 PFS proposed rule (84 FR 40518), we referred to these services using placeholder codes, HCPCS codes GYYY1, GYYY2, and GYYY3, which are being replaced with the final G codes above. Similar to our addition of the required face-to-face visit component of TCM services to the Medicare Telehealth list in the CY 2014 PFS final rule with comment period (78 FR 74403), since HCPCS codes G2086, G2087, and G2088 include face-to-face psychotherapy services, we believe that the face-to-face portions of these services are sufficiently similar to services currently on the list of Medicare telehealth services for these services to be added under Category 1. Specifically, we believe that the psychotherapy portions of the bundled codes are similar to the psychotherapy codes described by CPT codes 90832 and 90853, which are currently on the Medicare telehealth list. We note that like certain other non-face-to-face PFS services, the other components of HCPCS codes G2086–G2088 describing care coordination are commonly furnished remotely using telecommunications technology, and do not require the patient to be present in-person with the practitioner when they are furnished. As such, we do not need to consider whether the non-face-to-face aspects of HCPCS codes G2086–G2088 are similar to other telehealth services. Were these components of HCPCS codes G2086–G2088 separately billable, they would not need to be on the Medicare telehealth list to be covered and paid in the same way as services delivered without the use of telecommunications technology. We also note that by considering the face-to-face portion of these services to be eligible for telehealth services, the originating site facility fee could be reported, consistent with all other rules, when these services are furnished via telehealth.

As discussed in the CY 2019 PFS final rule (83 FR 59496), we note that section 2001(a) of the SUPPORT Act (Pub. L. 115–271, October 24, 2018) amended section 1834(m) of the Act, adding a new paragraph (7) that removes the geographic limitations for telehealth services furnished on or after July 1, 2019, for individuals diagnosed with a

substance use disorder (SUD) for the purpose of treating the SUD or a co-occurring mental health disorder. Section 1834(m)(7) of the Act also allows telehealth services for treatment of a diagnosed SUD or co-occurring mental health disorder to be furnished to individuals at any telehealth originating site (other than a renal dialysis facility), including in a patient's home. Section 2001(a) of the SUPPORT Act additionally amended section 1834(m) of the Act to require that no originating site facility fee will be paid in instances when the individual's home is the originating site. We believe that adding HCPCS codes G2086, G2087, and G2088 to the Medicare telehealth list will complement the existing policies related to flexibilities in treating SUDs.

We note that we welcome public nominations for additions to the Medicare telehealth list. More information on the nomination process is posted under the Telehealth section of the CMS website, which can be accessed at the following web address <https://www.cms.gov/Medicare/Medicare-General-Information/Telehealth/index.html>.

We received public comments on the proposed HCPCS codes for addition to the telehealth list on a Category 1 basis. The following is a summary of the comments we received and our responses.

Comment: The majority of commenters supported our proposal to add HCPCS codes G2086, G2087, and G2088 to the Medicare telehealth list, although a few disagreed, stating that these services should only be furnished in person.

Response: We thank the commenters for their support and feedback. We note that the psychotherapy services that are included in this bundled payment are already on the list of Medicare

telehealth services. After consideration of the comments received, we are finalizing our proposal to add HCPCS codes G2086, G2087, and G2088 to the Medicare telehealth list beginning in CY 2020.

Comment: Several commenters disagreed with CMS' statement that most eligible services had been added to the Medicare telehealth list and suggested that CMS should continue to engage with stakeholders to identify other services that could be furnished via Medicare telehealth or communication technology-based services. A few commenters also provided recommendations for additional services that could be added to the Medicare telehealth list, as well as suggestions for how CMS could improve the process of requesting that services be added. Commenters reiterated as they have for many years that the statutory restrictions under section 1834(m) of the Act limit availability of telehealth services, and many encouraged CMS to utilize its demonstration authority to waive restrictions.

Response: We will continue to engage with stakeholders to identify services to add to the Medicare telehealth list and other ways to leverage technology in furnishing services under the PFS within the scope of the statute. We note that the deadline for submitting requests for additions to the Medicare Telehealth list is February 10 of the year prior to the year in which the codes could be added to the Medicare telehealth list, and any requests that are received after that time will be considered in the following year's rulemaking.

Comment: A few commenters requested that CMS allow visits with the prescribing physician for medications that require medical visits for monitoring (for example,

buprenorphine) to also be furnished via telehealth.

Response: We note that the majority of the E/M visit codes are already on the Medicare telehealth list and can be furnished in addition to HCPCS codes G2086, G2087, and G2088. Specific requests for consideration of additional codes for the Medicare telehealth list should be submitted through the process outlined above. We also note that there are existing rules related to telemedicine and prescribing buprenorphine for the treatment of OUD (<https://www.hhs.gov/opioids/sites/default/files/2018-09/hhs-telemedicine-hhs-statement-final-508compliant.pdf>).

3. Telehealth Originating Site Facility Fee Payment Amount Update

Section 1834(m)(2)(B) of the Act established the Medicare telehealth originating site facility fee for telehealth services furnished from October 1, 2001 through December 31, 2002, at \$20.00. For telehealth services furnished on or after January 1 of each subsequent calendar year, the telehealth originating site facility fee is increased by the percentage increase in the Medicare Economic Index (MEI) as defined in section 1842(i)(3) of the Act. The originating site facility fee for telehealth services furnished in CY 2019 is \$26.15. The MEI increase for 2020 is 1.9 percent and is based on the most recent historical update of the MEI through 2019Q2 (2.4 percent), and the most recent historical multifactor productivity adjustment (MFP) through calendar year 2018 (0.5 percent). Therefore, for CY 2020, the payment amount for HCPCS code Q3014 (Telehealth originating site facility fee) is 80 percent of the lesser of the actual charge or \$26.65. The Medicare telehealth originating site facility fee and the MEI increase by the applicable time period is shown in Table 17.

TABLE 17: The Medicare Telehealth Originating Site Facility Fee

Time Period	MEI Increase	Facility Fee
10/01/2001–12/31/2002	N/A	\$20.00
01/01/2003–12/31/2003	3.0	\$20.60
01/01/2004–12/31/2004	2.9	\$21.20
01/01/2005–12/31/2005	3.1	\$21.86
01/01/2006–12/31/2006	2.8	\$22.47
01/01/2007–12/31/2007	2.1	\$22.94
01/01/2008–12/31/2008	1.8	\$23.35
01/01/2009–12/31/2009	1.6	\$23.72
01/01/2010–12/31/2010	1.2	\$24.00
01/01/2011–12/31/2011	0.4	\$24.10
01/01/2012–12/31/2012	0.6	\$24.24
01/01/2013–12/31/2013	0.8	\$24.43
01/01/2014–12/31/2014	0.8	\$24.63
01/01/2015–12/31/2015	0.8	\$24.83
01/01/2016–12/31/2016	1.1	\$25.10
01/01/2017–12/31/2017	1.2	\$25.40
01/01/2018–12/31/2018	1.4	\$25.76
01/01/2019–12/31/2019	1.5	\$26.15
01/01/2020–12/31/2020	1.9	\$26.65

G. Medicare Coverage for Opioid Use Disorder Treatment Services Furnished by Opioid Treatment Programs (OTPs)

1. Overview

Opioid use disorder (OUD) and deaths from prescription and illegal opioid overdoses have reached alarming levels. The Centers for Disease Control and Prevention (CDC) estimated 47,000 overdose deaths were from opioids in 2017 and 36 percent of those deaths were from prescription opioids.¹ OUD has become a public health crisis. On October 26, 2017, Acting Health and Human Services Secretary, Eric D. Hargan declared a nationwide public health emergency on the opioid crisis as requested by President Donald Trump.² This public health emergency was renewed by Secretary Alex M. Azar II on January 24, 2018, April 24, 2018, July 23, 2018, and October 21, 2018, January 17, 2019, April 19, 2019, July 17, 2019, and most recently, October 16, 2019.³

The Medicare population, including individuals who are eligible for both Medicare and Medicaid, has the fastest growing prevalence of OUD compared to the general adult population, with more than 300,000 beneficiaries

diagnosed with OUD in 2014.⁴ An effective treatment for OUD is known as medication-assisted treatment (MAT). The Substance Abuse and Mental Health Services Administration (SAMHSA) defines MAT as the use of medication in combination with behavioral health services to provide an individualized approach to the treatment of substance use disorder (SUD), including OUD (§ 8.2). Currently, Medicare covers medications for MAT, including buprenorphine, buprenorphine-naloxone combination products, and extended-release injectable naltrexone under Part B or Part D, but does not cover methadone. Medicare also covers counseling and behavioral therapy services that are reasonable and necessary and furnished by practitioners that can bill and receive payment under Medicare.

Historically, Medicare has not covered methadone for MAT because of the unique manner in which this drug is dispensed and administered. Medicare Part B covers physician-administered drugs, drugs used in conjunction with durable medical equipment, and certain other statutorily-specified drugs. Medicare Part D covers drugs that are dispensed upon a prescription by a pharmacy. Methadone for MAT is not a drug administered by a physician under the “incident to” benefit like other MAT drugs (that is,

implanted buprenorphine or injectable extended-release naltrexone) and therefore has not previously been covered by Medicare Part B. Methadone for MAT is also not a drug dispensed by a pharmacy like certain other MAT drugs (that is buprenorphine or buprenorphine-naloxone combination products) and therefore is not covered under Medicare Part D. Methadone for MAT is a schedule II controlled substance that is highly regulated because it has a high potential for abuse which may lead to severe psychological or physical dependence. As a result, methadone for MAT can only be dispensed and administered by an opioid treatment program (OTP) as provided under section 303(g)(1) of the Controlled Substances Act (21 U.S.C. 823(g)(1)) and 42 CFR part 8. Additionally, OTPs, which are healthcare entities that focus on providing MAT for people diagnosed with OUD, were not previously entities that could bill and receive payment from Medicare for the services they furnish. Therefore, there has historically been a gap in Medicare coverage of MAT for OUD since methadone (one of the three Food and Drug Administration (FDA)-approved drugs for MAT) has not been covered.

Section 2005 of the Substance Use-Disorder Prevention that Promotes Opioid Recovery and Treatment for Patients and Communities Act (the SUPPORT Act) (Pub. L. 115–271, enacted October 24, 2018) added a new

¹ <https://www.cdc.gov/drugoverdose/data/index.html>.

⁴ <https://jamanetwork.com/journals/jamapsychiatry/fullarticle/2535238>.

section 1861(jjj) to the Act, establishing a new Part B benefit category for OUD treatment services furnished by an OTP beginning on or after January 1, 2020. Section 1861(jjj)(1) of the Act defines OUD treatment services as items and services furnished by an OTP (as defined in section 1861(jjj)(2) of the Act) for treatment of OUD. Section 2005 of the SUPPORT Act also amended the definition of “medical and other health services” in section 1861(s) of the Act to provide for coverage of OUD treatment services and added a new section 1834(w) to the Act and amended section 1833(a)(1) of the Act to establish a bundled payment to OTPs for OUD treatment services furnished during an episode of care beginning on or after January 1, 2020.

OTPs must have a current, valid certification from SAMHSA to satisfy the Controlled Substances Act registration requirement under 21 U.S.C. 823(g)(1). To obtain SAMHSA certification, OTPs must have a valid accreditation by an accrediting body approved by SAMHSA, and must be certified by SAMHSA as meeting federal opioid treatment standards in § 8.12. There are currently about 1,700 OTPs nationwide.⁵ All states except Wyoming have OTPs. Approximately 74 percent of patients receiving services from OTPs receive methadone for MAT, with the vast majority of the remaining patients receiving buprenorphine.⁶

Many payers currently cover MAT services for treatment of OUD. Medicaid⁷ is one of the largest payers of medications for SUD, including methadone for MAT provided in OTPs.⁸ OUD treatment services and MAT are also covered by other payers such as TRICARE and private insurers. TRICARE established coverage and payment for MAT and OUD treatment services furnished by OTPs in late 2016 (81 FR 61068). In addition, as discussed in the “Patient Protection and Affordable Care Act; HHS Notice of Benefit and Payment Parameters for 2020” final rule, many qualified health

plans covered MAT medications for plan year 2018 (84 FR 17536).

In the CY 2019 PFS final rule (83 FR 59497), we included a Request for Information (RFI) to solicit public comments on the implementation of the new Medicare benefit category for OUD treatment services furnished by OTPs established by section 2005 of the SUPPORT Act. We received 9 public comments. Commenters were generally supportive of the new benefit and expanding access to OUD treatment for Medicare beneficiaries. We received feedback that the bundled payments to OTPs should recognize the intensity of services furnished in the initiation stages, durations of care, the needs of patients with more complex needs, costs of emerging technologies, and use of peer support groups. We also received feedback that costs associated with care coordination among the beneficiary’s practitioners should be included in the bundled payment given the myriad of health issues beneficiaries with OUD face. We considered this feedback as we developed our proposals for implementing the new benefit category for OUD treatment services furnished by OTPs and the proposed bundled payments for these services.

To implement section 2005 of the SUPPORT Act, we proposed to establish rules to govern Medicare coverage of and payment for OUD treatment services furnished in OTPs. We proposed to establish definitions of OUD treatment services and OTP for purposes of the Medicare Program. We also proposed a methodology for determining Medicare payment for such services provided by OTPs. We proposed to codify these policies in a new section of the regulations at § 410.67. For a discussion about Medicare enrollment requirements and the program integrity approach for OTPs, we refer readers to section III.H. in this final rule, Medicare Enrollment of Opioid Treatment Programs.

2. Definitions

a. Opioid Use Disorder Treatment Services

The SUPPORT Act amended section 1861 of the Act by adding a new subsection (jjj)(1) that defines “opioid use disorder treatment services” as the items and services that are furnished by an OTP for the treatment of OUD, as set forth in subparagraphs (A) through (F) of section 1861(jjj)(1) of the Act which include:

- Opioid agonist and antagonist treatment medications (including oral, injected, or implanted versions) that are approved by the Food and Drug

Administration (FDA) under section 505 of the Federal Food, Drug, and Cosmetic Act (FFDCA) (21 U.S.C. 355) for use in the treatment of OUD;

- Dispensing and administration of such medications, if applicable;
- Substance use counseling by a professional to the extent authorized under state law to furnish such services;
- Individual and group therapy with a physician or psychologist (or other mental health professional to the extent authorized under state law);
- Toxicology testing; and
- Other items and services that the Secretary determines are appropriate (but in no event to include meals or transportation).

As described previously, section 1861(jjj)(1)(A) of the Act defines covered OUD treatment services to include oral, injected, and implanted opioid agonist and antagonist medications approved by the FDA under section 505 of the FFDCA for use in the treatment of OUD. There are three drugs currently approved by the FDA for the treatment of opioid dependence: Buprenorphine, methadone, and naltrexone.⁹ FDA notes that all three of these medications have been demonstrated to be safe and effective in combination with counseling and psychosocial support and that those seeking treatment for an OUD should be offered access to all three options as this allows providers to work with patients to select the medication best suited to an individual’s needs.¹⁰ Each of these medications is discussed below in more detail.

Buprenorphine is FDA-approved for acute and chronic pain in addition to opioid dependence. It is listed by the Drug Enforcement Administration (DEA) as a Schedule III controlled substance because of its moderate to low potential for physical and psychological dependence.^{11 12} The medication’s partial agonist properties allow for its use in opioid replacement therapy, which is a process of treating OUD by using a substance, for example, buprenorphine or methadone, to substitute for a stronger full agonist opioid.¹³ Buprenorphine drug products that are currently FDA-approved and marketed for the treatment of opioid dependence include oral buprenorphine tablets, oral buprenorphine with

⁶ <https://www.dasis.samhsa.gov/dasis2/nssats.htm>.

⁷ Medicaid provides health care coverage to 65.9 million Americans, including low-income adults, children, pregnant women, elderly adults and people with disabilities. Medicaid is administered by states, according to federal requirements, and is funded jointly by states and the federal government. States have the flexibility to administer the Medicaid program to meet their own state needs within the Medicaid program parameters set forth in federal statute and regulations. As a result, there is variation in how each state implements its programs.

⁸ https://store.samhsa.gov/system/files/medicaid_financingmatreport.pdf.

naloxone¹⁴ films and tablets, an extended-release buprenorphine injection for subcutaneous use, and a buprenorphine implant for subdermal administration.¹⁵ In most patients with opioid dependence, the initial oral dose is 2 to 4 mg per day with a maintenance dose of 8–12 mg per day.¹⁶ Dosing for the extended-release injection is 300 mg monthly for the first 2 months followed by a maintenance dose of 100 mg monthly.¹⁷ The extended-release injection is indicated for patients who have initiated treatment with an oral buprenorphine product for a minimum of 7 days.¹⁸ The buprenorphine implant consists of four rods containing 74.2 mg of buprenorphine each, and provides up to 6 months of treatment for patients who are clinically stable on low-to-moderate doses of an oral buprenorphine-containing product.¹⁹ Currently, federal regulations permit buprenorphine to be prescribed or dispensed by qualifying physicians and qualifying other practitioners at office-based practices and dispensed in OTPs.^{20 21}

Methadone is FDA-approved for management of severe pain in addition to opioid dependence. It is listed by the DEA as a Schedule II controlled substance because of its high potential for abuse, with use potentially leading to severe psychological or physical dependence.^{22 23} Methadone drug products that are FDA-approved for the treatment of opioid dependence include oral methadone concentrate and tablets.²⁴ In patients with opioid dependence, the total daily dose of methadone on the first day of treatment should not ordinarily exceed 40 mg, unless the program physician documents in the patient's record that 40 mg did not suppress opioid abstinence, with clinical stability generally achieved at doses between 80 to 120 mg/day.²⁵ By law, methadone

used for treatment of OUD can only be dispensed through an OTP certified by SAMHSA except in certain, very limited circumstances.²⁶

Naltrexone is FDA-approved to treat alcohol dependence in addition to OUD.²⁷ Unlike buprenorphine and methadone, which activate opioid receptors, naltrexone binds and blocks opioid receptors and reduces opioid cravings.²⁸ Therefore, naltrexone is not a scheduled substance; there is no abuse and diversion potential with naltrexone.^{29 30} The naltrexone drug product that is FDA-approved for the treatment of opioid dependence is an extended-release, intramuscular injection.³¹ The recommended dose is 380 mg delivered intramuscularly every 4 weeks or once a month after the patient has achieved an opioid-free duration of a minimum of 7–10 days.³² Naltrexone can be prescribed by any health care provider who is licensed to prescribe medications.³³

We proposed that the OUD treatment services that may be furnished by OTPs include the first five items and services listed in the statutory definition described above, specifically the medications approved by the FDA under section 505 of the FFDCa for use in the treatment of OUD; the dispensing and administration of such medication, if applicable; substance use counseling; individual and group therapy; and toxicology testing. We also proposed to use our discretion under section 1861(jjj)(1)(F) of the Act to include other items and services that the Secretary determines are appropriate to include the use of telecommunications for certain services, as discussed later in this section. We proposed to codify this definition of OUD treatment services furnished by OTPs at § 410.67(b). As part of this definition, we also proposed to specify that an OUD treatment service is an item or service that is furnished by an OTP that meets the applicable requirements to participate in the Medicare Program and receive payment.

We solicited comment on any other items and services (not including meals

or transportation as they are statutorily prohibited) currently covered and paid for under Medicare Part B when furnished by Medicare-enrolled providers/suppliers that the Secretary should consider adding to this definition, including any evidence supporting the impact of the use of such items and services in the treatment of OUD and enumeration of their costs. We noted we were particularly interested in public feedback on whether intake activities, which may include services such as an initial physical examination, initial assessments and preparation of a treatment plan, as well as periodic assessments, should be included in the definition of OUD treatment services. Additionally, we noted that while the current FDA-approved medications under section 505 of the FFDCa for the treatment of OUD are opioid agonists and antagonist medications, other medications that are not opioid agonist and antagonist medications, including drugs and biologicals, could be developed for the treatment of OUD in the future. We solicited public feedback on whether there are any drug development efforts in the pipeline that could result in medications intended for use in the treatment of OUD with a novel mechanism of action that does not involve opioid agonist and antagonist mechanisms (that is, outside of activating and/or blocking opioid receptors). We also solicited comment on how medications that may be approved by the FDA in the future for use in the treatment of OUD with a novel mechanism of action, such as medications approved under section 505 of the FFDCa to treat OUD and biological products licensed under section 351 of the Public Health Service Act to treat OUD, should be considered in the context of OUD treatment services provided by OTPs, and whether CMS should use the discretion afforded under section 1861(jjj)(1)(F) of the Act to include such medications in the definition of OUD treatment services given the possibility that such medications could be approved in the future.

We received a number of public comments on the proposed definition of “opioid use disorder treatment services.” The following is a summary of the comments we received and our responses.

Comment: Commenters were generally supportive of including the five statutorily-required items and services in the definition of OUD treatment services: (1) Opioid agonist and antagonist treatment medications approved by the FDA for treatment of OUD; (2) dispensing and administration

¹⁴ Naloxone is added to buprenorphine to reduce its abuse potential and limit diversion.

of such medications; (3) substance use counseling; (4) individual and group therapy; and (5) toxicology testing. Commenters were also generally supportive of the use of telecommunications for substance use counseling and individual and group therapy services.

Response: We thank commenters for their support of including the five statutorily-required items and services and the use of telecommunications for certain services in the definition of OUD treatment services. We are finalizing a definition of OUD treatment services that includes these items and services at § 410.67(b).

Comment: Many commenters expressed support for allowing licensed mental health professionals to directly bill Medicare for counseling and therapy services provided in an OTP. Some commenters requested clarification on whether OUD treatment services would only include substance use counseling and individual and group therapy services furnished by physicians, psychologists, and practitioners that can bill Medicare directly and not services furnished by other types of mental health professionals that are licensed by the state, such as licensed professional counselors, licensed mental health counselors, and licensed clinical professional counselors. These commenters raised concerns that only allowing physicians and psychologists to furnish these services and not including other mental health professionals authorized by the state to furnish counseling and therapy services would limit access to care due to workforce shortages. Some commenters requested that we clarify the distinction between substance use counseling and individual and group therapy services or allow these terms to be generally used interchangeably.

Response: Under sections 1861(jjj)(1)(C) and (D) of the Act, substance use counseling for OUD treatment can be provided by “a professional to the extent authorized under State law to furnish such services,” while individual and group therapy can be “with a physician or psychologist (or other mental health professional to the extent authorized under State law).” Consistent with the statute, in the proposed rule we did not propose to limit the professionals that can provide these services to physicians, psychologists, or other practitioners who can bill Medicare directly. Instead, we noted that the professionals that could provide such services could include licensed professional counselors, licensed

clinical alcohol and drug counselors, and certified peer specialists that are permitted to furnish this type of therapy or counseling by state law and scope of practice. To the extent that the individuals furnishing therapy or counseling services are not authorized under state law to furnish such services, the therapy or counseling services provided by these professionals would not be covered as OUD treatment services. Regarding the commenters’ request for clarification of the distinction between substance use counseling and therapy services, we are not specifying the differences between these two types of services, but would note that different types of professionals may be authorized to furnish substance use counseling versus therapy services under state law. Regarding the comments that supported allowing licensed mental health professionals to directly bill Medicare for counseling and therapy services provided in an OTP, we note that only OTPs can bill for the bundled payment for furnishing OUD treatment services.

Comment: Several commenters opined on the types of toxicology testing that should be included in the definition of OUD treatment services. One commenter recommended that we clarify the language regarding “toxicology testing” in the definition of OUD treatment services to include “presumptive and definitive drug testing in line with clinical best practice” to better de-stigmatize the use of these services. Other commenters suggested that only presumptive toxicology testing be included in the definition and that definitive testing be billed separately under the Medicare Clinical Laboratory Fee Schedule (CLFS). Alternatively, if definitive testing were to be included, commenters suggested that the bundled payment rate should be updated to reflect the cost of this type of toxicology testing by increasing the bundled payment rate or establishing add-on payments for definitive testing. Commenters raised the differences in complexities and costs between presumptive and definitive toxicology testing. These commenters explained that presumptive testing is an initial test that is conducted through point of care rapid result cup testing, which has testing and accuracy limitations. OTPs typically perform presumptive toxicology testing for drugs of abuse on-site using cups and dipsticks that indicate the presence or absence of drug classes as long as the test systems that are used are classified as waived test systems under the regulations implementing the Clinical

Laboratory Improvement Amendments (CLIA) (Pub. L. 100–578, enacted October 31, 1988), as amended, 42 CFR part 493, and the OTP has a valid certificate of waiver that authorizes it to perform CLIA waived tests.

Due to limitations of presumptive testing, OTPs may also send urine samples to reference labs for definitive drug testing to make sure they know exactly which drugs have been ingested. Definitive drug testing uses liquid or gas chromatography coupled with mass spectrometry to identify hundreds of specific drugs and their metabolites. Definitive drug testing identifies and precisely quantifies specific drugs and/or metabolites that are positive in a sample. A treating physician may order a confirmatory test despite the outcome of the presumptive testing to obtain more information on the drugs that a patient is taking. Commenters raised the cost differences under the CY 2019 Medicare CLFS between the two types of tests ranging from \$12.60–\$64.65 for presumptive testing to \$114.43–\$246.92 for definitive testing. Some commenters requested clarification of the distinction between the toxicology testing that would be included in the definition of OUD treatment services and would be paid under the bundle and medically-necessary toxicology testing that is billed and paid under the Medicare CLFS.

Response: We noted in the CY 2020 PFS proposed rule that under SAMHSA certification standards at § 8.12(f)(6), OTPs are required to provide adequate testing or analysis for drugs of abuse, including at least eight random drug abuse tests per year, per patient in maintenance treatment in accordance with generally accepted clinical practice. These drug abuse tests are used for diagnosing, monitoring and evaluating progress in treatment (84 FR 40527). Consistent with the discussion of the different types of toxicology testing in the proposed rule, we are clarifying that the reference to toxicology testing in the definition of OUD treatment services includes both presumptive and definitive testing. We are also clarifying that all types of toxicology testing that are used for diagnosing, monitoring and evaluating the progress in treatment at the OTP are included in the definition of OUD treatment services and would be paid under the bundled payment. Toxicology tests that are unrelated to the care and treatment for OUD at an OTP may be paid separately under the CLFS, if reasonable and necessary, since toxicology tests for these purposes are not included in the bundled payments to OTPs. CMS expects that the ordering

practitioner would document the medical necessity for this additional testing in the beneficiary's medical record.

Comment: Many commenters supported the inclusion of intake activities, such as the initial physician examination, initial assessment and preparation of a treatment plan, as well as periodic assessments in the definition of OUD treatment services. One of the commenters noted these were significant activities performed by the treatment teams that were not included in the proposed bundle, nor are they paid for separately in the OTPs, and stated these services should be included. Another commenter stated that initial assessment and treatment planning activities are generally the first part of OUD treatment and that treatment planning cannot always be linear and must, at times, be revised. The commenter noted that these activities are typical of any substance abuse treatment program and should be included in the definition of OUD treatment services.

Response: We agree with commenters that intake activities, such as the initial physician examination, initial assessment and preparation of a treatment plan, should be included in the definition of OUD treatment services. We also agree with commenters that periodic assessment should be included in the definition of OUD treatment services. We note that an initial medical examination and both initial and periodic assessments are required under the SAMHSA regulations. Specifically, under the SAMHSA requirements at § 8.12(f)(2), OTPs shall require each patient to undergo a complete, fully documented physical evaluation by a program physician or a primary care physician, or an authorized healthcare professional under the supervision of a program physician, before admission to the OTP. The full medical examination, including the results of serology and other tests, must be completed within 14 days following admission.

Under § 8.12(f)(4), OTPs are required to do initial and periodic assessments. Each patient accepted for treatment at an OTP shall be assessed initially and periodically by qualified personnel to determine the most appropriate combination of services and treatment. The initial assessment must include preparation of a treatment plan that includes: The patient's short-term goals and the tasks the patient must perform to complete the short-term goals; the patient's requirements for education, vocational rehabilitation, and employment; and the medical,

psychosocial, economic, legal, or other supportive services that a patient needs. The treatment plan also must identify the frequency with which these services are to be provided. The plan must be reviewed and updated to reflect that patient's personal history, his or her current needs for medical, social, and psychological services, and his or her current needs for education, vocational rehabilitation, and employment services. We understand that intake activities and periodic assessments are integral services for the establishment and maintenance of OUD treatment for a beneficiary at an OTP. Therefore, we believe it is reasonable to include these services in the definition of OUD treatment services. Accordingly, we are finalizing a revised definition of OUD treatment services in § 410.67(b) that reflects the required intake activities and periodic assessments. We discuss coding and payment for these services in the Coding section below.

Comment: A few commenters requested that CMS publish a detailed list of the items and services that are covered as OUD treatment services and would be included in the bundled payment to the OTPs.

Response: The items and services included in the definition of OUD treatment services are listed in the preamble of this final rule and in the regulations at § 410.67(b). We note that the items and services that are medically-necessary for OUD treatment could in some cases also be furnished and billed by other Medicare practitioners under another Medicare benefit category. For example, we anticipate that some beneficiaries receiving counseling or therapy as part of an OTP bundle of services may also be receiving medically reasonable and necessary counseling or therapy as part of a physician's service during the same time period. In this scenario, the counseling or therapy provided as part of a physician's service could be billed separately.

Comment: One commenter supported a definition of OUD treatment services that would allow for coverage of innovative therapies in development that have not yet been approved by the FDA for treatment of OUD. The commenter suggested changing the proposed regulatory language in § 410.67(b)(1) to "Therapies approved by the Food and Drug Administration under section 505 of the Federal, Food, Drug, and Cosmetic Act for use in treatment of opioid use disorder." A few commenters recommended that drugs used for opioid detoxification withdrawal and management maintenance such as naloxone,

clonidine, and lofexidine be included in the definition of OUD treatment services.

Response: We thank the commenters for their feedback on including drugs that are not opioid agonist or antagonist medications in the definition of OUD treatment services. For CY 2020, we are finalizing a definition of OUD treatment services that reflects the statutory requirement in section 1861(jjj)(1)(A) of the Act to include opioid agonist and antagonist treatment medications approved by the FDA in the definition of OUD treatment services. We will consider these comments on additional drugs to include in the definition of OUD treatment services under our discretionary authority in section 1861(jjj)(1)(F) of the Act as we continue to work on refining this new Medicare benefit in future rulemaking.

Comment: In response to the request for comment on adding various other types of items and services to the definition of OUD treatment services, several commenters indicated that case management and care coordination are services furnished by OTPs and should be included in the definition of OUD treatment services. Some commenters also requested that peer-to-peer support, crisis management, and non-opioid alternative treatment be included in the definition of OUD treatment services. One commenter urged CMS to include Medical Nutrition Therapy services that are furnished by registered dietician nutritionists as a core component of OTPs because individuals with OUD suffer from gastrointestinal issues, eating disorders and malnutrition. The commenter stated it is essential that CMS build a payment model that leverages the different expertises of the full health care team, including registered dietician nutritionists. Another commenter urged CMS to include physical therapy within the list of OUD treatment services and recommended adjusting the bundled payment rates to account for instances in which effective treatment requires physical therapy and other nonpharmacological treatment services. Some commenters noted that the proposed bundled payment should include both e-prescribing and behavioral health information technology consultation and support services. One commenter urged that the definition of OUD treatment services include services performed by pharmacists including psychiatric pharmacists, such as medication adherence, management, and education or counseling. Some commenters suggested adding other laboratory tests, including HIV, Hepatitis, liver disease,

or infectious diseases. Other commenters noted SAMHSA requirements for treatment for tobacco use disorder, alcohol use disorder, and family services for OTPs and recommended that these should be included in the definition of OUD treatment.

Response: We appreciate the comments recommending additional types of items and services that could be added to the definition of OUD treatment services. For CY 2020, we are finalizing a definition of OUD treatment services that includes those items and services that we understand are required for all OTPs to furnish as specified in SAMHSA regulations (part 8). Because this is the first year of the OTP benefit, we believe it would be premature to include in the definition additional items and services until we have additional information regarding their use by OTPs in the treatment of Medicare beneficiaries with OUD. However, we note that the definition of OUD treatment services does not prevent an OTP from furnishing the additional items and services suggested above in accordance with best practices as clinically appropriate, SAMHSA regulations and guidance, and State law. We may consider the items and services suggested by commenters further as we continue to work on refining this new Medicare benefit in future rulemaking. Accordingly, we are interested in continued feedback and data on the specific items and services, including their frequency, furnished to beneficiaries by an OTP.

After consideration of the public comments, we are finalizing our proposal to include the five statutorily-required items and services in the definition of OUD treatment services in § 410.67(b). For the reasons discussed previously, we will also include intake activities and periodic assessments required under § 8.14(f)(4) in the definition of OUD treatment services in § 410.67(b).

b. Opioid Treatment Program

Section 2005 of the SUPPORT Act also amended section 1861 of the Act by adding a new subsection (jjj)(2) to define an OTP as an entity meeting the definition of OTP in 42 CFR 8.2 or any successor regulation (that is, a program or practitioner engaged in opioid treatment of individuals with an opioid agonist treatment medication registered under 21 U.S.C. 823(g)(1)), that meets the additional requirements set forth in subparagraphs (A) through (D) of section 1861(jjj)(2) of the Act. Specifically, the OTP:

- Is enrolled under section 1866(j) of the Act;
- Has in effect a certification by SAMHSA for such a program;
- Is accredited by an accrediting body approved by SAMHSA; and
- Meets such additional conditions as the Secretary may find necessary to ensure the health and safety of individuals being furnished services under such program and the effective and efficient furnishing of such services.

These requirements are discussed in more detail in this section.

(1) Enrollment

As discussed previously, under section 1861(jjj)(2)(A) of the Act, an OTP must be enrolled in Medicare to receive Medicare payment for covered OUD treatment services under section 1861(jjj)(1) of the Act. We refer the reader to section III.H. of this final rule, Medicare Enrollment of Opioid Treatment Programs, for further details on our policies related to enrollment of OTPs.

(2) Certification by SAMHSA

As provided in section 1861(jjj)(2)(B) of the Act, OTPs must be certified by SAMHSA to furnish Medicare-covered OUD treatment services. SAMHSA has created a system to certify and accredit OTPs, which is governed by part 8, subparts B and C. This regulatory framework allows SAMHSA to focus its oversight efforts on improving treatment rather than solely ensuring that OTPs are meeting regulatory criteria, and preserves states' authority to regulate OTPs. To be certified by SAMHSA, OTPs must comply with the federal opioid treatment standards as outlined in § 8.12, be accredited by a SAMHSA-approved accreditation body, and comply with any other conditions for certification established by SAMHSA. Specifically, SAMHSA requires OTPs to provide the following services:

- *General*—OTPs shall provide adequate medical, counseling, vocational, educational, and other assessment and treatment services.
- *Initial medical examination services*—OTPs shall require each patient to undergo a complete, fully documented physical evaluation by a program physician or a primary care physician, or an authorized healthcare professional under the supervision of a program physician, before admission to the OTP.
- *Special services for pregnant patients*—OTPs must maintain current policies and procedures that reflect the special needs of patients who are pregnant. Prenatal care and other gender specific services for pregnant patients

must be provided either by the OTP or by referral to appropriate healthcare providers.

- *Initial and periodic assessment services*—Each patient accepted for treatment at an OTP shall be assessed initially and periodically by qualified personnel to determine the most appropriate combination of services and treatment.

- *Counseling services*—OTPs must provide adequate substance abuse counseling to each patient as clinically necessary by a program counselor, qualified by education, training, or experience to assess the patient's psychological and sociological background.

- *Drug abuse testing services*—OTPs must provide adequate testing or analysis for drugs of abuse, including at least eight random drug abuse tests per year, per patient in maintenance treatment, in accordance with generally accepted clinical practice. For patients in short-term detoxification treatment, defined in § 8.2 as detoxification treatment not in excess of 30 days, the OTP shall perform at least one initial drug abuse test. For patients receiving long-term detoxification treatment, the program shall perform initial and monthly random tests on each patient.

The provisions governing recordkeeping and patient confidentiality at § 8.12(g)(1) require that OTPs shall establish and maintain a recordkeeping system that is adequate to document and monitor patient care. All records are required to be kept confidential in accordance with all applicable federal and state requirements. The requirements at § 8.12(g)(2) state that OTPs shall document in each patient's record that the OTP made a good faith effort to review whether or not the patient is enrolled in any other OTP. A patient enrolled in an OTP shall not be permitted to obtain treatment in any other OTP except in exceptional circumstances, as determined by the medical director or program physician of the OTP in which the patient is enrolled (§ 8.12(g)(2)). Additionally, the requirements at § 8.12(h) address medication administration, dispensing, and use.

SAMHSA requires that OTPs shall ensure that opioid agonist treatment medications are administered or dispensed only by a practitioner licensed under the appropriate state law and registered under the appropriate state and federal laws to administer or dispense opioid drugs, or by an agent of such a practitioner, supervised by and under the order of the licensed practitioner. OTPs shall use only those

opioid agonist treatment medications that are approved by the FDA for use in the treatment of OUD. They must maintain current procedures that are adequate to ensure that the dosing requirements are met, and each opioid agonist treatment medication used by the program is administered and dispensed in accordance with its approved product labeling.

At § 8.12(i), regarding unsupervised or “take-home” use of opioid agonist treatment medications, SAMHSA has specified that OTPs must follow requirements specified by SAMHSA to limit the potential for diversion of opioid agonist treatment medications to the illicit market when dispensed to patients as take-homes, including maintaining current procedures to identify the theft or diversion of take-home medications. The requirements at § 8.12(j) for interim maintenance treatment, state that the program sponsor of a public or nonprofit private OTP subject to the approval of SAMHSA and the state, may place an individual, who is eligible for admission to comprehensive maintenance treatment, in interim maintenance treatment if the individual cannot be placed in a public or nonprofit private comprehensive program within a reasonable geographic area and within 14 days of the individual’s application for admission to comprehensive maintenance treatment. Patients in interim maintenance treatment are permitted to receive daily dosing, but take-homes are not permitted. During interim maintenance treatment, initial treatment plans and periodic treatment plan evaluations are not required and a primary counselor is not required to be assigned to the patient. The OTP must be able to transfer these patients from interim maintenance into comprehensive maintenance treatment within 120 days. Interim maintenance treatment must be provided in a manner consistent with all applicable federal and state laws.

The SAMHSA requirements at § 8.12(b) address administrative and organizational structure, requiring that an OTP’s organizational structure and facilities shall be adequate to ensure quality patient care and meet the requirements of all pertinent federal, state, and local laws and regulations. At a minimum, each OTP shall formally designate a program sponsor and medical director who is a physician who is licensed to practice medicine in the jurisdiction in which the OTP is located. The program sponsor shall agree on behalf of the OTP to adhere to all requirements set forth in part 8, subpart C, and any regulations regarding

the use of opioid agonist treatment medications in the treatment of OUD that may be promulgated in the future. The medical director shall assume responsibility for administering all medical services performed by the OTP. In addition, the medical director shall be responsible for ensuring that the OTP is in compliance with all applicable federal, state, and local laws and regulations.

The provision governing patient admission criteria at § 8.12(e) requires that an OTP shall maintain current procedures designed to ensure that patients are admitted to maintenance treatment by qualified personnel who have determined, using accepted medical criteria such as those listed in the Diagnostic and Statistical Manual of Mental Disorders, that the person has had an OUD for at least 1 year before admission for treatment. If under 18 years of age, the patient is required to have had two documented unsuccessful attempts at short-term detoxification or drug-free treatment within a 12-month period and have the written consent of a parent, legal guardian, or responsible adult designated by the relevant state authority, to be eligible for maintenance treatment.

To ensure continuous quality improvement, the requirements at § 8.12(c) state that an OTP must maintain current quality assurance and quality control plans that include, among other things, annual reviews of program policies and procedures and ongoing assessment of patient outcomes, and a current Diversion Control Plan as part of its quality assurance program.

The requirements at § 8.12(d) with respect to staff credentials, state that each person engaged in the treatment of OUD must have sufficient education, training, and experience, or any combination thereof, to enable that person to perform the assigned functions. In addition, all physicians, nurses, and other licensed professional care providers, including addiction counselors, must comply with the credentialing requirements of their respective professions.

In addition to meeting the criteria described above, OTPs must apply to SAMHSA for certification. As part of the conditions for certification, SAMHSA specifies that OTPs shall:

- Comply with all pertinent state laws and regulations.
- Allow inspections and surveys by duly authorized employees of SAMHSA, by accreditation bodies, by the DEA, and by authorized employees of any relevant State or federal governmental authority.

- Comply with the provisions of 42 CFR part 2 (regarding confidentiality of SUD patient records).

- Notify SAMHSA within 3 weeks of any replacement or other change in the status of the program sponsor or medical director.

- Comply with all regulations enforced by the DEA under 21 CFR chapter II, and be registered by the DEA before administering or dispensing opioid agonist treatment medications.

- Operate in accordance with federal opioid treatment standards and approved accreditation elements.

Furthermore, SAMHSA has issued additional guidance for OTPs that describes how programs can achieve and maintain compliance with federal regulations.³⁴

(3) Accreditation of OTPs by a SAMHSA-Approved Accrediting Body

As provided in section 1861(jjj)(2)(C) of the Act, OTPs must be accredited by a SAMHSA-approved accrediting body in order to furnish Medicare-covered OUD treatment services. In 2001, the Department of Health and Human Services (HHS) and SAMHSA issued final regulations to establish a new oversight system for the treatment of SUDs with MAT (part 8). SAMHSA-approved accrediting bodies evaluate OTPs and perform site visits to ensure SAMHSA’s opioid dependency treatment standards are met. SAMHSA also requires OTPs to be accredited by a SAMHSA-approved accrediting body (§ 8.11).

The SAMHSA regulations establish procedures for an entity to apply to become a SAMHSA-approved accrediting body (§ 8.3). When determining whether to approve an applicant as an accreditation body, SAMHSA examines the following:

- Evidence of the nonprofit status of the applicant (that is, of fulfilling Internal Revenue Service requirements as a nonprofit organization) if the applicant is not a state governmental entity or political subdivision;

- The applicant’s accreditation elements or standards and a detailed discussion showing how the proposed accreditation elements or standards will ensure that each OTP surveyed by the applicant is qualified to meet or is meeting each of the federal opioid treatment standards set forth in § 8.12;

- A detailed description of the applicant’s decision-making process, including:

- ++ Procedures for initiating and performing onsite accreditation surveys of OTPs;

³⁴ <https://store.samhsa.gov/system/files/pep15-fedguideotp.pdf>.

++ Procedures for assessing OTP personnel qualifications;

++ Copies of an application for accreditation, guidelines, instructions, and other materials the applicant will send to OTPs during the accreditation process;

++ Policies and procedures for notifying OTPs and SAMHSA of deficiencies and for monitoring corrections of deficiencies by OTPs; for suspending or revoking an OTP's accreditation; and to ensure processing of applications for accreditation and for renewal of accreditation within a timeframe approved by SAMHSA; and;

++ A description of the applicant's appeals process to allow OTPs to contest adverse accreditation decisions.

- Policies and procedures established by the accreditation body to avoid conflicts of interest, or the appearance of conflicts of interest;

- A description of the education, experience, and training requirements for the applicant's professional staff, accreditation survey team membership, and the identification of at least one licensed physician on the applicant's staff;

- A description of the applicant's training policies;

- Fee schedules, with supporting cost data;

- Satisfactory assurances that the applicant will comply with the requirements of § 8.4, including a contingency plan for investigating complaints under § 8.4(e);

- Policies and procedures established to protect confidential information the applicant will collect or receive in its role as an accreditation body; and

- Any other information SAMHSA may require.

SAMHSA periodically evaluates the performance of accreditation bodies primarily by inspecting a selected sample of the OTPs accredited by the accrediting body and by evaluating the accreditation body's reports of surveys conducted, to determine whether the OTPs surveyed and accredited by the accreditation body are in compliance with the federal opioid treatment standards. There are currently six SAMHSA-approved accreditation bodies.³⁵

(4) Provider Agreement

Section 2005(d) of the SUPPORT Act amended section 1866(e) of the Act by adding a new paragraph (3) which includes OTPs (but only with respect to the furnishing of OUD treatment

services) as a "provider of services" for purposes of section 1866 of the Act. All providers of services under section 1866 of the Act must enter into a provider agreement with the Secretary and comply with other requirements specified in that section. These requirements are codified at 42 CFR part 489. Therefore, we proposed to amend part 489 to include OTPs (but only for furnishing OUD treatment services) as a provider. Specifically, we proposed to add OTPs (but only for the furnishing of OUD treatment services) to the list of providers in § 489.2. This addition makes clear that the other requirements specified in section 1866 of the Act, and implemented in part 489, which include the limits on charges to beneficiaries, will apply to OTPs (in connection with the furnishing of OUD treatment services). We also proposed additional changes to make clear that certain parts of part 489, which implement statutory requirements other than section 1866 of the Act, do not apply to OTPs. For example, since we did not propose any conditions of participation for OTPs, we proposed to amend § 489.10(a), which states that providers specified in § 489.2 must meet conditions of participation, to add that OTPs must meet the requirements set forth in part 489 and elsewhere in that chapter. In addition, we proposed to specify that the effective date of the provider agreement is the date on which CMS accepts a signed agreement (proposed amendment to § 489.13(a)(2)), and is not dependent on surveys or an accrediting organization's determination related to conditions of participation. As noted earlier in the preamble to this final rule, OTPs are required to be certified by SAMHSA and accredited by an accrediting body approved by SAMHSA. In § 489.53, we proposed to create a basis for termination of the provider agreement if the OTP no longer meets the requirements set forth in part 489 or elsewhere in that chapter (including if it no longer has a SAMHSA certification or accreditation by a SAMHSA-approved accrediting body). Finally, we proposed to revise 42 CFR part 498 to ensure that OTPs have access to the appeal process in case of an adverse determination concerning continued participation in the Medicare program. Specifically, we proposed to amend the definition of provider in § 498.2 to include OTPs. We also indicated that we would continue to review the application of the provider agreement requirements to OTPs to determine whether any further amendments to parts 489 and 498 were needed to ensure that the existing provider

agreement regulations are applied to OTPs consistent with our proposals and section 2005 of the SUPPORT Act.

Comment: Multiple commenters questioned whether provider agreements, once executed, will be made retroactive to January 1, 2020.

Response: We proposed in § 489.13(a)(2)(i) that the effective date of an OTP provider agreement would be the date on which we accept a signed agreement that ensures that the OTP meets all federal requirements. Yet, as discussed in section III.H of the final rule we also proposed retrospective billing dates in § 424.520(d) and § 424.521(a) if the requirements of those sections were met. To ensure that the provider agreement and billing effective dates are uniform, we are not finalizing our proposed change to § 489.13(a)(2)(i). Instead, we will establish a new § 489.13(a)(2)(iii) stating that the provider agreement effective date is to be consistent with the billing effective date established pursuant to § 424.520(d) or § 424.521(a), as applicable. In sum, the effective dates of OTP provider agreements will not automatically be made retroactive to January 1, 2020, but will instead be governed by § 489.13(a)(2)(iii).

After consideration of comments received, we are making changes to § 489.13(a)(2)(i) to align with the provider agreement effective date to the billing effective date under § 424.520(d) or § 424.521(a), as applicable. We did not receive any other comments on the proposals for the provider agreement requirements in §§ 489.2, 489.10, 489.43, and 498.2., and are finalizing these changes as proposed.

(5) Additional Conditions

As provided in section 1861(jjj)(2)(D) of the Act, to furnish Medicare-covered OUD treatment services, OTPs must meet any additional conditions as the Secretary may find necessary to ensure the health and safety of individuals being furnished services under such program and the effective and efficient furnishing of such services. The comprehensive OTP standards for certification of OTPs address the same topics as would be addressed by CMS supplier standards, such as client assessment and the services required to be provided. Furthermore, the detailed process established by SAMHSA for selecting and overseeing its accreditation organizations is similar to the accrediting organization oversight process that would typically be established by CMS. Thus, in the proposed rule, we stated that we believe the existing SAMHSA certification and accreditation requirements are both

³⁵ <https://www.samhsa.gov/medication-assisted-treatment/opioid-treatment-accrediting-bodies/approved>.

appropriate and sufficient to ensure the health and safety of individuals being furnished services by OTPs, as well as the effective and efficient furnishing of such services. We also indicated that we believe that creating additional conditions at this time for participation in Medicare by OTPs could create unnecessary regulatory duplication and could be potentially burdensome for OTPs. Therefore, we did not propose any additional conditions for participation in Medicare by OTPs in the CY 2020 PFS proposed rule. We solicited public comments on our proposed approach, including input on whether there are any additional conditions that should be required for OTPs furnishing Medicare-covered OUD treatment services.

(6) Proposed Definition of Opioid Treatment Program

We proposed to define “opioid treatment program” at § 410.67(b) as an entity that is an OTP as defined in § 8.2 (or any successor regulation) and meets the applicable requirements for an OTP. We proposed to codify this definition at § 410.67(b). In addition, we proposed that for an OTP to participate and receive payment under the Medicare program, the OTP must be enrolled under section 1866(j) of the Act, have in effect a certification by SAMHSA for such a program, and be accredited by an accrediting body approved by SAMHSA. We also proposed that an OTP must have a provider agreement as required by section 1866(a) of the Act. We proposed to codify these requirements at § 410.67(c). We solicited public comments on the proposed definition of OTP and the proposed Medicare requirements for OTPs.

The following is a summary of the comments we received and our responses.

Comment: Commenters generally supported the proposed definition of OTP, including the requirements that OTPs be enrolled under section 1866(j) of the Act, have in effect a certification by SAMHSA for such a program, and be accredited by an accrediting body approved by SAMHSA. One commenter stated that these policies represent only the start of an ongoing effort to address the opioid epidemic.

Response: We appreciate the support for the proposed definition of OTPs. We understand the importance of combating the opioid epidemic and intend to monitor the implementation of this new Medicare benefit and may propose further refinements in future rulemaking. After consideration of the comments received, we are finalizing

our proposed definition of “opioid treatment program” at § 410.67(b).

Comment: Commenters supported the proposed Medicare requirements for OTPs, including the requirement that they have in effect a provider agreement with the Secretary. One commenter welcomed CMS’ reminder to providers that being a Medicare provider carries with it a limit on charges to beneficiaries, and stated that in addition to the proposal for zero cost sharing for OTP services, this policy would help to protect beneficiary access to care and economic security.

Response: We appreciate the support for the proposal to require OTPs to enter into a provider agreement and are finalizing this requirement at § 410.67(c), along with § 424.67(b). Additionally, we reiterate that as indicated in the Health Insurance Benefit Agreement (Form CMS–1561),³⁶ the provider agrees to conform to the provisions of section 1866 of the Social Security Act and the applicable provisions in Title 42 Code of Federal Regulations (CFR), which in part establish the requirement that a provider must accept assignment of Medicare payment.

Comment: Many commenters supported CMS’ view that the comprehensive OTP standards for certification of OTPs established by SAMHSA address the same topics as would be addressed by CMS conditions of participation, and that the detailed process established by SAMHSA for selecting and overseeing its accreditation organizations is similar to the accrediting organization oversight process that would typically be established by CMS. Furthermore, commenters agreed with CMS’ conclusion that the existing SAMHSA certification and accreditation requirements are both appropriate and sufficient to ensure the health and safety of individuals receiving services from OTPs, as well as the effective and efficient furnishing of such services. Commenters also noted the regulations established by the DEA and the regulations established by states for licensure purposes as additional assurances of patient health and safety. The commenters agreed that creating additional conditions at this time for participation in Medicare by OTPs could create unnecessary regulatory duplication and could be potentially burdensome for OTPs. Thus, the commenters supported the proposal to accept the existing SAMHSA requirements for certification and

accreditation as the health and safety standards that must be met in order for an OTP to participate in Medicare.

Response: We are finalizing our proposal to adopt the existing SAMHSA requirements for certification and accreditation as the health and safety standards that must be met in order for an OTP to participate in Medicare. This approach will avoid unnecessary regulatory duplication while assuring Medicare beneficiary safety at OTPs.

After consideration of the comments, we are finalizing the proposed definition of “opioid treatment program” at § 410.67(b). We are also finalizing the proposed Medicare requirements for OTPs at § 410.67(c). Specifically, in order for an OTP to participate and receive payment under the Medicare program, the OTP must be enrolled under section 1866(j) of the Act, have in effect certification by SAMHSA, and be accredited by an accrediting body approved by SAMHSA. Additionally, we are finalizing our proposal that an OTP must have a provider agreement as required by section 1866(a) of the Act.

3. Bundled Payments for OUD Treatment Services

Section 1834(w) of the Act, added by section 2005 of the SUPPORT Act, directs the Secretary to pay to the OTP an amount that is equal to 100 percent of a bundled payment for OUD treatment services that are furnished by the OTP to an individual during an episode of care. We proposed to establish bundled payments for OUD treatment services which, as discussed above, would include the medications approved by the FDA under section 505 of the FFDCA for use in the treatment of OUD; the dispensing and administration of such medication, if applicable; substance use counseling; individual and group therapy; and toxicology testing. In calculating the bundled payments, we proposed to apply separate payment methodologies for the drug component (which includes the medications approved by the FDA under section 505 of the FFDCA for use in the treatment of OUD) and the non-drug component (which includes the dispensing and administration of such medications, if applicable; substance use counseling; individual and group therapy; and toxicology testing) of the bundled payments. We proposed to calculate the full bundled payment rate by combining the drug component and the non-drug components. We outlined our proposals for determining the bundled payments for OUD treatment services addressing payment rates for these services under the Medicaid and

³⁶ <https://www.cms.gov/Medicare/CMS-Forms/CMS-Forms/Downloads/CMS1561.pdf>.

TRICARE programs, duration of the episode of care for which the bundled payment is made (including partial episodes), methodology for determining bundled payment rates for the drug and non-drug components, site of service, coding and beneficiary cost sharing. We proposed to codify the methodology for determining the bundled payment rates for OUD treatment services at § 410.67(d).

We received a number of public comments on the proposed approach to calculating the full bundled payment rate. The following is a summary of the comments we received and our responses.

Comment: A few commenters supported the proposal to calculate the full bundled payment rate by combining the drug component and the non-drug components. Another commenter stated that clinical services, such as individual and group counseling, should be billed separately from the medication.

Response: Section 1861(jjj) of the Act defines OUD treatment services to include certain opioid treatment medications furnished by an OTP, as well as other services such as substance use counseling and individual and group therapy. Section 1834(w) of the Act instructs the Secretary to make a bundled payment for the services that are furnished by an OTP to an individual during an episode of care. We do not believe the statute supports unbundling the medications from the other OUD treatment services furnished by OTPs during the same episode of care.

After consideration of the public comments, we are finalizing our proposal to calculate the full bundled payment rate for services furnished by OTPs by combining the drug component and the non-drug components. We are codifying the methodology for determining the bundled payment rates for OUD treatment services at § 410.67(d).

a. Review of Medicaid and TRICARE Programs

Section 1834(w)(2) of the Act, added by section 2005(c) of the SUPPORT Act, provides that in developing the bundled payment rates for OUD treatment services furnished by OTPs, the Secretary may consider payment rates paid to the OTPs for comparable services under the state plans under title XIX of the Act (Medicaid) or under the TRICARE program under chapter 55 of title 10 of the United States Code (U.S.C.). The payments for comparable services under TRICARE and Medicaid programs are discussed below. In the proposed rule, we acknowledged that

many private payers cover services furnished by OTPs, and welcomed comment on the scope of private payer OTP coverage and the payment rates private payers have established for OTPs furnishing comparable OUD treatment services. We also indicated that we might consider this information as part of the development of the final bundled payment rates for OUD treatment services furnished by OTPs.

(1) TRICARE

In the “TRICARE: Mental Health and Substance Use Disorder Treatment” final rule, which appeared in the September 2, 2016 **Federal Register** (81 FR 61068) (hereinafter referred to as the 2016 TRICARE final rule), the Department of Defense (DOD) finalized its methodology for determining payments for services furnished to TRICARE beneficiaries by an OTP in the regulations at 32 CFR 199.14(a)(2)(ix). The payments are also described in Chapter 7, Section 5 and Chapter 1, Section 15 of the TRICARE Reimbursement Manual 6010.61–M, April 1, 2015. As discussed in the 2016 TRICARE final rule, a number of commenters indicated that they believed the rates established by DOD are near market rates and acceptable (81 FR 61079).

In the 2016 TRICARE final rule, DOD established separate payment methodologies for treatment in OTPs based on the particular medication being administered. DOD finalized a weekly all-inclusive per diem rate for OTPs when furnishing methadone for MAT. Under 32 CFR 199.14(a)(2)(ix)(A)(3)(i), this weekly rate includes the cost of the drug and the cost of related non-drug services (that is, the costs related to intake/assessment, drug dispensing and screening and integrated psychosocial and medical treatment and supportive services), hereafter referred to as the non-drug services. In the proposed rule (84 FR 40524), we noted that the services included in the TRICARE weekly bundle are generally comparable to the definition of OUD treatment services in section 2005 of the SUPPORT Act. The weekly all-inclusive per diem rate for these services was determined based on preliminary review of industry billing practices (which included Medicaid and other third-party payers) for the dispensing of methadone, including an estimated daily drug cost of \$3 and a daily estimated cost of \$15 for the non-drug services. These daily costs were converted to an estimated weekly per diem rate of \$126 (\$18 per day × 7 days) in the 2016 TRICARE final rule. Under 32 CFR 199.14(a)(2)(iv)(C)(2), this rate is

updated annually by the Medicare hospital inpatient prospective payment system (IPPS) update factor. The 2019 TRICARE weekly per diem rate for methadone treatment in an OTP is \$133.15.³⁷ Beneficiary cost-sharing consists of a flat copayment that may be applied to this weekly rate.

DOD also established payment rates for other medications used for MAT (buprenorphine and extended-release injectable naltrexone) to allow OTPs to bill for the full range of medications available. Under 32 CFR 199.14(a)(2)(ix)(A)(3)(ii), DOD established a fee-for-service (FFS) payment methodology for buprenorphine and extended-release injectable naltrexone because they are more likely to be prescribed and administered in an office-based treatment setting but are still available for treatment furnished in an OTP. DOD stated in the 2016 TRICARE final rule (81 FR 61080) that treatment with buprenorphine and naltrexone is more variable in dosage and frequency than with methadone. Therefore, TRICARE pays for these medications and the accompanying non-drug services separately on a FFS basis. Buprenorphine is paid based on 95 percent of average wholesale price (AWP) and the non-drug component is paid on a per visit basis at an estimated cost of \$22.50 per visit. Extended-release injectable naltrexone is paid at the average sales price (ASP) plus a drug administration fee while the non-drug services are also paid at an estimated per visit cost of \$22.50. DOD also reserved discretion to establish the payment methodology for new drugs and biologicals that may become available for the treatment of SUDs in OTPs.

DOD instructed that OTPs use the “Alcohol and/or other drug use services, not otherwise specified” H-code for billing the non-drug services when buprenorphine or naltrexone is used, and required OTPs to also include both the J-code and the National Drug Code (NDC) for the drug used, as well as the dosage and acquisition cost on the claim form.³⁸ Drugs listed on Medicare’s Part B ASP files are paid using the ASP.³⁹ Drugs not appearing on the Medicare ASP file are paid at the lesser of billed

charges or 95 percent of the AWP.⁴⁰ Using this methodology, TRICARE estimated a daily drug cost of \$10 for buprenorphine and a monthly drug cost of \$1,129 for extended-release injectable naltrexone.⁴¹

(2) Medicaid (Title XIX)

States have the flexibility to administer the Medicaid program to meet their own needs within the Medicaid program parameters set forth in federal statute and regulations. All states cover and pay for some form of medications for MAT of OUD under their Medicaid programs. However, as of 2018, only 42 states covered methadone for MAT for OUD under their Medicaid programs.⁴² We note that section 1006(b) of the SUPPORT Act amended sections 1902 and 1905 of the Act to require that Medicaid State plans cover all drugs approved under section 505 of the FFDCA to treat OUD, including methadone, and all biological products licensed under section 351 of the Public Health Service Act to treat OUD, beginning October 1, 2020. This requirement sunsets on September 30, 2025.

In reviewing Medicaid payments for OUD treatment services furnished by OTPs in a few states, we found significant variation in the MAT coverage, OUD treatment services, and payment structure among the states. Thus, it is difficult to identify a standardized Medicaid payment amount for OTP services. A number of factors such as the unit of payment, types of services bundled within a payment code, and how MAT services are paid varied among the states. For example, for treatment of OUD using methadone for MAT, most OTPs bill under HCPCS code H0020 (Alcohol and/or drug services; methadone administration and/or service (provision of the drug by a licensed program)) under the Medicaid program; however, the unit of payment varies by state from daily, weekly, or monthly. For example, the unit of payment in California is daily for methadone treatment,⁴³ while the unit of payment in Maryland for methadone

maintenance is weekly,⁴⁴ and Vermont uses a monthly unit⁴⁵ of payment of these OUD treatment items and services.

For the other MAT drugs, all states cover buprenorphine and the buprenorphine-naloxone medications;⁴⁶ however, fewer than 70 percent cover the implanted or extended-release injectable versions of buprenorphine.⁴⁷ In addition, all states cover the extended-release injectable naltrexone.⁴⁸ We also found that many states pay different rates based on the specific type of drug used for MAT.

Non-drug items and services may be included in a bundled payment with the drug or paid separately, depending on the state, and can include dosing, dispensing and administration of the drug, individual and group counseling, and toxicology testing. In some states, certain services such as assessments, individual and group counseling, and toxicology testing can be billed separately. For example, some states (such as Maryland,⁴⁹ Texas,⁵⁰ and California⁵¹) separately reimburse for individual and group counseling services, while other states (such as Vermont⁵² and New Mexico⁵³) include these services in the OUD bundled payment.

b. Aspects of the Bundle

(1) Duration of Bundle

Section 1834(w)(1) of the Act requires the Secretary to pay an OTP an amount that is equal to 100 percent of the bundled payment for OUD treatment services that are furnished by the OTP

to an individual during an episode of care (as defined by the Secretary) beginning on or after January 1, 2020. We proposed that the duration of an episode of care for OUD treatment services would be a week (that is, a contiguous 7-day period that may start on any day of the week). As noted in the proposed rule, this is similar to the structure of the TRICARE bundled payment to OTPs for methadone, which is based on a weekly bundled rate (81 FR 61079), as well as the payments by some state Medicaid programs. Given this similarity to existing coding structures, we stated that we believe a weekly duration for an episode of care would be most familiar to OTPs, and therefore, the least disruptive to adopt. We proposed to define an episode of care at § 410.67(b) as a 1-week (contiguous 7-day) period; however, we also solicited comments on whether we should consider a daily or monthly bundled payment.

We also recognized that patients receiving MAT are often on this treatment regimen for an indefinite amount of time, and therefore, we did not propose any maximum number of weeks during an overall course of treatment for OUD.

We received a number of public comments on the duration of the bundled payment. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported the proposal to define an episode of care as a 1-week (contiguous 7-day) period, while several commenters stated that a monthly episode of care may be more appropriate in some circumstances, such as during the maintenance phase of treatment, and a few commenters supported daily bundles because that approach is more consistent with the payment structure under their state Medicaid program. Many commenters were supportive of our decision not to propose any maximum number of weeks for a course of treatment for OUD.

Response: While we recognize that the clinical needs of patients may differ depending on their stage of treatment, we are finalizing our proposal to define an episode of care as a 1-week (contiguous 7-day) period. OTPs are generally familiar with weekly episodes and we believe use of a weekly bundle will be less disruptive to the extent that an OTP already has processes in place to bill for weekly episodes. We recognize that patients receiving MAT are often on this treatment regimen for an indefinite amount of time, and therefore, we are not imposing any limit on the maximum number of weeks

⁴⁰ <https://manuals.health.mil/pages/DisplayManualHtmlFile/TR15/30/AsOf/TR15/C7S5.html>; <https://manuals.health.mil/pages/DisplayManualHtmlFile/TR15/30/AsOf/TR15/c1s15.html2FM10546>.

during an overall course of treatment for OUD.

After consideration of the public comments, we are finalizing our proposal to define an episode of care as a 1-week (contiguous 7-day) period at § 410.67(b). We are not finalizing any limit on the maximum number of weeks during an overall course of treatment for OUD.

(a) Requirements for an Episode

In the proposed rule (84 FR 40525), we noted that SAMHSA requires OTPs to have a treatment plan for each patient that identifies the frequency with which items and services are to be provided (§ 8.12(f)(4)). We recognized that there is a range of service intensity depending on the severity of a patient's OUD and stage of treatment, and therefore, a "full weekly bundle" may consist of a very different frequency of services for a patient in the initial phase of treatment compared to a patient in the maintenance phase of treatment, but that we would still consider the requirements to bill for the full weekly bundle to be met if the patient is receiving the majority of the services identified in their treatment plan at that time. However, for the purposes of valuation, we assumed one substance use counseling session, one individual therapy session, and one group therapy session per week and one toxicology test per month. Given the anticipated changes in service intensity over time based on the individual patient's needs, we explained that we expect that treatment plans would be updated to reflect these changes or noted in the patient's medical record, for example, in a progress note. In cases where the OTP has furnished the majority (51 percent or more) of the services identified in the patient's current treatment plan (including any changes noted in the patient's medical record) over the course of a week, we proposed that it could bill for a full weekly bundle. We proposed to codify the payment methodology for full episodes of care (as well as partial episodes of care and non-drug episodes of care, as discussed below) in § 410.67(d)(2).

Comment: Several commenters stated that the frequency of services listed in the proposed rule for a typical case (we assumed one substance use counseling session, one individual therapy session, and one group therapy session per week and one toxicology test per month) would usually only occur during the initial phase of treatment/stabilization.

Response: We reiterate that we understand that the frequency of services will vary over time, and may be very different for a patient in the initial

phase of treatment compared to a patient in the maintenance phase of treatment. We note that while we identified a set of services for purposes of calculating the payment rate for the weekly bundle, it is not a requirement for billing the bundled payment that all of those services be furnished in a given episode of care. Rather, as we discuss in more detail below, we are finalizing a policy under which the threshold to bill for an episode of care will be that at least one service was furnished to the patient during the week that corresponds to the episode of care.

(b) Partial Episode of Care

As we explained in the proposed rule, we understand that there may be instances in which a beneficiary does not receive all of the services expected in a given week due to any number of issues, including, for example, an inpatient hospitalization during which a beneficiary would not be able to go to the OTP or inclement weather that impedes access to transportation. To provide more accurate payment to OTPs in cases where a beneficiary is not able to or chooses not to receive all items and services described in their treatment plan or the OTP is unable to furnish services, for example, in the case of a natural disaster, we proposed to establish separate payment rates for partial episodes that correspond with each of the full weekly bundles. In cases where the OTP has furnished at least one of the items or services (for example, dispensing one day of an oral MAT medication or one counseling session or one toxicology test) but less than 51 percent of the items and services included in OUD treatment services identified in the patient's current treatment plan (including any changes noted in the patient's medical record) over the course of a week, we proposed that it could bill for a partial weekly bundle. In cases in which the beneficiary does not receive a drug during the partial episode, we proposed that the code describing a non-drug partial weekly bundle must be used. For example, the OTP could bill for a partial episode in instances where the OTP is transitioning the beneficiary from one OUD medication to another and therefore the beneficiary is receiving less than a week of one type of medication. In those cases, two partial episodes could be billed, one for each of the medications, or one partial episode and one full episode, if all requirements for billing are met. We noted our intent to monitor this issue and to consider the need to make changes to this policy in future rulemaking to ensure that the billing for partial episodes is not being

abused. We proposed to define a partial episode of care in § 410.67(b) and to codify the payment methodology for partial episodes in § 410.67(d). We solicited comments on our proposed approach to full and partial episodes, including the threshold that should be applied to determine when an OTP may bill for the full weekly bundle versus a partial episode. We also solicited comment on the minimum threshold that should be applied to determine when a partial episode could be billed (for example, at least one item or service, or an alternative threshold such as 10 or 25 percent of the items and services included in the OUD treatment services identified in the patient's current treatment plan (including any changes noted in the patient's medical record) over the course of a week). We also solicited comment regarding whether any other payers of OTP services allow for billing of partial bundles and what thresholds they use.

We received public comments on our proposal to create separate coding and payment for partial episodes. The following is a summary of the comments we received and our responses.

Comment: Many commenters noted that determining the threshold for when to bill the partial episode versus the full episode was impractical, stating it would be cumbersome to implement and would require far more frequent updating of the treatment plan than is typical, especially since the frequency of services delivered can vary significantly from week to week. Commenters also requested clarification on how various services would count toward the 51 percent threshold, and urged CMS to eliminate the partial bundled payment to simplify billing and reduce confusion that could lead to billing compliance issues. A few commenters stated that the total number of services associated with a patient's treatment plan is not documented in a way that would facilitate using the proposed threshold for billing for a full bundle, and therefore, it would not be feasible for OTPs to operationalize the proposed approach. Some commenters also noted that operationalizing this approach would require them to obtain additional administrative resources to track the services provided to each patient in relation to their treatment plan in order to determine when the threshold for billing for a full bundle is met. A few commenters stated that applying partial episodes to the TRICARE bundled rate is inconsistent with TRICARE's approach, which already accounts for differences in treatment intensity in a single unified payment rate. Others recommended that

CMS should not apply partial week payments, as the reduced resource costs for some episodes are already reflected in the payment rate for the full week bundle. A few commenters supported the concept of partial episodes, but requested clarification about the billing threshold.

Response: Based on the concerns raised by the commenters, we are not finalizing partial episodes at this time. We understand that many OTPs would need to change their documentation patterns to operationalize the proposed threshold for determining when to bill a full episode versus a partial episode and that having to make such changes in a short amount of time could be burdensome and potentially create barriers to providing care. In the interest of combating the opioid crisis and in the best interest of beneficiaries, our goal is to minimize barriers to OTPs enrolling in Medicare and beginning to furnish services to Medicare beneficiaries. Accordingly, for CY 2020, we are finalizing only the proposal to establish full weekly bundled payments at § 410.67(d)(2). The threshold to bill a full episode will be that at least one service was furnished (from either the drug or non-drug component) to the patient during the week that corresponds to the episode of care. We are finalizing this threshold at § 410.67(d)(3). We note that we will be monitoring for abuse given this lower threshold for billing for full weekly bundled payment. We also note that we remain interested in implementing a payment policy for partial episodes at some point in the future. We would establish the policies to govern partial episodes through notice and comment rulemaking, and we are interested in working with OTPs to explore how such a policy would best be applied.

(c) Non-Drug Episode of Care

In addition to the bundled payments for full and partial episodes of care that are based on the medication administered for treatment (and include both a drug and non-drug component as described in detail below), we proposed to establish a non-drug episode of care to provide a mechanism for OTPs to bill for non-drug services, including substance use counseling, individual and group therapy, and toxicology testing that are rendered during weeks when a medication is not administered, for example, in cases where a patient is being treated with injectable buprenorphine or naltrexone on a monthly basis or has a buprenorphine implant. We proposed to codify this non-drug episode of care at § 410.67(d).

We did not receive any comments on non-drug episodes of care, and are finalizing the policies governing the use of non-drug episodes of care in § 410.67(d)(1)(iii).

(2) Drug and Non-Drug Components

As discussed above, in establishing the bundled payment rates, we proposed to develop separate payment methodologies for the drug component and the non-drug (which includes the dispensing and administration of such medication, if applicable; substance use counseling; individual and group therapy; and toxicology testing) components of the bundled payment. Each of these components is discussed in this section.

(a) Drug Component

As discussed previously, the cost of medications used by OTPs to treat OUD varies widely. Creating a single bundled payment rate that does not reflect the type of drug used could result in access issues for beneficiaries who might be best served by treatment using a more expensive medication. As a result, in the proposed rule (84 FR 40526), we stated our belief that the significant variation in the cost of these drugs would need to be reflected adequately in the bundled payment rates for OTP services to avoid impairing access to appropriate care.

Section 1834(w)(2) of the Act states that the Secretary may implement the bundled payment to OTPs through one or more bundles based on a number of factors, including the type of medication provided (such as buprenorphine, methadone, extended-release injectable naltrexone, or a new innovative drug). Accordingly, consistent with the discretion afforded under section 1834(w)(2) of the Act, and after consideration of payment rates paid to OTPs for comparable services by other payers as discussed above, we proposed to base the OTP bundled payment rates, in part, on the type of medication used for treatment. Specifically, we proposed the following categories of bundled payments to reflect those drugs currently approved by the FDA under section 505 of the FFDCA for use in treatment of OUD:

- Methadone (oral).
- Buprenorphine (oral).
- Buprenorphine (injection).
- Buprenorphine (implant).
- Naltrexone (injection).

In addition, we proposed to create a category of bundled payment describing a drug not otherwise specified to be used for new drugs (as discussed further below). We also proposed a non-drug bundled payment to be used when

medication is not administered (as discussed further below) noting that we believe creating these categories of bundled payments based on the drug used for treatment would strike a reasonable balance between recognizing the variable costs of these medications and the statutory requirement to make a bundled payment for OTP services. We proposed to codify this policy of establishing the categories of bundled payments based on the type of opioid agonist and antagonist treatment medication in § 410.67(d)(1).

We received public comments related to our proposal to establish categories of OTP bundled payments based on the type of opioid agonist and antagonist treatment medication used during the episode of care. The following is a summary of the comments we received and our responses.

Comment: Several commenters submitted comments concerning our proposal to base the OTP bundled payment rates, in part, on the type of medication (that is, methadone (oral), buprenorphine (oral), buprenorphine (injection), buprenorphine (implant), naltrexone (injection)) used for treatment. A few commenters supported our proposal to use the five medication categories. Another commenter supported the medication categories but cautioned CMS to monitor and evaluate drug pricing and availability to ensure the payments are sufficient to cover the cost of medications. In contrast, another commenter stated that the medications should not be bundled and that the bundles, if used, were too broad. This commenter believed such an approach would inhibit the ability of the health care provider to choose the best treatment for a patient.

Response: Section 1861(jjj)(1) of the Act defines OUD treatment services to include certain opioid treatment medications furnished by an OTP. Section 1834(w) of the Act instructs the Secretary to make a bundled payment for these services. We do not believe the statute supports unbundling the medications from the other OUD treatment services furnished by OTPs. We defined the five medication categories to represent the distinct types of covered OTP medications currently on the market based on primary active ingredient, method of administration, and cost. We believe these categories of bundled payments strike a reasonable balance between recognizing the variable costs of these medications and the statutory requirement to make a bundled payment for OTP services. We discuss our treatment of new drugs below.

Comment: One commenter urged CMS to clarify whether the naltrexone bundled payment category referred to injectable or oral naltrexone.

Response: The naltrexone drug product that is FDA-approved for the treatment of opioid dependence is an extended-release, intramuscular injection.⁵⁴ The naltrexone bundled payment category refers to this injectable product.

Comment: A commenter brought to our attention the fact that buprenorphine-only products are both FDA-approved and marketed for the treatment of opioid dependence by generic manufacturers, whereas in the proposed rule, we stated our understanding that all oral buprenorphine products also contained naloxone as an active ingredient. The commenter recommended that we clarify the definition of buprenorphine products to note the inclusion of these products as well.

Response: Upon further inspection, we have identified marketed buprenorphine-only products. We have also reviewed the available pricing for both the buprenorphine-only and the buprenorphine with naloxone products and found them to be similar. We believe that including both types of products in the same drug category for payment purposes would not negatively impact patient access to either of these two versions of buprenorphine. Therefore, we are clarifying that the proposed “Buprenorphine (oral)” drug category includes both the buprenorphine-only and buprenorphine-naloxone products that are currently FDA-approved and marketed for the treatment of opioid dependence.

After consideration of the public comments, we are finalizing our proposal to base the OTP bundled payment rates, in part, on the type of medication used for treatment. These categories reflect those drugs currently approved by the FDA under section 505 of the FDCA for use in treatment of OUD: that is, methadone (oral), buprenorphine (oral), buprenorphine (injection), buprenorphine (implant), naltrexone (injection). We will codify this policy of establishing the categories of bundled payments based on the type of opioid agonist and antagonist treatment medication in § 410.67(d)(1).

i. New Drugs

We anticipate that there may be new FDA-approved opioid agonist and antagonist treatment medications to

treat OUD in the future. In the scenario where an OTP furnishes MAT using a new FDA-approved opioid agonist or antagonist medication for OUD treatment that is not specified in one of our existing codes, we proposed that OTPs would bill for the episode of care using the medication not otherwise specified (NOS) code (HCPCS code G2075). In such cases, we proposed to use the typical or average maintenance dose to determine the drug cost for the new bundle. We also proposed that pricing would be determined based on the relevant pricing methodology (described in section II.G.3. of this final rule) or invoice pricing in the event the information necessary to apply the relevant pricing methodology is not available. For example, in the case of injectable and implantable drugs, which are generally covered and paid for under Medicare Part B, we proposed to use the methodology in section 1847A of the Act (which bases most payments on ASP). For oral medications, which are generally covered and paid for under Medicare Part D, we proposed to use ASP-based payment when we receive manufacturer-submitted ASP data for these drugs. In the event that we do not receive manufacturer-submitted ASP pricing data, we considered several potential pricing mechanisms (discussed further below) to estimate the payment amounts for oral drugs typically paid for under Medicare Part D but that would become OTP drugs paid under Part B when used as part of MAT furnished in an OTP. We did not propose a specific pricing mechanism for the situation in which we do not receive manufacturer-submitted ASP pricing data, but solicited public comment on several potential approaches for estimating the acquisition cost and payment amounts for these drugs. If the information necessary to apply the alternative pricing methodology chosen for the oral drugs is also not available to price the new medication, we proposed to use invoice pricing until either ASP pricing data or the information necessary to apply the chosen alternate pricing methodology becomes available to price the medication. We proposed to codify this approach for determining the amount of the bundled payment for new medications in § 410.67(d)(2). The medication NOS code would be used until we have the opportunity to consider through rulemaking establishing a unique bundled payment for episodes of care during which the new drug is furnished. We solicited comments on this proposed approach to

the treatment of new drugs used for MAT in OTPs.

We received public comments on the proposals related to new drugs. The following is a summary of the comments we received and our responses.

Comment: A few commenters generally supported coverage of new FDA-approved medications for OUD. One commenter noted that a flexible approach to innovative therapies to treat OUD is critical to ensure that Medicare beneficiaries have access to all FDA-approved therapies that best meet their needs.

Response: We believe that our proposal to allow providers to bill using a medication NOS code would offer OTPs the flexibility to provide beneficiaries with quick access to new FDA-approved medications for OUD until we have the opportunity to consider through rulemaking establishing a unique bundled payment for episodes of care during which the new drug is furnished.

Therefore, we are finalizing our proposal to allow OTPs to bill for an episode of care using the medication not otherwise specified (NOS) code (HCPCS code G2075) in the scenario where an OTP furnishes MAT using a new FDA-approved opioid agonist or antagonist medication for OUD treatment that is not specified in one of our existing codes. In such cases, the typical or average maintenance dose would be used to determine the drug cost for the new bundle, which contractors would then add to the non-drug component payment amount that corresponds with the relevant payment for drug administration (oral, injectable, or implantable) to determine the total bundled payment for the episode of care. We are also finalizing our proposal that pricing would be determined based on the relevant pricing methodology as described in section II.G.3. of this final rule or through invoice pricing in the event the information necessary to apply the relevant pricing methodology is not available. We are codifying this approach for determining the amount of the bundled payment for episodes of care with new medications in § 410.67(d)(2)(i)(C).

As discussed above, we also solicited comments on how new medications that may be approved by the FDA in the future for use in the treatment of OUD with a novel mechanism of action (for example, not an opioid agonist and/or antagonist), such as medications approved under section 505 of the FDCA to treat OUD and biological products licensed under section 351 of the Public Health Service Act to treat OUD, should be considered in the

⁵⁴ <https://www.fda.gov/drugs/drugsafety/informationbydrugclass/ucm600092.htm>.

context of OUD treatment services provided by OTPs. Additionally, we solicited comments on how such new drugs with a novel mechanism of action should be priced, and specifically whether pricing for these new non-opioid agonist and/or antagonist medications should be determined using the same pricing methodology proposed for new opioid agonist and antagonist treatment medications, described above or whether an alternative pricing methodology should be used.

We did not receive any comments on the pricing of new drugs with a novel mechanism of action. We intend to monitor for the development of such new drugs for the treatment of OUD, and may consider this topic further in future rulemaking.

(b) Non-Drug Component

i. Counseling, Therapy, Toxicology Testing, and Drug Administration

As discussed above, the bundled payment is for OUD treatment services furnished during the episode of care, which we proposed to define as the FDA-approved opioid agonist and antagonist treatment medications, the dispensing and administration of such medications (if applicable), substance use counseling by a professional to the extent authorized under state law to furnish such services, individual and group therapy with a physician or psychologist (or other mental health professional to the extent authorized under state law), and toxicology testing. The non-drug component of the OUD treatment services includes all items and services furnished during an episode of care except for the medication.

Under the SAMHSA certification standards at § 8.12(f)(5), OTPs must provide adequate substance abuse counseling to each patient as clinically necessary. We note that section 1861(jjj)(1)(C) of the Act, as added by section 2005(b) of the SUPPORT Act defines OUD treatment services as including “substance use counseling by a professional to the extent authorized under state law to furnish such services.” Therefore, professionals furnishing therapy or counseling services for OUD treatment must be operating within state law and scope of practice. These professionals could include licensed professional counselors, licensed clinical alcohol and drug counselors, and certified peer specialists that are permitted to furnish this type of therapy or counseling by state law and scope of practice. To the extent that the individuals furnishing

therapy or counseling services are not authorized under state law to furnish such services, the therapy or counseling services would not be covered as OUD treatment services.

Additionally, under the SAMHSA certification standards at § 8.12(f)(6), OTPs are required to provide adequate testing or analysis for drugs of abuse, including at least eight random drug abuse tests per year, per patient in maintenance treatment, in accordance with generally accepted clinical practice. These drug abuse tests (which are identified as toxicology tests in the definition of OUD treatment services in section 1861(jjj)(1)(E) of the Act) are used for diagnosing, monitoring and evaluating progress in treatment. The testing typically includes tests for opioids and other controlled substances. Urinalysis is primarily used for this testing; however, there are other types of testing such as hair or fluid analysis that could be used. We note that any of these types of toxicology tests would be considered to be OUD treatment services and would be included in the bundled payment for services furnished by an OTP.

The non-drug component of the bundle also includes the cost of drug dispensing and/or administration, as applicable. Additional details regarding our proposed approach for pricing this aspect of the non-drug component of the bundle are included in our discussion of payment rates later in this section. We did not receive comments on our proposal to include counseling, therapy, toxicology testing, and drug administration in the non-drug component of the bundle.

ii. Other Services

As discussed in the CY 2020 PFS proposed rule, we proposed to define OUD treatment services as those items and services that are specifically enumerated in section 1861(jjj)(1) of the Act, including services that are furnished via telecommunications technology, and solicited comment on any other items and services we might consider including as OUD treatment services under the discretion given to the Secretary in subparagraph (F) of that section to determine other appropriate items and services. We noted that if we were to finalize a definition of OUD treatment services that includes any other items or services, such as intake activities or periodic assessments as discussed above, we would consider whether any changes to the payment rates for the bundled payments would be necessary. As discussed above, we received comments that were supportive of creating add-on payment adjustments

for intake activities and periodic assessments, and we are finalizing including intake activities and periodic assessment in the definition of OUD treatment services.

(3) Adjustment to Bundled Payment Rate for Additional Counseling or Therapy Services

In addition to the items and services that we proposed to include in the bundles, we recognized that counseling and therapy are important components of MAT and that patients may need to receive counseling and/or therapy more frequently at certain points in their treatment. In developing our policies for the proposed rule, we sought to ensure that patients have access to these needed services. Accordingly, we proposed to adjust the bundled payment rates through the use of an add-on code in order to account for instances in which effective treatment requires additional counseling or group or individual therapy to be furnished for a particular patient that substantially exceeds the amount specified in the patient’s individualized treatment plan. As noted previously, we understand that there is variability in the frequency of services a patient might receive in a given week depending on the patient’s severity and stage of treatment; however, in the proposed rule, we assumed that a typical case might include one substance use counseling session, one individual therapy session, and one group therapy session per week. As we explained in the proposed rule, we understand that the frequency of services will vary among patients and will change over time based on the individual patient’s needs. We expect that the patient’s treatment plan or the medical record will be updated to reflect when there are changes in the expected frequency of medically-necessary services based on the patient’s condition and following such an update, the add-on code should no longer be billed if the frequency of the patient’s counseling and/or therapy services is consistent with the treatment plan or medical record. In the case of unexpected or unforeseen circumstances that are time-limited, resolve quickly, and do not lead to updates to the treatment plan, we explained that we expect the medical necessity for billing the add-on code would be documented in the medical record. The proposed add-on code would reflect each additional 30 minutes of counseling or group or individual therapy furnished in a week of MAT, and could be billed in conjunction with the codes describing the full episode of care. For example,

there may be some weeks when a patient has a relapse or unexpected psychosocial stressors arise that warrant additional reasonable and necessary counseling services that were not foreseen at the time that the treatment plan was developed. We acknowledged that an unintended consequence of using the treatment plan to determine when billing of the add-on code would be permissible is a potential incentive for OTPs to document minimal counseling and/or therapy needs for a beneficiary, thereby resulting in increased opportunity for billing the add-on code. We indicated that we expect OTPs will ensure that treatment plans reflect the full scope of services expected to be furnished during an episode of care and will update treatment plans regularly to reflect changes. We noted that we intend to monitor this issue and would consider making changes to this policy through future rulemaking if necessary to ensure that this payment adjustment is not being billed inappropriately. We solicited comments on the add-on code and the threshold for billing. We proposed to codify this adjustment to the bundled payment rate for additional counseling or therapy services in § 410.67(d)(3)(i).

We received several comments on our proposed adjustment to the bundled payment rate for additional counseling or therapy services. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported our proposal to create an add-on G-code to adjust the bundled payment rate for additional counseling or therapy services furnished. Several commenters stated that the number of therapy and counseling services described in the proposed rule usually only occurs during the initial stages of treatment and a few commenters stated that patients with that level of need in a given week may be referred for more intensive treatment, such as Intensive Outpatient (IOP) treatment. Some commenters noted the variation in payment rates for counseling across various state Medicaid programs and a few commenters suggested that we use HCPCS code G0396 as a reference code in valuing the payment rate for the counseling add-on code.

Response: After consideration of the public comments, we are finalizing our proposal to establish an add-on code to describe an adjustment to the bundled payment when additional counseling or therapy services are furnished. This add-on payment is codified in the regulations at § 410.67(d)(4)(i)(A). The payment rate we are finalizing for this

add-on payment is discussed in more detail later in this final rule. This add-on code may be billed when counseling or therapy services are furnished that substantially exceed the amount specified in the patient's individualized treatment plan. OTPs will be required to document the medical necessity for these services in the patient's medical record. Additionally, we note that we understand the frequency with which counseling and therapy services are furnished will vary over time for each individual patient and will often decrease over time as a patient stabilizes. Nevertheless, we believe it is important to acknowledge that some patients will require more intensive counseling and therapy services at certain times during their treatment and to establish a payment methodology under which OTPs may receive payment for furnishing these medically necessary services.

(4) Site of Service (Telecommunications)

In recent years, we have sought to decrease barriers to access to care by furthering policies that expand the use of communication technologies. In the CY 2019 PFS final rule (83 FR 59482), we finalized new separate payments for communication technology-based services, including a virtual check-in and a remote evaluation of pre-recorded patient information. SAMHSA's federal guidelines (<https://store.samhsa.gov/system/files/pep15-fedguideotp.pdf>) for OTPs refer to the CMS guidance on telemedicine and also state that OTPs are advised to proceed with full understanding of requirements established by state or health professional licensing boards. SAMHSA's federal guidelines for OTPs state that exceptional attention needs to be paid to data security and privacy in this evolving field. Telemedicine services should, under no circumstances, expand the scope of practice of a healthcare professional or permit practice in a jurisdiction (the location of the patient) where the provider is not licensed.

We proposed to allow OTPs to furnish the substance use counseling, individual therapy, and group therapy included in the bundle via two-way interactive audio-video communication technology, as clinically appropriate, in order to increase access to care for beneficiaries. We believed this would be an appropriate approach because, as discussed previously, we expected the telehealth services that will be furnished by OTPs will be similar to the Medicare telehealth services furnished under section 1834(m) of the Act, and

the use of two-way interactive audio-video communication technology is required for these Medicare telehealth services under § 410.78(a)(3). By allowing use of communication technology in furnishing these services, OTPs in rural communities or federally-designated geographic health professional shortage areas would be able to facilitate treatment through virtual care coming from an urban or other external site; however, we noted that the physicians and other practitioners furnishing these services would be required to comply with all applicable requirements related to professional licensing and scope of practice.

We noted that section 1834(m) of the Act applies only to Medicare telehealth services furnished by a physician or other practitioner. Because OUD treatment services furnished by an OTP are not considered to be services furnished by a physician or other practitioner, we indicated that the restrictions of section 1834(m) of the Act would not apply. Additionally, we noted that counseling or therapy furnished via communication technology as part of OUD treatment services furnished by an OTP must not be separately billed by the practitioner furnishing the counseling or therapy because these services would already be paid through the bundled payment made to the OTP.

We proposed to include language in § 410.67(b) in the definition of OUD treatment services to allow OTPs to use two-way interactive audio-video communication technology, as clinically appropriate, in furnishing substance use counseling and individual and group therapy services, respectively. We solicited comment as to whether the proposal, including the furnishing of these services through communication technology, would be clinically appropriate. We also solicited public comment on other components of the bundle that may be clinically appropriate to be furnished via communication technology, while considering SAMHSA's guidance that OTPs should pay exceptional attention to data security and privacy.

We received public comments on the proposal to include substance use counseling and individual and group therapy services furnished using telecommunications technology in the definition of OUD treatment services. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported the proposal to allow OTPs to use two-way interactive audio-video

communication technology, as clinically appropriate, in furnishing substance use counseling and individual and group therapy services, respectively. Several commenters noted that allowing the use of communication technology in furnishing these services has the potential to vastly expand OTPs' reach, particularly in underserved areas. A few commenters urged CMS to afford OTPs maximum flexibility in how telemedicine is deployed, such as allowing the provision of such services regardless of whether or not the counselor or patient is physically located at an OTP and noted that several states already support less restrictive telemedicine practices. One commenter recommended that CMS should also allow OTPs to furnish other important medical services to beneficiaries via telecommunications, including: Medication dose assessment and interactions, basic primary care, and HIV and hepatitis C risk reduction. A few commenters requested clarification as to whether a patient participating in individual and/or group counseling could do so from their home or another location of their choosing as opposed to a designated satellite location.

Response: We are finalizing our proposal to allow OTPs to use two-way interactive audio-video communication technology, as clinically appropriate, in furnishing substance use counseling and individual and group therapy services. In response to the requests for clarification regarding where the beneficiary and practitioner can be located at the time the service is furnished, we note that section 2001 of the SUPPORT Act allows telehealth services for treatment of a diagnosed SUD or co-occurring mental health disorder to be furnished to individuals at any telehealth originating site (other than a renal dialysis facility), including in a patient's home. Accordingly, consistent with this policy, we believe it is appropriate to permit beneficiaries to receive substance use counseling and individual group therapy services furnished by an OTP using telecommunications technology in their home or any other telehealth originating site, provided the requirements that apply to telehealth services payable under the PFS after July 1, 2019, are met. In response to commenters who recommended that CMS should allow OTPs to furnish other medical services to beneficiaries via telecommunications, we note that SAMHSA and the DEA have regulations related to OUD services furnished via telecommunications that we would need further time to consider, but we may revisit this recommendation

in developing our policies for future rulemaking.

After consideration of the public comments, we are finalizing our proposal to allow OTPs to use two-way interactive audio-video communication technology, as clinically appropriate, in furnishing substance use counseling and individual and group therapy services. We are also finalizing our proposal to include substance use counseling and individual and group therapy services furnished via two-way interactive audio-video communication technology in the definition of opioid use disorder treatment service in § 410.67(b). We note that as OTP services are not PFS services, no originating site facility fee (HCPCS code Q3014) applies to OUD treatment services, and OTPs are not authorized to bill for the originating site facility fee.

(5) Coding

We proposed to adopt a coding structure for OUD treatment services that would vary by the medication administered. To operationalize this approach, we proposed to establish G codes for weekly bundles describing treatment with methadone, buprenorphine oral, buprenorphine injectable, buprenorphine implants (insertion, removal, and insertion/removal), extended-release injectable naltrexone, a non-drug bundle, and one for a medication not otherwise specified. We also proposed to establish partial episode G codes to correspond with each of those bundles, respectively. Additionally, we proposed to create an add-on code to describe additional counseling that is furnished beyond the amount specified in the patient's treatment plan. We also noted that were we to finalize including intake activities and periodic assessments in the definition of OUD treatment services, we welcomed feedback on whether we should consider modifying the payment associated with the bundle or creating add-on codes for services such as the initial physical examination, initial assessments and preparation of a treatment plan, periodic assessments or additional toxicology testing, and if so, what inputs we might consider in pricing such services, such as payment amounts for similar services under the PFS or CLFS. For example, we noted that to price the initial assessment, medical examination, and development of a treatment plan, we could crosswalk to the Medicare payment rate for a level 3 evaluation and management (E/M) visit for a new patient and to price the periodic assessments, we could crosswalk to the Medicare payment rate for a level 3 E/M visit for an established

patient. To price additional toxicology testing, we could crosswalk to the Medicare payment for presumptive drug testing, such as that described by CPT code 80305. Additionally, we welcomed feedback on whether we should consider creating codes to describe bundled payments that include only the cost of the drug and drug administration as applicable in order to account for beneficiaries who are receiving interim maintenance treatment (as described previously in this section) or other situations in which the beneficiary is not receiving all of the services described in the full bundles.

Regarding the non-drug bundle, we noted that this code would be billed for services furnished during an episode of care or partial episode of care when a medication is not administered. For example, when a patient receives a buprenorphine injection on a monthly basis, the OTP will only require payment for the medication during the first week of the month when the injection is given, and therefore, would bill the code describing the bundle that includes injectable buprenorphine during the first week of the month and would bill the code describing the non-drug bundle for the remaining weeks in that month for services such as substance use counseling, individual and group therapy, and toxicology testing.

As discussed previously, we proposed that the codes describing the bundled payment for an episode of care or partial episode of care with a medication not otherwise specified should be used when the OTP furnishes MAT with a new opioid agonist or antagonist treatment medication approved by the FDA under section 505 of the FFDCA for the treatment of OUD. OTPs would use these codes until we have the opportunity to propose and finalize a new G code to describe the bundled payment for treatment using that drug and price it accordingly in the next rulemaking cycle. We noted that the code describing the weekly bundle for a medication not otherwise specified should not be used when the drug being administered is not a new opioid agonist or antagonist treatment medication approved by the FDA under section 505 of the FFDCA for the treatment of OUD, and therefore, for which Medicare would not have the authority to make payment since section 1861(j)(1)(A) of the Act requires that the medication must be an opioid agonist or antagonist treatment medication approved by the FDA under section 505 of the FFDCA for the treatment of OUD. Given the program integrity concerns regarding the

potential for misuse of a medication not otherwise specified code, we also welcomed comments as to whether this code was needed.

See Table 18 for a list of the HCPCS codes for the weekly bundles that we are finalizing (G2067–G2075). We proposed that only an entity enrolled with Medicare as an OTP could bill these codes. Additionally, we proposed that OTPs would be limited to billing only these codes describing bundled payments, and may not bill for other codes, such as those paid under the PFS.

We received many comments related to coding and payment for OTP services. The following is a summary of the comments we received and our responses.

Comment: As described previously, many commenters supported the inclusion of intake activities, such as the initial physician examination, initial assessment and preparation of a treatment plan, as well as periodic assessments in the definition of OUD treatment services. Many commenters suggested that we create add-on codes to describe these services, and several commenters specifically suggested that we use CPT codes 99204 and 99214 as reference codes for pricing the intake and periodic assessment add-ons, respectively. A few commenters recommended that CMS work with OTPs and/or SAMHSA to determine whether an add-on for periodic assessments would sufficiently cover the needs of pregnant and postpartum women who seek care at OTPs.

Response: As discussed above, we are finalizing including intake activities and periodic assessment in the definition of OUD treatment services. It is our understanding that these services are furnished much less frequently than the other services included in the weekly bundled payments; therefore, we are creating add-on G-codes to describe these services, which will allow us to make more targeted payments for these services. We note that the add-on code describing intake activities should only be billed for new patients (that is, patients starting treatment at the OTP). We agree with the commenters that the level 4 office/outpatient E/M visits are a good approximation of the services provided at intake and during periodic assessments at OTPs based on the expected acuity of patients with OUD receiving services at OTPs, who are likely to have multiple co-morbidities and present with problems that are of moderate to high severity and require medical decision making of moderate complexity. Therefore, we are pricing the add-on code describing intake

activities using CPT code 99204 (*Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Typically, 45 minutes are spent face-to-face with the patient and/or family*) as a reference code, which is assigned a CY 2019 non-facility rate of \$166.86 under the PFS in addition to accounting for one toxicology test furnished at intake, using CPT code 80305 (*Drug test(s), presumptive, any number of drug classes, any number of devices or procedures; capable of being read by direct optical observation only (e.g., utilizing immunoassay [e.g., dipsticks, cups, cards, or cartridges]), includes sample validation when performed, per date of service*) as a reference code, which is assigned a rate of \$12.60 under the CLFS in CY 2019. Therefore, we summed those two amounts to calculate the total payment rate for the add-on code describing intake activities, which is \$179.46. Similarly, we are pricing the add-on code describing periodic assessments using CPT code 99214 (*Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A detailed history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Typically, 25 minutes are spent face-to-face with the patient and/or family*) as a reference code, which is assigned a CY 2019 non-facility rate of \$110.28 under the PFS. The medical services described by these add-on codes could be furnished by a program physician, a primary care physician or an authorized healthcare professional under the supervision of a program physician or qualified personnel such as nurse practitioners and physician assistants. The other assessments, including psychosocial assessments could be furnished by practitioners who are eligible to do so under their state

law and scope of licensure. Additionally, we note that the add-on code describing periodic assessments could be billed for each periodic assessment performed for patients that require multiple assessments during an episode of care, such as patients who are pregnant or postpartum. We note that in order to bill for the add-on code, the services would need to be medically reasonable and necessary and that OTPs should document the rationale for billing the add-on code in the patient's medical record. We also plan to monitor utilization of the periodic assessment add-on code given program integrity concerns about overutilization, and may consider further refinements in future rulemaking.

Comment: Several commenters supported the creation of add-on codes to account for more frequent presumptive testing, including presumptive testing using instrumented chemistry analyzers, and for definitive testing. Several commenters highlighted the differences between presumptive and definitive tests, stating that CPT code 80305 describes a presumptive screen test by Dipstick or Point of Care rapid test cup, and noted that there is a significant difference in the payment rate for this code compared to the codes describing definitive drug testing. Several commenters requested that CMS set a rate that encompasses medically-appropriate testing frequencies, but also addresses the complexity of testing, noting that that the presumptive screening test uses limited technology and should not be relied upon by clinicians for providing true actionable and reliable information and stated that a bundled rate that includes only a crosswalk to a point-of-care rapid test will severely impact patient care. A few commenters noted that most basic drug tests will not detect Fentanyl and that failure to properly identify Fentanyl may place patients' lives at risk, and therefore, recommended that CMS consider referencing the current CLFS rates for codes HCPCS codes G0480–G0483, which describe definitive drug testing. A few commenters noted that point of care immunoassay testing is rarely able to detect methadone or buprenorphine and can never detect naltrexone and, if methadone or buprenorphine is detected, the immunoassay is unable to determine whether the patient is compliant or is adulterating the urine sample. In contrast, definitive testing is appropriate for detecting all of the drugs used for MAT therapy.

Response: We find the commenters' arguments that both higher level presumptive tests and definitive tests

can be clinically appropriate in the treatment of OUD to be compelling. Further, we want to avoid creating financial disincentives that would prevent OTPs from furnishing medically-necessary care. Accordingly, we are building into the bundled payments both presumptive and definitive testing. We understand from commenters that while SAMHSA requires at least 8 toxicology screenings per year per patient, toxicology screening is frequently done more often, including up to weekly in new patients and that this is most frequently presumptive testing, but in more rare circumstances definitive testing is also performed. Thus, in consideration of what we believe might be an average case, we are assuming that beneficiaries will receive an average of two presumptive tests and one definitive test per month.

We priced the presumptive test based on the CLFS rate for CPT code 80305, which is \$12.60, and then prorated that amount by dividing that rate by 2 to reflect the presumption that this type of testing would be furnished only twice a month. We priced the definitive test based on the CLFS rate for HCPCS code G0480, which is \$114.43 and then prorated that amount by dividing that rate by 4 to reflect our presumption that this type of testing would be furnished once a month. Additionally, we note that we interpret the statute to require that all toxicology testing furnished by the OTP must be included in the bundled payment or adjustments to the bundled payment and could not be billed separately under the CLFS. We have elected to build the payment for these tests into the weekly bundled rates, rather than creating add-on codes, in order to avoid creating an incentive to furnish testing more frequently than needed. However, as OTPs begin to bill Medicare, if we find that there is an issue with beneficiaries receiving access to medically-necessary definitive testing, we may consider making changes to how these tests are paid through future rulemaking.

Comment: Several commenters stated that OTPs often provide case management and/or care management services and requested that CMS consider reimbursing for these services either as part of the standard bundle or as an adjustment to the bundled payment, as applicable. A few commenters stated that OTPs serve as a fixed point of responsibility in the provision of whole person-centered care and improving health outcomes through collaborative arrangements with health care providers outside of the OTP and that the goal of care management is to

reduce health care costs, specifically preventable hospital admissions, readmissions, and avoidable emergency room visits. The commenters also stated that OTP staff also help patients with accessing food benefits, housing, and employment searches, which are critical components for sustained recovery, as part of case management.

Response: We appreciate the feedback and note that we would like to work with OTPs to better understand how these services are furnished in the OTP setting and, as noted previously, we are interested in continued feedback and data on the specific items and services, including their frequency, furnished to beneficiaries by an OTP. We may consider making payment for case management/care management activities in future rulemaking.

We note that the definition of OUD treatment services described in this final rule would need to be revised in future rulemaking to include any such additional items and services.

Comment: A few commenters requested that CMS clarify whether the proposed billing codes could be used when a patient is undergoing detoxification in an OTP and some commenters requested a separate code describing a bundled payment for the costs associated with medications for medically-supervised management of opioid withdrawal, as well as counseling and toxicology testing. One commenter requested guidance to clarify how OTPs could bill for a “naloxone challenge test” prior to initiation of treatment with Vivitrol (naltrexone for extended-release injectable suspension).

Response: We note that there is no specified dosage required for billing the bundled payments, so if a patient is tapering off methadone or buprenorphine while undergoing detoxification, the bundled payments describing those drugs may be used if the requirements for billing are satisfied and the non-drug bundle could be billed during any time that the patient is not being dispensed or administered a covered OUD treatment medication. We may consider for future rulemaking whether additional coding or payment changes are needed with respect to detoxification or the provision of naloxone.

Comment: Several commenters requested clarification related to how take-home dosages of medication should be billed. A few commenters noted that the proposed definition of a partial episode does not account for patients who have earned take-home dose privileges and as a result may only

attend the OTP once or twice in a month.

Response: We agree with the commenters that additional coding is required to accurately account for the costs associated with providing a patient with take-home doses of medication. Accordingly, we are finalizing two codes to describe adjustments to the bundled payments, one for take-home supplies of methadone, which describes up to 7 additional days of medication, and can be billed along with the respective weekly bundled payment in units of up to 3 (for a total of up to a one month supply), and one for take-home supplies of oral buprenorphine, which also describes up to 7 additional days of medication and can be billed along with the base bundle in units of up to 3 (for a total of up to a 1 month supply). We note that SAMHSA allows a maximum take-home supply of one month of medication; therefore, we do not expect the add-on codes describing take-home doses of methadone and oral buprenorphine to be billed any more than 3 times in one month (in addition to the weekly bundled payment). We also note that the add-on code for take-home doses of methadone can only be used with the methadone weekly episode of care code (HCPCS code G2067). Similarly, the add-on code for take-home doses of oral buprenorphine can only be used with the oral buprenorphine weekly episode of care code (HCPCS code G2068). We are pricing the add-on code describing take-home supplies of methadone, HCPCS code G2078, based on the payment rate for the drug component for the weekly bundle describing treatment with methadone (\$35.28) and we are pricing the add-on code describing take home supplies of buprenorphine, HCPCS code G2079, based on the payment rate for the drug component for the weekly bundle describing treatment with oral buprenorphine (\$86.26).

Comment: Several commenters requested clarification related to how the bundled payment codes should be billed in a variety of situations. A few commenters specifically requested clarification on how “guest dosing” should be billed and others inquired as to whether prior authorization would be required.

Response: In response to comments seeking clarification about the threshold to bill the partial vs. the full episodes, as noted above, we are finalizing only full episodes at this time and will consider partial episodes for future rulemaking. Additionally, as noted above, we are finalizing a number of add-on G codes to describe adjustments

to the bundle. Specifically, we are creating add-on codes for intake activities, periodic assessments, take-home supplies of methadone, take-home supplies of oral buprenorphine, and additional counseling furnished. We note that some of the bundled payment codes describe a drug that is typically only administered once per month, such as the injectable drugs, or once in a 6-month period, in the case of the buprenorphine implants. In those cases, the code describing the bundled payment that includes the cost of the drug would be billed during the week that the drug is administered, and if at least once service is furnished in a subsequent week, the non-drug bundle would be billed. For example, in the case of a patient receiving injectable buprenorphine, we would expect that HCPCS code G2069 would be billed for the week during which the injection was administered and that HCPCS code G2074, which describes a bundle not including the drug, would be billed during any subsequent weeks that at least one non-drug service is furnished until the injection is administered again, at which time HCPCS code G2069 would be billed again for that week. We note that as HCPCS codes G2067–G2075 cover episodes of care of 7 contiguous days, we will not permit an OTP to bill any of these codes for the same beneficiary more than once per 7 contiguous day period. Additionally, consistent with FDA labelling, we do not generally expect the codes describing bundled payments including the injectable drugs (HCPCS codes G2069 and G2073) to be furnished more than once every 4 weeks. Similarly, consistent with FDA labelling, we do not generally expect the codes describing bundled payments including insertion of the buprenorphine implants (HCPCS codes G2070 and G2072) to be furnished more than once every 6 months.

However, we do understand there are limited clinical scenarios when a beneficiary may be appropriately furnished OUD treatment services at more than one OTP within a 7 contiguous day period, such as for guest dosing or when a beneficiary transfers care between OTPs. We note that in these limited circumstances, each of the involved OTPs may bill the appropriate HCPCS codes that reflect the services furnished to the beneficiary. We expect that both OTPs involved would provide sufficient documentation in the patient's medical record to reflect the clinical situation and services provided. We will be monitoring the claims data to ensure that this flexibility is not being

abused. Additionally, in instances in which a patient is switching from one drug to another, the OTP should only bill for one code describing a weekly bundled payment for that week and should determine which code to bill based on which drug was furnished for the majority of the week. In response to commenters who requested clarification regarding prior authorization, we note that we did not propose, and are not finalizing any prior authorization requirements for services furnished in OTPs, as our goal is not to restrict access to necessary care.

The codes and long descriptors for the OTP bundled services and add-on services we are finalizing are:

- HCPCS code G2067: *Medication assisted treatment, methadone; weekly bundle including dispensing and/or administration, substance use counseling, individual and group therapy, and toxicology testing, if performed (provision of the services by a Medicare-enrolled Opioid Treatment Program).*

- HCPCS code G2068: *Medication assisted treatment, buprenorphine (oral); weekly bundle including dispensing and/or administration, substance use counseling, individual and group therapy, and toxicology testing if performed (provision of the services by a Medicare-enrolled Opioid Treatment Program).*

- HCPCS code G2069: *Medication assisted treatment, buprenorphine (injectable); weekly bundle including dispensing and/or administration, substance use counseling, individual and group therapy, and toxicology testing if performed (provision of the services by a Medicare-enrolled Opioid Treatment Program).*

- HCPCS code G2070: *Medication assisted treatment, buprenorphine (implant insertion); weekly bundle including dispensing and/or administration, substance use counseling, individual and group therapy, and toxicology testing if performed (provision of the services by a Medicare-enrolled Opioid Treatment Program).*

- HCPCS code G2071: *Medication assisted treatment, buprenorphine (implant removal); weekly bundle including dispensing and/or administration, substance use counseling, individual and group therapy, and toxicology testing if performed (provision of the services by a Medicare-enrolled Opioid Treatment Program).*

- HCPCS code G2072: *Medication assisted treatment, buprenorphine (implant insertion and removal); weekly bundle including dispensing and/or*

administration, substance use counseling, individual and group therapy, and toxicology testing if performed (provision of the services by a Medicare-enrolled Opioid Treatment Program).

- HCPCS code G2073: *Medication assisted treatment, naltrexone; weekly bundle including dispensing and/or administration, substance use counseling, individual and group therapy, and toxicology testing if performed (provision of the services by a Medicare-enrolled Opioid Treatment Program).*

- HCPCS code G2074: *Medication assisted treatment, weekly bundle not including the drug, including substance use counseling, individual and group therapy, and toxicology testing if performed (provision of the services by a Medicare-enrolled Opioid Treatment Program).*

- HCPCS code G2075: *Medication assisted treatment, medication not otherwise specified; weekly bundle including dispensing and/or administration, substance use counseling, individual and group therapy, and toxicology testing, if performed (provision of the services by a Medicare-enrolled Opioid Treatment Program).*

- HCPCS code G2076: *Intake activities, including initial medical examination that is a complete, fully documented physical evaluation and initial assessment conducted by a program physician or a primary care physician, or an authorized healthcare professional under the supervision of a program physician or qualified personnel that includes preparation of a treatment plan that includes the patient's short-term goals and the tasks the patient must perform to complete the short-term goals; the patient's requirements for education, vocational rehabilitation, and employment; and the medical, psycho-social, economic, legal, or other supportive services that a patient needs, conducted by qualified personnel (provision of the services by a Medicare-enrolled Opioid Treatment Program); List separately in addition to code for primary procedure.*

- HCPCS code G2077: *Periodic assessment; assessing periodically by qualified personnel to determine the most appropriate combination of services and treatment (provision of the services by a Medicare-enrolled Opioid Treatment Program); List separately in addition to code for primary procedure.*

- HCPCS code G2078: *Take-home supply of methadone; up to 7 additional day supply (provision of the services by a Medicare-enrolled Opioid Treatment*

Program); List separately in addition to code for primary procedure.

- HCPCS code G2079: *Take-home supply of buprenorphine (oral); up to 7 additional day supply (provision of the services by a Medicare-enrolled Opioid Treatment Program); List separately in addition to code for primary procedure.*

- HCPCS code G2080: *Each additional 30 minutes of counseling or group or individual therapy in a week of medication assisted treatment, (provision of the services by a Medicare-enrolled Opioid Treatment Program); List separately in addition to code for primary procedure.*

Finally, we proposed that only an entity enrolled with Medicare as an OTP could bill these codes. Additionally, we proposed that OTPs would be limited to billing only these codes describing bundled payments, and may not bill for other codes, such as those paid under the PFS. We did not receive comments on these proposals, and are finalizing both these proposals.

(6) Payment Rates

We proposed that the codes describing the OTP bundled services (HCPCS codes G2067–G2075) would be assigned flat dollar payment amounts, as listed in Table 18. As discussed previously, section 2005 of the SUPPORT Act amended the definition of “medical and other health services” in section 1861(s) of the Act to provide for coverage of OUD treatment services furnished by an OTP and also added a new section 1834(w) to the Act and amended section 1833(a)(1) of the Act to establish a bundled payment to OTPs for OUD treatment services furnished during an episode of care beginning on or after January 1, 2020. Therefore, OUD treatment services and the payments for such services are wholly separate from physicians’ services, as defined under section 1848(j)(3) of the Act, and for which payment is made under section 1848 of the Act. Because OUD treatment services are not considered physicians’ services and are paid outside the PFS, we indicated that they would not be priced using relative value units (RVUs).

Consistent with section 1834(w) of the Act, which requires the Secretary to make a bundled payment for OUD treatment services furnished by OTPs, we proposed to build the payment rates for OUD treatment services by combining the cost of the drug and the non-drug components (as applicable) into a single bundled payment as described in more detail below.

(a) Drug Component

As part of determining a payment rate for the proposed bundles for OUD

treatment services, a dosage of the applicable medication must be selected in order to calculate the costs of the drug component of the bundle. We proposed to use the typical or average maintenance dose to determine the drug costs for each of the bundles. As dosing varies considerably, this approach attempts to strike an appropriate balance between high- and low-dose drug regimens in the context of a bundled payment. Specifically, we proposed to calculate payment rates using a 100 mg daily dose for methadone, a 10 mg daily dose for oral buprenorphine, a 100 mg monthly dose for the extended-release buprenorphine injection, four rods each containing 74.2 mg of buprenorphine for the 6-month buprenorphine implant, and a 380 mg monthly dose for extended-release injectable naltrexone. We solicited public comments on our proposal to use the typical maintenance dose in order to calculate the drug component of the bundled payment rate for each of the proposed codes. We also solicited comment on the specific typical maintenance dosage level that we have identified for each drug, and a process for identifying the typical maintenance dose for new opioid agonist or antagonist treatment medication approved by the FDA under section 505 of the FFDCA when such medications are billed using the medication NOS code, such as using the FDA-approved prescribing information or a review of the published, preferably peer-reviewed, literature. We noted that the bundled payment rates were intended to be comprehensive with respect to the drugs provided; therefore, we did not intend to include any other amounts related to drugs, other than for administration, as discussed below. This means, for example, that we would not pay for drug wastage, which we did not anticipate to be significant in the OTP setting.

We received several comments on our proposal to use typical maintenance dosage levels to calculate payment rates.

Comment: One commenter expressed concern over the proposal to use average maintenance doses to determine the drug cost component of the bundled payment. This commenter noted that TRICARE explicitly rejected this approach for buprenorphine and naltrexone due to significant variation in the dosage and frequency of administration for these drugs; and, instead, suggested an alternative methodology that would more appropriately account for variations in the clinical needs of patients.

Response: While the TRICARE payment rates for OTP services were considered in determining the Medicare payment for OTP services, we note that section 1834(w)(2) of the Act expressly directs the Secretary to implement the Medicare OTP benefit using one or more payment bundles. We recognize that there may be some variation in the dosage and frequency of administration of these medications. Some beneficiaries may receive a larger than average dose, while other beneficiaries will receive a smaller than average dose; but payment based on the typical dose means that, across the Medicare beneficiaries served by the OTP, the payment amount should be reasonable and represent the average costs incurred in furnishing the drug component of the OUD treatment services. We believe the proposal to use the typical maintenance dosages is a reasonable approach to address the variable dosing of these medications within the statutory direction to implement this payment through one or more bundles.

Comment: Most commenters agreed that the proposed 100 mg daily dose for methadone was reasonable. A couple of commenters also agreed with the proposed typical maintenance dosages of four rods each containing 74.2 mg of buprenorphine for the 6-month buprenorphine implant and a 380 mg monthly dose for extended-release injectable naltrexone. However, several commenters stated that the proposed typical maintenance dosage for oral buprenorphine of 10 mg is too low. A few commenters suggested that there is evidence indicating that higher doses of buprenorphine are associated with better treatment retention. Other commenters stated that OTP patients respond better to a higher dosing level of oral buprenorphine, in part, because they tend to have a longer history of opioid abuse. Commenters suggested potential alternative dosages ranging from 12–20 mg. Several commenters suggested setting the typical maintenance dosage for oral buprenorphine at 16 mg per day. One commenter noted this dosage is supported by SAMHSA’s Treatment Improvement Protocol (TIP) 63 (located at <https://store.samhsa.gov/system/files/sma18-5063fulldoc.pdf>). In addition, while a few commenters stated that the 100 mg monthly dose for the extended-release buprenorphine injection was the appropriate maintenance dose, some commenters noted it would not adequately account for the first 2 months of treatment at the higher dose of 300 mg per month. Another commenter stated that there was

evidence indicating certain patients would require longer treatment with the higher dose of the extended-release buprenorphine injection and that the FDA label instructions allowed consideration of increasing the maintenance dose to 300 mg monthly for patients in which the benefits outweigh the risk. One commenter stated that CMS would need to better define how the average maintenance dose was calculated in order to allow for comment on the methodology.

Response: We disagree with the commenter who stated that there was insufficient detail provided in the proposed rule in order to comment on the proposed average maintenance doses. As we described in the proposed rule, we identified the typical maintenance dose for each medication using the FDA-approved prescribing information or through a review of the published, preferably peer-reviewed, literature. We also included a reference in the proposed rule to each of the sources used to identify the typical maintenance doses.

We note that, as the HCPCS codes for the extended-release buprenorphine injection (that is, Q9991: Buprenorphine XR 100 mg or less and Q9992: Buprenorphine XR over 100 mg) have the same payment rate; therefore, we do not believe that it is necessary to establish a second typical maintenance dose to calculate the payment rate for this drug. However, we agree that the typical maintenance dosage for oral buprenorphine should be set higher than the proposed 10 mg. The range offered by commenters was between 12 mg and 20 mg, with a 16 mg per day dose receiving the most support. We also note that SAMHSA's TIP 63 and the FDA labeling support a target dosage of 16 mg for maintenance treatment.⁵⁵

After consideration of the public comments, we are finalizing our proposal to use the typical maintenance dosages to calculate payment rates for the drug component of the weekly bundles (that is, a 100 mg daily dose for methadone, a 100 mg monthly dose for the extended-release buprenorphine injection, four rods each containing 74.2 mg of buprenorphine for the 6-month buprenorphine implant, and a 380 mg monthly dose for extended-release injectable naltrexone) except that the payment rate for the drug component of the oral buprenorphine bundle will be calculated using a typical maintenance dose of 16 mg daily, rather than a 10 mg dose.

i. Potential Drug Pricing Data Sources

Payment structures that are closely tailored to the provider's actual acquisition cost reduce the likelihood that a drug will be chosen primarily for a reason that is unrelated to the clinical care of the patient, such as the drug's profit margin for a provider. We proposed to estimate an OTP's costs for the drug component of the bundles based on available data regarding drug costs rather than a provider-specific cost-to-charge ratio or another more direct assessment of facility or industry-specific drug costs. OTPs do not currently report costs associated with their services to the Medicare program, and we did not believe that a cost-to-charge ratio based on such reported information could be available for a significant period of time. Furthermore, we explained that we are unaware of any industry-specific data that may be used to more accurately assess the prices at which OTPs acquire the medications used for OUD treatment. Therefore, we proposed to estimate an OTP's costs for the drugs used in MAT based on other available data sources, rather than applying a cost-to-charge ratio or another more direct assessment of drug acquisition cost; however, we also noted that we intended to continue to explore alternate ways to gather this information. As described in greater detail below, we proposed that the payment amounts for the drug component of the bundles be based on CMS pricing mechanisms currently in place. We solicited comment on other potential data sources for pricing OUD treatment medications either generally or specifically with respect to acquisition by OTPs. In the case of oral drugs that we proposed to include in the OTP bundled payments and for which we do not receive manufacturer-submitted ASP data, we explained that we were considering several potential approaches for determining the payment amounts for the drug component of the bundles. Although we did not propose a specific pricing mechanism, we solicited comments on several different approaches, and stated that we intended to develop a final policy for determining the payment amount for the drug component of the relevant bundles after considering the comments received.

In considering the payment amount for the drug component of each of the bundled payments that include a drug, we began by breaking the drugs into two categories based on their current coverage and payment by Medicare. First, we discussed the injectable and implantable drugs, which are generally covered and paid for under Medicare

Part B, and then discussed the oral medications, which are generally covered and paid for under Medicare Part D.⁵⁶ Buprenorphine (injection), buprenorphine (implant), and naltrexone (injection) would fall into the former category and methadone and buprenorphine (oral) would fall into the latter category.

ii. Part B Drugs

Part B includes a limited drug benefit that encompasses drugs and biologicals described in section 1861(t) of the Act. Currently, covered Part B drugs fall into three general categories: Drugs furnished incident to a physician's services, drugs administered via a covered item of durable medical equipment, and other drugs specified by statute (generally in section 1861(s)(2) of the Act). Types of providers and suppliers that are paid for all or some of the Medicare-covered Part B drugs that they furnish include physicians, pharmacies, durable medical equipment suppliers, hospital outpatient departments, and end-stage renal disease (ESRD) facilities.

The majority of Part B drug expenditures are for drugs furnished incident to a physician's service. Drugs furnished incident to a physician's service are typically injectable drugs that are administered in a non-facility setting (covered under section 1861(s)(2)(A) of the Act) or in a hospital outpatient setting (covered under section 1861(s)(2)(B) of the Act). The statute (sections 1861(s)(2)(A) and 1861(s)(2)(B) of the Act) limits "incident to" services to drugs that are not usually self-administered; self-administered drugs, such as orally administered tablets and capsules are not paid for under the "incident to" provision. Payment for drugs furnished incident to a physician's service falls under section 1842(o) of the Act. In accordance with section 1842(o)(1)(C) of the Act, "incident to" drugs furnished in a non-facility setting are paid under the methodology in section 1847A of the Act. "Incident to" drugs furnished in a facility setting also are paid using the methodology in section 1847A of the Act when it has been incorporated under the relevant payment system (for

⁵⁶ Because, by law, methadone used in MAT cannot be dispensed by a pharmacy, it is not currently considered a Part D drug when used for MAT. Methadone used for this purpose can be dispensed only through an OTP certified by SAMHSA. However, methadone dispensed for pain may be considered a Part D drug and can be dispensed by a pharmacy.

⁵⁵ See https://www.accessdata.fda.gov/drugsatfda_docs/label/2019/022410s038lbl.pdf.

example, the Hospital Outpatient Prospective Payment System (OPPS)).⁵⁷

In most cases, payment using the methodology in section 1847A of the Act means payment is determined based on the ASP plus a statutorily-mandated 6 percent add-on. The payment for these drugs does not include costs for administering the drug to the patient (for example, by injection or infusion); payments for these physician and hospital services are made separately, and the payment amounts are determined under the PFS⁵⁸ and the OPPS, respectively. The ASP payment amount determined under section 1847A of the Act reflects a volume-weighted ASP for all NDCs that are assigned to a HCPCS code. The ASP is calculated quarterly using manufacturer-submitted data on sales to all purchasers (with limited exceptions as articulated in section 1847A(c)(2) of the Act, such as for sales at nominal charge and sales exempt from best price) with manufacturers' rebates, discounts, and price concessions reflected in the manufacturer's determination of ASP.

Although the Part B drug benefit is generally considered to be limited in scope, it includes many categories of drugs and encompasses a variety of care settings and payment methodologies. In addition to the "incident to" drugs described above, Part B also covers and pays for certain oral drugs with specific benefit categories defined under section 1861(s) of the Act, including certain oral anti-cancer drugs and certain oral antiemetic drugs. In accordance with section 1842(o)(1) of the Act or through incorporation under the relevant payment system as discussed above, most of these oral Part B drugs are also paid based on the ASP methodology described in section 1847A of the Act.

However, at times Part B drugs are paid based on wholesale acquisition cost (WAC) as authorized under section 1847A(c)(4) of the Act⁵⁹ or average manufacturer price (AMP)-based price substitutions as authorized under section 1847A(d) of the Act⁶⁰. Also, in accordance with section 1842(o) of the Act, other payment methodologies may be applied to determine the payment amount for certain Part B drugs, for example, AWP-based payments (using current AWP) are made for influenza, pneumococcal pneumonia, and

hepatitis B vaccines.⁶¹ We also use current AWP to make payment under the OPPS for very new drugs without an ASP.⁶² Contractors may also make independent payment amount determinations in situations where a national price is not available for physician and other supplier claims and for drugs that are specifically excluded from payment based on section 1847A of the Act (for example, radiopharmaceuticals as noted in section 303(h) of the Medicare Prescription Drug, Improvement and Modernization Act of 2003 (MMA) (Pub. L. 108-173, enacted December 8, 2003). In such cases, pricing may be determined based on compendia or invoices.⁶³

While most Part B drugs are paid based on the ASP methodology, MedPAC has noted that the ASP methodology may encourage the use of more expensive drugs because the 6 percent add-on generates more revenue for more expensive drugs.⁶⁴ The ASP payment amount also does not vary based on the price an individual provider or supplier pays to acquire the drug. The statute does not identify a reason for the additional 6 percent add-on above ASP; however, as noted in the MedPAC report (and by sources cited in the report), the add-on is needed to account for handling and overhead costs and/or for additional mark-up in the distribution channels that are not captured in the manufacturer-reported ASP.⁶⁵

We proposed to use the methodology in section 1847A of the Act (which bases most payments on ASP) to set the payment rates for the "incident to" drugs. However, we proposed to limit the payment amounts for "incident to" drugs to 100 percent of the volume-weighted ASP for a HCPCS code instead of 106 percent of the volume-weighted ASP for a HCPCS code. We explained our belief that limiting the add-on would incentivize the use of the most clinically appropriate drug for a given patient. In addition, we noted that it was our understanding that many OTPs purchase directly from drug manufacturers, thereby limiting the markup from distribution channels. We also proposed to use the same version of the quarterly manufacturer-submitted

data used for calculating the most recently posted ASP data files in preparing the CY 2020 payment rates for OTPs. We noted that the quarterly ASP Drug Pricing Files include ASP plus 6 percent payment amounts.⁶⁶ Accordingly, we adjusted these amounts consistent with our proposal to limit the payment amounts for these drugs to 100 percent of the volume-weighted ASP for a HCPCS code. The proposed payment rates can be found in Table 15 of the CY 2020 PFS proposed rule (84 FR 40537). We proposed to codify the ASP payment methodology for the drug component of weekly bundles that include implantable or injectable medications at § 410.67(d)(2). We solicited public comment on the proposals, as well as on using alternative ASP-based payments to price these drugs, such as a rolling average of the past year's ASP payment rates.

We received several comments on our proposals regarding pricing of Part B drugs. The following is a summary of the comments received and our responses.

Comment: Several commenters expressed concern regarding the proposal to use the methodology in section 1847A of the Act (which bases most payments on ASP) to set the payment rates for the "incident to" drugs and to limit the payment amounts to 100 percent of the volume-weighted ASP for a code instead of 106 percent of the volume-weighted ASP for a code. (We note that a similar proposal for setting the payment rates for the oral OTP drugs follows and that several of the comments we received did not specifically reference which group of drugs they were addressing; therefore, we have included a discussion of these comments under both sections.) A few commenters supported the proposal, reasoning that ASP provides a transparent and public benchmark that would allow monitoring for unexpected and unnecessary price changes by manufacturers.

Several other commenters expressed concerns about the proposal to price the Part B injectable and implantable drugs used in the bundle using the ASP without the 6 percent add-on. Commenters noted that the add-on is a necessary part of the payment to account for items such as overhead costs and/or additional mark-ups in the traditional drug distribution channels that are not captured in the manufacturer-reported ASP. A few commenters stated that the 6 percent

add-on would allow the OTP to recoup costs associated with rigorous storage and inventory tracking systems required by the DEA. These commenters also stated that the large OTPs, hospitals, and physician systems could skew ASP lower than the prices that smaller or rural OTPs could negotiate on their own. One commenter expressed concerns that OTPs might not be able to afford Part B drugs without the add-on to cover these costs, and suggested a cautious approach to ensure the success of these programs. A few commenters noted that the proposal to price Part B drugs using ASP without the 6 percent add-on would provide a disincentive for an OTP to utilize the most appropriate product for the patient in order to limit their cost of care. Some commenters objected to CMS' statement in the proposed rule that limiting the 6 percent add-on would incentivize the use of the most clinically appropriate drug for a given patient asserting that the 6 percent add-on does not provide an incentive to choose high-cost treatment inappropriately because physicians do not profit from administering Part B drugs under the ASP methodology. Several commenters also questioned CMS' legal authority to limit the payment amount for these drugs to 100 percent of the ASP.

Response: We thank the commenters for their feedback on our proposal to set the payment amounts for "incident to" drugs at 100 percent of the volume-weighted ASP. We agree that use of ASP provides a transparent and public benchmark for manufacturers' pricing as it reflects the manufacturers' actual sales prices to all purchasers (with limited exceptions) and is the only pricing methodology that includes off-invoice rebates and discounts as described in section 1847A(c)(3) of the Act. For this reason, we believe the ASP to be the most market-based approach to set drug prices for the OTP bundled payments.

As noted above, section 1834(w) of the Act grants the Secretary significant discretion to establish bundled payment rates for OUD treatment services. The statute does not dictate the use of any specific methodology, such as the methodology in section 1847A of the Act, in setting the payment rate for the drug component of the bundled payments. Therefore, we do not agree with the comments that indicated CMS has a legal obligation to include the 6 percent add-on when using ASP to determine the payment rate for the drug component of the bundled payments to OTPs for OUD treatment services.

As noted in the proposed rule, we understand that many OTPs purchase

medications directly from drug manufacturers, thereby limiting the markup from distribution channels. We received this information during a routine informational industry call with OTP advocates in preparation for drafting the proposed rule. We also note that this fact was not challenged by any of the commenters. Furthermore, we do not believe the record-keeping or storage requirements noted are unique to OTPs. In fact, the selection of drugs purchased by most OTPs is quite limited, which theoretically limits the utility of third-parties, such as wholesalers, and their associated costs and increases the purchase volume for OTPs and accompanying manufacturer discounts. We believe that this situation could lend itself to an OTP drug channel for purchasing at discounted rates either directly or through the use of buying groups as is the standard in the pharmacy industry today. Furthermore, we remain concerned that certain providers will look to differential drug costs to determine which therapies to offer. As a result, we believe that our proposed approach of paying for "incident to" drugs based on ASP offers the most appropriate balance between ensuring OTPs receive appropriate reimbursement for their drug acquisition costs, while also preserving the incentive to use the most clinically appropriate drug for the treatment of individual beneficiaries.

After consideration of the public comments, we are finalizing our proposal to use the methodology in section 1847A of the Act (which bases most payments on ASP) to set the payment rates for the "incident to" drugs and to limit the payment amounts for these drugs to 100 percent of the volume-weighted ASP for a drug category or code. We are codifying this policy in the regulations at § 410.67(d)(2)(i)(A). However, we continue to be interested in feedback regarding drug acquisition costs for OTP providers, and in particular any drug acquisitions that exceed these rates after factoring in discounts, rebates, etc., and, if necessary, may revisit the payment methodology for "incident to" OTP drugs in future rulemaking to ensure that OTPs' drug acquisition costs are appropriately reimbursed.

iii. Oral Drugs

We proposed to use ASP-based payment, which would be determined based on ASP data that have been calculated consistent with the provisions in 42 CFR part 414, subpart 800, to set the payment rates for the oral product categories when we receive manufacturer-submitted ASP data for

these drugs. We stated that we believe using the ASP pricing data for oral OTP drugs currently covered under Part D⁶⁷ would facilitate the computation of the estimated costs of these drugs. However, we acknowledged that we do not collect ASP pricing information under section 1927(b) of the Act for these drugs. We solicited public comment on whether manufacturers would be willing to submit ASP pricing data for OTP drugs currently covered under Part D on a voluntary basis.

We also proposed to limit the payment amounts for oral drugs to 100 percent of the volume-weighted ASP for a HCPCS code instead of 106 percent of the volume-weighted ASP for that HCPCS code. We explained our belief that limiting the 6 percent add-on would incentivize the use of the most clinically appropriate drug for a given patient. In addition, we explained our understanding that many OTPs purchase directly from drug manufacturers, thereby limiting the markup from distribution channels. We proposed to use the same version of the quarterly manufacturer-submitted data used for calculating the most recently posted ASP data files in preparing the CY 2020 payment rates for OTPs. We noted that the quarterly ASP Drug Pricing Files include ASP plus 6 percent payment amounts.⁶⁸ Accordingly, we would adjust these amounts consistent with our proposal to limit the payment amounts for these drugs to 100 percent of the volume-weighted ASP for a HCPCS code. The proposed payment rates were provided in Table 15 of the proposed rule. We proposed to codify the ASP payment methodology for the drug component of weekly bundles that include an oral medication at § 410.67(d)(2)(i)(B). We solicited public comment on these proposals, as well as on using alternative ASP-based payments to price these drugs, such as a rolling average of the past year's ASP payment rates.

In the event that we do not receive manufacturer-submitted ASP pricing data, we also considered several potential alternative pricing mechanisms to estimate the payment amounts for oral drugs typically paid for under Medicare Part D but that would become OTP drugs paid under Part B when used as part of MAT in an OTP.

⁶⁷ Please note that methadone is not currently considered a Part D drug when used for MAT. Methadone used for this purpose can be dispensed only through an OTP certified by SAMHSA. However, methadone dispensed for pain may be considered a Part D drug.

⁶⁸ See <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Part-B-Drugs/McrPartBDrugAvgSalesPrice/2016ASPFiles.html>.

We did not propose a specific pricing mechanism for these drugs at this time, but solicited public comment on the following potential approaches for estimating the acquisition cost and payment amounts for these drugs and on alternative approaches. We noted that we would consider the comments received in developing our final policy for determining these drug prices.

Approach 1: The Methodology in Section 1847A of the Act

One approach for estimating the cost of the drugs that are currently covered under Part D and for which ASP data are not available would be to use the methodology in section 1847A of the Act. Please see above for a discussion of the payment methodology in section 1847A of the Act. Under the methodology in section 1847A of the Act, when ASP data are not available, this option would price drugs using, for example, WAC or invoice pricing.

Approach 2: Medicare Part D Prescription Drug Plan Finder Data

On January 28, 2005, we issued the “Medicare Program; Medicare Prescription Drug Benefit” final rule (70 FR 4194) which implemented the Medicare voluntary prescription drug benefit, as enacted by section 101 of the MMA. Beginning on January 1, 2006, a prescription drug benefit program was available to beneficiaries with much broader drug coverage than was previously provided under Part B to include: Brand-name prescription drugs and biologicals, generic drugs, biosimilars, vaccines, and medical supplies associated with the injection of insulin.⁶⁹ This prescription drug benefit is offered to Medicare beneficiaries through Medicare Advantage Drug Plans (MA-PDs) and stand-alone Prescription Drug Plans (PDPs). The prescription drug benefit under Medicare Part D is administered based on the “negotiated prices” of covered Part D drugs. Under § 423.100 of the Part D regulations, the negotiated price of a Part D drug equals the amount paid by the Part D sponsor (or its pharmacy benefit manager) to the pharmacy at the point-of-sale for that drug. Typically, these Part D “negotiated prices” are based on AWP minus a percentage for brand drugs or either the maximum allowable cost, which is based on proprietary methodologies used to establish the same payment for therapeutically equivalent products marketed by multiple labelers with different AWP, or the Generic Effective Rate, which guarantees aggregate minimum

reimbursement (for example, AWP–85 percent). The negotiated price under Part D also includes a dispensing fee (for example, \$1–\$2), which is added to the cost of the drug.

Many of the beneficiaries who choose to enroll in Part D drug plans must pay premiums, deductibles, and copayments/co-insurance. The Medicare Prescription Drug Plan Finder is an online tool available at <http://www.medicare.gov>. This web tool allows beneficiaries to make informed choices about enrolling in Part D plans by comparing the plans’ benefit packages, premiums, formularies, pharmacies, and pricing data. PDPs and MA-PDs are required to submit this information to CMS for posting on the Medicare Drug Plan Finder. The database structure provides the drug pricing and pharmacy network information necessary to accurately communicate plan information in a comparative format. The Medicare Prescription Drug Plan Finder displays information on pharmacies that are contracted to participate in the sponsors’ network as either retail or mail order pharmacies.

Another approach for estimating the cost of the drugs that are currently covered under Part D and for which ASP data are not available would be to use data retrieved from the online Medicare Prescription Drug Plan Finder. For example, the Part D drug prices for each drug used by an OTP as part of MAT could be estimated based on a national average price charged by all Part D plans and their network pharmacies. However, the prices listed in the Medicare Prescription Drug Plan Finder generally reflect the prices that are negotiated by larger buying groups, as larger pharmacies often have significant buying power and smaller pharmacies generally contract with a pharmacy services administrative organization (PSAO). As a result, we indicated that our primary concern with this pricing approach is that such prices may fail to reflect the drug prices that smaller OTP facilities may pay in acquiring these drugs and could therefore disadvantage these facilities. We explained that if we were to select this pricing approach for oral drugs for which ASP data are not available, we would anticipate setting the pricing for these drugs using the most recent Medicare Prescription Drug Plan Finder data available at the drafting of this CY 2020 PFS final rule. We noted that, for the Part B ESRD prospective payment system (PPS) outlier calculation, which provides ESRD facilities with additional payment in situations where the costs for treating patients exceed an

established threshold under the ESRD PPS, we chose to adopt the ASP methodology in section 1847A of the Act, and the other pricing methodologies under section 1847A of the Act, as appropriate, when ASP data are not available, to price the renal dialysis drugs and biological products that were or would have been separately billable under Part B prior to implementation of the ESRD PPS,⁷⁰ and the national average drug prices based on the Medicare Prescription Drug Plan Finder as the data source for pricing the renal dialysis drugs or biological products that were or would have been separately covered under Part D prior to implementation of the ESRD PPS.⁷¹

In the proposed rule, we stated that we believe all of the MAT drugs proposed for inclusion in the OTP benefit that are currently covered under Part D have clinical treatment indications beyond MAT such as for the treatment of pain.⁷² These drugs will continue to be covered under Part D for these other indications. Buprenorphine will continue to be covered under Part D for MAT as well. Consequently, Part D pricing information should continue to be available for these drugs and could be used in the computation of payment under the approach discussed above.

Because, by law, methadone used in MAT cannot be dispensed by a pharmacy, it is not currently considered a Part D drug when used for MAT. Methadone used for this purpose can be dispensed only through an OTP certified by SAMHSA. However, methadone dispensed for pain may be considered a Part D drug and can be dispensed by a pharmacy. Accordingly, we also solicited comment on the applicability of Part D payment rates for methadone dispensed by a pharmacy to methadone dispensed by an OTP for MAT.

Approach 3: Wholesale Acquisition Cost (WAC)

Another approach for estimating the cost of the oral drugs that we proposed to include as part of the bundled payments, but for which ASP data are not available, would be to use WAC. Section 1847A(c)(6)(B) of the Act defines WAC as the manufacturer’s list price for the drug to wholesalers or direct purchasers in the U.S., not including prompt pay or other discounts, rebates, or reductions in price, for the most recent month for

⁷⁰ 82 FR 50742 through 50745.

⁷¹ 75 FR 49142.

⁷² For example, while methadone is not covered by Medicare Part D for MAT, methadone dispensed for pain may be considered a Part D drug.

⁶⁹ See section 1860D–2(e) of the Act.

which the information is available, as reported in wholesale price guides or other publications of drug pricing data. As noted above in the discussion of Part B drugs, WAC is used as the basis for pricing some Part B drugs; for example, it is used when it is less than ASP in the case of single source drugs (section 1847A(b)(4) of the Act) and in cases where ASP is unavailable during the first quarter of sales (section 1847A(c)(4) of the Act).

Because WAC is the manufacturer's list price to wholesalers, we noted that we believe it is more reflective of the price paid by the end user than the AWP. As a result, we believe that this pricing mechanism would be consistent with pricing that currently occurs for drugs that are separately billable under Part B. However, we have concerns about the fact that WAC does not include prompt pay or other discounts, rebates, or reductions in price. We noted that if we were to select this option to estimate the cost of certain drugs, we would develop pricing using the most recent data files available at the time of drafting this CY 2020 PFS final rule.

Approach 4: National Average Drug Acquisition Cost (NADAC)

Another approach for estimating the cost of the oral drugs that we proposed to include as part of the bundled payments, but for which ASP data are not available, would be to use Medicaid's NADAC survey. This survey provides another national drug pricing benchmark. CMS conducts surveys of retail community pharmacy prices, including drug ingredient costs, to develop the NADAC pricing benchmark. The NADAC was designed to create a national benchmark that is reflective of the prices paid by retail community pharmacies to acquire prescription and over-the-counter covered outpatient drugs and is available for consideration by states to assist with their individual pharmacy payment policies.

State Medicaid agencies reimburse pharmacy providers for prescribed covered outpatient drugs dispensed to Medicaid beneficiaries. The reimbursement formula consists of two parts: (1) Drug ingredient costs; and (2) a professional dispensing fee. In a final rule with comment period titled "Medicaid Program; Covered Outpatient Drugs," which appeared in the February 1, 2016 **Federal Register** (81 FR 5169), we revised the methodology that state Medicaid programs use to determine drug ingredient costs, establishing an Actual Acquisition Cost (AAC) based determination, as opposed to a determination based on estimated acquisition costs (EAC). AAC is defined

at 42 CFR 447.502 as the agency's determination of the pharmacy providers' actual prices paid to acquire drugs marketed or sold by specific manufacturers. As explained in the Covered Outpatient Drugs final rule with comment period (81 FR 5175), we believe shifting from an EAC to an AAC based determination of ingredient costs is more consistent with the dictates of section 1902(a)(30)(A) of the Act. In 2010, a working group within the National Association of State Medicaid Directors (NASMD) recommended the establishment of a single national pricing benchmark based on average drug acquisition costs. Pricing metrics based on actual drug purchase prices provide greater accuracy and transparency in how drug prices are established and are more resistant to manipulation. The NASMD requested that CMS coordinate, develop, and support this benchmark.

Section 1927(f) of the Act provides, in part, that CMS may contract with a vendor to conduct monthly surveys with respect to prices for covered outpatient drugs dispensed by retail community pharmacies. We entered into a contract with Myers & Stauffer, LLC to perform a monthly nationwide retail price survey of retail community pharmacy covered outpatient drug prices (CMS-10241, OMB 0938-1041) and to provide states with weekly updates on pricing files, that is, the NADAC files. The NADAC survey process focuses on drug ingredient costs for retail community pharmacies. The survey collects acquisition costs for covered outpatient drugs purchased by retail pharmacies, which include invoice prices from independent and chain retail community pharmacies. The survey data provide information that CMS uses to assure compliance with federal requirements. In the proposed rule, we explained that we believe NADAC data could be used to set the prices for the oral drugs furnished by OTPs for which ASP data are not available. Survey data on invoice prices provide the closest pricing metric to ASP that we are aware of. However, we also noted that similar to the other available pricing metrics, we have concerns about the applicability of retail pharmacy prices to the acquisition costs available to OTPs since we have no evidence to suggest that these entities would be able to acquire drugs at a similar price point. We noted that if we were to select this option to estimate the cost of certain drugs, we would develop pricing using the most recent data files available at the time of drafting this CY 2020 PFS final rule.

Alternative Methadone Pricing: TRICARE

We also considered an approach for estimating the cost of methadone using the amount calculated by TRICARE. As discussed above in this section of this final rule, the TRICARE rates for medications used in OTPs to treat OUD are spelled out in the 2016 TRICARE final rule (81 FR 61068); in the regulations at 32 CFR 199.14(a)(2)(ix); and in Chapter 7, Section 5 and Chapter 1, Section 15 of the TRICARE Reimbursement Manual 6010.61-M, April 1, 2015.

In the 2016 TRICARE final rule, DOD established separate payment methodologies for OTPs based on the particular medication being administered for treatment.⁷³ Based on TRICARE's review of industry billing practices, the initial weekly bundled rate for administration of methadone included a daily drug cost of \$3, which is subject to an update factor.⁷⁴

We noted that this option would only be applicable for methadone because TRICARE has developed a FFS payment methodology for buprenorphine and naltrexone.⁷⁵ In the 2016 TRICARE final rule, the DOD stated that the payments for buprenorphine and naltrexone are more variable in dosage and frequency for both the drug and non-drug services.⁷⁶ Accordingly, TRICARE pays for drugs listed on Medicare's Part B ASP files, such as the injectable and implantable versions of buprenorphine using the ASP; drugs not appearing on the Medicare ASP file, such as oral buprenorphine, are priced at the lesser of billed charges or 95 percent of the AWP.⁷⁷

We stated that we believed that pricing methadone consistent with the TRICARE payment rate could provide a reasonable payment amount for methadone when ASP data are not available. As DOD noted in the 2016 TRICARE final rule, "a number of commenters indicated that they believed the rates DOD proposed for OTPs' services are near market rates and are acceptable."⁷⁸

We proposed to codify this proposal to apply an alternative approach for determining the payment rate for oral drugs only if ASP data are not available in § 410.67(d)(2)(i)(B). We solicited

public comment on the potential alternative approaches for estimating the cost of oral drugs that we proposed to include as part of the bundled payments but for which ASP data are not available, including any other alternate sources of data to estimate the cost of these oral MAT drugs. Payment rates based on these different options were set forth in Table 14 of the proposed rule. We stated that we would consider the comments received on these different approaches when deciding on the approach that we would use to determine the payment rates for oral drugs in the CY 2020 PFS final rule. We also solicited public comment on any other potential data sources for estimating the provider acquisition costs of OTP drugs currently paid under either Part B or Part D.

We received several comments on our proposals regarding pricing of oral drugs. The following is a summary of the comments received and our responses.

Comment: Several commenters submitted comments on the proposal to use ASP-based payment to set the payment rates for the oral product categories when we receive manufacturer-submitted ASP data for these drugs and to limit the payment amounts for oral drugs to 100 percent of the volume-weighted ASP instead of 106 percent of the volume-weighted ASP. (We note that a similar proposal for the injectable and implantable Part B drugs is discussed above and that several of the comments we received did not specifically reference which group of drugs they were concerning; therefore, we have included a discussion of these comments under both sections.) A few commenters supported the proposal, reasoning that ASP provides a transparent and public benchmark that would allow monitoring for unexpected and unnecessary price changes by manufacturers; and a couple of commenters encouraged us to require manufacturers to report these data.

Several other commenters expressed concerns about the proposal to price the oral drugs used in the bundle using the ASP without the 6 percent add-on. Commenters stated that the add-on is a necessary part of the payment to account for things such as overhead costs and/or additional mark-ups in the traditional drug distribution channels that are not captured in the manufacturer-reported ASP. A few commenters stated that the 6 percent add-on would allow the OTP to recoup costs associated with rigorous storage and inventory tracking systems required by the DEA. These commenters also stated that large OTPs, hospitals, and

physician systems could skew ASP lower than the prices that smaller or rural OTPs could negotiate on their own. One commenter expressed concerns that OTPs might not be able to afford the oral drugs used in MAT without the add-on to cover these costs, and suggested that the Administration should be overly cautious to ensure success of these programs. Some commenters expressed concerns that this proposal would provide a disincentive for an OTP to utilize the most appropriate product for the patient to limit their cost of care. Several commenters also questioned CMS' legal authority to limit the payment amount for these drugs to 100 percent of the ASP.

Response: We thank the commenters for their feedback on our proposal to use ASP-based payment to set the payment rates for the oral product categories when we receive manufacturer-submitted ASP data for these drugs and to limit the payment amounts for oral drugs to 100 percent of the volume-weighted ASP instead of 106 percent of the volume-weighted ASP. We agree that use of ASP provides a transparent and public benchmark for manufacturers' pricing as it reflects the manufacturers' actual sales prices to all purchasers (with limited exceptions) and is the only pricing methodology that includes off-invoice rebates and discounts as described in section 1847A(c)(3) of the Act. For this reason, we believe the ASP to be the most market-based approach to set drug prices for the OTP benefit.

As noted above, section 1834(w) of the Act grants the Secretary considerable discretion to establish bundled payment rates for OUD treatment services. The statute does not dictate use of any specific methodology, such as the methodology in section 1847A of the Act, in setting these payments. We used our discretion, granted by the Act, in proposing to modify the methodology in section 1847A of the Act to set payments to OTPs for oral drugs for which ASP data are available. Therefore, we do not agree with the comments that indicated CMS has a legal obligation to include the 6 percent add-on when using ASP to determine payments to OTPs for oral drugs.

As noted in the proposed rule, we understand that many OTPs purchase medications directly from drug manufacturers, thereby limiting the markup from distribution channels. We received this information during a routine informational industry call with OTP advocates in preparation for drafting the proposed rule. We also note

that this fact was not challenged by any of the commenters. Furthermore, we do not believe the record-keeping or storage requirements noted are unique to OTPs. In fact, the selection of drugs purchased by most OTPs is quite limited, which theoretically limits the utility of third-parties, such as wholesalers, and their associated costs and increases the purchase volume for OTPs and accompanying manufacturer discounts. We believe that this situation could lend itself to an OTP drug channel for purchasing at discounted rates either directly or through the use of buying groups as is the standard in the pharmacy industry today. Furthermore, we remain concerned that certain providers will look to differential drug costs to determine which therapies to offer. As a result, we believe that our proposed approach of paying for oral drugs based on ASP, when available, offers an appropriate balance between ensuring OTPs receive appropriate reimbursement for their drug acquisition costs, while also preserving the incentive to use the most clinically appropriate drug for the treatment of individual beneficiaries.

After consideration of the public comments, we are finalizing our proposal to use ASP-based payment to set the payment rates for the oral drugs and to limit the payment amounts for these drugs to 100 percent of the volume-weighted ASP when it is available. However, we continue to be interested in feedback regarding drug acquisition costs for OTP providers, and in particular any drug acquisitions that exceed these rates after factoring in discounts, rebates, etc., and if necessary, may revisit the payment methodology for oral OTP drugs in future rulemaking to ensure that OTPs' drug acquisition costs are appropriately reimbursed.

Comment: A few commenters submitted comments on the potential pricing mechanisms described in the proposed rule to estimate the payment amounts for oral OTP drugs in the event that we do not receive manufacturer-submitted ASP pricing data. Some commenters supported establishing payments based on current Medicare law and practice, such as the rates provided under Part D, for other oral drugs. Another commenter advised against using methods such as AWP and WAC as these options can be manipulated by the manufacturers. This commenter also noted that NADAC and the Medicare Plan Finder prices may not be relevant to all OTP medications as they are retail-based price measures and OTPs are providers. One commenter suggested use of the methodology in section 1847A of the

Act, which would generally default to WAC-based payment if ASP is not reported. One commenter generally opposed the use of TRICARE rates, while another specifically stated that the current TRICARE payment rate for methadone, as presented in the proposed rule, is fair and should be used as a reference price for Medicare.

Response: We agree with commenters that using current programmatic pricing mechanisms where available is preferable to a pricing methodology that is novel and unproven. As oral buprenorphine used for OUD is currently dispensed by retail pharmacies, we believe that a retail-based pricing method may be most relevant to this drug product and more reflective of actual costs than a list price. As noted above, the NADAC survey collects acquisition costs for covered outpatient drugs purchased by retail pharmacies, which include invoice prices from independent and chain retail community pharmacies. Pricing metrics based on actual drug purchase prices provide greater accuracy and transparency in how drug prices are established and are more resistant to manipulation. As the NADAC survey data on invoice prices provide the closest pricing metric to ASP that we are aware of, we believe, at this time, that NADAC data would be the best pricing benchmark to set the prices for non-methadone oral drugs (that is, currently only the oral buprenorphine products) furnished by OTPs for which ASP data are not available. We further agree that retail pricing benchmarks, such as NADAC and Part D Plan Finder data, may not be particularly relevant for methadone, because methadone is not dispensed by retail pharmacies for this indication and its use for OUD is limited to OTPs. As a result, we believe that use of the TRICARE rate for methadone, when ASP data are not available, is currently the most applicable reference price for Medicare payment of methadone used in the OTP setting.

After consideration of the public comments, we are finalizing our proposal to use ASP-based payment to set the payment rates for the oral product categories when we receive manufacturer-submitted ASP data for these drugs and to limit the payment amounts for oral drugs to 100 percent of the volume-weighted ASP. We have used the same version of the quarterly manufacturer-submitted data used for calculating the most recently posted ASP data files to determine the CY 2020 payment rates for OTPs. When ASP data are not available for the oral drugs used in OTPs, we are finalizing a policy

under which we will use the TRICARE rate to set the payment for the drug component of the methadone bundle, and NADAC data to set the payment for the drug component of the oral buprenorphine bundle. Payment rates for these drugs are provided in Table 18. We note that, for purposes of determining payment for CY 2020, we were able to calculate an ASP for methadone using manufacturer reported data. However, we did not receive ASP data from any of the buprenorphine oral manufacturers. Therefore, the drug component of the oral buprenorphine weekly bundle will be priced using NADAC survey data. We are finalizing this payment methodology for the oral drugs at § 410.67(d)(2)(i)(B).

(b) Non-Drug Component

To price the non-drug component of the bundled payments, we proposed to use a crosswalk to the non-drug component of the TRICARE weekly bundled rate for services furnished when a patient is prescribed methadone. As described above, in 2016, TRICARE finalized a weekly bundled rate for administration of methadone that included a daily drug cost of \$3, along with a \$15 per day cost for non-drug services (that is, the costs related to the intake/assessment, drug dispensing and screening and integrated psychosocial and medical treatment and supportive services). The daily projected per diem cost (\$18/day) was converted to a weekly rate of \$126 (\$18/day × 7 days) (81 FR 61079). TRICARE updates the weekly bundled methadone rate for OTPs annually using the Medicare update factor used for other mental health care services rendered under TRICARE (that is, the Inpatient Prospective Payment System update factor) (81 FR 61079). The updated amount for CY 2019 is \$133.15 (of which \$22.19 is the methadone cost and the remainder, \$110.96, is for the non-drug services).⁷⁹ In the proposed rule, we stated that we believed using the TRICARE weekly bundled rate would be a reasonable approach to setting the payment rate for the non-drug component of the bundled payments to OTPs, particularly given the time constraints in developing a payment methodology prior to the January 1, 2020 effective date of this new Medicare benefit category. The TRICARE rate is an established national payment rate that was established through notice and comment rulemaking. As a result, OTPs and other interested parties had an

opportunity to present information regarding the costs of these services. Furthermore, the TRICARE rate describes a generally similar bundle of services to those services that are included in the definition of OUD treatment services in section 1861(jjj)(1) of the Act. We recognized that there are differences in the patient population for TRICARE compared with the Medicare beneficiary population. However, as OTP services have not previously been covered by Medicare, we noted that it is not clear what impact, if any, these differences would have on the cost of the services included in the non-drug component of the bundled payments. We proposed to codify the methodology for determining the payment rate for the non-drug component of the bundled payments using the TRICARE weekly rate for non-drug services at § 410.67(d)(2). As part of the proposal, we noted that we would plan to monitor utilization of non-drug services by Medicare beneficiaries and, if needed, would consider in future rulemaking ways we could tailor the TRICARE payment rate for these non-drug services to the Medicare population, including dually eligible beneficiaries.

Because the TRICARE payment rate for the non-drug services included in its weekly bundled rate for methadone reflects the daily administration of methadone, as part of our proposed approach we indicated that we would adjust the TRICARE payment rate for non-drug services for most of the other bundled payments to more accurately reflect the cost of administering the other drugs used in MAT. For the oral buprenorphine bundled payment, we proposed to retain the same amount as the rate for the methadone bundled payment based on an assumption that this drug is also being dispensed daily. We stated that we understood that patients who have stabilized may be given 7–14 day supplies of oral buprenorphine at a time, but for the purposes of developing the proposed rates, we proposed to value this service to include daily drug dispensing to account for cases where daily drug dispensing is occurring. For the injectable drugs (buprenorphine and naltrexone), we proposed to subtract from the non-drug component, an amount that is comparable to the dispensing fees paid by several state Medicaid programs (\$10.50) for a week of daily dispensing of methadone. This adjustment would account for the fact that these injectable drugs are not oral drugs that are dispensed daily; we proposed that we would then instead add the fee that Medicare pays for the

⁷⁹ <https://health.mil/Military-Health-Topics/Business-Support/Rates-and-Reimbursement/MHSUD-Facility-Rates>.

administration of an injection (which is currently \$16.94 under the CY 2019 non-facility Medicare payment rate for CPT code 96372). We proposed to update the amount of this adjustment annually using the same methodology that we were proposing to use to update the non-drug component of the bundled payments.

Similarly, we proposed that the payment rates for the non-drug component of the codes for the weekly bundled payments for buprenorphine implants would be adjusted to add an amount for insertion and/or removal of the implants based on a direct crosswalk to the non-facility payment rates under the Medicare PFS for the insertion, removal, or insertion and removal of these implants, which describe the physician work, PE, and malpractice costs associated with these procedures, and to remove the costs of daily drug dispensing (determined based on the dispensing fees paid by several state Medicaid programs for a week of daily dispensing of methadone, currently \$10.50). For the code describing implant insertion, we proposed that we would use a crosswalk to the rate for HCPCS code G0516 (*Insertion of non-biodegradable drug delivery implants, 4 or more (services for subdermal rod implant)*); for the code describing implant removal, we proposed that we would use a crosswalk to the rate for HCPCS code G0517 (*Removal of non-biodegradable drug delivery implants, 4 or more (services for subdermal implants)*); and for the code describing implant insertion and removal, we proposed that we would use a crosswalk to the rate for HCPCS code G0518 (*Removal with reinsertion, non-biodegradable drug delivery implants, 4 or more (services for subdermal implants)*). We note that in the proposed rule, we inadvertently misstated the amounts for HCPCS codes G0516, G0517, and G0518. The correct amounts for HCPCS codes G0516, G0517, and G0518 under the CY 2019 non-facility Medicare payment rate are \$246.15, \$265.61, and \$465.26, respectively.

To determine the payment rates for the code describing a non-drug bundled payment, we proposed to use a crosswalk to the reimbursement rate for the non-drug services included in the TRICARE weekly bundled rate for administration of methadone, adjusted to subtract the cost of methadone dispensing (using an amount that is comparable to the dispensing fees paid by several state Medicaid programs for a week of daily dispensing of methadone, which is currently \$10.50).

We proposed that the payment rate for the add-on code for each additional 30

minutes of counseling or group or individual therapy would be based on 30 minutes of substance use counseling and valued based on a crosswalk to the rates set by state Medicaid programs for similar services.

We received a number of public comments on our proposed payment rates for the non-drug component of the bundled payment and the add-on code for additional counseling or therapy services. The following is a summary of the comments we received and our responses.

Comment: Many commenters stated that the proposed rate for the non-drug component of the bundled payment was insufficient. A few commenters expressed concern that establishing a Medicare rate that is lower than the rates set by some state Medicaid programs would destabilize the market. Some commenters recommended that the single full week TRICARE payment rate should be the floor used to pay for a basic Medicare OTP benefit assuming a similar level of service and that any additional services, such as extra counseling and/or therapy visits, should be reimbursed outside of the bundle, as CMS proposed for counseling sessions above the basic benefit and stated that if additional services are added to the basic benefit, the bundled payment should increase to reflect the additional services. Some commenters stated that the proposed rate reflects a market rate that is significantly discounted, noting that it is benchmarked on an insurance industry practice rooted in stigma and limited resources and expressed concern that it may inadvertently limit access to care at a time when the opioid overdose epidemic continues to cause significant mortality. Additionally, a few commenters noted that the TRICARE rate reflects the average cost of care for the typical TRICARE patient, but that they believed Medicare patients would generally require more services. A few commenters noted that the only difference between OTPs and office-based OUD treatment is the means of regulation and medication offered, and that therefore, the different settings should not be cause to pay differentially. Some commenters encouraged CMS to adjust the payment rates to account for severity of illness. Several commenters stated that the proposed rate for counseling is too low, which would make it difficult for providers to employ qualified practitioners. Several commenters urged CMS to use a building block methodology, which sums the Medicare payment rates for similar services furnished in the non-facility setting, to

calculate the payment rate for the non-drug component.

Response: After consideration of the public comments, we are finalizing a payment rate for the non-drug component that is calculated based on a building block methodology using the Medicare payment rates for similar services furnished in the non-facility setting. We note that we considered a variety of different rates, including TRICARE and Medicaid, and decided ultimately to use Medicare rates for similar services. We appreciate commenters' feedback about the TRICARE rate, including the concern that it reflects an average cost of care for the TRICARE patient population, and note that by finalizing payment rates using the established rates for similar services under Medicare, we believe these rates will be more reflective of the resource costs involved in furnishing services to the Medicare patient population. We also acknowledge that establishing a methodology under which Medicare payments would be less than those made by state Medicaid programs could create unnecessary barriers to access to care. Additionally, we recognize that a differential in payment OUD treatment services furnished by OTPs and OUD treatment furnished in the office setting may set up a disparity that could disadvantage OTPs.

The services that are included in the non-drug component of the weekly bundles are the same services that are included in the TRICARE rate, which are individual therapy, group therapy, substance use counseling, and toxicology testing. Therefore, we believe that a reasonable alternative approach is to finalize payment rates for the non-drug component of the bundled payments for CY 2020 that are determined using a building block methodology under which the payment rate for the same set of non-drug services is based on established rates for similar services under the Medicare PFS (non-facility rates), the Medicare CLFS, and state Medicaid programs.

Specifically, the payment rate we are finalizing for the non-drug component reflects the Medicare payment rates for the following codes as reference codes for the services that are included in the TRICARE rate, (individual therapy, group therapy, substance use counseling, and toxicology testing): CPT code 90832 (*Psychotherapy, 30 minutes with patient*), in CY 2019 is currently assigned a non-facility rate of \$68.47 under the PFS; CPT code 90853 (*Group psychotherapy (other than of a multiple-family group)*), which in CY 2019 is assigned a non-facility rate of \$27.39

under the PFS; HCPCS code G0396 (*Alcohol and/or substance (other than tobacco) abuse structured assessment (e.g., audit, dast), and brief intervention 15 to 30 minutes*), which in CY 2019 is assigned a non-facility rate of \$30.94 under the PFS when furnished by nonphysician practitioners (NPPs), as we believe this is a more accurate reflection of the practitioner type who would be furnishing substance use counseling in an OTP; CPT code 80305 (*Drug test(s), presumptive, any number of drug classes, any number of devices or procedures; capable of being read by direct optical observation only (e.g., utilizing immunoassay [e.g., dipsticks, cups, cards, or cartridges]), includes sample validation when performed, per date of service*), which in CY 2019 is assigned a rate of \$12.60 under the CLFS, and which we will prorate to account for two tests per month in the base bundled payment; and HCPCS code G0480 (*Drug test(s), definitive, utilizing (1) drug identification methods able to identify individual drugs and distinguish between structural isomers (but not necessarily stereoisomers), including, but not limited to gc/ms (any type, single or tandem) and lc/ms (any type, single or tandem) and excluding immunoassays (e.g., ia, eia, elisa, emit, fpia) and enzymatic methods (e.g., alcohol dehydrogenase)), (2) stable isotope or other universally recognized internal standards in all samples (e.g., to control for matrix effects, interferences and variations in signal strength), and (3) method or drug-specific calibration and matrix-matched quality control material (e.g., to control for instrument variations and mass spectral drift); qualitative or quantitative, all sources, includes specimen validity testing, per day; 1–7 drug class(es), including metabolite(s) if performed*), which in CY 2019 is assigned a rate of \$114.43 under the CLFS, and which we will prorate to account for one test per month in the base bundled payment, as discussed previously. The sum of these amounts is \$161.71.

We are also finalizing our proposal to adjust the non-drug component rate to account for different administration and dispensing costs of the drug that is used in the episode of care (either oral, injectable, or implantable). We note that in calculating the proposed rates, the TRICARE weekly bundled rate included administration of oral drugs, which we then adjusted accordingly for the other bundled payments by subtracting the amount for dispensing oral drugs and adding a different amount to account for administration of the injectable and

implantable drugs. We are finalizing the rate we proposed for dispensing oral drugs using an approximation of the average dispensing fees under state Medicaid programs, which is \$10.50, since there is no Medicare Part B rate for oral MAT drugs. For the injectable drugs (buprenorphine and naltrexone), we proposed to subtract from the non-drug component an amount that is comparable to the dispensing fees paid by several state Medicaid programs (\$10.50) for a week of daily dispensing of methadone, and to add the Medicare non-facility rate for administration of an injection. This adjustment was necessary to account for the fact that the TRICARE rate includes oral dispensing fees, whereas these injectable drugs are not oral drugs that are dispensed daily. However, because we are adopting a building block methodology in final rule to determine the payment rate for the non-drug component of the weekly bundles, it is no longer necessary to subtract the oral dispensing fee; however, as we proposed, we will include the Medicare non-facility rate for administration of an injection in our determination of the payment rate for the non-drug component for weekly bundles that include injectable drugs. We are finalizing the rate we proposed for administration of an injection, based on CPT code 96372 (*Therapeutic, prophylactic, or diagnostic injection (specify substance or drug); subcutaneous or intramuscular*) as a reference code, is \$16.94.

For the codes describing the insertion, removal, or insertion and removal of the buprenorphine implants, we proposed to adjust the non-drug component payment rate to remove the cost of daily administration of an oral drug and by adding the Medicare non-facility payment rate for the insertion, removal, or insertion and removal of the implants, respectively. Again, removal of the cost of daily administration of an oral drug is no longer necessary under our building block methodology; but, we are finalizing our proposal to include the rates for the insertion, removal, or insertion and removal of the buprenorphine implants, as applicable. The reference codes, which we proposed and are finalizing are: HCPCS codes G0516 (*Insertion of non-biodegradable drug delivery implants, 4 or more (services for subdermal rod implant)*), which in CY 2019 is assigned a non-facility rate of \$246.15. G0517 (*Removal of non-biodegradable drug delivery implants, 4 or more (services for subdermal implants)*), which in CY 2019 is assigned a non-facility rate of \$265.61 under the PFS, and G0518

(*Removal with reinsertion, non-biodegradable drug delivery implants, 4 or more (services for subdermal implants)*), which in CY 2019 is assigned a non-facility rate of \$465.26 under the PFS. Under the building block methodology we are adopting in this final rule, the total non-drug component payment for the non-drug bundle is \$161.71, the total non-drug component payment for oral drugs is \$172.21, the total non-drug component payment for the injectable drugs is \$178.65, the total non-drug component payment for the buprenorphine implant insertion is \$407.86, the total non-drug component payment for the buprenorphine implant removal is \$427.32, and the total non-drug component payment for the buprenorphine implant insertion and removal is \$626.97. See Table 18 for a full listing of the final payment rates that we are establishing in this final rule, which reflect the sum of the drug component and non-drug component for each bundled payment. We believe the rates we are finalizing are reflective of an average case, but we recognize that the number of services furnished for patients who have stabilized and are in the maintenance phase of treatment, may be significantly less. However, we note that while the reference codes listed above were considered for the purpose of valuation of the non-drug component of the weekly bundled payments, it is not a requirement for billing these codes (HCPCS codes G2067–G2075) that all of the services described by these reference codes would necessarily be furnished during each week that the bundled payment is billed. Rather, the threshold to bill for the bundled payment is that at least one service in the bundle is furnished during that week, which could be administration of the drug, individual therapy, group therapy, substance use counseling, or toxicology testing.

In response to commenters who stated that the proposed rate for the counseling add-on code was too low, we note that we are finalizing a rate of \$30.94, which is based on the CY 2019 PFS non-facility rate for HCPCS code G0396 (*Alcohol and/or substance (other than tobacco) abuse structured assessment (e.g., audit, dast), and brief intervention 15 to 30 minutes*), when furnished by NPPs, and is higher than the proposed amount for this add-on code. Additionally, we believe that the availability of this add-on code will allow OTPs to receive reimbursement for additional counseling services furnished to patients with more needs, thereby accounting for varying levels of severity of illness. We will be

monitoring the claims data to ensure that use of this add-on code is not being abused.

i. Medication Not Otherwise Specified

In the proposed rule, we stated that we would expect the non-drug component for the medication not otherwise specified bundled payment (HCPCS code G2075) to be consistent with the pricing methodology for the other bundled payments and therefore, to be based on a crosswalk to the TRICARE rate, adjusted for any applicable administration and dispensing fees. For example, for oral medications, we would use the rate for the non-drug services included in the TRICARE methadone bundle, based on an assumption that the drug is also being dispensed daily. For the injectable medications, we similarly stated that we would adjust the TRICARE payment rate for non-drug services using the same methodology we proposed for the bundled payments with injectable medications (to subtract an amount for daily dispensing and add the non-facility Medicare payment rate for administration of the injection). For implantable medications, we stated that we would also use the same methodology we proposed for the bundled payments with implantable medications, with the same crosswalked non-facility Medicare payment rates (for insertion, removal, and insertion and removal). We solicited comments on how the price of the non-drug component of such bundled payments should be determined, in particular the dispensing and/or administration fees, including whether the methodology we proposed for determining the payment rate for the non-drug component of an episode of care that includes a new opioid agonist and antagonist medication (which is based on whether the drug is oral, injectable, or implantable) would be appropriate to use for these new drugs.

We did not receive any comments on our proposal relating to pricing the non-drug component for medication not otherwise specified bundled payments. Consistent with our original proposal, we intend to determine the payment for the non-drug component of the medication not otherwise specified

bundle based on whether the drug is oral, injectable, or implantable. However, this payment would be determined using the building block payment methodology that we are adopting in this final rule to determine the non-drug component of the bundled payments for medications that have the same mode of administration.

(c) Partial Episode of Care

For the codes describing partial episodes for methadone and oral buprenorphine, we proposed that the payment rates for the non-drug component would be calculated by taking one half of the payment rate for the non-drug component for the corresponding weekly bundles. We chose one half as the best approximation of the median cost of the services furnished during a partial episode consistent with our proposal to make a partial episode bundled payment when the majority of services described in a beneficiary's treatment plan are not furnished during a specific episode of care. However, we solicited comment on other methods that could be used to calculate these payment rates. We proposed that the payment rates for the drug component of these partial episode bundles would be calculated by taking one half of the payment rate for the drug component of the corresponding weekly bundles.

For the codes describing partial episodes for injectable buprenorphine and naltrexone, we proposed that the payment rates for the drug component would be the same as the payment rate for the drug component of the full weekly bundle so that the OTP would be reimbursed for the cost of the drug that is given at the start of the episode. For the non-drug component, we proposed that the payment rate would be calculated as follows: The TRICARE non-drug component payment rate (\$110.96), adjusted to remove the cost of daily administration of an oral drug (\$10.50), then divided by two; that amount would be added to the fee that Medicare pays for the administration of an injection (which is currently \$16.94 under the CY 2019 non-facility Medicare payment rate for CPT code 96372).

For the codes describing partial episodes for the buprenorphine implant insertion, removal, and insertion and removal, we proposed that the payment rates for the drug component would be the same as the payment rate for the corresponding weekly bundle. For the non-drug component, we proposed that the payment rate would be calculated as follows: The TRICARE non-drug component payment rate (\$110.96), adjusted to remove the cost of daily administration of an oral drug (\$10.50), then divided by two; that amount would be added to the Medicare non-facility payment rate for the insertion, removal, or insertion and removal of the implants, respectively (based on the non-facility rates for HCPCS codes G0516, G0517, and G0518, which are currently \$246.15, \$265.61, and \$465.26, respectively).

For the code describing a non-drug partial episode of care, we proposed that the payment rate would be calculated by taking one half of the payment rate for the corresponding weekly bundle.

We proposed that the payment rate for the code describing partial episodes for a medication not otherwise specified would be calculated based on whether the medication is oral, injectable or implantable, following the methodology described above for the corresponding type of partial episode. We solicited comments on how partial episodes of care using new drugs with a novel mechanism of action (that is, non-opioid agonist and/or antagonist treatment medications) should be priced. For example, we could use the same approach described previously for pricing new opioid agonist and antagonist medications not otherwise specified, which is to follow the methodology based on whether the drug is oral, injectable or implantable.

We did not receive comments on our proposed methodology for determining payment rates for partial episodes. However, as discussed above, after consideration of the public comments, we are not finalizing our proposal to create partial episodes at this time, and thus will not be finalizing our proposed methodology for pricing partial episodes.

BILLING CODE 4120-01-P

TABLE 18: OTP Final Code Descriptors and Payment Amounts

HCPCS	Descriptor	Drug Cost*	Non-drug Cost**	Total Cost
G2067	Medication assisted treatment, methadone; weekly bundle including dispensing and/or administration, substance use counseling, individual and group therapy, and toxicology testing, if performed (provision of the services by a Medicare-enrolled Opioid Treatment Program)	\$35.28	\$172.21	\$207.49
G2068	Medication assisted treatment, buprenorphine (oral); weekly bundle including dispensing and/or administration, substance use counseling, individual and group therapy, and toxicology testing if performed (provision of the services by a Medicare-enrolled Opioid Treatment Program)	\$86.26	\$172.21	\$258.47
G2069	Medication assisted treatment, buprenorphine (injectable); weekly bundle including dispensing and/or administration, substance use counseling, individual and group therapy, and toxicology testing if performed (provision of the services by a Medicare-enrolled Opioid Treatment Program)	\$1,578.64	\$178.65	\$1,757.29
G2070	Medication assisted treatment, buprenorphine (implant insertion); weekly bundle including dispensing and/or administration, substance use counseling, individual and group therapy, and toxicology testing if performed (provision of the services by a Medicare-enrolled Opioid Treatment Program)	\$4,918.98	\$407.86	\$5,326.84
G2071	Medication assisted treatment, buprenorphine (implant removal); weekly bundle including dispensing and/or administration, substance use counseling, individual and group therapy, and toxicology testing if performed (provision of the services by a Medicare-enrolled Opioid Treatment Program)	\$0	\$427.32	\$427.32
G2072	Medication assisted treatment, buprenorphine (implant insertion and removal); weekly bundle including dispensing and/or administration, substance use counseling, individual and group therapy, and toxicology testing if performed (provision of the services by a Medicare-enrolled Opioid Treatment Program)	\$4,918.98	\$626.97	\$5,545.95
G2073	Medication assisted treatment, naltrexone; weekly bundle including dispensing and/or administration, substance use counseling, individual and group therapy, and toxicology testing if performed (provision of the services by a Medicare-enrolled Opioid Treatment Program)	\$1,164.02	\$178.65	\$1,342.67
G2074	Medication assisted treatment, weekly bundle not including the drug, including substance use counseling, individual and group therapy, and toxicology testing if performed (provision of the services by a Medicare-enrolled Opioid Treatment Program)	\$0	\$161.71	\$161.71
G2075	Medication assisted treatment, medication not otherwise specified; weekly bundle including dispensing and/or administration, substance use counseling, individual and group therapy, and toxicology testing, if performed (provision of the services by a Medicare-enrolled Opioid Treatment Program)	-	-	-
Intensity Add-on Codes				
G2076	Intake activities, including initial medical examination that is a complete, fully documented physical evaluation and initial assessment conducted by a program physician or a primary care physician, or an authorized healthcare professional under the supervision of a program physician or qualified personnel that includes preparation of a treatment plan that	\$0	\$179.46	\$ 179.46

HCPCS	Descriptor	Drug Cost*	Non-drug Cost**	Total Cost
	includes the patient’s short-term goals and the tasks the patient must perform to complete the short-term goals; the patient’s requirements for education, vocational rehabilitation, and employment; and the medical, psycho- social, economic, legal, or other supportive services that a patient needs, conducted by qualified personnel (provision of the services by a Medicare-enrolled Opioid Treatment Program); List separately in addition to code for primary procedure.			
G2077	Periodic assessment; assessing periodically by qualified personnel to determine the most appropriate combination of services and treatment (provision of the services by a Medicare-enrolled Opioid Treatment Program); List separately in addition to code for primary procedure.	\$0	\$110.28	\$ 110.28
G2078	Take-home supply of methadone; up to 7 additional day supply (provision of the services by a Medicare-enrolled Opioid Treatment Program); List separately in addition to code for primary procedure.	\$35.28	\$0	\$35.28
G2079	Take-home supply of buprenorphine (oral); up to 7 additional day supply (provision of the services by a Medicare-enrolled Opioid Treatment Program); List separately in addition to code for primary procedure.	\$86.26	\$0	\$86.26
G2080	Each additional 30 minutes of counseling in a week of medication assisted treatment, (provision of the services by a Medicare-enrolled Opioid Treatment Program); List separately in addition to code for primary procedure.	\$0	\$30.94	\$30.94

*Methadone drug costs are calculated using ASP data, oral buprenorphine drug costs are calculated using NADAC data, and the other drug costs are calculated using data from the quarterly ASP Drug Pricing Files. The payment amounts in this table are based on data files posted at the time of the drafting of this final rule.

**The non-drug component for the non-drug bundle is based on the sum of the rates under Medicare for the following codes: CPT codes 90832, 90853, 80305, and HCPCS codes G0396 and G0480. For the codes that include oral medications (HCPCS codes G2067 and G2068), we added to that amount the rate for dispensing oral drugs using an approximation of the average dispensing fees under state Medicaid programs, which is \$10.50. For the codes that include injectable drugs (HCPCS codes G2069 and G2073), we added to the non-drug bundle amount the fee that Medicare pays for the administration of an injection (which is currently \$16.94 under the CY 2019 non-facility Medicare payment rate for CPT code 96372). For the codes that include implantable buprenorphine (HCPCS codes G2070, G2071, and G2072), we added the rates under Medicare for the insertion, removal, and insertion/removal of buprenorphine implants (which is \$246.15, \$265.61, and \$465.26, respectively, based on the CY 2019 non-facility Medicare payment rates for HCPCS codes G0516, G0517 and G0518). The payment rate for HCPCS code G2076 is based on the CY 2019 non-facility Medicare payment rate for CPT code 99204 plus one presumptive toxicology test (CPT code 80305). The non-drug component for HCPCS code G2077 is based on the CY 2019 non-facility Medicare payment rate for CPT code 99214. The payment rate for HCPCS code G2080 is based on the CY 2019 non-facility Medicare payment rate for HCPCS code G2080 when furnished by an NPP. Additionally, the non-drug component of the bundled payment amounts will be geographically adjusted based on the PFS GAF, this adjustment will also be extended to the non-drug component add-on payments as discussed below.

BILLING CODE 4120-01-C

(8) Place of Service (POS) Code for Services Furnished at OTPs

In the proposed rule, we explained that we would be creating a new POS code specific to OTPs since there are no existing POS codes that specifically describe OTPs. We indicated that claims for OTP services would include this place of service code. We also noted that POS codes are available for use by all payers. We did not propose to make any differential payment based on the use of this new POS code.

The following is a summary of the comments we received regarding the

discussion of creating a new POS and our responses.

Comment: Several commenters supported the plan to create a new POS code that would specifically describe OTPs. A few commenters stated that if non-OTP pharmacies were to dispense MAT drugs covered by an OTP bundle, it is not clear how the OTP POS code will be transmitted to Part D plans or pharmacies so that they will know whether an enrollee is also enrolled in an OTP. Another commenter stated that while POS codes currently distinguish inpatient from outpatient OUD treatment, they do not distinguish

between a Medicare-enrolled OTP and a non-Medicare-enrolled OTP and recommended that CMS should consider multiple value sets for POS codes to help retail pharmacies dispense prescriptions and process claims appropriately.

Response: We have created a new place of service code, which will be described as Place of Service code 58 (*Non-residential Opioid Treatment Facility—a location that provides treatment for OUD on an ambulatory basis. Services include methadone and other forms of MAT*). We expect that POS code 58 will be noted on claims

submitted for the HCPCS G codes describing OTP services. Additionally, we note that the G codes describing the OTP bundled payments and add-on codes can only be billed by OTPs and cannot be billed by other providers. We note that POS codes are not specific to Medicare use and may be used by other payers.

In response to the comments about non-OTP pharmacies dispensing MAT drugs included in an OTP bundle, we encourage pharmacies and prescribing OTPs be in close communication in order to ensure proper billing procedures are followed and to prevent duplicative payments. The presence of POS code 58 on retail pharmacy claims will not mean that the pharmacy should process MAT claims any differently than they do now. We appreciate the suggestion to create multiple value sets for POS codes, and will take that under consideration.

c. Duplicative Payments Under Parts B or D

Section 1834(w)(1) of the Act, added by section 2005(c) of the SUPPORT Act, requires the Secretary to ensure, as determined appropriate by the Secretary, that no duplicative payments are made under Part B or Part D for items and services furnished by an OTP. In the proposed rule, we noted that many of the individual items or services provided by OTPs that would be included in the bundled payment rates under the proposed policies may also be appropriately available to beneficiaries through other Medicare benefits. Although we recognized the potential for significant program integrity concerns when similar items or services are payable under separate Medicare benefits, we also stated that we believe it is important that any efforts to prevent duplicative payments not inadvertently restrict Medicare beneficiaries' access to other Medicare benefits even for the time period they are being treated by an OTP. For example, a beneficiary receiving counseling or therapy as part of an OTP bundle of services may also be receiving medically reasonable and necessary counseling or therapy as part of a physician's service during the same time period. Similarly, there could be circumstances where Medicare beneficiaries with OUD could receive treatment and/or medication from non-OTP entities that would not result in duplicative payments, presuming that both the OTP and the other entity appropriately furnished separate medically-necessary services or items. Consequently, we explained that we do not believe that provision of the same kinds of services by both an OTP and a

separate provider or supplier would itself constitute a duplicative payment.

We explained our belief that duplicative payments would result from the submission of claims to Medicare leading to payment for drugs furnished to a Medicare beneficiary and the associated dispensing fees on a certain date of service to both an OTP and another provider or supplier under a different benefit. In these circumstances, we would consider only one of the claims to be paid for appropriately. Accordingly, for purposes of implementing section 1834(w)(1) of the Act, we proposed to consider payment for medications delivered, administered or dispensed to the beneficiary as part of the OTP bundled payment to be a duplicative payment if delivery, administration or dispensing of the same medications was also separately paid under Medicare Parts B or D. We proposed to codify this policy at § 410.67(d)(4). We acknowledged that some OTPs may negotiate arrangements whereby community pharmacies supply MAT-related medications to OTPs. However, we stated that if the OTP provides medically-necessary MAT-related medications as part of an episode of care, we would expect the OTP to take measures to ensure that there is no claim for payment for these drugs other than as part of the OTP bundled payment. For example, the MAT drugs billed by an OTP as part of a bundled payment should not be reported to or paid under a Part D plan. We stated that we expect that OTPs will take reasonable steps to ensure that the items and services furnished under their care are not reported or billed under a different Medicare benefit. We also noted that CMS intends to monitor for duplicative payments, and would take appropriate action as needed when such duplicative payments are identified. Therefore, we proposed that in cases where a payment for drugs used as part of an OTP's treatment plan is identified as being a duplicative payment because the same costs were paid under a different Medicare benefit, CMS will generally recoup the duplicative payment made to the OTP as the OTP would be in the best position to know whether or not the drug that is included as part of the beneficiary's treatment plan is furnished by the OTP or by another provider or supplier given that the OTP is responsible for managing the beneficiary's overall OUD treatment. We proposed to codify this policy at § 410.67(d)(4). We noted that this general approach would not preclude CMS or other auditors from conducting appropriate oversight of duplicative

payments made to the other provider or suppliers, particularly in cases of fraud and/or abuse.

We received a few comments on our proposed policy to address duplicative payments. The following is a summary of the comments we received and our responses.

Comment: A few commenters supported the proposal that the OTP should be accountable for ensuring duplicative payments are not made on the basis that OTPs are in the best position to know whether a drug included in the patient's treatment plan is furnished by the OTP.

Response: We thank the commenters for their feedback and support.

Comment: One commenter stated that the new Medicare bundled payments to OTPs should not impact payment for MAT prescriptions rightfully transmitted to a retail pharmacy unless the prescription is from an OTP. The commenter stated that having to determine whether a MAT drug presented to a retail pharmacy should be covered under the new Part B OTP bundle or Part D could introduce a delay in access to treatment. The commenter stated that retail pharmacies should continue to process any MAT prescription under Part D, as they do today. The commenter also stated that prescribers who administer implantable or injectable MAT drugs outside of a SAMHSA-certified OTP would continue to bill these drugs to Part B. Additionally, the commenter questioned if the Medicare bundled payments to OTPs will include MAT drugs that are prescribed within an OTP by a licensed prescriber, but dispensed outside of it.

Response: With regard to the commenter's question concerning MAT drugs prescribed within an OTP but dispensed outside of it, there is no issue of duplicative payment if the OTP has an arrangement with the pharmacy whereby CMS pays the OTP a bundled payment rate and the OTP reimburses the pharmacy through an independent arrangement (in which case the pharmacy would not bill the Part D plan, as it would be reimbursed by the OTP). However, if such an arrangement does not exist, and the pharmacy intends to submit a Part D claim, then the OTP should not bill for an episode of care that includes a drug component but instead should bill for a non-drug episode of care (HCPCS code G2074). Similarly, we note that if the drug administration for a Part B MAT drug occurs outside the OTP and the OTP is not also billing for a weekly bundle that includes that Part B drug, then the administering provider can bill Part B.

Comment: One commenter stated that while they agree with our proposal to recoup duplicative payments from OTPs, CMS should monitor for any unintended impacts to access or other challenges that may result. The commenter stated that CMS must not create a situation in which beneficiaries cannot access needed care because they are receiving OUD treatment through an OTP bundle.

Response: We have explicitly acknowledged that we do not believe a beneficiary receiving the same kinds of services from both an OTP and another provider or supplier would necessarily constitute a duplicative payment. We reiterate, however, that we do have an expectation that OTPs will take reasonable steps to ensure that the items and services furnished under their care are not reported or billed under a different Medicare benefit. For example, OTPs could actively coordinate care and facilitate information exchange between other prescribers, dispensers and plans who prescribe, administer, dispense, or pay for medications for OUD treatment. We also note that OTPs and other health care providers must comply with all applicable laws and regulations, such as the Health Insurance Portability and Accountability Act and the Substance Abuse Confidentiality Regulations (42 CFR part 2). We intend to conduct monitoring to ensure that our policies regarding duplicative payment do not have any such unintended consequences as described by the commenter.

Comment: A few commenters stated that drugs dispensed outside the OTP should not be included in the OTP bundle. One commenter stated that community pharmacies currently face challenges in knowing whether a prescription is from an inpatient OTP or whether the inpatient OTP is prescribing outpatient therapy for a patient who is being discharged. The commenter stated that the best way to avoid duplicate payments from occurring is to limit the OTP bundled payment to drugs dispensed by an OTP facility; similarly the commenter stated that if take-home medications are included in the OTP bundle, they should also be dispensed by the OTP.

Response: We disagree that only medications provided at the OTP should be included in the bundled payment. As indicated above, we are aware that some OTPs have arrangements with pharmacies whereby the OTP reimburses the pharmacy through an independent arrangement. In this case, it is appropriate for the OTP to bill for the weekly bundled payment that corresponds to the medication provided

to the beneficiary. We also note that if questions arise regarding the purpose of the prescription, as described by the commenter, the pharmacy should contact the prescribing OTP for any necessary clarifications.

Comment: A few commenters stated that more information is needed to better understand how CMS will monitor and protect against duplicative billing/payment. The commenters recommended that CMS update the guidance in the Medicare Program Integrity Manual to better outline the process through which duplicative payments will be monitored and corrected.

Response: We will consider issuing further guidance either through future rulemaking or subregulatory guidance, as suggested.

Comment: One commenter disagreed that OTPs should be financially accountable for duplicative payments. The commenter stated that OTPs may not have access to prescribing information for every physician or clinician the beneficiary sees outside of the OTP, nor do reporting mechanisms exist for this information in order for OTPs to quickly and efficiently review prior to engaging patients in time-sensitive deployment of OUD treatment.

Response: We reiterate that we have explicitly acknowledged that we do not believe that payments for the same kinds of services from both an OTP and a separate provider or supplier would necessarily result in a duplicative payment. We also emphasize that we have narrowly defined duplicative payment to involve only those circumstances where medications that are delivered, administered or dispensed to a beneficiary are paid as part of the OTP bundled payment, and where the delivery, administration or dispensing of the same medications (that is, same drug, dosage and formulation) is also separately paid under Medicare Part B or Part D for the same beneficiary with the same date of service. As noted earlier, we do not intend to prevent the appropriate billing under Medicare Part B or Part D for individual items or services that could be provided by OTPs as part of an episode of care and included in the bundled payment rate, but that may also be appropriately available to beneficiaries through other Medicare benefits.

Comment: One commenter supported the proposal to hold OTPs accountable for duplicative payments, but stated that CMS should issue a non-enforcement or hold harmless grace period for CY 2020 for audits and other consequences such

as Star Ratings related to the new OUD treatment services benefit.

Response: We appreciate the feedback and note that section 1834(w)(1) of the Act expressly requires that we take steps to ensure that no duplicative payments are made. Moreover, as explained above, we have narrowly defined duplicative payment, so we do not believe that a grace period would be necessary for CY 2020.

After consideration of the public comments, we clarifying that our final policy on duplicative payments refers to payment for the same medication for the same beneficiary on the same date of service. Thus we are finalizing our proposal that in cases where a payment for drugs used as part of an OTP's treatment plan is identified as being a duplicative payment because a claim for the same medications for the same beneficiary on the same date of service was paid under a different Medicare benefit, CMS will generally recoup the duplicative payment made to the OTP. We have updated the text at § 410.67(d)(5) to reflect this clarification.

d. Cost Sharing

Section 2005(c) of the SUPPORT Act amended section 1833(a)(1) of the Act, relating to payment of Part B services, by adding a new subparagraph (CC), which specifies with respect to OUD treatment services furnished by an OTP during an episode of care that the amount paid shall be equal to the amount payable under section 1834(w) of the Act less any copayment required as specified by the Secretary. Section 1834(w) of the Act, which was also added by section 2005(c) of the SUPPORT Act, requires that the Secretary pay an amount that is equal to 100 percent of a bundled payment under this part for OUD treatment services. Given these two provisions, we believe that there is flexibility for CMS to set the copayment amount for OTP services either at zero or at an amount above zero. Therefore, we proposed to set the copayment at zero for a time-limited duration (for example, for the duration of the national opioid crisis), as we believe this would minimize barriers to patient access to OUD treatment services. Setting the copayment at zero would also ensure OTP providers receive the full Medicare payment amount for Medicare beneficiaries if secondary payers are not available or do not pay the copayment, especially for those dually eligible for Medicare and Medicaid.⁸⁰ We solicited

⁸⁰ For those dually eligible individuals in the Qualified Medicare Beneficiary program (7.7

public comment on our proposal to set the copayment at zero for a time-limited duration, such as for the duration of the national opioid crisis, and any other metrics CMS might consider using to determine when to start requiring a copayment. In developing our approach, we also considered other alternatives, such as setting the copayment at a fixed fee calculated based on 20 percent of the payment rate for the bundle, consistent with the standard copayment requirement for other Part B services, or applying a flat dollar copayment amount similar to TRICARE's copayment; however, we recognized that setting the copayment for OUD services at an amount greater than zero could create a barrier to access to treatment for many beneficiaries. We proposed to codify the proposed copayment amount of zero at § 410.67(e). We solicited feedback on our proposal to set the copayment amount for OTP services at zero, and on the alternatives considered, including whether we should consider any of these alternatives for CY 2020 or future years.

Separately, we noted that the Part B deductible would apply for OUD treatment services, as mandated for all Part B services by section 1833(b) of the Act.

We received public comments on the proposals related to cost sharing for the bundled payments for OUD treatment services. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported the proposal to set the copayment at zero for a time limited duration. A few commenters encouraged CMS to consider setting the copayment at zero permanently, noting that individuals who require the services of an OTP will have difficulty making copayments for a variety of reasons, regardless of whether there is an opioid epidemic across the nation. One commenter noted that if a patient received OUD treatment services outside of an OTP, they would pay 20 percent Part B coinsurance under

million of the 12 million dually eligible individuals in 2017), state Medicaid programs cover the Medicare Part A and Part B deductible and coinsurance. However, section 4714 of the Balanced Budget Act of 1997 (Pub. L. 105–33) provides discretion for states to pay Medicare cost-sharing only if the Medicaid payment rate for the service is above the Medicare paid amount for the service. Since most states opt for this discretion, and most Medicaid rates are lower than Medicare's, states often do not pay the provider for the Medicare cost-sharing amount. Providers are further prohibited from collecting the Medicare cost-sharing amount from the beneficiary, effectively having to take a discount compared to the amount received for other Medicare beneficiaries.

Medicare at other health care settings or Part D plan cost sharing for any pharmacy-dispensed prescription drugs which may disadvantage other established Medicare provider types. This commenter also noted that OTPs may not be available to patients in all geographic localities, which would seem to be unfair.

Response: We appreciate the support for our proposal. After consideration of the public comments, we are finalizing our proposal to set the copayment at zero for a time limited duration, as we believe this would minimize barriers to patient access to OUD treatment services. Setting the copayment at zero also ensures OTPs receive the full Medicare payment amount for Medicare beneficiaries if secondary payers are not available or do not pay the copayment, especially for those beneficiaries who are dually eligible for Medicare and Medicaid. However, as we explained in the proposed rule, we are interested in setting the copayment at zero for a time limited duration (for example, until such time as the Secretary does not renew the national public health emergency declaration for the continued consequence of the opioid crisis affecting our nation), and intend to address the copayment in future rulemaking at such a time we deem appropriate. Although we appreciate the concern that OUD treatment services furnished in other settings require beneficiary cost sharing, we believe it is important, especially in light of the opioid epidemic, to minimize barriers to patient access to OUD treatment services in such instances that we are able to and note that section 2005 of the SUPPORT Act does not provide authority to waive cost sharing for OUD treatment services furnished in other settings.

Comment: One commenter requested that OTPs be allowed to receive Medicare bad debt payments for any uncollected Part B deductible payments, noting that OTP providers are unlikely to be successful in collecting deductibles for many patients in this population. Another commenter expressed concern that the application of the Part B deductible to OUD treatment services furnished by OTPs might particularly affect dually eligible beneficiaries currently receiving OTP care as they are likely to visit an OTP provider in January, before they hit their annual Part B deductible. This could put them in the position of owing over \$100 in January.

Response: We note that bad debts arising from covered services paid under a reasonable charge-based methodology or a fee schedule are not

reimbursable under the Medicare program (42 CFR 413.89(i)). Additionally, we note that the majority of dually eligible individuals are Qualified Medicare Beneficiaries (QMBs), a program in which Medicaid covers the Medicare Part A (if any) and Part B premiums and other Medicare cost-sharing. States may pay for deductibles, coinsurance, and copayments for Medicare services furnished by Medicare providers to QMBs to the extent consistent with the Medicaid State Plan. States have the option to reduce or eliminate the state's Medicare cost sharing payments by adopting policies that limit payment to the lesser of (a) the Medicare cost sharing amount, or (b) the difference between the Medicare payment and the Medicaid rate for the service, consistent with the methodology identified in the state plan. When Medicaid rates are lower this can result in the provider receiving reduced or even no payment for the deductible. Regardless of the amount paid by the state for the deductible, coinsurance, and copayments, sections 1848(g)(3) and 1866(a)(1)(A) of the Act prohibit Medicare providers from billing QMBs for Medicare Parts A and B cost sharing amounts. States may also choose to cover Medicare cost-sharing for certain other full-benefit dually eligible individuals.

As discussed in more detail below, once a provider is enrolled in Medicare, Medicare will crossover the deductible portion of the claim to state Medicaid agencies, and the state will adjudicate the claim. However, as noted above, states often use different HCPCS billing codes for OTP services than Medicare does; in these cases, we note that the state's claims processing system may reject the claim and will notify the provider, who can re-code and resubmit the claim directly to the state.

In summary, we are finalizing our proposal to set the copayment for OUD treatment services furnished by OTPs at zero for a time limited duration, as we believe this would minimize barriers to patient access to OUD treatment services. We are codifying this beneficiary cost-sharing amount at § 410.67(e).

4. Adjustments to Bundled Payment Rates for OUD Treatment Services

The costs of providing OUD treatment services will likely vary over time and depending on the geographic location where the services are furnished. Below we discuss our proposed adjustments to the bundled payment rates to account for these factors.

a. Locality Adjustment

Section 1834(w)(2) of the Act, as added by section 2005(c) of the SUPPORT Act provides that the Secretary may implement the bundled payment for OUD treatment services furnished by OTPs through one or more bundles based on the type of medications, the frequency of services, the scope of services furnished, characteristics of the individuals furnished such services, or other factors as the Secretary determines appropriate. The cost for the provision of OUD treatment services, like many other healthcare services covered by Medicare, will likely vary across the country based upon the differing cost in a given geographic locality. To account for such geographic cost differences in the provision of services, in a number of payment systems, Medicare routinely applies geographic locality adjustments to the payment rates for particular services. Because we believe OUD treatment services furnished by OTPs will also be subject to varying cost based upon the geographic locality where the services are furnished, in the proposed rule we proposed to apply a geographic locality adjustment to the bundled payment rate for OUD treatment services. We discussed our proposed approach with respect to both the drug component (which reflects payment for the drug) and the non-drug component (which reflects payment for all other services furnished to the beneficiary by the OTP, such as drug administration, counseling, toxicology testing, etc.) of the bundled payment.

(1) Drug Component

Because our proposed approaches for pricing the MAT drugs included in the bundles all reflected national pricing, and because there is no GAF applied to the payment of Part B drugs under the ASP methodology, we did not believe that it would be necessary to adjust the drug component of the bundled payment rates for OTP services based upon geographic locality. Therefore, we proposed not to apply a geographic locality adjustment to the drug component of the bundled payment rate for OTP services. We did not receive any comments on this proposal and are finalizing as proposed not to make any geographic adjustment to the drug component of the bundled payment rates.

(2) Non-Drug Component

Unlike the national pricing of drugs, the costs for the services included in the non-drug component of the OTP bundled payment for OUD treatment

services are not constant across all geographic localities. For example, OTPs' costs for rent or employee wages could vary significantly across different localities and could potentially result in disparate costs for the services included in the non-drug component of OUD treatment services. Because the costs of furnishing the services included in the non-drug component of the OTP bundled payment for OUD treatment services will vary based upon the geographic locality in which the services are provided, in the proposed rule we stated that we believed it would be appropriate to apply a geographic locality adjustment to the non-drug component of the bundled payments. We believed that the geographic variation in the cost of the non-drug services provided by OTPs would be similar to the geographic variation in the cost of services furnished in physician offices. Therefore, to account for the differential costs of OUD treatment services across the country, we proposed to adjust the non-drug component of the bundled payment rates for OUD treatment services using an approach similar to the established methodology used to geographically adjust payments under the PFS based upon the location where the service is furnished. The PFS currently provides for an adjustment to the payment for PFS services based upon the fee schedule area in which the service is provided through the use of Geographic Practice Cost Indices (GPCIs), which measure the relative cost differences among localities compared to the national average for each of the three fee schedule components (work, PE, and malpractice).

Although we proposed to adjust the non-drug component of the payments for OUD treatment services using an approach similar to the established methodology used to adjust PFS payment for geographic locality, because GPCIs provide for the application of geographic locality adjustments to the three distinct components of PFS services, and we proposed the OTP bundled payment as a flat rate payment for all OUD treatment services furnished during an episode of care, we explained that a single factor would be required to apply the geographic locality adjustment to the non-drug component of the OTP bundled payment rate. Therefore, to apply a geographic locality adjustment to the non-drug component of the OTP bundled payment for OUD treatment services through a single factor, we proposed to use the Geographic Adjustment Factor (GAF) at § 414.26.

Specifically, we proposed to use the GAF to adjust the payment for the non-drug component of the OTP bundled payment to reflect the costs of furnishing the non-drug component of OUD treatment services in each of the PFS fee schedule areas. The GAF is calculated using the GPCIs under the PFS, and is used to account for cost differences in furnishing physicians' services in differing geographic localities. The GAF is calculated for each fee schedule area as the weighted composite of all three GPCIs (work, PE, and malpractice) for that given locality using the national GPCI cost share weights. In developing the proposal, we also considered geographically adjusting the payment for the non-drug component of the OTP bundled payment using only the PE GPCI value for each fee schedule area. However, because the non-drug component of OUD treatment services is comprised of work, PE, and malpractice expenses, we proposed using the GAF as we believe the weighted composite of all three GPCIs reflected in the GAF would be the more appropriate GAF to reflect geographic variations in the cost to OTPs of furnishing OUD treatment services.

The GAF, which is determined under § 414.26, is discussed earlier in section I.D.1. of this final rule and the specific GAF values for each payment locality are posted in Addendum D to this final rule. In developing the proposed geographic locality adjustment for the non-drug component of the OUD treatment services payment rate, we also considered other potential locality adjustments, such as the Inpatient Prospective Payment System (IPPS) hospital wage index. However, we proposed using the GAF as we believed the services provided in an OTP more closely resemble the services provided at a physician office than the services provided in other settings, such as inpatient hospitals. We proposed to codify using the GAF to adjust the non-drug component of the OTP bundled payments to reflect the cost differences in furnishing these services in differing geographic localities at § 410.67(d)(3)(ii). We solicited public comment on the proposal to adjust the non-drug component of the OTP bundled payments for geographic variations in the costs of furnishing OUD treatment services using the GAF. We also solicited comments on any factors, other than the GAF, that could be used to make this payment adjustment.

Additionally, we noted that the majority of OTPs operate in urban localities. In light of this fact, we

explained that we were interested in receiving information on whether rural areas have appropriate access to treatment for OUD. We were particularly interested in any potential limitations on access to care for OUD in rural areas and whether there are additional adjustments to the proposed bundled payments that should be made to account for the costs incurred by OTPs in furnishing OUD treatment services in rural areas. We solicited comment for future consideration on this issue and potential solutions we could consider adopting to address this potential issue through future rulemaking.

We received a few comments on the proposed locality adjustment. The following is a summary of the comments we received and our responses.

Comment: One commenter supported using the GAF to geographically adjust the non-drug component of the bundled payment.

Response: We thank the commenter for their support and feedback.

Comment: One commenter stated that CMS should create a 17 percent rural add-on payment to be applied to the bundled payment rate in low-population density areas where it is difficult to find doctors, nurses, and counselors to treat OUD patients. The commenter noted that Medicare provides a 17 percent rural add-on for inpatient psychiatric facilities which often treat substance abuse cases.

Response: We appreciate the suggestion and may consider whether to propose a rural add-on payment in future rulemaking. In the interim, we note that the current Medicare PFS locality structure contains 34 states with a statewide payment locality, which means that, in these states, the geographic adjustment is the same in all areas, whether urban or rural, thus reducing rural/urban payment differentials within a state. We intend to monitor this issue, and as previously stated, may revisit the issue of a rural add-on payment in the future.

After consideration of the public comments, we are finalizing our proposal to adjust the non-drug component of the OTP bundled payments using the GAF in § 410.67(d)(4)(ii). Additionally, although we did not explicitly address the application of a geographic adjustment in the context of the add-on payment adjustments for non-drug services in the proposed rule, we believe that the same logic regarding the differential costs for those services would apply and should be recognized. As such, we are also finalizing that the add-on payment adjustments for non-drug services will

be geographically adjusted as described above.

b. Annual Update

Section 1834(w)(3) of the Act, as added by section 2005(c) of the SUPPORT Act, requires that the Secretary provide an update each year to the OTP bundled payment rates. To fulfill this statutory requirement, we proposed to apply a blended annual update, comprised of distinct updates for the drug and non-drug components of the bundled payment rates, to account for the differing rate of growth in the prices of drugs relative to other services. We proposed that this blended annual update for the OTP bundled payment rates would first apply for determining the CY 2021 OTP bundled payment rates. The specific details of the proposed updates for the drug and non-drug components respectively are discussed in this section.

(1) Drug Component

As stated above, we proposed to establish the pricing of the drug component of the OTP bundled payment rates for OUD treatment services based on CMS pricing mechanisms currently in place. To recognize the potential change in costs of the drugs used in MAT from year to year and to fulfill the requirement to provide an annual update to the OTP bundled payment rates, we proposed to update the payment for the drug component based upon the changes in drug costs reported under the pricing mechanism used to establish the pricing of the drug component of the applicable bundled payment rate, as discussed earlier. For example, if we were to price the drug component of the bundled payment rate for episodes of care using ASP data, the pricing of the drug component for these OTP bundled payments would be updated using the most recently available ASP data at the time of ratesetting for the applicable calendar year. In the proposed rule, we also discussed a number of alternative data sources that could be used to price oral drugs in the drug component of OTP bundled payments in cases when we do not receive manufacturer-submitted ASP pricing data. As an example, if we were to use NADAC data, as discussed as one of the alternatives, to determine the payment for the drug component of the bundled payment for oral drugs in cases when we do not have manufacturer-submitted ASP pricing data, this payment rate would be updated using the most recently available NADAC data at the time of ratesetting for the applicable calendar year.

In developing the proposal to annually update the pricing of the drug component of the OUD treatment services payment rate, we also considered other methodologies, including applying a single uniform update factor to the drug and non-drug components of the proposed payment rates. We ultimately determined not to propose the use of a single uniform update factor, because we believed that it was important to apply an annual update to the payment rates that recognizes the differing rate of growth of drug costs compared to the rate of growth in the cost of the other services. In addition, we also considered annually updating the pricing of the drug component of the OUD treatment services payment rate via an established update factor such as the Producer Price Index (PPI) for chemicals and allied products, analgesics (WPU06380202). The PPI for chemicals and allied products, analgesics is a subset of the PPI produced by the Bureau of Labor Statistics (BLS), which measures the average change over time in the selling prices received by domestic producers for their output. Ultimately we decided against proposing to update the pricing of the drug component of the OUD treatment services payment rate via an established update factor such as the PPI in favor of our proposed approach because we believed the proposed approach would update the pricing of the drug component of the OUD treatment services payment rate in the manner that would be most familiar to stakeholders. We solicited public comment on the proposed approach to updating the drug component of the bundled payment rates. We also solicited comment on possible alternate methodologies for updating the drug component of the payment rate for OUD treatment services, such as use of the PPI for chemicals and allied products, analgesics.

We did not receive any comments on the proposed approach to update the drug component of the bundled payment rates, and are finalizing our proposal to use the most recently available data from the applicable pricing mechanism finalized for drug pricing, as described above, to annually update the drug component of the bundled payment. We are codifying this policy at § 410.67(d)(2)(i), which provides that the payment for the drug component of episodes of care will be determined using the most recent data available at the time of ratesetting for the applicable calendar year.

(2) Non-Drug Component

To account for the potential changing costs of the services included in the non-drug component of the bundled payment rates for OUD treatment services, we proposed to update the non-drug component of the bundled payment for OUD treatment services based upon the Medicare Economic Index (MEI). The MEI is defined in section 1842(i)(3) of the Act and the methodology for computing the MEI is described in § 405.504(d). The MEI is used to update the payment rates for physician services under section 1842(b)(3) of the Act, which states that prevailing charge levels beginning after June 30, 1973, may not exceed the level from the previous year except to the extent that the Secretary finds, on the basis of appropriate economic index data, that such a higher level is justified by year-to-year economic changes. The MEI is a fixed-weight input price index that reflects the physicians' own time and the physicians' PEs, with an adjustment for the change in economy-wide, private nonfarm business multifactor productivity. The method for calculating the MEI was last revised in the CY 2014 PFS final rule with comment period (78 FR 74264). In developing the proposed update factor for the non-drug component of the OUD treatment services payment rate, we also considered other potential update factors, such as the BLS Consumer Price Index for All Items for Urban Consumers (CPI-U) (Bureau of Labor Statistics #CUUR0000SA0 (<https://www.bls.gov/cpi/data.htm>) and the IPPS hospital market basket reduced by the multifactor productivity adjustment. The CPI-U is a measure of the average change over time in the prices paid by urban consumers for a market basket of consumer goods and services. However, we concluded that a healthcare-specific update factor, such as the MEI, would be more appropriate for OTPs than the CPI-U, which measures general inflation, as the MEI would more accurately reflect the change in the prices of goods and services included in the non-drug component of the OTP bundled payments.

Similarly, we believed the MEI would be more appropriate than the IPPS market basket to update the non-drug component of the bundled payment rates as the services provided by an OTP more closely resemble the services provided at a physician office than the services provided by an inpatient hospital. Accordingly, we proposed to update the payment amount for the non-drug component of each of the bundled payment rates for OUD treatment

services furnished by OTPs based upon the most recently available historical annual growth in the MEI available at the time of rulemaking. We proposed to codify this proposal at § 410.67(d)(3)(iii).

We received one comment on the annual update for the non-drug component of the bundled payment rate. The following is a summary of the comment we received and our response.

Comment: One commenter disagreed with using the MEI to increase the non-drug component payment and stated that the MEI focuses more narrowly on physician practices. The commenter stated that an OTP's cost structures are more similar to hospital outpatient departments than physician offices. The commenter stated that over time, updating rates by the MEI, which closely mirrors general inflation, will create access to care issues as federal and state mandated OTP costs grow faster than Medicare reimbursements. The commenter also stated that TRICARE utilizes the IPPS annual update factor and if CMS' goal is to align payment with the TRICARE model, it should act consistently and also adopt its annual adjustment policy.

Response: We clarify that CMS' goal is not to align payment with the TRICARE model. As indicated above, section 1834(w)(2) of the Act provides that the Secretary may consider the rates paid to OTPs for comparable services under Medicaid or under TRICARE. As we discussed in the CY 2020 PFS proposed rule, we considered payments for those comparable services in the development of our payment rates. However, we note that we also solicited comment on the scope of private payer OTP coverage and the payment rates private payers have established for OTPs furnishing comparable OUD treatment services for consideration.

We appreciate the commenter's concern about using the MEI to update the non-drug component of the OTP bundled payment rate. Ideally, we would develop a market basket that reflects the detailed cost structures of OTP facilities; however, these data are not currently available. Therefore, we have to use a price index that best approximates the cost of the medical services being provided by the OTP facilities. Although TRICARE uses the IPPS annual update factor, we believe the MEI is a more appropriate index to use to update the non-drug component of the OTP bundled payment rate based on both conceptual and compositional reasons.

From a conceptual standpoint, we believe physicians' services furnished in the office setting more closely align to

the OUD treatment services furnished by OTPs as they both encompass minimally invasive medical care such as assessment, counseling, and administering of medications. The MEI measures the market price changes in the inputs used to furnish physicians' services, and represents both the medical and non-medical costs associated with providing this care. In contrast, hospitals engage in complex inpatient and outpatient medical services, such as surgical procedures and emergency room trauma, which are significantly different to the services furnished in OTP facilities. The IPPS market basket reflects these complex services and the non-medical costs associated with managing these large facilities, such as non-medical labor-related services (including but not limited to legal, accounting, financial, and installation and maintenance repair services), which account for almost 25 percent of the IPPS market basket.

From a compositional standpoint, the MEI more closely aligns with the services associated with the OTP payment system. In particular, the MEI does not reflect drug costs (which will be updated separately for OTPs, as discussed previously) as these costs are not reimbursed under the Medicare PFS, for which the MEI was originally developed. The IPPS market basket, however, is an operating market basket that reflects drug costs because these costs are included in the IPPS operating base payment rate. Additionally, the MEI includes PE associated with all operations, including any capital or leasing costs. The IPPS market basket, on the other hand, excludes capital costs because under the IPPS, capital costs are reimbursed separately and the IPPS capital payment rates are updated using the IPPS capital market basket, which reflects the complex capital acquisition and financing methods of IPPS hospitals. Finally, the MEI reflects an adjustment for expected productivity improvements associated with the provision of care (the MEI uses the change in economy-wide private non-farm business multifactor productivity), which, given the similarity in the nature of services furnished in the physician office and OTP settings, OTPs would also be anticipated to be able to achieve. The IPPS market basket does not include a productivity adjustment as that adjustment is applied separately as part of the payment rate update. These compositional differences account for many of the differences between the growth rates of the MEI and the IPPS market basket that the commenter identified as a concern. Because the

differences in growth rates between the IPPS market basket and the MEI are due to these compositional differences, we disagree with the commenter that there is a concern with using the MEI to update the non-drug component of the bundled payment rates. That is, we believe the MEI is an appropriate price index to serve as a proxy for changes in market costs associated with providing OTP services, as it reflects both the medical and non-medical costs of providing noninvasive medical care in a non-inpatient facility.

After consideration of the public comments, we are finalizing the proposal to update the non-drug component of the bundled payment for OUD treatment services based upon the MEI. These policies are codified in § 410.67(d)(4)(iii). Additionally, although we did not explicitly address the application of the annual update to the add-on payment adjustments for non-drug services in the proposed rule, we believe that the same logic regarding the potential changing costs of the services included in the non-drug component of the bundled payment rates is applicable. As such, we are finalizing that the add-on payment adjustments for non-drug services will be subject to the annual update as described above.

In addition to comments on our proposals and the related issues on which we specifically requested public input, we received a number of other public comments related to our implementation of this new Medicare benefit for OUD treatment services furnished in an OTP. Several comments focused on various aspects of how the OTP proposals intersect with Medicaid, those beneficiaries dually eligible for Medicare and Medicaid, Medicare Advantage, and certain requirements related to compliance, quality measurement, and Electronic Health Records. While these issues were not addressed specifically in the proposed rule, we believe it is important to clarify how the OTP policies interface with existing policies under these other programs. The following is a summary of the comments we received and our responses.

Comment: Most commenters expressed concerns that in the states that currently cover OTP services under Medicaid, the transition from Medicaid to Medicare as primary payer for those OTP services for dually eligible individuals could result in disruptions to dually eligible individuals' OTP treatment, as well as for OTP providers. Several commenters noted the tight timeframes for OTP providers to enroll in Medicare. For those OTPs currently

servicing dually eligible individuals under Medicaid, any enrollment backlog may create cash flow problems for these providers, as Medicaid is the payer of last resort, which normally means Medicaid stops paying for a benefit once Medicare starts to cover it. They also noted that the timing of the final regulation would result in less than 60 days to implement needed changes to billing systems. Commenters requested flexibilities during this transition, including a transition period in which OTP providers could still bill Medicaid, with well-publicized transition timelines for a grace period during which improperly submitted claims could be corrected.

Response: We appreciate the concerns expressed by commenters. As discussed in more detail below, Medicaid must pay for OTP services for dually eligible individuals if the service is covered by the Medicaid state plan and the OTP provider is enrolled in Medicaid and not yet enrolled in Medicare.

We will issue guidance to states on strategies to promote continuity of care for dually eligible individuals during this transition period while upholding their responsibilities under Medicaid as the payer of last resort. We will remind states that Medicaid must pay for services delivered to these beneficiaries by OTP providers who are not yet enrolled in Medicare. Recognizing that many OTP providers may not yet be enrolled in Medicare on January 1, 2020, we will recommend that states not impose systems edits to automatically reject claims, (under the assumption that the OTP is Medicare-enrolled and therefore Medicare is the appropriate primary payer for the dually eligible individual) for OTP services furnished to dually eligible individuals at the start of the year. We will encourage states to reach out to their Medicaid-enrolled OTP providers to advise them to enroll as quickly as possible in Medicare. To support continuity of care, we will ask states to offer OTPs options during the interim until Medicare approves the provider enrollment, including billing Medicaid for payment (with the understanding that Medicaid will later recoup the Medicaid payments made, back to the effective date of Medicare provider enrollment, and the provider will bill Medicare instead for those claims), or to hold claims and bill Medicare once the OTP provider is Medicare-enrolled. As requested by the commenters, we will also include in our outreach to OTP providers information about these transition options.

Comment: One commenter who supported a transition period requested that the transition period be extended in

cases where OTP providers need to be credentialed and contract with a large number of Medicare Advantage plans, or when Medicaid Managed Care Organizations are involved in covering the Medicare cost-sharing. Commenters noted that unlike Medicare, where there is a single provider enrollment process, it will take significantly longer for OTP providers to become network providers with multiple Medicare Advantage plans, potentially delaying their ability to provide services to dually eligible enrollees of those plans.

Response: We share the concern around ensuring continuity of care for dually eligible individuals who are currently obtaining treatment from an OTP provider through Medicaid and are enrolled in a Medicare Advantage managed care plan. The factors impacting transition are different in Medicare Advantage from those discussed below for Original Medicare. Under section 1852(a) of the Act and 42 CFR 422.100, Medicare Advantage (MA) plans must cover the Medicare OTP benefit because it is a Part B benefit. MA plans may meet this obligation by contracting with OTP providers or making other arrangements with non-contracted OTP providers. Under current MA program requirements, MA plans may furnish OTP access for their enrollees either by establishing direct contracts with OTPs or by arranging access on a non-contract basis. If an MA plan furnishes access to OTPs by contracting with one or more OTPs the MA plan is not necessarily required to contract with all OTP providers in the area, but must ensure that the contracts with OTPs it does have furnish sufficient access and availability to OTP services for its enrollees and are also consistent with the community pattern of care based on the service area where the MA plan is being offered. If an MA plan allows its enrollees to obtain OTP services on a non-contract basis the MA plan must ensure that its enrollees are able to access OTP services that are available within the community pattern of care. (see § 422.112). If a dually eligible individual enrolled in the plan is currently in treatment with an OTP provider with which the plan does not contract, the plan should create a transition process under which the individual can continue to see their current OTP provider while the plan works with the individual to transition to a network provider. Allowing the individual to continue to see their current provider during this transition will ensure continuity of care for this vulnerable population.

Comment: One commenter specifically requested that dually

eligible individuals receiving services from an OTP provider not enrolled in Medicare be able to continue to receive treatment from that provider, and further requested this apply to dually eligible individuals not yet in treatment but who have no Medicare OTP providers in their area.

Response: As noted above, Medicaid must still cover OTP services for dually eligible individuals whose provider is not yet enrolled in Medicare. This flexibility promotes continuity of care for dually eligible individuals already receiving OTP services under Medicaid now, as well as providing beneficiaries access to Medicaid-enrolled OTP providers when there are no Medicare-enrolled OTP providers in their area.

Comment: Some commenters requested clarification on how OTP providers would bill for dually eligible individuals once Medicare starts covering these services on January 1, 2020, including the process for the Part B deductible to be paid by Medicaid.

Response: Once Medicare starts covering OTP services, a Medicare-enrolled OTP provider would bill Medicare for OUD treatment services furnished to dually eligible individuals under Original Medicare. For Original Medicare, if the dually eligible beneficiary has not yet met their annual Medicare Part B deductible, Medicare will automatically “crossover” the claim to Medicaid to adjudicate for payment of the deductible. In addition, please see responses to comments below for a discussion of the process when a state is using different billing codes than Medicare, and when an OTP provider is not yet enrolled in Medicare.

For OTP providers serving dually eligible individuals enrolled in Medicare Advantage, there is no automated crossover process. For cost sharing applicable to the OTP benefit under the MA plan, MA plans are required by § 422.504(g)(1) to specify in their contracts with providers that such dually eligible enrollees will not be held liable for Medicare Part A and Part B cost sharing when the State is responsible for paying such amounts, and to inform providers of Medicare and Medicaid benefits, and rules for enrollees eligible for Medicare and Medicaid. We understand most MA plans have not entered into coordination of benefit agreements with state Medicaid agencies. In these instances, the MA plan would not have any means to forward claims for cost sharing directly to state Medicaid programs for payment; and so an OTP provider would need to bill Medicaid directly for the cost sharing that the provider may not collect from the

enrollee; this may also mean that the OTP provider has to re-code the claim if the state uses different billing codes than the Medicare Advantage plan uses.

Comment: One commenter specifically requested that the timeframe for state Medicaid agencies to update their respective fee schedules match the Medicare payment methodology to prevent denials when Medicare sends the crossover claim to Medicaid for the deductible.

Response: State Medicaid programs often use different codes and pay differently than Medicare. There is no requirement to match the Medicare payment methodology, but states do need to be able to process claims for the beneficiary’s cost-sharing liability for most dually eligible individuals. If the state uses different billing codes, its claims processing system may initially deny the crossover claim, and send a remittance advice to the provider notifying the provider of the denial. The OTP provider should then re-code the claim using the Medicaid billing codes and resubmit to Medicaid for processing.

Comment: A few commenters suggested that CMS offer an expedited process for receiving a Medicare denial, to provide Medicaid with proof that Medicare will not cover the OTP services. A few other commenters also suggested CMS make available an up-to-date-listing of Medicare enrolled OTP providers in each state.

Response: We agree it is important to support OTP providers and states by providing the information needed to facilitate the process for an OTP provider to bill Medicaid for services furnished to a dually eligible individual, when that is permitted. Medicaid will often accept a Medicare claims denial as proof that Medicare will not cover the service, and will process the claim for Medicaid coverage. However, Medicare can only process a claim from a Medicare-enrolled provider, and thus can only issue a claims denial to a Medicare-enrolled provider.

As we note in our response to a prior comment, Medicaid must pay for OUD treatment services furnished by an OTP to a dually eligible individual when the service is covered by the Medicaid state plan and the OTP provider is enrolled in Medicaid, but is not enrolled in Medicare. We agree with the suggestion to make publicly-available and update a list of Medicare-enrolled OTP providers so OTPs and states have evidence that a given provider is not Medicare-enrolled. We anticipate this information will also have value for Medicare beneficiaries seeking OUD treatment services in OTPs. We also note that

states already have access to the CMS Provider Enrollment, Chain, and Ownership System (PECOS) provider enrollment system, and can confirm provider enrollment or lack thereof through queries to that system.

Comment: Several commenters expressed concern about the intersection of Medicaid’s “Upper Payment Limit” (UPL) policy with the proposed Medicare payment rates for OTP services. The commenters noted that most states that cover OTP services have payment rates that are higher than the proposed Medicare payment rates, and expressed a concern that Medicaid’s UPL policy requires Medicaid rates to be lower than Medicare’s. Commenters noted that unless Medicare significantly increases its proposed rates, state Medicaid agencies would be forced to lower theirs to comply with the UPL. Commenters requested that CMS increase the Medicare rates for services furnished by OTPs to exceed the Medicaid rate in every state, or not apply the UPL requirements to the Medicaid OTP services.

Response: We appreciate the concern expressed by the commenters. However, the UPL requirements do not directly impact payment rates for individual services such as the OUD treatment services furnished by OTPs in the way commenters describe, and states have policy options to address UPL-related concerns. As background, state Medicaid agencies can opt to cover OTP services under the Medicaid clinic benefit or the Medicaid rehabilitation benefit. The Medicaid clinic benefit is subject to a UPL based on estimated Medicare payments, but states demonstrate compliance with this requirement at an aggregate level across the range of services covered under the clinic benefit as a whole for a given year. States are not required to set Medicaid payment lower than Medicare at a service or code-level basis. Within the UPL requirements, states have significant flexibility in how they may pay for individual services or codes or make payments to clinics that specialize in providing certain types of care. As a result, states offering OTP services under the clinic benefit would not be required to reduce their payment rates to be less than Medicare for OTP services. We will issue guidance reminding states that the UPL policy for the clinic benefit applies at the aggregate level, and will work with states to determine how to comply with the UPL if they currently cover OTP under the clinic benefit. For states that offer OTP services under the rehabilitation benefit, we note there is no UPL for that benefit, so the Medicare

payment rate for OTP services does not impact Medicaid payment for those states. As a result, there is no need to adjust the Medicare payment rates for OUD treatment services furnished by OTPs that we are adopting in this final rule to address this concern.

Comment: One commenter suggested CMS provide guidance to states on what the Medicare OTP benefit does and does not cover, to facilitate Medicaid covering specific OTP services for dually eligible individuals that Medicare does not cover.

Response: We acknowledge that states may have a more expansive benefit for services provided by OTPs than Medicare's, and that in those situations, states may continue to cover specific OTP services that Medicare does not. To support a smooth transition, we will provide guidance to states to describe the Medicare OTP benefit and remind them that Medicaid may still cover specific OTP services not covered under the Medicare OTP benefit.

Comment: Several commenters suggested that CMS conduct significant outreach on coordination of benefits; that is, how Medicare will be primary payer and Medicaid will be secondary payer for dually eligible individuals. One commenter further suggested that OTP providers should receive training and technology to facilitate screening patients for Medicare, as well as Medicaid, eligibility and enrollment.

Response: We agree with the need for significant outreach to OTP providers regarding coordination of benefits, and are collaborating with SAMHSA—which certifies OTP providers—to do so. We will explore options around providing technical assistance on connecting eligible clients to Medicare and Medicaid coverage.

Comment: One commenter suggested that as part of supporting the transition from Medicaid to Medicare coverage of OTP services, CMS issue guidance to remind states to continue transportation coverage for full benefit dually eligible individuals receiving services under the Medicare OTP benefit.

Response: As noted elsewhere, Medicare is the primary payer for services that are payable by both Medicare and Medicaid. However, Medicare has a limited non-emergency ambulance transportation benefit. If a full benefit dually eligible individual is obtaining a Medicaid-coverable benefit for which Medicare is the primary payer, the state must assure, in certain circumstances, transportation to the medical service (in the limited instances in which Medicaid does not cover a service Medicare covers, it is optional for states to cover transportation). As a

result, when states cover OTP services, and when the applicable criteria are met, Medicaid must assure non-emergency medical transportation for full benefit dually eligible individuals obtaining Medicare-covered OTP services.

Comment: Several commenters supported the proposal to initially set the copayment for OTP services zero, but requested that this policy be made permanent for dually eligible individuals.

Response: We will consider issues on future copayment rates, and on keeping the zero copayment for dually eligible individuals, as part of any future rulemaking on the cost-sharing requirements for the benefit as a whole.

Comment: A commenter raised concerns regarding the January 1, 2020 implementation date for the OTP benefit due to implementation barriers. The commenter stated that MAOs need final payment codes, payment information and clarity regarding any benefit caps or other benefit limits. The commenter further stated that MAOs need additional time to finalize contracting systems and to develop operational details for the benefit.

Response: Although we understand the concern, we do not plan to delay the implementation of this benefit due to the acute need for the OUD treatment services furnished by OTPs. We will work closely with MAOs to ensure timely implementation of this benefit. Plans must provide enrollees with a level of access to Medicare-covered OTP services that is consistent with prevailing community patterns of care in the areas where the network is being offered (§ 422.112(a)(10)). We note that, for CY 2020, Medicare Advantage plans may contract with an OTP provider so long as the requirements for such providers (such as licensure, certification, and other qualifications, etc.) under Titles XVIII and XI of the Act are met. Allowing the individual to continue to see their current provider during this transition will ensure continuity of care for this vulnerable population.

Comment: One commenter recommended that CMS issue a non-enforcement or “hold harmless” grace period against plans for Part B vs. Part D determinations for 2020, with respect to audits and other consequences such as Star Ratings related to the new OUD treatment services benefit.

Response: We do not believe it is appropriate for CMS to issue a “hold harmless” period regarding the implementation of the new OTP benefit. As we have noted in other responses, we believe there is an urgency in

making this benefit available to people struggling with opioid use disorder. CMS will work closely with organizations to ensure a smooth implementation of this benefit. With regard to the Part B versus Part D determination, we remind Medicare Advantage plans that § 422.112(b)(7) requires plans that also cover Part D drugs to coordinate coverage and have a process in place to ensure provision of the covered drug to an enrollee in a timely fashion. CMS clarifies that buprenorphine prescribed by DATA 2000 providers outside of OTPs can continue to be covered under Part D. The DATA 2000 and OTP programs are designed to meet the needs of those needing opioid dependency treatment in different ways. Therefore, because buprenorphine is still covered under Part D when furnished outside an OTP, sponsors should not need to implement new point of service Part B versus Part D pharmacy edits for a buprenorphine claim. In addition, any substantive changes to the Star Ratings measure specifications must be adopted through rulemaking per §§ 422.164 and 423.184.

Comment: A commenter recommended that CMS delay the implementation of the OTP benefit until January 1, 2021, because MA plans did not have an opportunity to account for the new benefit in their 2020 year bids.

Response: In the CY 2020 Call Letter released April 1, 2019 available at the following web link: <https://www.cms.gov/Medicare/Health-Plans/MedicareAdvgtgSpecRateStats/Downloads/Announcement2020.pdf>, CMS issued guidance to MAOs regarding section 2005 of the SUPPORT Act and implementing the OTP benefit. In the Call Letter, CMS reminded plans that opioid use disorder treatment services furnished by OTPs would be covered as a Medicare Part B benefit beginning January 1, 2020. We also stated that MA organizations should prepare their bids using available information and reiterated that MA plans must provide all medically necessary Part A and Part B covered services to enrollees consistent with section 1852 of the Act and the regulations in part 422. As such, MA plans were given the opportunity to account for the new benefit in their 2020 bids and did so when bids were submitted on June 3, 2019.

Comment: A commenter expressed concerns that there may be insufficient number of OTPs available in 2020 who are SAMSHA accredited with a Medicare provider agreement to contract with MA plans.

Response: We note that MA plans will be required to furnish access to OTP

services consistent with what is available to Original Medicare beneficiaries residing in the same geographic area. (see § 422.112) While OTPs will currently not be a specialty included in our evaluation of MA networks, all plan covered services must be furnished consistent with community patterns of care (see § 422.112(a)(10)). This means that a plan's enrollees, who are receiving services from an OTP, cannot be required to travel significantly farther than the distance Original Medicare beneficiaries are required to travel in order to access services from the OTP. MA plans are not required to furnish transportation to the OTP facilities as part of the OTP benefit. However, MA plans can furnish transportation to health care services as a supplemental benefit. In addition, as noted elsewhere, Medicaid must assure, in certain circumstances, non-emergency transportation for a dually eligible individual to obtain a Medicaid-covered benefit for which Medicare is primary payer.

Comment: A commenter stated that, in order to administer this new benefit, guidance is needed on which services must be covered by an MA plan without cost-sharing and the timelines for coverage without cost-sharing (for example, no more than 12 months of active treatment). The commenter further stated that since OUD treatment is complex and can vary from patient to patient, it is important that plans understand whether there should be no cost-sharing on all components or if there are specific nuances in how to apply the requirement.

Response: MA plans can offer the OTP benefit consistent with the bids which were submitted for CY 2020, including proposed cost-sharing. We note that MA plans must assure that, in instances in which they impose cost-sharing for the OTP benefit, providers do not bill a Qualified Medicare Beneficiary for such cost-sharing. (see § 422.504(g)(1).)

Comment: A commenter requested clarification as to whether OTPs will be billing Medicare Part B—that is, the FFS Medicare program—for services furnished to Medicare Advantage enrollees.

Response: No. OTPs that furnish Medicare covered medically necessary services to MA enrollees will be paid by the enrollees' MA plans. MA plans are required to furnish or cover all benefits that are covered by Medicare Part A and Part B, excluding hospice, for their enrollees. As previously noted, MA plans are required to contract with, or arrange on a non-contract basis for, enrollee access to medically necessary

OTP services consistent with the community pattern of care. MA plans may have direct contracts with OTPs in which they negotiate the terms and conditions of payment for the Medicare-covered services furnished by the OTP. An OTP treating an MA enrollee that does not have a contract with the enrollee's MA plan should contact the MA plan to confirm coverage and payment.

Comment: A commenter requested additional information about CMS' expectations of how the OTP benefit will be made available to Medicare Advantage enrollees.

Response: In the CY 2020 Call Letter released on April 1, 2019, CMS issued guidance to MA organizations regarding section 2005 of the SUPPORT Act and implementing the OTP benefit. In the CY 2020 Call Letter, CMS reminded plans that opioid use disorder treatment services furnished by OTPs would be covered as a Medicare Part B benefit by plans beginning January 1, 2020. We also stated that MA organizations should prepare their bids using available information and reiterated that MA plans must provide all medically necessary Part A and Part B covered services to enrollees consistent with section 1852 of the Act and the regulations in part 422.

For dually eligible individuals who may already be receiving OTP services through Medicaid, MA plans should ensure continuity of care for their enrollees any time there is a transition from a non-contracted to a contracted provider. In addition, as noted above, MA plans must assure that in instances in which they impose cost-sharing on the OTP benefit, providers do not bill a Qualified Medicare Beneficiary for such cost-sharing.

Comment: A commenter asks that CMS not allow MA plans to utilize prior authorization (PA) or step therapy for treatment of opioid withdrawal symptoms.

Response: MA plans may use step therapy for Part B drugs when medically appropriate and consistent with the requirements in § 422.136. We also note that when an MA plan processes a coverage request that involves prior authorization or other utilization management requirements, such as step therapy for Part B drugs, the plan's determination on whether to grant approval of a service or a drug for an enrollee constitutes an organization determination under part 422, subpart M, and is subject to appeal. Specifically, as described at § 422.568, the MA organization must notify the enrollee of its determination as expeditiously as the enrollee's health condition requires.

CMS is considering strategies we can use to monitor the implementation of the OTP benefit by MA plans and any issues that may impede access to medically necessary treatment of opioid use disorder, including what data might be available to evaluate plan performance.

Comment: A commenter questioned how MA-PD and Prescription Drug Plan sponsors will know what beneficiaries are eligible for this benefit. The commenter proposes that an option would be to provide an indicator in the CMS Medicare Advantage and Prescription Drug data System (MARx), with start and end dates, for beneficiary eligibility for OTP services.

Response: All beneficiaries needing treatment for opioid addiction are eligible for this benefit. We appreciate the data suggestion and will take it into consideration in our on-going implementation of the OTP benefit.

Comment: A commenter questioned how Medicare's managed care plan partners are supposed to reflect the use of this new benefit in their required data submissions.

Response: We will furnish guidance to MA organizations and cost plans on this topic at a later date.

Comment: A commenter requested that since OTPs are currently providing OUD services to Medicare beneficiaries, and that the provider enrollment process would not start until the new Part B benefit is available (January 1, 2020), will CMS allow for payments to OTPs for services delivered in the 30 days prior to their successful enrollment.

Response: As we noted in a previous response, MA plans cannot contract or furnish the Part B OTP services through any OTP that is SAMSHA accredited if that OTP has not yet enrolled in Medicare but the MA plan may cover or furnish services provided by such a provider as a supplemental benefit (§ 422.204(b)(3)). Allowing the individual to continue to see their current provider during this transition will ensure continuity of care for this vulnerable population. Furthermore, in some situations, the MA plan may be required by § 422.112(a)(3) to provide out-of-network access for the OTP benefit and we remind MA organizations of their obligations under part 422 regulations to furnish all Part A and Part B benefits, excluding hospice, to their enrollees.

Comment: A commenter noted that the Annual Notice of Change and Evidence of Coverage (ANOC and EOC) documents can play an essential role in updating beneficiaries as to new benefits, but the timing for

implementation of the OTP benefit in 2020 makes this impractical, and instead suggested that CMS undertake a robust public education campaign aimed directly at beneficiaries.

Response: The SUPPORT Act became law in October 2018 and CMS issued guidance to MA organizations in the CY 2020 Draft Call Letter (issued in January 2019) and the CY 2020 Final Call Letter (issued in April 2019) about the requirement to cover the OTP benefit, so MA organizations had sufficient time to plan to include the necessary information in ANOCs and EOCs for 2020. Medicare Advantage plans are required to include the new OTP benefit in their 2020 ANOC/EOC. We are also implementing a comprehensive education campaign regarding the new OTP benefit. Our public education campaign will feature CMS information channels, education resources and outreach leveraging media/stakeholder networks to raise awareness and engage Medicare beneficiaries. Specifically it will include earned media (for example, drop-in article for local/community newspapers), social media (for example, tweets and Facebook posts), beneficiary publications, and outreach to beneficiary partners including State Health Insurance Assistance Programs (SHIPs) across the country, in addition to information available from 1-800-MEDICARE and our consumer website, <http://www.medicare.gov>.

Comment: One commenter requested more information about the compliance criteria, quality metrics, and electronic health record (EHR) requirements that will be used to evaluate OTPs, and whether OTPs will be subject to the requirements of the Quality Payment Program.

Response: We did not propose any compliance criteria, quality metrics, or EHR requirements for OTPs. As OTPs are not one of the eligible clinician types for the Quality Payment Program, they are not able to participate in MIPS or to be a Qualifying APM Participant (QP). However, OTPs may be able to participate in a Center for Medicare and Medicaid Innovation payment model, depending on the eligible participants identified for that specific model, and then would be subject to the requirements of that specific model, which could include quality or EHR-related requirements.

After a thorough review of the above policy considerations reflected in the public comments we received, we are finalizing the proposed provisions to implement the new OTP benefit under section 2005 of the SUPPORT Act, with modifications as described above, at § 410.67, part 489 and part 498.

H. Bundled Payments Under the PFS for Substance Use Disorders

1. Background and Provision

In the CY 2019 PFS proposed rule (83 FR 35730), we solicited comment on creating a bundled episode of care payment for management and counseling treatment for substance use disorders. We received approximately 50 comments on this topic, most of which were supportive of creating a separate bundled payment for these services. Some commenters recommended focusing the bundle on services related to medication assisted treatment (MAT) used in treatment for opioid use disorder (OUD). Several commenters also recommended that we establish higher payment amounts for patients with more complex needs who require more intensive services and management, and also expressed concern that an episode of care that limited the duration of treatment would not be conducive to treating OUD, given the chronic nature of this disorder. Other commenters recommended that we establish separate bundled payments for treatment of substance use disorders that does, and does not, involve MAT.

In response to the public comments, we proposed to establish bundled payments for the overall treatment of OUD, including management, care coordination, psychotherapy, and counseling activities. We noted that, if a patient's treatment involves MAT, this bundled payment would not include payment for the medication itself. Billing and payment for medications under Medicare Part B or Part D would remain unchanged. Additionally, payment for medically necessary toxicology testing would not be included in the proposed OUD bundle, and would continue to be billed separately under the Clinical Lab Fee Schedule. We also proposed to implement the new Medicare Part B benefit added by section 2005 of the SUPPORT Act for coverage of certain services furnished by Opioid Treatment Programs (OTPs) beginning in CY 2020. We believe the bundled payment under the PFS for OUD treatment described below will create an avenue for physicians and other health professionals to bill for a bundle of services that is similar to the new bundled OUD treatment services benefit, but not furnished by an OTP. By creating a separate bundled payment for these services under the PFS, we hope to incentivize increased provision of counseling and care coordination for patients with OUD in the office setting, thereby expanding access to OUD care. We note that use of these codes is

limited to only beneficiaries diagnosed with OUD; however, we may consider other potential bundles describing services for other substance use disorders in future rulemaking.

To implement this new bundled payment, we proposed to create two HCPCS G-codes to describe monthly bundles of services that include overall management, care coordination, individual and group psychotherapy and counseling for office-based OUD treatment. Although we considered proposing weekly-reported codes to describe a bundle of services that would align with the proposed OTP bundle, we believe that monthly-reported codes will better align with the practice and billing of other types of care management services furnished in office settings and billed under the PFS (for example, behavioral health integration (BHI) services). We believe monthly-reported codes would be less administratively burdensome for practitioners, and more likely to be consistent with care management and prescribing patterns in the office setting (as compared with an OTP) given the increased use of long-acting MAT drugs (such as injectable naltrexone or implanted buprenorphine) in the office setting compared to the OTP setting. We note that these codes should not be billed for beneficiaries who are receiving treatment at an OTP, as we believe that would be duplicative since the bundled payments made to OTPs cover similar services for the treatment of OUD. Based on feedback we received through the comment solicitation, we proposed to create a code to describe the initial month of treatment, which would include intake activities and development of a treatment plan, as well as assessments to aid in development of the treatment plan in addition to care coordination, individual therapy, group therapy, and counseling; a code to describe subsequent months of treatment including care coordination, individual therapy, group therapy, and counseling; and an add-on code that could be billed in circumstances when effective treatment requires additional resources for a particular patient that substantially exceed the resources included in the base codes. In other words, the add-on code would address extraordinary circumstances that are not contemplated by the bundled code. We acknowledge that the course of treatment for OUD is variable, and in some instances, the first several months of treatment may be more resource intensive. We solicited comment on whether we should consider creating a separately billable

code or codes to describe additional resources involved in furnishing OUD treatment-related services after the first month, for example, when substantial revisions to the treatment plan are needed, and what resource inputs we might consider in setting values for such codes.

We believe that, in general, bundled payments create incentives to provide efficient care by mitigating incentives tied to volume of services furnished, and that these incentives can be undermined by creating separate billing mechanisms to account for higher resource costs for particular patients. However, we share some of the concerns raised by commenters that an OUD bundle should not inadvertently limit the appropriate amount of OUD care furnished to patients with varying medical needs. In consideration of this concern, we proposed to create an add-on code to make appropriate payment for additional resource costs in order to mitigate the risks that the bundled OUD payment might limit clinically-indicated patient care for patients that require significantly more care than is in the range of what is typical for the kinds of care described by the base codes. However, we are also interested in comments regarding ways we might better stratify the coding for OUD treatment to reflect the varying needs of patients (based on complexity or frequency of services, for example) while maintaining the full advantage of the bundled payment, including increased efficiency and flexibility in furnishing care.

We anticipate that these services would often be billed by addiction specialty practitioners, but note that these codes are not limited to any particular physician or nonphysician practitioner (NPP) specialty. Additionally, unlike the codes that describe care furnished using the psychiatric collaborative care model (CPT codes 99492, 99493, and 99494), which require consultation with a psychiatric consultant, we did not propose to require consultation with a specialist as a condition of payment for these codes, but we note that consultation with a specialist could be counted toward the minutes required for billing HCPCS codes G2086, G2087, and G2088.

The codes and descriptors for the services are:

- HCPCS code G2086: *Office-based treatment for opioid use disorder, including development of the treatment plan, care coordination, individual therapy and group therapy and counseling; at least 70 minutes in the first calendar month.*

- HCPCS code G2087: *Office-based treatment for opioid use disorder, including care coordination, individual therapy and group therapy and counseling; at least 60 minutes in a subsequent calendar month.*

- HCPCS code G2088: *Office-based treatment for opioid use disorder, including care coordination, individual therapy and group therapy and counseling; each additional 30 minutes beyond the first 120 minutes (List separately in addition to code for primary procedure).*

For the purposes of valuation for HCPCS codes G2086 and G2087, we are assuming two individual psychotherapy sessions per month and four group psychotherapy sessions per month; however, we understand that the number of therapy and counseling sessions furnished per month will vary among patients and also fluctuate over time based on the individual patient's needs. Consistent with the methodology for pricing other services under the PFS, HCPCS codes G2086, G2087, and G2088 are valued based on what we believe to be a typical case, and we understand that based on variability in patient needs, some patients will require more resources, and some fewer. In order to maintain the advantages inherent in developing a payment bundle, we proposed that the add-on code (HCPCS code G2088) can only be billed when the total time spent by the billing professional and the clinical staff furnishing the OUD treatment services described by the base code exceeds double the minimum amount of service time required to bill the base code for the month. We believe it is appropriate to limit billing of the add-on code to situations where medically necessary OUD treatment services for a particular patient exceed twice the minimum service time for the base code because, as noted above, the add-on code is intended to address extraordinary situations where effective treatment requires additional resources that substantially exceed the resources included in the base codes. For example, the needs of a particular patient in a month may be unusually acute, well beyond the needs of the typical patient; or there may be some months when psychosocial stressors arise that were unforeseen at the time the treatment plan was developed, but warrant additional or more intensive therapy services for the patient. We proposed that when the time requirement is met, HCPCS code G2088 could be billed as an add-on code during the initial month or subsequent months of OUD treatment. Practitioners should document the medical necessity

for the use of the add-on code in the patient's medical record. We solicited comment on the proposal.

We proposed to value HCPCS codes G2086, G2087, and G2088 using a building block methodology that sums the work RVUs and direct PE inputs from codes that describe the component services we believe would be typical, consistent with the approach we have previously used in valuing monthly care management services that include face-to-face services within the payment. For HCPCS code G2086, we developed proposed inputs using a crosswalk to CPT code 99492 (*Initial psychiatric collaborative care management, first 70 minutes in the first calendar month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional, with the following required elements: Outreach to and engagement in treatment of a patient directed by the treating physician or other qualified health care professional; initial assessment of the patient, including administration of validated rating scales, with the development of an individualized treatment plan; review by the psychiatric consultant with modifications of the plan if recommended; entering patient in a registry and tracking patient follow-up and progress using the registry, with appropriate documentation, and participation in weekly caseload consultation with the psychiatric consultant; and provision of brief interventions using evidence-based techniques such as behavioral activation, motivational interviewing, and other focused treatment strategies.*), which is assigned a work RVU of 1.70, plus CPT code 90832 (*Psychotherapy, 30 minutes with patient*), which is assigned a work RVU of 1.50 (assuming two over the course of the month), and CPT code 90853 (*Group psychotherapy (other than of a multiple-family group)*), which is assigned a work RVU of 0.59 (assuming four over the course of a month), for a work RVU of 7.06. The required minimum number of minutes described in HCPCS code G2086 is also based on a crosswalk to CPT code 99492. Additionally, for HCPCS code G2086, we proposed to use a crosswalk to the direct PE inputs associated with CPT code 99492, CPT code 90832 (times two), and CPT code 90853 (times four). We believe that the work and PE described by these crosswalk codes is analogous to the services described in HCPCS code G2086 because HCPCS code G2086 includes similar care

coordination activities as described in CPT code 99492 and bundles in the psychotherapy services described in CPT codes 90832 and 90853.

We proposed to value HCPCS code G2087 using a crosswalk to CPT code 99493 (*Subsequent psychiatric collaborative care management, first 60 minutes in a subsequent month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional, with the following required elements: tracking the patient follow-up and progress using the registry, with appropriate documentation; participation in weekly caseload consultation with the psychiatric consultant; ongoing collaboration with and coordination of the patient's mental health care with the treating physician or other qualified health care professional and any other treating mental health providers; additional review of progress and recommendations for changes in treatment, as indicated, including medications, based on recommendations provided by the psychiatric consultant; provision of brief interventions using evidence-based techniques such as behavioral activation, motivational interviewing, and other focused treatment strategies; monitoring of patient outcomes using validated rating scales; and relapse prevention planning with patients as they achieve remission of symptoms and/or other treatment goals and are prepared for discharge from active treatment*), which is assigned a work RVU of 1.53, plus CPT code 90832, which is assigned a work RVU of 1.50 (assuming two over the course of the month), and CPT code 90853, which is assigned a work RVU of 0.59 (assuming four over the course of a month), for a work RVU of 6.89. The required minimum number of minutes described in HCPCS code G2087 is also based on a crosswalk to CPT codes 99493. For HCPCS code G2087, we proposed to use a crosswalk to the direct PE inputs associated with CPT code 99493, CPT code 90832 (times two), and CPT code 90853 (times four). We believe that the work and PE described by these crosswalk codes is analogous to the services described in HCPCS code G2087 because HCPCS code G2087 includes similar care coordination activities as described in CPT code 99493 and bundles in the psychotherapy services described in CPT codes 90832 and 90853.

We proposed to value HCPCS code G2088 using a crosswalk to CPT code 99494 (*Initial or subsequent psychiatric*

collaborative care management, each additional 30 minutes in a calendar month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional (List separately in addition to code for primary procedure)), which is assigned a work RVU of 0.82. The required minimum number of minutes described in HCPCS code G2087 is also based on a crosswalk to CPT codes 99493. For HCPCS code G2088, we proposed to use a crosswalk to the direct PE inputs associated with CPT code 99494. We believe that the work and PE described by this crosswalk code is analogous to the services described in HCPCS code G2088 because HCPCS code G2088 includes similar care coordination activities as described in CPT code 99494.

We understand that many beneficiaries with OUD have comorbidities and may require medically-necessary psychotherapy services for other behavioral health conditions. In order to avoid duplicative billing, we proposed that, when furnished to treat OUD, CPT codes 90832, 90834, 90837, and 90853 may not be reported by the same practitioner for the same beneficiary in the same month as HCPCS codes G2086, G2087, and G2088. We solicited comments on the proposal.

We proposed that practitioners reporting the OUD bundle must furnish a separately reportable initiating visit in association with the onset of OUD treatment, since the bundle requires a level of care coordination that cannot be effective without appropriate evaluation of the patient's needs. This is similar to the requirements for chronic care management (CCM) services (CPT codes 99487, 99489, 99490, and 99491) and BHI services (CPT codes 99484, 99492, 99493, and 99494) finalized in the CY 2017 PFS final rule (81 FR 80239). The initiating visit would establish the beneficiary's relationship with the billing practitioner, ensure the billing practitioner assesses the beneficiary to determine clinical appropriateness of MAT in cases where MAT is being furnished, and provide an opportunity to obtain beneficiary consent to receive care management services (as discussed further below). We proposed that the same services that can serve as the initiating visit for CCM services and BHI services can serve as the initiating visit for the services described by HCPCS codes G2086–G2088. For new patients or patients not seen by the practitioner within a year prior to the commencement of CCM services and

BHI services, the billing practitioner must initiate the service during a “comprehensive” E/M visit (levels 2 through 5 E/M visits), annual wellness visit (AWV) or initial preventive physical exam (IPPE). The face-to-face visit included in transitional care management (TCM) services (CPT codes 99495 and 99496) also qualifies as a “comprehensive” visit for CCM and BHI initiation. We proposed that these visits could similarly serve as the initiating visit for OUD services.

We proposed that the counseling, therapy, and care coordination described in the OUD treatment codes could be provided by professionals who are qualified to provide the services under state law and within their scope of practice “incident to” the services of the billing physician or other practitioner. We also proposed that the billing clinician would manage the patient's overall care, as well as supervise any other individuals participating in the treatment, similar to the structure of the BHI codes describing the psychiatric collaborative care model finalized in the CY 2017 PFS final rule (81 FR 80229), in which services are reported by a treating physician or other qualified health care professional and include the services of the treating physician or other qualified health care professional, as well as the services of other professionals who furnish services incident to the services of the treating physician or other qualified health care professional. Additionally, we proposed to add these codes to the list of designated care management services for which we allow general supervision of the non-face-to-face portion of the required services. Consistent with policies for other separately billable care management services under the PFS, because these proposed OUD treatment bundles include non-face-to-face care management components, we proposed that the billing practitioner or clinical staff must document in the beneficiary's medical record that they obtained the beneficiary's consent to receive the services, and that, as part of the consent, they informed the beneficiary that there is cost sharing associated with these services, including potential deductible and coinsurance amounts, for both in-person and non-face-to-face services that are provided.

We proposed to allow any of the individual therapy, group therapy and counseling services included in HCPCS codes G2086, G2087, and G2088 to be furnished via telehealth, as clinically appropriate, in order to increase access to care for beneficiaries. As discussed in section II.F. of this final rule regarding

Telehealth Services, like certain other non-face-to-face PFS services, the components of HCPCS codes G2086 through G2088 describing care coordination are commonly furnished remotely using telecommunications technology, and do not require the patient to be present in-person with the practitioner when they are furnished. As such, these services are not considered telehealth services for purposes of Medicare, and we do not need to consider whether the non-face-to-face aspects of HCPCS codes G2086 through G2088 are similar to other telehealth services. If the non-face-to-face components of HCPCS codes G2086 through G2088 were separately billable, they would not need to be on the Medicare telehealth list to be covered and paid in the same way as services delivered without the use of telecommunications technology.

Section 2001(a) of the SUPPORT Act amended section 1834(m) of the Act, adding a new paragraph (7) that removes the geographic limitations for telehealth services furnished on or after July 1, 2019, to an individual with a substance use disorder (SUD) diagnosis for purposes of treatment of such disorder or co-occurring mental health disorder. The new paragraph at section 1834(m)(7) of the Act also allows telehealth services for treatment of a diagnosed SUD or co-occurring mental health disorder to be furnished to individuals at any telehealth originating site (other than a renal dialysis facility), including in a patient's home. As discussed in section I.F. of this final rule, Telehealth Services, we proposed to add HCPCS codes G2086, G2087, and G2088 to the list of Medicare Telehealth services. Because certain required services (such as individual psychotherapy or group psychotherapy services) that are included in the proposed OUD bundled payment codes would be furnished to treat a diagnosed SUD, and would ordinarily require a face-to-face encounter, they could be furnished more broadly as telehealth services as permitted under section 1834(m)(7) of the Act.

For these services described above (HCPCS codes G2086, G2087, and G2088), we solicited comment on how these potential codes, descriptors, and payment rates align with state Medicaid coding and payment rates for the purposes of state payment of cost sharing for Medicare-Medicaid dually eligible individuals. Additionally, we understand that treatment for OUD can vary, and that MAT alone has demonstrated efficacy. In cases where a medication such as buprenorphine or naltrexone is used to treat OUD alone,

without therapy or counseling, we note that existing applicable codes can be used to furnishing and bill for that care (for example, using E/M visits, in lieu of billing the bundled OUD codes proposed here).

As discussed in section II.G. of this final rule, Medicare Coverage for Certain Services Furnished by Opioid Treatment Programs, we proposed to set the copayment at zero for OUD services furnished by an OTP, given the flexibility in section 1834(w)(1) of the Act for us to set the copayment amount for OTP services either at zero or at an amount above zero. We note that we do not have the statutory authority to eliminate the deductible and coinsurance requirements for the bundled OUD treatment services under the PFS. We acknowledge the potential impact of coinsurance on patient health care decisions and intend to monitor its impact if these proposals were to be finalized.

Finally, we recognize that historically, the CPT Editorial Panel has frequently created CPT codes describing services that we originally established using G-codes and adopted them through the CPT Editorial Panel process. We note that we would consider using any newly available CPT coding to describe services similar to those described here in future rulemaking, as early as CY 2021. We would consider and adopt any such CPT codes through subsequent rulemaking.

Additionally, we understand that in some cases, OUD can first become apparent to practitioners in the emergency department setting. We recognize that there is not specific coding that describes diagnosis of OUD or the initiation of, or referral for, MAT in the emergency department setting. We solicited comment on the use of MAT in the emergency department setting, including initiation of MAT and the potential for either referral or follow-up care, as well as the potential for administration of long-acting MAT agents in this setting, in order to better understand typical practice patterns to help inform whether we should consider making separate payment for such services in future rulemaking. We solicited feedback from stakeholders and the public on other potential bundles describing services for other substance use disorders for our consideration in future rulemaking.

We received public comments on the proposed bundled payments under the PFS for substance use disorders. The following is a summary of the comments we received and our responses.

Comment: Many commenters expressed support for this proposal and

a few noted that the PFS bundle would provide an opportunity to increase access to OUD treatment for beneficiaries who live in areas without an OTP, but also encouraged CMS to seek opportunities to more closely align the benefit across OTP and PFS settings before it is introduced and to monitor for any unintended responses to payment incentives, noting differences in the number of psychotherapy sessions included.

Response: We agree with the commenters regarding the importance of alignment in these services when furnished in different settings and note that we are finalizing several changes to the coding and payment for services furnished in an OTP (see section II.G of this final rule), which we believe more closely align the payments made by Medicare for OUD services across settings. For example, we are finalizing using a building block methodology to calculate the payment rate for the OTP bundled payments using Medicare rates, including the rates for CPT codes 90832 and 90853, which were also used to calculate the payment rates HCPCS codes G2086, G2087, and G2088. Additionally, we are finalizing an adjustment to the OTP bundled payments to account for intake activities, similar to activities included in HCPCS code G2086, which describes the initial month of treatment. In response to the comments related to monitoring for unintended responses to payment incentives, we note that we will be monitoring utilization of HCPCS codes G2086, G2087, and G2088 and their interaction with other services, as well as the codes describing bundled payments for services furnished at OTPs.

Comment: A few commenters commended CMS on several aspects of this proposal and urged that the proposed codes and valuations be finalized, and also recommended that CMS consider establishing bundled payment amounts that recognize services for different levels of patient need and different types of practice arrangements, including consultation with specialists.

Response: We thank the commenters for their statements of support. We are finalizing the payment amounts for HCPCS codes G2086, G2087, and G2088 as proposed. We also appreciate the commenters' views on coding for these services, and will consider whether it would be appropriate to create codes describing different levels of patient need and different practice arrangements for possible future rulemaking.

Comment: A few commenters recommended that CMS adjust the payment methodology for these services to account for patient complexity/severity using the American Society of Addiction Medicine (ASAM) Criteria or other equivalent criteria and to account for different types of practice arrangements and emerging technologies. These commenters also recommended that we lower the threshold for billing the add-on code to allow it to be billed when the OUD treatment services described by the base code exceeds 125–150 percent of the minimum time required to bill the base code for the month. Additionally, the commenters recommended that CMS urge health care practitioners to consult with physician addiction specialists, as appropriate, when treating patients with moderate to severe OUD.

Response: After considering public comments, we are finalizing our proposal without modification that HCPCS code G2088 can be billed when the total time spent by the billing professional and the clinical staff furnishing the OUD treatment services described by the base code exceeds double the minimum amount of service time required to bill the base code for the month. We continue to believe it is appropriate to limit billing of the add-on code to situations where medically necessary OUD treatment services for a particular patient exceed twice the minimum service time for the base code because, as noted above, the add-on code is intended to address extraordinary situations where effective treatment requires additional resources that substantially exceed the resources included in the base codes. Additionally, we agree with the commenter's recommendation that practitioners furnishing OUD treatment services should consult with addiction specialists, as clinically appropriate.

Comment: Many commenters requested that CMS allow additional psychotherapy services to be furnished for patients receiving treatment for OUD or another SUD. A few commenters expressed concern that a practitioner would not be able to bill separately for psychotherapy services furnished to beneficiaries with OUD and a co-occurring mental health condition, noting that in rural areas there may not be enough behavioral health providers for a patient to be seen by separate practitioners for SUD and mental health diagnoses.

Response: It is not our intention to limit access to medically necessary services through the creation of bundled payment for OUD treatment services. We clarify that while the psychotherapy

services described by CPT codes 90832 (*Psychotherapy, 30 minutes with patient*), 90834 (*Psychotherapy, 45 minutes with patient*), 90837 (*Psychotherapy, 60 minutes with patient*), and 90853 (*Group psychotherapy (other than of a multiple-family group)*) cannot be reported by the same practitioner for the same beneficiary in the same month as the codes describing this bundled episode of care, practitioners can bill for additional psychotherapy furnished for the treatment of OUD using the add-on code (HCPCS code G2088). In cases where psychotherapy services are furnished for co-occurring diagnoses, any of the psychotherapy codes could be billed, as medically reasonable and necessary. We note that practitioners should determine which of the patient's diagnoses they are treating is the primary one being treated during that session in order to decide whether it is appropriate to bill separately for psychotherapy services furnished for co-occurring diagnoses. After reflecting on these and other comments, we also believe it is important to modify our proposal to establish a requirement that at least one psychotherapy service must be furnished in order to bill for HCPCS codes G2086 or G2087. Since the new G codes incorporate the resource costs involved in furnishing psychotherapy services into the payment rate, we believe it is appropriate that a minimum of at least one psychotherapy service be furnished in order to bill for HCPCS codes G2086 or G2087. We note that not all OUD treatment necessarily require provision of regular psychotherapy services for all patients, for example for patients receiving MAT over a long period of time. In these cases, we note that existing coding describing care management services (CPT codes 99484, 99492, 99493, and 99494) and E/M services can be billed for treatment of substance use disorders, including OUD, so we do not believe that this requirement will inhibit access to OUD services.

Comment: A few commenters expressed concern that the proposed G codes will inappropriately limit access to a variety of evidence-based, non-opioid pain management therapies.

Response: We note that the proposed bundled payment codes would not preclude practitioners from furnishing or billing for other non-opioid pain management treatments.

In summary, after consideration of the comments, we are finalizing HCPCS codes G2086, G2087, and G2088 with modifications to establish a requirement that at least one psychotherapy service must be furnished in order to bill for

HCPCS codes G2086 or G2087. We are clarifying that practitioners can bill for additional psychotherapy furnished for the treatment of OUD using the add-on code (HCPCS code G2088) and, in cases where psychotherapy services furnished are furnished for co-occurring diagnoses, for any of the psychotherapy codes, as medically reasonable and necessary.

2. Rural Health Clinics (RHCs) and Federally-Qualified Health Centers (FQHCs)

In the CY 2018 PFS final rule (82 FR 53169 through 53180), we established payment for General Care Management (CCM) services using HCPCS G0511 which is an RHC and FQHC-specific G code for at least 20 minutes of CCM, complex CCM, or general behavioral health services. Payment for this code is currently set at the average of the non-facility, non-geographically adjusted payment rates for CPT codes 99490, 99487, 99491, and 99484. The types of chronic conditions that are eligible for care management services include mental health or behavioral health conditions, including substance use disorders.

In the CY 2018 PFS final rule with comment period (82 FR 53169 through 53180), we also established payment for psychiatric Collaborative Care Services (CoCM) using HCPCS code G0512, which is an RHC and FQHC specific G-code for at least 70 minutes in the first calendar month, and at least 60 minutes in subsequent calendar months of psychiatric CoCM services. Payment for this code is set at the average of the non-facility, non-geographically adjusted rates for CPT codes 99492 and 99493. The psychiatric CoCM model of care may be used to treat patients with any behavioral health condition that is being treated by the billing practitioner, including substance use disorders.

RHCs and FQHCs can also bill for individual psychotherapy services using CPT codes 90791, 90792, 90832, 90834, 90837, 90839, or 90845, which are billable visits under the RHC all-inclusive rate (AIR) and FQHC Prospective Payment System (PPS) when furnished by an RHC or FQHC practitioner. If a qualified mental health service is furnished on the same day as a qualified primary care service, the RHC or FQHC can bill for 2 visits.

RHCs and FQHCs are engaged primarily in providing services that are furnished typically in a physician's office or an outpatient clinic. As a result of the bundled payment under the PFS for OUD treatment furnished by physicians, we reviewed the applicability of RHCs and FQHCs

furnishing and billing for similar services. Specifically, we considered establishing a new RHC and FQHC specific G code for OUD treatment with the payment rate set at the average of the non-facility, non-geographically adjusted payment rates for G2086 and G2087, beginning on January 1, 2020. The requirements to bill the services would be similar to the requirements under the PFS for G2086 and G2087, including that an initiating visit with a primary care practitioner must occur within one year before OUD services begin, and that consent be obtained before services are furnished.

However, because RHCs and FQHCs that choose to furnish OUD services can continue to report these individual codes when treating OUD, and can also offer their patients comprehensive care coordination services using HCPCS codes G0511 and G0512, we stated that we did not believe that adding a new and separate code to report a bundle of OUD services was necessary. Therefore, we did not propose to add a new G code for a bundle of OUD services.

We received public comments on our decision not to add a new G code for a bundle of OUD services furnished by RHCs and FQHCs. The following is a summary of the comments we received and our responses.

Comment: Commenters requested that we create a new G code for RHCs and FQHCs to bill for a bundle of OUD services. None of these comments were from an RHC or FQHC or a representative of RHCs or FQHCs.

Response: As we have noted, RHCs and FQHCs that provide OUD services to their patients can bill for individual psychotherapy services using a range of CPT codes that are billable visits under the RHC all-inclusive rate (AIR) and FQHC Prospective Payment System (PPS) when furnished by an RHC or FQHC practitioner. These codes can be billed on the same day as a qualified primary care visit, and RHCs and FQHCs can also bill for care management services and receive a payment in addition to their AIR or PPS payment. We did not receive any comments that lead us to conclude that a separate G code for RHCs and FQHCs to bill for OUD services is necessary, or any comments on how such a code would not be duplicative of existing billing mechanisms.

After considering the comments, we are finalizing our proposal not to establish a separate G code for OUD payments to RHCs and FQHCs. If we become aware that a separate code would be beneficial to RHCs and FQHCs that choose to furnish these services, we will again consider this.

I. Physician Supervision for Physician Assistant (PA) Services

1. Background

Section 4072(e) of the Omnibus Budget Reconciliation Act of 1986 (Pub. L. 99–509, October 21, 1986), added section 1861(s)(2)(K)(i) of the Act to establish a benefit for services furnished by a physician assistant (PA) under the supervision of a physician. We have interpreted this physician supervision requirement in the regulation at § 410.74(a)(2)(iv) to require PA services to be furnished under the general supervision of a physician. This general supervision requirement was based upon another longstanding regulation at § 410.32(b)(3)(i) that defines three levels of supervision for diagnostic tests, which are general, direct and personal supervision. Of these three supervision levels, general supervision is the most lenient. Specifically, the general supervision requirement means that PA services must be furnished under a physician's overall direction and control, but the physician's presence is not required during the performance of PA services.

In the CY 2018 PFS proposed rule (82 FR 34172 through 34173), we published a request for information (RFI) on CMS flexibilities and efficiencies. In response to this RFI, commenters including PA stakeholders informed us about recent changes in the practice of medicine for PAs, particularly regarding physician supervision. These commenters also reached out separately to CMS with their concerns. They stated that PAs are now practicing more autonomously, like nurse practitioners (NPs) and clinical nurse specialists (CNSs), as members of medical teams that often consist of physicians, nonphysician practitioners (NPPs) and other allied health professionals. This changed approach to the delivery of health care services involving PAs has resulted in changes to scope of practice laws in some states for PAs regarding physician supervision. According to these commenters, some states have already updated their requirements for PAs related to physician supervision, some states have made changes and are now silent about their physician supervision requirements, while other states have not yet changed their PA scope of practice in terms of their physician supervision requirements. Overall, these commenters believe that as states continue to make changes to their physician supervision requirements for PAs, the Medicare requirement for general supervision of PA services may become increasingly out of step with current medical practice, imposing a

more stringent standard than state laws governing physician supervision of PA services. Furthermore, as currently defined, stakeholders have suggested that the supervision requirement is often misinterpreted or misunderstood in a manner that restricts PAs' ability to practice to the full extent of their education and expertise. The stakeholders have suggested that the current regulatory definition of physician supervision as it applies to PAs could inappropriately restrict the practice of PAs in delivering their professional services to the Medicare population.

We note that we have understood our current policy to require general physician supervision for PA services to fulfill the statutory physician supervision requirement; and we believe that general physician supervision gives PAs flexibility to furnish their professional services without the need for a physician's physical presence or availability. Nonetheless, we appreciate the concerns articulated by stakeholders. To more fully understand the current landscape for medical practice involving PA services and how the current regulatory definition may be problematic, we invited public comments on specific examples of changes in state law and state scope of practice rules that enable PAs to practice more broadly such that those rules are in tension with the Medicare requirement for general physician supervision of PA services that has been in place since the inception of the PA benefit category under Medicare law.

Given the commenters' understanding of ongoing changes underway to the state scope of practice laws regarding physician supervision of PA services, commenters on our CY 2018 RFI have requested that CMS reconsider its interpretation of the statutory requirement that PA services must be furnished under the supervision of a physician to allow PAs to operate similarly to NPs and CNSs, who are required by section 1861(s)(2)(K)(ii) of the Act to furnish their services "in collaboration" with a physician. In general, we have interpreted collaboration for this purpose at §§ 410.75(c)(3) and 410.76(c)(3) of our regulations to mean a process in which an NP or CNS (respectively) works with one or more physicians to deliver health care services within the scope of the practitioner's expertise, with medical direction and appropriate supervision as provided by state law in which the services are performed. The commenters stated that allowing PA services to be furnished using such a collaborative

process would offer PAs the flexibility necessary to deliver services more effectively under today's health care system in accordance with the scope of practice in the state(s) where they practice, rather than being limited by the system that was in place when PA services were first covered under Medicare Part B over 30 years ago.

2. Summary of Proposal and Final Provisions

After considering the comments we received on the RFI, as well as information we received regarding the scope of practice laws in some states regarding supervision requirements for PAs, we proposed to revise the regulation at § 410.74 that establishes physician supervision requirements for PAs. Specifically, we proposed to revise § 410.74(a)(2) to provide that the statutory physician supervision requirement for PA services at section 1861(s)(2)(K)(i) of the Act would be met when a PA furnishes their services in accordance with state law and state scope of practice rules for PAs in the state in which the services are furnished, with medical direction and appropriate supervision as required by state law in which the services are performed. In the absence of state law governing physician supervision of PA services, the physician supervision required by Medicare for PA services would be evidenced by documentation in the medical record of the PA's approach to working with physicians in furnishing their services. Consistent with current rules, such documentation would need to be available to CMS, upon request. This change would substantially align the regulation on physician supervision for PA services at § 410.74(a)(2) with our current regulations on physician collaboration for NP and CNS services at §§ 410.75(c)(3) and 410.76(c)(3). We continue to engage with key stakeholders on this issue and receive information on the expanded role of NPPs as members of the medical team. As we are informed about transitions in state law and scope of practice governing physician supervision, as well as changes in the way that PAs practice, we acknowledge the state's role and autonomy to establish, uphold, and enforce their state laws and PA scope of practice requirements to ensure that an appropriate level of physician oversight occurs when PAs furnish their professional services to Medicare Part B patients. Our policy on this issue largely defers to state law and scope of practice and enables states the flexibility to develop requirements for PA services that are unique and appropriate for their

respective state, allowing the states to be accountable for the safety and quality of health care services that PAs furnish.

We received public comments on the proposed physician supervision PA services provisions. The following is a summary of the comments we received and our responses.

Comment: The majority of commenters supported our proposal overall, to the extent that it considers state law and scope of practice rules for the state in which the services are furnished, to largely conform our interpretation of the statutory physician supervision requirement for PA services as interpreted under regulations at § 410.74(a)(2) with the statutory physician collaboration requirement for NP and CNS services as interpreted under regulations at §§ 410.75(c)(3) and 410.76(c)(3). Commenters indicated that aligning the physician supervision requirement for PA services with the physician collaboration requirement for NPs and CNSs would reduce practical differences in PA and NP/CNS utilization for employers, employees, States and even Medicare patients. They stated that deferring to state law and scope of practice rules for supervision of PA services will enable PAs to practice at the top of their education and expertise, and therefore, assist the State in which they practice with meeting its healthcare workforce needs, particularly in states that include remote rural and underserved areas. These commenters noted that PAs are authorized to provide medical and surgical care in all 50 States and the District of Columbia, and are committed to increasing access to high quality care for all, as well as continuity of care under the changing landscape of healthcare in the U.S. Commenters from 20 States provided evidence of changes in their state laws or scope of practice rules to move away from references to "physician supervision" of PAs, and in some cases replacing it with the term, "physician collaboration" to describe the PA-physician relationship. Commenters reported such changes in laws and rules for PA supervision in Arizona, California, Colorado, Connecticut, Florida, Idaho, Illinois, Massachusetts, Michigan, Missouri, Montana, Nevada, North Dakota, Oregon, Oklahoma, Rhode Island, South Carolina, Texas, Utah, and Virginia. PA commenters practicing in Kansas, Vermont and Wisconsin indicated that their state laws and scope of practice rules are currently undergoing similar changes that should be effective in 2020 or shortly thereafter. Additionally, these commenters supported CMS' efforts to reduce practice burdens on PAs and to

develop regulations for the Medicare program that closely align with the transition in state laws and scope of practice rules for PAs regarding physician supervision. These commenters also noted that the changes being made to state laws and scope of practice rules were recommended by the December 2018 Federal government report on healthcare competition entitled, "Reforming America's Healthcare System Through Choice and Competition" available at <https://www.hhs.gov/sites/default/files/Reforming-Americas-Healthcare-System-Through-Choice-and-Competition.pdf>. The commenters directed our attention to the specific recommendation in the report that states should consider eliminating requirements for rigid collaborative practice and supervision agreements that are not justified by legitimate health and safety concerns to ensure continuity of care for American healthcare consumers.

Response: We appreciate the commenters' recognition of our efforts to reduce burden on PA practice given the changes in their professional practice since the inception of the Medicare Part B benefit category for PAs under Medicare law. We also appreciate the commenters' support of our proposal to consider state law and scope of practice rules governing PA supervision as an appropriate measure by which to ensure that the physician supervision requirement for PA services under Medicare statute at section 1861(s)(K)(i) of the Act is met. We particularly appreciate the feedback from commenters citing changes that have already been made to state laws and scope of practice rules to address evolution in PA practice. These comments are very helpful to inform our broader understanding of the current healthcare landscape for PAs, and to ensure that the statutory PA physician supervision requirement continues to be met.

Comment: Many commenters who supported our proposal to the extent that it relates to state law and scope of practice rules for physician supervision of PA services disagreed with our proposal to address situations where states are silent about their scope of practice requirements for physician supervision of PA services. Specifically, these commenters urged us to require that, in the absence of state law governing physician supervision of PA services, PAs should be required to document at the practice level, rather than in the medical record, the working relationship that they have with physicians. The commenters expressed

concern that requiring PAs to document their approach in the medical record for every patient that they treat would be a tremendous administrative burden that would have a significantly adverse impact on the PA's ability to deliver care. A few commenters suggested that there should not be a requirement for PAs to document the relationship with any supervising or collaborating physician in every patient chart because such documentation is already provided as part of the practice protocols for PAs that are maintained by the individual State boards of medicine. Furthermore, some commenters recommended that, in the absence of state law addressing physician supervision of PA services, documentation at the practice of the working relationship that PAs have with physicians should be required to address situations where PAs deal with issues outside their scope of practice.

Response: We are clarifying that it is not our intention to create an overly burdensome and unnecessary administrative documentation requirement governing PA physician supervision that results in a hindrance to PA practice. We believe that, in the absence of state law, if there is documentation at the practice which demonstrates the working relationship that PAs have with physicians in furnishing their professional services, then this would be adequate to ensure that the statutory requirement for PA physician supervision is met. However, we believe that in the absence of state law and scope of practice rules governing physician supervision of PAs, the relationship that PAs have with physicians in their practice should be required and documented at the practice for all services that PAs furnish, not solely for services outside their scope of practice.

Comment: One commenter suggested that the PA physician supervision requirement and the NP and CNS physician collaboration requirement should be totally removed so that these health care professionals are not tethered to a physician in any way. This commenter further suggested that the removal of a physician supervision requirement would enable PAs to be able to bill the Medicare program directly for their services like NPs and CNSs, rather than having their services billed by their employer as they currently are.

Response: The Medicare statute sets forth the requirements for physician supervision of PA services and the requirement for physician collaboration for NP and CNS services. As such, we do not have authority to remove those requirements. Additionally, our

regulation at § 410.150(b)(15), which is based on the statutory requirements of section 1842(b)(6)(C)(i) of the Act governing payment for PA services requires that a PA's employer or independent contractor must bill the Medicare program for PA services. Accordingly, we are not making changes to requirements for Medicare Part B payment for PA professional services in this final rule.

Comment: Some commenters opposed the proposal overall, and particularly the standard CMS proposed to address the PA physician supervision requirement in the absence of state law and scope of practice rules. These commenters stressed that by just substituting "physician supervision" with "physician collaboration," the proposal fails to meet the statutory physician supervision requirement and instead relies on unnecessary variations in standards of care based on differences in state law that are inappropriate for a federal program. These commenters stated that the PA educational curricula are not tailored to developing the responsibilities of PAs to perform all medical services and procedures such as ordering appropriate diagnostic tests and performing highly technical radiology procedures without physician oversight and direction. They believe that physician involvement, either through the physical presence of a physician or availability via telecommunications technology, was necessary to ensure that optimal patient care is not compromised. Additionally, these commenters alluded to high-profile lawsuits against provider organizations in the last year involving PA documentation and billing policy where audits revealed documentation and signature challenges for electronic medical records (EMR) systems in determining whether physician supervision had occurred, and in distinguishing work furnished by a physician, PA or other supplier involved in a patient's care. They suggested that these same obstacles could potentially apply to our proposed medical record documentation standard for PAs to demonstrate, in the absence of state law, the relationship that they have with physicians when furnishing their services. Overall, these commenters stated that the current requirement we established in regulation for a general level of physician supervision to meet the statutory physician supervision requirement for PA services is appropriately consistent with state laws, and enables physicians to maintain the ultimate responsibility for managing

patient care without preempting state law and scope of practice rules or inadvertently eliminating any physician oversight of PA services. Accordingly, these commenters urged CMS to maintain the current regulatory standard for general physician supervision of PA services as a clearer standard for physician supervision across-the-board for the Medicare program, and consistent with statutory requirements.

Response: We appreciate the concerns that these commenters raised about our proposal and acknowledge that the statutory requirement for physician supervision of PA services remains in effect. Further, we believe it is appropriate for the Medicare program to recognize and consider the role of states in regulating medical practice and their autonomy to establish, uphold, and enforce their laws and PA scope of practice requirements that are uniquely appropriate for their respective states, just as we ensure that there is appropriate physician supervision of PA services, consistent with the requirement under Medicare law. Additionally, we believe that the commenters' concerns about obstacles for EMR systems to determine whether physician supervision occurred will be mitigated by our decision, as described above, to require in the absence of state law addressing physician supervision of PA services that PAs must document at the practice, rather than in the medical record, their relationship with physicians when furnishing their professional services.

Comment: Some of the commenters who opposed our proposal to require that PAs must document how they handle physician supervision of their services in the absence of state law recommended that we remove the documentation standard as proposed and replace it with a standard that imposes a requirement that PAs work within a health care team led by a physician, given that they believe no state allows PAs to practice independently without any physician supervision or collaboration.

Response: We appreciate this suggestion about how to ensure that physician supervision of PA services occurs in states that are silent about this requirement in their laws or scope of practice requirements for PA professional services. However, we disagree with the commenters' suggestion that, where state law or scope of practice requirements do not address physician supervision of PA services, we should not adopt the proposed requirement that PAs document their approach to working with physicians. We believe it is

important to continue to ensure that the statutory requirement for physician supervision of PA services is met. We also disagree with the commenters' suggestion that we should impose specific requirements that PAs must practice as part of a physician-led health care team. Based on information provided by other commenters, it seems clear that the way PAs practice is evolving, and that state laws and scope of practice rules are being modified to embrace that change. We believe our role and responsibility is to ensure continued compliance with Medicare statutory requirements without placing undue limitations on changes in PA medical practice. As such, we will recognize and consider state law and scope of practice rules principally to ensure that physician supervision occurs without mandating under our regulations that PAs work within a health care team led by a physician.

Comment: Commenters posed various questions about PA services that are outside the scope the proposals we included in the CY 2020 PFS proposed rule. These comments pertained to issues such as PA supervision requirements for both SAMHSA-designated physicians and PAs when furnishing medically-assisted treatment (MAT) services to patients with opioid use disorder; physician supervision requirements for PAs when furnishing services in PA-directed rural health clinics; hospice physician supervision requirements for PAs and the presence of hospice Medical Directors; extending the same considerations for PA physician supervision requirements to pharmacists when furnishing their services incident to the professional services of physicians; and, the Medicare payment implications under this proposal for PA services.

Response: We did not propose changes to the regulations regarding PA services other than the provision that generally addresses the statutory requirement for physician supervision of PA services. Therefore, we are not addressing these other issues in this final rule.

After considering the public comments, we are finalizing our proposal on PA physician supervision, with modifications as described above, to require under § 410.74(a)(2) the following:

- That a PA must furnish their professional services in accordance with state law and state scope of practice rules for PAs in the state in which the PA's professional services are furnished. Any state laws or state scope of practice rules that describe the required practice relationship between physicians and

PAs, including explicit supervisory or collaborative practice requirements, describe a form of supervision for purposes of section 1861(s)(2)(K)(i) of the Act.

- For states with no explicit state law or scope of practice rules regarding physician supervision of PA services, physician supervision is a process in which a PA has a working relationship with one or more physicians to supervise the delivery of their health care services. Such physician supervision is evidenced by documenting at the practice level the PA's scope of practice and the working relationships the PA has with the supervising physician/s when furnishing professional services.

J. Review and Verification of Medical Record Documentation

1. Background

In an effort to reduce mandatory and duplicative medical record evaluation and management (E/M) documentation requirements, we finalized an amended regulatory provision at 42 CFR part 415, subpart D, in the CY 2019 PFS final rule (83 FR 59653 through 59654). Specifically, § 415.172(a) requires as a condition of payment under the PFS that the teaching physician (as defined in § 415.152) must be present during certain portions of services that are furnished with the involvement of residents (individuals who are training in a graduate medical education program). Section 415.174(a) provides for an exception to the teaching physician presence requirements in the case of certain E/M services under certain conditions, but requires that the teaching physician must direct and review the care provided by no more than four residents at a time. Sections 415.172(b) and 415.174(a)(6), respectively require that the teaching physician's presence and participation in services involving residents must be documented in the medical record. We amended these regulations to provide that a physician, resident, or nurse may document in the patient's medical record that the teaching physician presence and participation requirements were met. As a result, for E/M visits furnished beginning January 1, 2019, the extent of the teaching physician's participation in services involving residents may be demonstrated by notes in the medical records made by a physician, resident, or nurse.

For the same burden reduction purposes, we issued Change Request (CR) 10412, Transmittal 3971 <https://www.cms.gov/Regulations-and-Guidance/Guidance/Transmittals/>

[2018Downloads/R3971CP.pdf](https://www.cms.gov/Regulations-and-Guidance/Guidance/Transmittals/2018Downloads/R3971CP.pdf) on February 2, 2018, which revised a paragraph in our manual instructions on "Teaching Physician Services" at Pub. 100-04, Medicare Claims Processing Manual, Chapter 12, Section 100.1.1B., to reduce duplicative documentation requirements by allowing a teaching physician to review and verify (sign/date) notes made by a student in a patient's medical record for E/M services, rather than having to re-document the information, largely duplicating the student's notes. We issued corrections to CR 10412 through Transmittal 4068 <https://www.cms.gov/Regulations-and-Guidance/Guidance/Transmittals/2018Downloads/R4068CP.pdf> and re-issued the CR on May 31, 2018. Pub. 100-04, Medicare Claims Processing Manual, Chapter 12, Section 100 contains a list of definitions pertinent to teaching physician services.

Following these amendments to our regulations and manual, certain stakeholders raised concerns about the definitions in this section, particularly those for teaching physician, student, and documentation; and when considered in conjunction with the interpretation of the manual provision at Pub. 100-04, Medicare Claims Processing Manual, Chapter 12, Section 100.1.1B., which addresses documentation of E/M services involving students. While there is no regulatory definition of student, the manual instruction defines a student as an individual who participates in an accredited educational program (for example, a medical school) that is not an approved graduate medical education (GME) program. The manual instructions also specify that a student is never considered to be an intern or a resident, and that Medicare does not pay for services furnished by a student (see Section 100.1.1B. for a discussion concerning E/M service documentation performed by students).

As stated in the CY 2020 PFS proposed rule, we are aware that nonphysician practitioners (NPPs) who are authorized under Medicare Part B to furnish and be paid for all levels of E/M services are seeking similar relief from burdensome E/M documentation requirements that would allow them to review and verify medical record notes made by their students, rather than having to re-document the information. These NPPs include nurse practitioners (NPs), clinical nurse specialists (CNSs), and certified nurse-midwives (CNMs), collectively referred to hereafter for purposes of this discussion as advanced practice registered nurses (APRNs), as well as physician assistants (PAs). Subsequent to the publication of the CY

2019 PFS final rule (83 FR 59653 through 59654), through feedback from listening sessions hosted by CMS' Documentation Requirements Simplification workgroup, we began to hear concerns from a variety of stakeholders about the requirements for teaching physician review and verification of documentation added to the medical record by other individuals. Physician and NPP stakeholders expressed concern about the scope of the changes to §§ 415.172(b) and 415.174(a)(6) which authorize only a physician, resident, or nurse to include notes in the medical record to document E/M services furnished by teaching physicians, because they believed that students and other members of the medical team should be similarly permitted to provide E/M medical record documentation. In addition to students, these stakeholders indicated that "other members of the medical team" could include individuals who the teaching physician, other physicians, PA and APRN preceptors designate as being appropriate to document services in the medical record, which the billing practitioner would then review and verify, and rely upon for billing purposes.

Subsequent to the publication of the student documentation manual instruction change at section 100.1.1B of the Medicare Claims Processing Manual, representatives of PAs and APRNs requested clarification about whether PA and APRN preceptors and their students were subject to the same E/M documentation requirements as teaching physicians and their medical students. These stakeholders suggested that the reference to "student" in the manual instruction on E/M documentation provided by students is ambiguous because it does not specify "medical student". These stakeholders also suggested that the definition of "student" in section 100 of this manual instruction is ambiguous because PA and APRN preceptors also educate students who are individuals who participate in an accredited educational program that is not an approved GME program. Accordingly, these stakeholders expressed concern that the uncertainty throughout the health care industry, including among our contractors, concerning the student E/M documentation review and verification policy under these manual guidelines results in unequal treatment as compared to teaching physicians. The stakeholders stated that depending on how the manual instruction is interpreted, PA and APRN preceptors may be required to re-document E/M

services in full when their students include notes in the medical records, without having the same option that teaching physicians do to simply review and verify medical student documentation.

2. Proposed Provisions and Summaries of and Responses to Public Comments

After considering the concerns expressed by these stakeholders, we noted in the CY 2020 PFS proposed rule that we believe it would be appropriate to provide broad flexibility to the physicians, PAs and APRNs (regardless of whether they are acting in a teaching capacity) who document and who are paid under the PFS for their professional services. Therefore, we proposed to establish a general principle to allow the physician, the PA, or the APRN who furnishes and bills for their professional services to review and verify, rather than re-document, information included in the medical record by physicians, residents, nurses, students or other members of the medical team. We explained that this principle would apply across the spectrum of all Medicare-covered services paid under the PFS. We noted that because the proposal is intended to apply broadly, we proposed to amend regulations for teaching physicians, physicians, PAs, and APRNs to add this new flexibility for medical record documentation requirements for professional services furnished by physicians, PAs and APRNs in all settings.

Specifically, to reflect our simplified and standardized approach to medical record documentation for all professional services furnished by physicians, PAs and APRNs paid under the PFS, we proposed to amend §§ 410.20 (Physicians' services), 410.74 (PA services), 410.75 (NP services), 410.76 (CNS services) and 410.77 (CNM services) to add a new paragraph entitled, "Medical record documentation." We noted that this paragraph would specify that, when furnishing their professional services, the clinician may review and verify (sign/date) notes in a patient's medical record made by other physicians, residents, nurses, students, or other members of the medical team, including notes documenting the practitioner's presence and participation in the services, rather than fully re-documenting the information. We also noted that, while the proposed change addresses who may document services in the medical record, subject to review and verification by the furnishing and billing clinician, it would not modify the scope of, or standards for, the

documentation that is needed in the medical record to demonstrate medical necessity of services, or otherwise for purposes of appropriate medical recordkeeping.

We also proposed to make conforming amendments to §§ 415.172(b) and 415.174(a)(6) to also allow physicians, residents, nurses, students, or other members of the medical team to enter information in the medical record that can then be reviewed and verified by a teaching physician without the need for re-documentation.

We received public comments on the proposed Review and Verification of Medical Record Documentation provisions. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported the premise for this documentation proposal which they stated almost unanimously would relieve burdensome documentation requirements for PAs, NP, CNSs, and CNMs who are authorized providers under Medicare Part B in that it would minimize "note bloat" and clinician burnout, and would allow clinicians to focus their limited time instead on patient care. The commenters stated that enabling physicians other than teaching physicians, PAs and APRNs who furnish and bill for their professional services to review and verify, rather than re-document information included in the medical record by physicians, residents, nurses, students or other members of the medical team is forward-thinking, reflective of the professional healthcare setting and, it eliminates disparities in clinical training opportunities so that a student's experience ranks more than shadowing. The commenters noted that recognizing PA and APRN preceptors in the same manner as teaching physicians regarding student medical record documentation would advance access to quality care for Medicare beneficiaries particularly in rural and underserved areas by granting clinical training opportunities to PA and APRN students. Additionally, these commenters expressed support for this documentation proposal because they believed it would remove the disparity in burden reduction between physicians and clinicians such as PAs and APRNs and, instead would lead to parity for all suppliers of Medicare services paid under the PFS. The commenters also noted that another advantage of these documentation requirements is that they will lead to electronic health records (EHRs) being less cluttered with repetitive notes of little additional clinical use, making more meaningful

information easier for physicians and clinicians to identify while offering greater certainty to medical team members and Medicare Administrative Contractors (MACs) alike.

Response: We appreciate the insight provided by commenters about how the broad flexibility under our proposal would enhance the clinical training opportunities and experience for other physicians, PAs, APRNs and their students while still maintaining the integrity of the information documented in the medical record as it is reviewed and verified by the billing practitioner.

Comment: A commenter supported the merit of the broad flexibility provided under the medical record documentation proposal and suggested that we could improve our proposal by including certified registered nurse anesthetists (CRNAs) and their students under this proposal because CRNAs are also included under the nursing industry's "APRN" umbrella. The commenter pointed out that the proposal currently includes NPs, CNSs and CNMs, which are three out of the four categories of APRNs. However, this commenter stated that CRNAs should also be included under this proposal, because not only are CRNAs considered APRNs, they are also authorized by Medicare to furnish and bill for E/M services and all medically necessary services within their state scope of practice. CRNAs regularly complete comprehensive E/M documentation for patients, which is also well within their scope of practice. Accordingly, the commenter believed that since this criterion was a factor in proposing the medical record documentation policy for PAs, NPs, CNSs and CNMs, CRNAs should be included under this policy.

Response: We appreciate the commenter bringing to our attention that CRNAs are another type of clinical nurse that the nursing industry recognizes as an APRN, and that the commenter believed should be included under this medical record documentation proposal. The regulations at § 410.69 interpret the statutory CRNA benefit category at section 1861(bb)(1) of the Act to authorize Medicare Part B payment to CRNAs for anesthesia services and related care that CRNAs are legally authorized to perform by the state in which the services are furnished. We also acknowledge that some states license CRNAs to furnish E/M services as part of the "related care" services authorized under their Medicare Part B benefit category. Upon further reflection, we agree that it is appropriate to include CRNAs and their students, as well as other members of their health

care team, for purposes of the medical record documentation proposal.

Comment: Several commenters suggested that CMS specifically name the types of students that it intends to include as those who are eligible to make notes in the medical record documentation in order to avoid unnecessary confusion by obscuring the intended scope of students as "other members of the medical team." These commenters stated that explicitly naming the types of clinicians and students for which the documentation they add can be reviewed and verified by the billing professional would eliminate misinterpretation on the part of health systems, care providers, and educators, and would improve both clinical training opportunities and, ultimately, patient care.

Response: We acknowledge that uncertainty in the healthcare industry and for MACs about the specific types of students who were allowed to make notes in the medical record which teaching physicians could review and verify without re-documenting was a factor we considered in proposing to revise the documentation requirements in the CY 2020 PFS proposed rule. We find the comment to be persuasive regarding the need for us to be more explicit regarding the flexibility we intend to establish for other physicians, PAs and APRNs and their students. Given that the initial impetus for our proposal was to address potential confusion about our reference in a manual provision to "students," we would not want to generate any further potential for confusion with this policy. In making our proposal, we referred not only to medical students, but more broadly to students in the disciplines of the clinicians who are authorized to bill the Medicare program for a broad spectrum of health care services, including all level E/M services. We agree with the commenters that it is important to be clear about the scope of this policy and, therefore, we will modify our proposal to explicitly list the types of students for which the medical records documentation policy applies rather than using a generic reference to "students." Therefore, at §§ 410.20, 410.69, 410.74, 410.75, 410.76 and 410.77, we will modify our proposed amendments to the regulation to specify the types of students who may make notes in the medical record that may then be reviewed and verified, rather than re-documented, by the billing clinician.

Comment: Several commenters suggested that CMS specify that physicians, PAs, and APRNs may sign off on only those notes in the medical

record made by someone of their same provider type or discipline. For example, a PA may only review and verify information included in a patient's chart by another PA or PA student. One of these commenters stated that CMS should withhold any documentation requirement changes until the agency establishes guidelines in future rulemaking that clarify the circumstances under which a clinician would be permitted to review and verify medical record documentation. Conversely, a few of these same commenters questioned the proposal and stated that it is unclear whether a PA or APRN can sign off on any resident or student documentation regardless of their credential level. For example, a PA would be able to attest and bill for work that was performed by a senior resident who is training to become a medical doctor. A few of these commenters warned that scope of practice laws may impose documentation requirements that lead to physicians and clinicians only reviewing documentation of their own student types and not that of other disciplines. Furthermore, the commenters stated that the teaching physician services requirements do not permit PAs and APRNs to formally act as teaching physicians.

Response: We did not propose any limitations that would restrict a billing professional to only reviewing and verifying documentation in the medical record entered by health care team members practicing or training within their same specialty or discipline. We believe that this type of limitation on our proposal would defeat our intended purpose to provide broad flexibility, establishing a generalized principle for medical record documentation for all professional services paid under the Medicare PFS in all settings. Therefore, we disagree with the commenters' recommendation, and are not finalizing restrictions on the scope of medical record documentation entered by members of the medical team that can be reviewed and verified by the billing professional. Additionally, our documentation proposal does not address any applicable billing or payment requirements for the work or services that others furnish in connection with the professional services that are billed by teaching physicians, other physicians, PAs or APRNs. Rather, our proposal is limited to addressing who is authorized, for purposes of the Medicare program, to review and verify documentation in the medical record entered by certain individuals, without having to re-document the information.

Comment: Similarly, several commenters representing physicians supported making the proposed changes to medical record documentation requirements for physicians only, and not for PAs and APRNs. They stated that only physicians submitting a claim for services are responsible and appropriately trained to review and verify documentation in the medical record provided by physicians, residents, nurses, students, or other members of the medical team across the spectrum of all Medicare-covered services paid under the PFS. They maintained that safeguards must be in place to ensure the medical record includes accurate documentation of clinical findings, treatments, and ongoing care plans by all members of the medical team.

Response: We note that the billing professional, in submitting a claim to Medicare for services paid under the PFS, is responsible for the accuracy of the information included on that claim. While we appreciate the perspective of these commenters, stakeholders and other commenters have made it clear to us that the role of PAs and APRNs has changed to the point that our current regulations present an unintended burden for billing practitioners, unnecessarily requiring them to re-document information entered into the medical record by physicians, residents, nurses, students, and other members of the medical team when it would be sufficient for them to simply review and verify it. Therefore, we are not establishing a requirement in this final rule that only a billing physician may review and verify documentation in the medical record added by physicians, residents, nurses, students, and other members of the medical team.

Comment: Commenters requested clarification about whether multiple students and residents can enter documentation into the medical record on the same day and during the same office visit. One commenter stated that, currently, MACs or auditing agencies will deny PA or APRN services when furnished on the same day as a service billed by a physician regardless of the physician's specialty.

Response: We appreciate the information and suggestion provided by these commenters. We did not propose a limitation on how many members of the medical team can enter information in the medical record for a given date of service or patient encounter, and do not believe such a limitation is warranted. We did not address the scope of services that can be billed for a patient on the same date of service. Therefore, this aspect of the comment is

outside the scope of the proposed rule and we will not address it in this final rule.

Comment: Several commenters encouraged CMS to re-examine the current requirements regarding documentation of the billing practitioner's physical presence and participation in certain E/M services and procedures. The commenters stated that this physical presence and participation requirement results in significant burden for teaching physicians and PA and APRN preceptors when their students are participating in patient care. These commenters stated that while physical presence and participation of physicians and practitioners in the clinic is critical for safe patient care, presence in the examination room during documentation is onerous and unnecessary. The commenters also noted that this requirement greatly diminishes the learning experience for students, as they do not develop the ability to think or operate independently, formulate diagnoses, and generate treatment plans, producing less experienced graduate clinicians who are not as prepared as they could be to provide care on their own.

Response: We did not propose any changes to requirements pertaining to the documentation of physical presence and participation for certain E/M services and procedures at §§ 415.172 and 415.174, and we are not addressing these requirements in this final rule.

Comment: A commenter questioned whether this proposal recognizes "scribes" other than a medical assistant or a registered nurse for purposes of entering notes in a patient's medical record. The commenter defined a scribe as an independent individual assisting a single care provider, and expressed concern that utilizing clinical support staff as a scribe to document services will lead to dissatisfaction of employees and loss of clinical support staff, which would adversely affect the shortage in clinical support staff that already exists. Likewise, a commenter suggested that CMS should explicitly include dietitians and nutritionists among the other members of the medical team who are eligible to enter notes in the medical record.

Response: We proposed broad flexibility for teaching physicians, other physicians, PAs and APRNs to use their discretion in identifying, for each particular case, the individuals who are serving as members of the medical team, potentially including scribes, dietitians, nutritionists, or other members of their medical team. Although we are modifying our proposal to clarify the

scope of students that may be considered members of the medical team for purposes of this documentation policy as explained above, we intentionally did not propose to specify who can be included as a member of the medical team.

Comment: One commenter questioned whether their assumption is correct that this proposal applies to all types of services (that is, procedures, E/M services, and diagnostic services).

Response: The commenter's assumption is accurate; our proposed medical record documentation policy would apply broadly to all services of physicians, PAs and APRNs, regardless of the type of service (E/M, procedure, diagnostic test) or the setting in which the service is furnished.

Comment: We received a number of comments that were outside the scope of the CY 2020 PFS proposed rule.

Response: We appreciate and will consider these comments for other purposes including possible future rulemaking.

After considering the comments, we are finalizing our proposal with a couple of modifications. We are explicitly naming PA and NP, CNS, CNM and CRNA students as APRN students, along with medical students, as the types of students who may document notes in a patient's medical record that may be reviewed and verified rather than re-documented by the billing professional; and revising §§ 410.20, 410.69, 410.74, 410.75, 410.76, 410.77, 415.172 and 415.174 to reflect this change. Additionally, similar to the revisions we are making to the regulations at §§ 410.20, 410.69, 410.74, 410.75, 410.76, 410.77, 415.172 and 415.174, we are amending our regulation at § 410.69 to add a new paragraph (5) under the definition of CRNA to include CRNAs as a category of APRNs for purposes of this policy, and to include CRNA students under the reference to APRN students.

K. Care Management Services

1. Background

In recent years, we have updated PFS payment policies to improve payment for care management and care coordination. Working with the CPT Editorial Panel and other clinicians, we have expanded the suite of codes describing these services. New CPT codes were created that distinguish between services that are face-to-face; represent a single encounter, monthly service or both; are timed services; represent primary care versus specialty care; address specific conditions; and represent the work of the billing

practitioner, their clinical staff, or both (see Table 19). Additional information regarding recent new codes and

associated PFS payment rules is available on our website at <https://www.cms.gov/Medicare/Medicare-Fee->

[for-Service-Payment/Physician FeeSched/Care-Management.html](https://www.cms.gov/Medicare/Medicare-Fee-).

TABLE 19: Summary of Special Care Management Codes

Service	Summary
Care Plan Oversight (CPO) (also referred to as Home Health Supervision, Hospice Supervision) (HCPCS Codes G0181, G0182)	Supervision of home health, hospice, per month
ESRD Monthly Services (CPT Codes 90951-70)	ESRD management, with and without face-to-face visits, by age, per month
Transitional Care Management (TCM) (adopted in 2013) (CPT Codes 99495, 99496)	Management of transition from acute care or certain outpatient stays to a community setting, with face-to-face visit, once per patient within 30 days post-discharge
Chronic Care Management (CCM) (adopted in 2015, 2017, 2019) (CPT Codes 99487, 99489, 99490, 99491)	Management of all care for patients with two or more serious chronic conditions, timed, per month
Advance Care Planning (ACP) (adopted in 2016) (CPT Codes 99497, 99498)	Counseling/discussing advance directives, face-to-face, timed
Behavioral Health Integration (BHI) (adopted in 2017) (CPT Codes 99484, 99492, 99493, 99494)	Management of behavioral health conditions(s), timed, per month
Assessment/Care Planning for Cognitive Impairment (adopted in 2017) (CPT Code 99483)	Assessment and care planning of cognitive impairment, face-to-face visit
Prolonged Evaluation & Management (E/M) Without Direct Patient Contact (adopted in 2017) (CPT Codes 99358, 99359)	Non-face-to-face E/M work related to a face-to-face visit, timed
Remote Physiologic Monitoring (adopted beginning 2018 with CPT Code 99091; in 2019, added CPT codes 99453, 99454, 99457; for CY 2020, will add CPT code 99458)	Analysis of patient data used to develop and manage a treatment plan
Interprofessional Consultation (adopted in 2019) (CPT Codes 99446, 99447, 99448, 99449, 99451, 99452)	Inter-practitioner consultation

Based on our review of the Medicare claims data we estimate that approximately 3 million unique beneficiaries (9 percent of the Medicare fee-for-service (FFS) population) receive these services annually, with higher use of chronic care management (CCM), transitional care management (TCM), and advance care planning (ACP) services. We believe gaps remain in coding and payment, such as for care management of patients having a single, serious, or complex chronic condition. In this final rule, we continue our ongoing work in this area through code set refinement related to TCM services and CCM services, in addition to new coding for principal care management (PCM) services, and addressing chronic care remote physiologic monitoring (RPM) services.

2. Transitional Care Management (TCM) Services

Utilization of TCM services has increased each year since CMS established coding and began paying separately for TCM services. There were almost 300,000 TCM professional claims

during 2013, the first year of TCM services, and almost 1.3 million professional claims during 2018, the most recent year of complete claims data. However, a recent analysis of TCM claims data by Bindman and Cox⁸¹ found that use of TCM services is low when compared to the number of Medicare beneficiaries with eligible discharges. Bindman and Cox noted that the beneficiaries who received TCM services demonstrated reduced readmission rates, lower mortality, and decreased health care costs. Based upon these findings, we believe that increasing utilization of medically necessary TCM services could positively affect patient outcomes.

In developing the proposal designed to increase utilization of TCM services, we considered factors that could contribute to low utilization. Bindman and Cox identified two likely

contributing factors: The administrative burdens associated with billing TCM services and the payment amount to physicians for furnishing these services.

We focused initially on the requirements for billing TCM services. In reviewing TCM billing requirements, we noted that we had established in the CY 2013 PFS final rule with comment period a list of 57 HCPCS codes that could not be billed during the 30-day period covered by TCM services by the same practitioner reporting TCM (77 FR 68990). This list mirrored reporting restrictions put in place by the CPT Editorial Panel for the TCM codes. At the time we established separate payment for the TCM CPT codes, we agreed with the CPT Editorial Panel that the services described by the 57 codes could be overlapping and duplicative with TCM in their definition and scope. Additionally, many of the codes were not separately payable or covered under the PFS so even if they had been reported for PFS payment, they would not have been paid separately (see, for example, 77 FR 68985).

⁸¹ Bindman, AB, Cox DF. Changes in health care costs and mortality associated with transitional care management services after a discharge among Medicare beneficiaries [published online July 30, 2018]. *JAMA Intern Med.* doi:10.1001/jamainternmed.2018.2572.

In response to those initial concerns, we adopted billing restrictions to avoid duplicative billing and payment for covered services. In our recent analysis of the services associated with the 57 codes, we found that the majority of codes on the list are either bundled, noncovered by Medicare, or invalid for Medicare payment purposes. Table 20 provides detailed information regarding the subset of these codes that would be separately payable under the PFS (Status Indicator “A”) and, as such, are the focus of CY 2020 policy for TCM.

Fourteen (14) codes on the list represent active codes that are paid separately under the PFS and that upon reconsideration, we believe do not substantially overlap with TCM services and should be separately payable alongside medically necessary TCM. For example, CPT code 99358 (*Prolonged E/M service before and/or after direct patient care; first hour; non-face-to-face time spent by a physician or other qualified health care professional on a given date providing prolonged service*) would allow the physician or other

qualified healthcare professional extra time to review records and manage patient support services after the face-to-face visit required as part of TCM services.

After review of the services described by the 14 HCPCS codes, we determined that the 14 codes, when medically necessary, may complement TCM services rather than substantially overlap or duplicate services. We also believed removing the billing restrictions associated with the 14 codes might increase use of TCM services.

TABLE 20: 14 HCPCS Codes that Currently Cannot be Billed Concurrently with TCM by the Same Practitioner and are Active Codes Payable by Medicare PFS

Code Family	HCPCS Code	Descriptor
Prolonged Services without Direct Patient Contact	99358	Prolonged E/M service before and/or after direct patient care; first hour; non-face-to-face time spent by a physician or other qualified health care professional on a given date providing prolonged service
	99359	Prolonged E/M service before and/or after direct patient care; each additional 30 minutes beyond the first hour of prolonged services
Home and Outpatient International Normalized Ratio (INR) Monitoring Services	93792	Patient/caregiver training for initiation of home INR monitoring
	93793	Anticoagulant management for a patient taking warfarin; includes review and interpretation of a new home, office, or lab INR test result, patient instructions, dosage adjustment and scheduling of additional test(s)
End Stage Renal Disease Services (patients who are 20+ years)	90960	ESRD related services monthly with 4 or more face-to-face visits per month; for patients 20 years and older
	90961	ESRD related services monthly with 2-3 face-to-face visits per month; for patients 20 years and older
	90962	ESRD related services with 1 face-to-face visit per month; for patients 20 years and older
	90966	ESRD related services for home dialysis per full month; for patients 20 years and older
	90970	ESRD related services for dialysis less than a full month of service; per day; for patient 20 years and older
*Analysis of Data	99091	Collection and interpretation of physiologic data
Complex Chronic Care Management Services	99487	Complex Chronic Care with 60 minutes of clinical staff time per calendar month
	99489	Complex Chronic Care; additional 30 minutes of clinical staff time per month
Care Plan Oversight Services	G0181	Physician supervision of a patient receiving Medicare-covered services provided by a participating home health agency (patient not present) requiring complex and multidisciplinary care modalities within a calendar month; 30+ minutes
	G0182	Physician supervision of a patient receiving Medicare-covered hospice services (Pt not present) requiring complex and multidisciplinary care modalities; within a calendar month; 30+ minutes

* In CY 2018, this code was unbundled and added as an active code to the PFS. The 2019 CPT Manual (p. 42) indicates the code cannot be billed concurrently with either TCM code.

Thus, with the goal of increasing medically appropriate use of TCM services, we proposed to revise our billing requirements for TCM by

allowing TCM codes to be billed concurrently with any of these 14 codes. In the proposed rule, we solicited

comment on four questions related to current billing policies. They included:

- Does overlap of services exist, and if so, which services should be

restricted from being billed concurrently with TCM?

- Does overlap depend upon whether the same or a different practitioner reports the services; we note that CPT reporting rules generally apply at the practitioner level?

- Should our policy differ based upon whether the same or different practitioner reports the services?

- Does the newest CPT code in the chronic care management services family (CPT code 99491 for CCM by a physician or other qualified health professional, established in 2019) overlap with TCM or should it be reportable and separately payable in the same service period?

The second part of our analysis examined how current payment rates for TCM might negatively affect the appropriate utilization of TCM services, an idea proposed by Bindman and Cox. Although we sought comment previously about factors affecting utilization of CCM and TCM services, we received too few comments related specifically to TCM to know if payment affected use of the service.

As part of a regular RUC review of new technologies or services during 2018, CPT code 99495 (*Transitional Care Management services with the following required elements: Communication (direct contact, telephone, electronic) with the patient and/or caregiver within two business days of discharge; medical decision making of at least moderate complexity during the service period; face-to-face visit within 14 calendar days of discharge*) and CPT code 99496 (*Transitional Care Management services with the following required elements: Communication (direct contact, telephone, electronic) with the patient and/or caregiver within two business days of discharge; medical decision making of at least high complexity during the service period; face-to-face visit within 7 calendar days of discharge*) were resurveyed. For this RUC resurvey, several years of claims data were available and clinicians had more experience to inform their views about the work required to furnish TCM services. Based upon the results of the 2018 RUC survey of the TCM codes, the RUC recommended a slight increase in work RVUs for both codes. We believe the results from the new survey better reflect the work involved in furnishing TCM services as care management services. Thus, also for CY 2020, we proposed the RUC-recommended work RVU of 2.36 for CPT code 99495 and the RUC-recommended work RVU of 3.10 for CPT code 99496. We did not propose any PE refinements to the TCM codes.

We received public comments to our proposed policies and questions. The following is a summary of the comments we received.

Comment: With regard to the questions about billing requirements, most commenters wrote in support of our proposal to remove billing restrictions associated with the 14 codes that, at present, cannot be billed concurrently with TCM. A few commenters indicated that overlap, if it does exist, is minimal. Some commenters cautioned that our suggested change to billing might cause increased confusion for payers other than Medicare and suggested that CMS instead work with the CPT Editorial Panel to review and possibly revise the restrictions. In response to our questions about overlap in services, commenters reported that overlap is not dependent upon whether the same or a different practitioner reports the services. Commenters added that policy should not be based upon what practitioner reports the services. Finally, commenters expressed support for allowing CPT code 99491 (*Chronic care management services, provided personally by a physician or other qualified healthcare professional, at least 30 minutes of professional time per calendar month*) to be reportable and separately payable in the same service period as TCM.

Response: We thank the many commenters for their comments regarding ways to increase utilization of TCM services. Our goal in proposing to remove the current billing restrictions was to increase appropriate utilization of TCM services, particularly in light of the potential benefits noted by Bindman and Cox. Since publication of the CY 2020 PFS proposed rule, we have identified two chronic care management codes, CPT codes 99490 and 99491 that are not listed in the TCM section of the CPT manual as being restricted from concurrent billing. However, in the care management section of the 2019 CPT Manual, prefatory language indicates that neither CPT code 99495 nor 99496 (see, page 50) can be billed during the same month as CPT code 99490. Given our proposal to remove current billing restrictions, we believe that both CPT codes 99490 and the new 99491 should be added to the list of care management codes that can be billed concurrently with TCM when relevant and medically necessary.

We continue to believe that revising the billing requirements and allowing TCM codes to be billed concurrently with codes currently restricted will help to achieve our goal and may result in

other payers implementing similar changes. Additionally, this change may lead the CPT Editorial Panel to consider revising the current prohibitions on billing TCM with certain codes.

Comment: Commenters uniformly recommended that CMS finalize the increased valuations for the two TCM codes. Commenters expressed support for the agency's goal of increasing utilization of medically necessary TCM services given the potential benefits the services provide to patients as noted by Bindman and Cox.

Response: We believe that adopting the RUC-recommended increase in valuation of the work RVUs will support our goal of increasing medically necessary TCM services.

After considering public comments on our questions and proposals, and in light of our goal of increasing utilization of TCM services, we are finalizing our proposal to allow concurrent billing of the care management codes currently restricted from being billed with TCM. This includes allowing concurrent billing of TCM with the 14 codes specified in Table 20, as well as CPT codes 99490 and 99491, which we have identified as codes that also fit this policy. We are finalizing for both TCM codes the proposed increases in work RVUs and the RUC-recommended direct PE inputs. We look forward to working with the public and other stakeholders to potentially further refine our billing policies through future notice and comment rulemaking.

3. Chronic Care Management (CCM) Services

CCM services are comprehensive care coordination services per calendar month, furnished by a physician or nonphysician practitioner (NPP) managing overall care and their clinical staff, for patients with two or more serious chronic conditions. There are currently two general subsets of codes: One for non-complex chronic care management (starting in 2015, with a new code for 2019) and a set of codes for complex chronic care management (starting in 2017). Tables 21 and 22 list the applicable current codes (abbreviated) and provide a high-level summary of the CCM service elements. We refer readers to the following website for more comprehensive information regarding the CCM codes and the existing requirements for billing them to the PFS, available on our website at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/Care-Management.html>.

TABLE 21: Chronic Care Management Codes (CY 2019)

CPT Code	Summary
99490 ("Non-Complex CCM")	Chronic care management services, at least 20 minutes of clinical staff time directed by a physician or other qualified health care professional (QHP), per calendar month
99491 ("Non-Complex CCM")	Chronic care management services, provided personally by a physician or other QHP, at least 30 minutes of physician or other QHP time, per calendar month
99487 ("Complex CCM")	Complex chronic care management services, first 60 minutes of clinical staff time with moderate or high complexity medical decision making by the reporting practitioner
99489 ("Complex CCM")	Complex chronic care management services, each additional 30 minutes of clinical staff time with moderate or high complexity medical decision making by the reporting practitioner

TABLE 22: Chronic Care Management Services Summary

CCM Service Summary*
<p>Verbal Consent</p> <ul style="list-style-type: none"> Inform regarding availability of the service; that only one practitioner can bill per month; the right to stop services effective at the end of any service period; and that cost sharing applies (if no supplemental insurance). Document that consent was obtained.
<p>Initiating Visit for New Patients (separately paid)</p>
<p>Certified Electronic Health Record (EHR) Use</p> <ul style="list-style-type: none"> Structured Recording of Core Patient Information Using Certified EHR (demographics, problem list, medications, allergies).
<p>24/7 Access ("On Call" Service)</p>
<p>Designated Care Team Member</p>
<p>Comprehensive Care Management</p> <ul style="list-style-type: none"> Systematic needs assessment (medical and psychosocial). Ensure receipt of preventive services. Medication reconciliation, management and oversight of self-management.
<p>Comprehensive Electronic Care Plan</p> <ul style="list-style-type: none"> Plan is available timely within and outside the practice (can include fax). Copy of care plan to patient/caregiver (format not prescribed). Establish, implement, revise or monitor the plan.
<p>Management of Care Transitions/Referrals (e.g., discharges, ED visit follow up, referrals).</p> <ul style="list-style-type: none"> Create/exchange continuity of care document(s) timely (format not prescribed).
<p>Home- and Community-Based Care Coordination</p> <ul style="list-style-type: none"> Coordinate with any home- and community-based clinical service providers, and document communication with them regarding psychosocial needs and functional deficits.
<p>Enhanced Communication Opportunities</p> <ul style="list-style-type: none"> Offer asynchronous non-face-to-face methods other than telephone, such as secure email.

*All elements that are medically reasonable and necessary must be furnished during the month, but all elements do not necessarily apply every month. Consent need only be obtained once, and initiating visits are only for new patients or patients not seen within a year prior to initiation of CCM.

Early data show that, in general, CCM services are increasing patient and practitioner satisfaction, saving costs and enabling solo practitioners to remain in independent practice.⁸² Utilization has reached approximately 75 percent of the level we initially assumed under the PFS when we began paying for CCM services separately

under the PFS. While these are positive results, we believe that CCM services (especially complex CCM services) continue to be underutilized. In addition, we note that, at the February 2019 CPT Editorial Panel meeting, certain specialty associations requested refinements to the existing CCM codes, and consideration of their proposal was postponed. Also, we have heard from some stakeholders suggesting that the

time increments for non-complex CCM performed by clinical staff should be changed to recognize finer increments of time, and that certain requirements related to care planning are unclear. Based on our consideration of this ongoing feedback, we believe some of the refinements requested by specialty associations and other stakeholders may be necessary to improve payment accuracy, reduce unnecessary burden

⁸² <https://innovation.cms.gov/Files/reports/chronic-care-mngmt-finalevalrpt.pdf>.

and help ensure that beneficiaries who need CCM services have access to them. Accordingly, we proposed the following changes to the CCM code set for CY 2020.

a. Non-Complex CCM Services by Clinical Staff (CPT Code 99490, HCPCS Codes GCCC1 and GCCC2)

Currently, the clinical staff CPT code for non-complex CCM, CPT code 99490 (*Chronic care management services, at least 20 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month, with the following required elements: Multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient; chronic conditions place the patient at significant risk of death, acute exacerbation/ decompensation, or functional decline; comprehensive care plan established, implemented, revised, or monitored.*) describes 20 or more minutes of clinical staff time spent performing chronic care management activities under the direction of a physician/qualified health care professional (QHP). When we initially adopted this code for payment and, in feedback we have since received, a number of stakeholders suggested that CMS undervalued the PE RVU because we assumed that the minimum time for the code (20 minutes of clinical staff time) would be typical (see, for example, 79 FR 67717 through 67718). In the CY 2017 PFS final rule with comment period, we continued to consider whether the payment amount for CPT code 99490 is appropriate, given the amount of time typically spent furnishing CCM services (81 FR 80243 through 80244). We adopted the complex CCM codes for payment beginning in CY 2017, in part, to pay more appropriately for services furnished to beneficiaries requiring longer service times (see below). Some stakeholders continue to recommend that we should create an add-on code for non-complex CCM performed by clinical staff, such that these services would be defined and valued in 20-minute increments of time with additional payment for each additional 20 minutes of clinical staff time spent performing care management activities.

We agreed that coding changes that identify additional time increments may improve payment accuracy for non-complex CCM. Accordingly, we proposed to adopt two new G codes with new increments of clinical staff time instead of the existing single CPT code (CPT code 99490). The first G code would have described the initial 20 minutes of clinical staff time, and the

second G code would have described each additional 20 minutes thereafter. We intended these would be temporary G codes, to be used for PFS payment instead of CPT code 99490 until the CPT Editorial Panel can consider revisions to the current CPT code set. We said we would consider adopting any CPT code(s) once the CPT Editorial Panel completes its work. We acknowledged that imposing a transitional period during which G codes would be used under the PFS in lieu of the CPT codes is potentially disruptive, and solicited comment on whether the benefit of proceeding with the proposed G codes outweighs the burden of transitioning to their use in the intervening year(s) before a decision by the CPT Editorial Panel.

We proposed that the base code would be HCPCS code GCCC1 (*Chronic care management services, initial 20 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month, with the following required elements: multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient; chronic conditions place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline; and comprehensive care plan established, implemented, revised, or monitored. (Chronic care management services of less than 20 minutes duration, in a calendar month, are not reported separately)*). We proposed a work RVU of 0.61 for HCPCS code GCCC1, which we crosswalked from CPT code 99490. We believed these codes would have a similar amount of work since they would have the same intra-service time of 15 minutes.

We proposed an add-on HCPCS code GCCC2 (*Chronic care management services, each additional 20 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month (List separately in addition to code for primary procedure). (Use GCCC2 in conjunction with GCCC1). (Do not report GCCC1, GCCC2 in the same calendar month as GCCC3, GCCC4, 99491)*). We proposed a work RVU of 0.54 for HCPCS code GCCC2 based on a crosswalk to CPT code 11107 (*Incisional biopsy of skin (e.g., wedge) (including simple closure, when performed); each separate/additional lesion (List separately in addition to code for primary procedure)*), which has a work RVU of 0.54, which we believed would accurately reflect the work associated with each additional 20 minutes of CCM services. Both codes would have the

same intraservice time of 15 minutes. We noted that the nature of the PFS relative value system is such that all services are appropriately subject to comparisons to one another. Although codes that describe clinically similar services are sometimes stronger comparator codes, codes need not share the same site of service, patient population, or utilization level to serve as an appropriate crosswalk. In this case, we believed CPT code 11107 shared a similar work intensity to proposed HCPCS code GCCC2. Furthermore, although HCPCS codes GCCC1 and GCCC2 would share the same intraservice time, add-on codes may have lower intensity than the base codes because they describe the continuation of an already initiated service.

We solicited public comment on whether we should limit the number of times HCPCS code GCCC2 could be reported in a given service period for a given beneficiary. It was not clear how often more than 40 minutes of clinical staff time is currently spent or is medically necessary. In addition, once 60 minutes of clinical staff time is spent, many or most patients might also require complex medical decision-making, and such patients would already be described under existing coding for complex CCM. We believed a limit (such as allowing the add-on code to be reported only once per service period per beneficiary) may be appropriate in order to maintain distinctions between complex and non-complex CCM, as well as appropriately limit beneficiary cost sharing and program spending to medically necessary services. We noted that complex CCM already describes (in part) 60 or more minutes of clinical staff time in a service period. We solicited comment on whether and how often beneficiaries who do not require complex CCM (for example, do not require the complex medical decision making that is part of complex CCM) would need 60 or more minutes of non-complex CCM clinical staff time and thereby warrant more than one use of HCPCS code GCCC2 within a service period.

Comment: Several commenters supported the proposed add-on HCPCS code GCCC2, and recommended that there be a limit on its use (frequency) to keep non-complex CCM distinct from complex CCM. These commenters stated that patients requiring multiple uses of the add-on service likely require the moderate to high medical decision making of complex CCM. Other commenters stated that, while they have patients who do not require the complex

medical decision making that is part of complex CCM, care management for these patients is time-consuming and would require 60 or more minutes of non-complex CCM clinical staff time within a service period. These commenters suggested that limiting the frequency of reporting HCPCS code G2058 to twice during a service period allows for accurate payments, while preventing inappropriate use of the code. The Medicare Payment Advisory Commission (MedPAC) expressed support for the proposed add-on code for non-complex CCM because it would better reflect the resources involved in furnishing care management services and increase payment accuracy for CCM. Other commenters stated that G codes would help to facilitate earlier implementation and would ease transition to any updates made to CPT codes.

However, a number of commenters were not supportive of the introduction of temporary G codes within the CCM code set, believing it would produce administrative burden and cause confusion. These commenters stated that in September 2019 the CPT Editorial Panel was considering an application for similar changes to refine the code set. These commenters urged us to work with the CPT Editorial Panel regarding changes to the CCM code set and its revaluation. A few commenters suggested that CMS could achieve its burden reduction goals by continuing to recognize CPT codes 99490, 99487, and 99489 and also provide CMS-specific guidance for those codes for purposes of billing Medicare.

Response: We are not finalizing our proposal to create HCPCS codes G2058 (or G2059 or G2060, see below) in consideration of commenters' concerns that the introduction of temporary G codes replacing most of the CCM code set would create administrative burden, especially in light of the CPT Editorial Panel's currently ongoing work in this area. However we are finalizing G2058 (the add-on for non-complex CCM clinical staff time), henceforth referred to as G2058, because this code addresses what we believe is an important gap in the current code set that should be addressed more immediately, and that finalizing only this single G code rather than the full range of proposed G codes will allow payment for these services while creating significantly less administrative burden. Practitioners who choose to use G2058 can report the initial 20 minutes of non-complex CCM under CPT code 99490 and receive increased payment for their work under G2058. We are sympathetic to commenters' concerns that the

introduction of temporary replacement G codes across the CCM code set may introduce substantial confusion or administrative burden, but we believe a single new G code to pay more for additional 20-minute increments of non-complex CCM clinical staff time is important to pursue now. We are finalizing the work RVU for G2058 as proposed.

We agree with commenters that there should be a frequency limit on the reporting of HCPCS code G2058 to maintain the distinction between complex and non-complex CCM and, in response to comments, we are finalizing that HCPCS code G2058 will be reportable a maximum of two times within a given service period for a given beneficiary. We believe the availability of this G code will further our policy goals to improve payment accuracy for care management services and allow practitioners and their teams to spend more time with their patients.

Comment: A few commenters suggested that CMS should revalue the work RVUs for the CCM codes given that we proposed to increase the work RVUs for TCM, and CCM was originally valued based upon the RVUs for TCM.

Response: We appreciate these suggestions but, given the ongoing work of the CPT Editorial Panel regarding these codes, we will consider potential revaluation of this code set in the context of any future changes or recommendations that may be made by the CPT Editorial Panel or the RUC.

b. Complex CCM Services (CPT Codes 99487 and 99489, and HCPCS Codes G2058 and G2059)

There are two CPT codes for complex CCM:

- CPT code 99487 (*Complex chronic care management services, with the following required elements: Multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient; chronic conditions place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline; establishment or substantial revision of a comprehensive care plan; moderate or high complexity medical decision making; 60 minutes of clinical staff time directed by physician or other qualified health care professional, per calendar month.*)

- CPT code 99489 (*each additional 30 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month*

(List separately in addition to code for primary procedure).

Complex CCM describes care management for patients who require not only more clinical staff time, but also complex medical decision-making and establishment or substantial revision of the care plan. Specifically, the CPT codes for complex CCM include in the code descriptors a requirement for establishment or substantial revision of the comprehensive care plan. The code descriptors for complex CCM also include moderate to high complexity medical decision-making (moderate to high complexity medical decision-making is an explicit part of the services).

We proposed to adopt two new G codes that would be used for billing under the PFS instead of CPT codes 99487 and 99489, and that would not include the service component of substantial care plan revision. We believed it is not necessary to explicitly include substantial care plan revision because patients requiring moderate to high complexity medical decision making implicitly need and receive substantial care plan revision. The service component of substantial care plan revision is potentially duplicative with the medical decision making service component and, therefore, we believed it is unnecessary as a means of distinguishing eligible patients. Instead of CPT code 99487, we proposed to adopt HCPCS code G2058 (*Complex chronic care management services, with the following required elements: Multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient; chronic conditions place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline; comprehensive care plan established, implemented, revised, or monitored; moderate or high complexity medical decision making; 60 minutes of clinical staff time directed by physician or other qualified health care professional, per calendar month.*) (Complex chronic care management services of less than 60 minutes duration, in a calendar month, are not reported separately)). We proposed a work RVU of 1.00 for HCPCS code G2058, which is a crosswalk to CPT code 99487.

Instead of CPT code 99489, we proposed to adopt HCPCS code G2059 (*each additional 30 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month (List separately in addition to code for primary procedure).*) (Report G2059 in conjunction with G2058). (Do not report G2059 for care

management services of less than 30 minutes additional to the first 60 minutes of complex chronic care management services during a calendar month)). We proposed a work RVU of 0.50 for HCPCS code GCCC4, which is a crosswalk to CPT code 99489.

We intended these would be temporary G codes to remain in place until the CPT Editorial Panel can consider revising the current code descriptors for complex CCM services. We stated that we would consider adopting any new or revised complex CCM CPT code(s) once the CPT Editorial Panel completes its work. We acknowledged that imposing a transitional period during which G codes would be used under the PFS in lieu of the CPT codes is potentially disruptive. We solicited comment on whether the benefit of proceeding with the proposed G codes outweighs the burden of transitioning to their use in the intervening year(s) before a decision by the CPT Editorial Panel.

Comment: While expressing general support for the proposed changes to these codes to remove the element of substantial care plan revision, several commenters expressed concerns that the temporary introduction of G codes would produce administrative burden and cause confusion. These commenters stated that in September 2019 the CPT Editorial Panel was considering an application for similar changes to refine the code set and clarify care planning. These commenters urged us to work with the CPT Editorial Panel regarding changes to the CCM code set and its reevaluation. However, other commenters stated that G codes would help to facilitate earlier implementation and would ease transition to any updates made to CPT codes. A few commenters suggested that CMS could achieve its burden reduction goals by continuing to recognize CPT codes 99490, 99487, and 99489 and also provide CMS-specific guidance for those codes for purposes of billing Medicare.

Response: We are not finalizing our proposal to create HCPCS codes GCCC3 and GCCC4 in light of concerns raised by commenters, especially in light of the CPT Editorial Panel's currently ongoing work in this area and the concerns expressed by those that we expect would likely provide these services. Instead, given the support for our proposed care planning changes, for CY 2020 we will continue to recognize CPT codes 99487 and 99489, but with a different care planning element for purposes of billing Medicare. Beginning in CY 2020, for PFS billing purposes for CPT codes 99487 and 99489, we will interpret the code descriptor

“establishment or substantial revision of a comprehensive care plan” to mean that a comprehensive care plan is established, implemented, revised, or monitored. This will allow for consistency in the care planning service element of complex CCM and non-complex CCM services provided by clinical staff. While we usually create G codes with alternative code descriptors when our payment policy varies from what is included in a CPT code descriptor(s), the change we proposed for the complex CCM care plan code descriptor is a relatively minor modification to the CPT code descriptor that we believe can be accomplished without the use of G codes. We look forward to reviewing any refinements or other recommendations for these services that may come from the CPT Editorial Panel and the RUC, and will consider such recommendations through our rulemaking process.

c. Typical Care Plan

In 2013, in working with the physician community to develop and propose the CCM codes for PFS payment, the medical community recommended and CMS agreed that adequate care planning is integral to managing patients with multiple chronic conditions. We stated our belief that furnishing care management to beneficiaries with multiple chronic conditions requires complex and multidisciplinary care modalities that involve, among other things, regular physician development and/or revision of care plans and integration of new information into the care plan (78 FR 43337). In the CY 2014 PFS final rule with comment period (78 FR 74416 through 74418), consistent with recommendations CMS received in 2013 from the AMA's Complex Chronic Care Coordination Workgroup, we finalized a CCM scope of service element for a patient-centered plan of care with the following characteristics: It is a comprehensive plan of care for all health problems and typically includes, but is not limited to, the following elements: Problem list; expected outcome and prognosis; measurable treatment goals; cognitive and functional assessment; symptom management; planned interventions; medical management; environmental evaluation; caregiver assessment; community/social services ordered; how the services of agencies and specialists unconnected to the practice will be directed/coordinated; identify the individuals responsible for each intervention, requirements for periodic review; and when applicable, revisions of the care plan.

The CPT Editorial Panel also incorporated and adopted this language in the prefatory language for Care Management Services codes (page 49 of the 2019 CPT Codebook) including CCM services.

As we continue to consider the need for potential refinements to the CCM code set, we have heard that there is still some confusion in the medical community regarding what a care plan typically includes. We re-reviewed this language for CCM, and we believe there may be aspects of the typical care plan language we adopted for CCM that are redundant or potentially unduly burdensome. In our CY 2020 PFS proposed rule, we noted that because these are “typical” care plan elements, these elements do not comprise a set of strict requirements that must be included in a care plan for purposes of billing for CCM services; the elements are intended to reflect those that are typically, but perhaps not always, included in a care plan as medically appropriate for a particular beneficiary. Nevertheless, we proposed to eliminate the phrase “community/social services ordered, how the services of agencies and specialists unconnected to the practice will be directed/coordinated, identify the individuals responsible for each intervention” and insert the phrase “interaction and coordination with outside resources and practitioners and providers.” We believed simpler language could describe the important work of interacting and coordinating with resources external to the practice. While it is preferable, when feasible, to identify who is responsible for interventions, it may be difficult to maintain an up-to-date listing of responsible individuals especially when they are outside of the practice, for example, when there is staff turnover or assignment changes.

We proposed new language to read: The comprehensive care plan for all health issues typically includes, but is not limited to, the following elements:

- Problem list.
- Expected outcome and prognosis.
- Measurable treatment goals.
- Cognitive and functional assessment.
- Symptom management
- Planned interventions.
- Medical management.
- Environmental evaluation
- Caregiver assessment
- Interaction and coordination with outside resources and practitioners and providers.
- Requirements for periodic review.
- When applicable, revision of the care plan.

We welcomed feedback on our proposal, including language that would best guide practitioners as they decide what to include in their comprehensive care plan for CCM recipients.

Comment: Commenters largely supported CMS' proposed definition of the typical care plan, and stated that it was simpler than the current definition and also comprehensive.

Response: We thank the commenters for their support and are finalizing our proposed changes to the typical care plan for all CCM. We are eliminating the phrase "community/social services ordered, how the services of agencies and specialists unconnected to the practice will be directed/coordinated, identify the individuals responsible for each intervention" and inserting the phrase "interaction and coordination with outside resources and practitioners and providers." The new language will read: "The comprehensive care plan for all health issues typically includes, but is not limited to, the following elements:

- Problem list.
- Expected outcome and prognosis.
- Measurable treatment goals.
- Cognitive and functional assessment.
- Symptom management
- Planned interventions.
- Medical management.
- Environmental evaluation
- Caregiver assessment
- Interaction and coordination with outside resources and practitioners and providers.
- Requirements for periodic review.
- When applicable, revision of the care plan."

We anticipate that this change will reduce burden and simplify the important work of interacting and coordinating with resources external to the practice.

4. Principal Care Management (PCM) Services

A gap we identified in coding and payment for care management services is care management for patients with only one chronic condition. The current CCM codes require patients to have two or more chronic conditions. These codes are primarily billed by practitioners who are managing a patient's total care over a month, including primary care practitioners and some specialists such as cardiologists or nephrologists. We have heard from a number of stakeholders, especially those in specialties that use the office/outpatient E/M code set to report the majority of their services, that there can be significant resources involved in care management for a single high risk disease or complex chronic condition

that is not well accounted for in existing coding (FR 78 74415). This issue has also been raised by the stakeholder community in proposal submissions to the Physician-Focused Payment Model Technical Advisory Committee (PTAC), which are available at <https://aspe.hhs.gov/ptac-physician-focused-payment-model-technical-advisory-committee>. Therefore, we proposed separate coding and payment for Principal Care Management (PCM) services, which describe care management services for one serious chronic condition. A qualifying condition will typically be expected to last between 3 months and 1 year, or until the death of the patient, may have led to a recent hospitalization, and/or place the patient at significant risk of death, acute exacerbation/ decompensation, or functional decline.

Although we did not propose any restrictions on the specialties that could bill for PCM, we expect that most of these services will be billed by specialists who are focused on managing patients with a single complex chronic condition requiring substantial care management. We expect that, in most instances, initiation of PCM will be triggered by an exacerbation of the patient's complex chronic condition or recent hospitalization such that disease-specific care management is warranted. We anticipate that in the majority of instances, PCM services will be billed when a single condition is of such complexity that it cannot be managed as effectively in the primary care setting, and instead requires management by another, more specialized, practitioner. For example, a typical patient may present to their primary care practitioner with an exacerbation of an existing chronic condition. Although the primary care practitioner may be able to provide care management services for this one complex chronic condition, it is also possible that the primary care practitioner and/or the patient could instead decide that another clinician should provide relevant care management services. In this case, the primary care practitioner will still oversee the overall care for the patient while the practitioner billing for PCM services will provide care management services for the specific complex chronic condition. The treating clinician may need to provide a disease-specific care plan or may need to make frequent adjustments to the patient's medication regimen. The expected outcome of PCM is for the patient's condition to be stabilized by the treating clinician so that overall care

management for the patient's condition can be returned to the patient's primary care practitioner. If the beneficiary only has one complex chronic condition that is overseen by the primary care practitioner, then the primary care practitioner will also be able to bill for PCM services. We proposed that PCM services include coordination of medical and/or psychosocial care related to the single complex chronic condition, provided by a physician or clinical staff under the direction of a physician or other qualified health care professional.

We anticipate that many patients will have more than one complex chronic condition. If a clinician is providing PCM services for one complex chronic condition, management of the patient's other conditions will continue to be managed by the primary care practitioner while the patient is receiving PCM services for a single complex condition. It is also possible that the patient could receive PCM services from more than one clinician if the patient experiences an exacerbation of more than one complex chronic condition simultaneously.

For CY 2020, we proposed to make separate payment for PCM services via two new G codes: HCPCS code G2064 (*Comprehensive care management services for a single high-risk disease, e.g., Principal Care Management, at least 30 minutes of physician or other qualified health care professional time per calendar month with the following elements: One complex chronic condition lasting at least 3 months, which is the focus of the care plan, the condition is of sufficient severity to place patient at risk of hospitalization or have been the cause of a recent hospitalization, the condition requires development or revision of disease-specific care plan, the condition requires frequent adjustments in the medication regimen, and/or the management of the condition is unusually complex due to comorbidities*) and HCPCS code G2065 (*Comprehensive care management for a single high-risk disease services, e.g., Principal Care Management, at least 30 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month with the following elements: One complex chronic condition lasting at least 3 months, which is the focus of the care plan, the condition is of sufficient severity to place patient at risk of hospitalization or have been cause of a recent hospitalization, the condition requires development or revision of disease-specific care plan, the condition requires frequent adjustments in the*

medication regimen, and/or the management of the condition is unusually complex due to comorbidities). HCPCS code G2064 would be reported when, during the calendar month, at least 30 minutes of physician or other qualified health care provider time is spent on comprehensive care management for a single high risk disease or complex chronic condition. HCPCS code G2065 would be reported when, during the calendar month, at least 30 minutes of clinical staff time is spent on comprehensive management for a single high risk disease or complex chronic condition.

For HCPCS code G2064, we proposed a crosswalk to the work value associated with CPT code 99217 (*Observation care discharge day management (This code is to be utilized to report all services provided to a patient on discharge from outpatient hospital "observation status" if the discharge is on other than the initial date of "observation status." To report services to a patient designated as "observation status" or "inpatient status" and discharged on the same date, use the codes for Observation or Inpatient Care Services [including Admission and Discharge Services, 99234–99236 as appropriate])*) as we believe these values most accurately reflect the resource costs associated when the billing practitioner performs PCM services. CPT code 99217 has the same intraservice time as HCPCS code G2064 and the physician work is of similar intensity. Therefore, we proposed a work RVU of 1.28 for HCPCS code G2064.

For HCPCS code G2065, we proposed a crosswalk to the work and PE inputs associated with CPT code 99490 (clinical staff non-complex CCM) as we believe these values reflect the resource costs associated with the clinician's direction of clinical staff who are performing the PCM services, and the intraservice times and intensity of the work for the two codes will be the same. Therefore, we proposed a work RVU of 0.61 for HCPCS code G2065.

Although we proposed separate coding and payment for PCM services performed by clinical staff with the oversight of the billing professional and services furnished directly by the billing professional, we solicited comment on whether both codes are necessary to appropriately describe and bill for PCM services. We note that we are basing this coding structure on the codes for CCM services with CPT code 99491 reflecting care management by the billing professional and CPT code 99490 reflecting care management by clinical

staff directed by a physician or other qualified health care professional.

We acknowledged that we concurrently proposed revisions for both complex and non-complex CCM services. Were we not to finalize the changes for both complex and non-complex CCM services, we stated our belief that the overall structure and description of the CCM services remain close enough to serve as a model for the coding structure and description of services for the proposed PCM services. We solicited public comment on whether it would be appropriate to create an add-on code for additional time spent each month (similar to HCPCS code G2064 discussed above) when PCM services are furnished by clinical staff under the direction of the billing practitioner.

Comment: Most commenters supported separate payment for PCM services, noting the gap in payment for care management and coordination for a patient's single complex or chronic condition. Other commenters were supportive of the policy goal but expressed concerns that the work described by PCM is duplicative of work being furnished as part of CCM and encouraged CMS to work with the CPT editorial panel to develop coding for this service.

Response: We appreciate the support for both the policy goal of appropriate payment for care management services conducted for a patient's single complex or chronic condition and for separate payment for PCM services. We look forward to reviewing and considering recommendations from the CPT Editorial Panel and the RUC, should they develop and value CPT codes describing this or similar services, through our rulemaking process.

Comment: A few commenters stated that HCPCS code G2064 was undervalued and should have a work RVU of 1.45, which is the same work RVU as CPT code 99491 (*Chronic care management services, provided personally by a physician or other qualified health care professional, at least 30 minutes of physician or other qualified health care professional time, per calendar month, with the following required elements: Multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient; chronic conditions place the patient at significant risk of death, acute exacerbation/ decompensation, or functional decline; comprehensive care plan established, implemented, revised, or monitored*). CPT code 99491 describes the work associated with care management performed by the billing practitioner, in

contrast to CPT code 99490, which describes the work associated with supervision of care management performed by clinical staff. Commenters pointed out that CPT codes 99491 and 99490 served as the model for HCPCS codes G2064 and G2065. Commenters stated that CPT code 99491 was a more accurate crosswalk for HCPCS code G2064 because both codes describe the work associated with care management and coordination performed by the billing practitioner, and G2065 describes the work associated with supervising care management done by clinical staff and was valued the same as CPT code 99490. Commenters also pointed out that, although PCM services describe care management associated with a single condition, the fact that this condition has most likely experienced an exacerbation or has caused the patient to recently be hospitalized, results in greater intensity than the work associated with managing multiple chronic conditions, some of which may be more stable.

Response: After considering these comments, we agree that the work RVU we proposed for code G2064 (1.28 RVUs) should be valued through a crosswalk to CPT code 99491, and we agree with the points made by commenters regarding the intensity of care management for a single condition, especially when that condition has likely experienced an exacerbation. We also agree that the relativity between CPT codes 99490 and 99491 should be preserved in HCPCS codes G2064 and G2065. Therefore, we are finalizing an RVU of 1.45 for HCPCS code G2064.

Comment: A few commenters supported creation of an add-on code for additional time spent engaged in PCM services beyond the initial 30 minutes, similar to HCPCS code G2060 discussed above.

Response: We thank commenters for their input. Given that this is a new service, we believe it would be more appropriate to monitor uptake and stakeholder response, and we will consider whether to establish a separate add-on code for additional time spent furnishing PCM services beyond the initial 30 minutes for possible future rulemaking.

Although we believe that PCM services describe a situation where a patient's condition is severe enough to require care management for a single complex chronic condition beyond what is described by CCM or performed in the primary care setting, we are concerned that a possible unintended consequence of making separate payment for care management for a single chronic condition is that a patient with multiple

chronic conditions could have their care managed by multiple practitioners, each only billing for PCM, which could potentially result in fragmented patient care, overlaps in services, and duplicative services. Although we did not propose additional requirements for the PCM services, we did consider alternatives such as requiring that the practitioner billing PCM must document ongoing communication with the patient's primary care practitioner to demonstrate that there is continuity of care between the specialist and primary care settings, or requiring that the patient have had a face-to-face visit with the practitioner billing PCM within the prior 30 days to demonstrate that they have an ongoing relationship. We solicited comment on whether requirements such as these are necessary or appropriate, and whether there should be additional requirements to prevent potential care fragmentation or service duplication.

We received public comments on whether requirements such as these are necessary or appropriate, and whether there should be additional requirements to prevent potential care fragmentation or service duplication. The following is a summary of the comments we received and our responses.

Comment: Many commenters' shared CMS' concerns. Some commenters recommended that CMS not finalize separate payment for PCM services, stating that this would move away from patient-specific, continuous, comprehensive value based care management and coordination toward a more disease specific care management, resulting in fragmented care and service

duplication. A few commenters with concerns about care fragmentation suggested that CMS first implement PCM through a demonstration. Others supported requiring the billing practitioner document ongoing communication and care coordination with any other practitioners overseeing care of the patient, such as primary care practitioners, pharmacists, hospitalists, or social workers, as applicable. These commenters stated that this would be sufficient to maintain coordination and continuity of care in the instance where multiple practitioners are involved in furnishing care to the beneficiary. A few commenters also suggested that CMS not allow billing of PCM services by multiple practitioners for the same indication. Still other commenters stated that it was not necessary to include any requirements pertaining to care fragmentation or service duplication, and that such requirements would be a barrier to uptake.

Response: While we share commenters' concerns regarding care fragmentation and service duplication, we do not believe they rise to the level that separate payment should not be adopted for these services. The type of care management services that we believe are appropriately described by the PCM codes involve work intensively focused on managing a single condition and, with very few exceptions, could not be replaced by a single practitioner billing CCM services for management of multiple chronic conditions. However, we also believe it necessary to put in place some requirements so as to avoid a situation where each of a patient's individual conditions are being

managed separately by different practitioners who all bill for PCM services. Therefore, we are finalizing a requirement that ongoing communication and care coordination between all practitioners furnishing care to the beneficiary must be documented by the practitioner billing for PCM in the patient's medical record.

Due to the similarity between the description of the PCM and CCM services, both of which involve non-face-to-face care management services, we proposed that the full CCM scope of service requirements apply to PCM, including documenting the patient's verbal consent in the medical record. We solicited comment on whether there are required elements of CCM services that the public and stakeholders believe should not be applicable to PCM, and should be removed or altered.

A high level summary of these requirements is available in Table 23 and available at <https://www.cms.gov/Outreach-and-Education/Medicare-Learning-Network-MLN/MLNProducts/Downloads/ChronicCareManagement.pdf>. Both the initiating visit and the patient's verbal consent are necessary as not all patients who meet the criteria to receive separately billable PCM services may want to receive these services. The beneficiary should be educated as to what PCM services are and any cost sharing that may apply. Additionally, as practitioners have informed us that beneficiary cost sharing is a significant barrier to provision of other care management services, we solicited comment on how best to educate practitioners and beneficiaries on the benefits of PCM services.

TABLE 23: Chronic Care Management Services Summary

CCM Service Summary*
Verbal Consent <ul style="list-style-type: none"> • Inform regarding availability of the service; that only one practitioner can bill per month; the right to stop services effective at the end of any service period; and that cost sharing applies (if no supplemental insurance). • Document that consent was obtained.
Initiating Visit for New Patients (separately paid)
Certified Electronic Health Record (EHR) Use <ul style="list-style-type: none"> • Structured Recording of Core Patient Information Using Certified EHR (demographics, problem list, medications, allergies).
24/7 Access (“On Call” Service)
Designated Care Team Member
Comprehensive Care Management <ul style="list-style-type: none"> • Systematic needs assessment (medical and psychosocial). • Ensure receipt of preventive services. • Medication reconciliation, management and oversight of self-management.
Comprehensive Electronic Care Plan <ul style="list-style-type: none"> • Plan is available timely within and outside the practice (can include fax). • Copy of care plan to patient/caregiver (format not prescribed). • Establish, implement, revise or monitor the plan.
Management of Care Transitions/Referrals (e.g., discharges, ED visit follow up, referrals). <ul style="list-style-type: none"> • Create/exchange continuity of care document(s) timely (format not prescribed).
Home- and Community-Based Care Coordination <ul style="list-style-type: none"> • Coordinate with any home- and community-based clinical service providers, and document communication with them regarding psychosocial needs and functional deficits.
Enhanced Communication Opportunities <ul style="list-style-type: none"> • Offer asynchronous non-face-to-face methods other than telephone, such as secure email.

*All elements that are medically reasonable and necessary must be furnished during the month, but all elements do not necessarily apply every month. Consent need only be obtained once, and initiating visits are only for new patients or patients not seen within a year prior to initiation of CCM.

We received public comments on whether there are required elements of CCM services that the public and stakeholders believe should not be applicable to PCM, and should be removed or altered. The following is a summary of the comments we received and our responses.

Comment: Most commenters supported application of the required elements of CCM to PCM with a number of refinements, although a few urged CMS not to add overly burdensome billing requirements. Commenters requested that CMS clarify that elements of CCM, such as the “systematic needs assessment,” “receipt of preventive services,” and a “comprehensive care plan” must be furnished only for the specific chronic condition for which the billing practitioner is treating the patient. Some commenters pointed out that a “comprehensive care plan” was not needed when a practitioner is

engaged in care management and coordination of a single complex or chronic condition, and instead suggested it be changed to “disease-specific care plan.” Other commenters suggest that we remove this language entirely. Commenters expressed concern with requiring that the EHR be certified to a particular standard. Commenters generally recommended that an initiating visit be furnished within a window of time to demonstrate that a relationship has been established between the beneficiary and the practitioner furnishing PCM. Commenters supported the retention of the requirement that there be the capacity for in-person care management. Commenters also recommended that verbal and or written consent be documented in the medical record so that the patient is aware of the service and any applicable cost sharing,

although some stated that this was a burdensome requirement given that they may not know in advance which beneficiaries will require PCM services.

Response: We thank commenters for all their input. We agree with commenters that a “disease-specific” care plan is more appropriate than a comprehensive care plan, as the practitioner will be providing care coordination and management for a single condition, and as such, the care plan may be more limited. We also agree that certain aspects of CCM, such as “systematic needs assessment” and “receipt of preventive services” should only be furnished as applicable to the condition being treated and should not be a requirement to bill for PCM services. Table 24 shows the elements of CCM, as revised in response to comments, that will be required for PCM.

TABLE 24: Principal Care Management Services Summary

PCM Service Summary*
Verbal Consent <ul style="list-style-type: none"> • Inform regarding availability of the service; that only one practitioner can bill per month; the right to stop services effective at the end of any service period; and that cost sharing applies (if no supplemental insurance). • Document that consent was obtained.
Initiating Visit for New Patients (separately paid)
Certified Electronic Health Record (EHR) Use <ul style="list-style-type: none"> • Structured Recording of Core Patient Information Using EHR (demographics, problem list, medications, allergies).
24/7 Access (“On Call” Service)
Designated Care Team Member
Disease Specific Care Management Disease Specific Care Management may include, as applicable: <ul style="list-style-type: none"> • Systematic needs assessment (medical and psychosocial). • Ensure receipt of preventive services. • Medication reconciliation, management and oversight of self-management.
Disease Specific Electronic Care Plan <ul style="list-style-type: none"> • Plan is available timely within and outside the practice (can include fax). • Copy of care plan to patient/caregiver (format not prescribed). • Establish, implement, revise or monitor the plan.
Management of Care Transitions/Referrals (e.g., discharges, ED visit follow up, referrals, as applicable). <ul style="list-style-type: none"> • Create/exchange continuity of care document(s) timely (format not prescribed).
Home- and Community-Based Care Coordination <ul style="list-style-type: none"> • Coordinate with any home- and community-based clinical service providers, and document communication with them regarding psychosocial needs and functional deficits, as applicable.
Enhanced Communication Opportunities <ul style="list-style-type: none"> • Offer asynchronous non-face-to-face methods other than telephone, such as secure email.

*All elements that are medically reasonable and necessary must be furnished during the month, but all elements do not necessarily apply every month. Consent need only be obtained once, and initiating visits are only for new patients or patients not seen within a year prior to initiation of PCM.

With regard to the certified EHR, we continue to believe that use of certified EHR technology is vital to ensure that practitioners are capable of providing the full scope of PCM services, such as timely care coordination and continuity of care (see our prior discussion of this issue at 79 FR 67723). The use of certified EHR technology helps ensure that members of the care team have timely access to the patient’s most updated health information. Also, we believe that use of certified EHR technology among physicians and other practitioners will increase as we move forward to implement the Quality Payment Program, including MIPS and Advanced Alternative Payment Models, as well as other value-based payment initiatives. Accordingly, we are not modifying the proposed use of certified EHR technology as an element of PCM services.

We received public comments on how best to educate practitioners and beneficiaries on the benefits of PCM services. The following is a summary of

the comments we received and our responses.

Comment: Commenters recommended that CMS issue guidance for billing and coding criteria, clinical situations in which PCM may be billed, and what defines a complex condition.

Response: We look forward to continued engagement with the public to revise and refine PCM services as they are implemented. We encourage stakeholders to submit questions and information to CMS so that we might consider changes or clarification for future rulemaking.

Additionally, we proposed to add HCPCS code G2065 to the list of designated care management services for which we allow general supervision as described in our regulation at § 410.26(b)(5).

Comment: Commenters supported adding HCPCS code G2065 to the list of designated care management services for which we allow general supervision.

Response: We thank commenters for their support and are finalizing as proposed.

Due to the potential for duplicative payment, we proposed that PCM could not be billed by the same practitioner for the same patient concurrent with certain other care management services, such as CCM, behavioral health integration services, and monthly capitated ESRD payments. We also proposed that PCM will not be billable by the same practitioner for the same patient during a surgical global period, as we believe those resource costs will already be included in the valuation of the global surgical code.

We also solicited comment on any potential for duplicative payment between the PCM services and other services, such as interprofessional consultation services (CPT codes 99446–99449 (*Interprofessional telephone/internet/electronic health record assessment and management service provided by a consultative physician, including a verbal and written report to the patient’s treating/requesting physician or other qualified health care professional*), CPT code 99451 (*Interprofessional telephone/*

internet/electronic health record assessment and management service provided by a consultative physician, including a written report to the patient's treating/requesting physician or other qualified health care professional, 5 minutes or more of medical consultative time), and CPT code 99452 (Interprofessional telephone/internet/electronic health record referral service(s) provided by a treating/requesting physician or other qualified health care professional, 30 minutes) or remote patient monitoring (CPT code 99091 (Collection and interpretation of physiologic data (e.g., ECG, blood pressure, glucose monitoring) digitally stored and/or transmitted by the patient and/or caregiver to the physician or other qualified health care professional, qualified by education, training, licensure/regulation (when applicable) requiring a minimum of 30 minutes of time, each 30 days), CPT code 99453 (Remote monitoring of physiologic parameter(s) (e.g., weight, blood pressure, pulse oximetry, respiratory flow rate), initial; set-up and patient education on use of equipment), and CPT code 99457 (Remote physiologic monitoring treatment management services, 20 minutes or more of clinical staff/physician/other qualified health care professional time in a calendar month requiring interactive communication with the patient/caregiver during the month).

Comment: Commenters generally supported restricting the number of care management services billable by the same practitioner for the same patient, stating that this was necessary to avoid service duplication. A few commenters also stated that services such as interprofessional consultation and chronic care RPM should not be separately billable in the same month as PCM by the same practitioner for the same beneficiary. Others disagreed, stating the RPM and interprofessional consultations describe distinct services not accounted for in the work of PCM. RPM in particular was described by these commenters as being complimentary to PCM services, rather than duplicative.

Commenters requested clarification as to potential overlap between PCM and CCM and some commenters suggested that PCM could be billed concurrent with CCM for the same beneficiary, if billed by different practitioners. Commenters also requested that CMS clarify any potential overlap between PCM and HCPCS code GPC1X (*Visit complexity inherent to evaluation and management associated with medical care services that serve as the*

continuing focal point for all needed health care services and/or with medical care services that are part of ongoing care related to a patient's single, serious, or complex chronic condition. (Add-on code, list separately in addition to office/outpatient evaluation and management visit, new or established).

Response: We do not believe there will be a duplication of care management between PCM and other care management services solely as a result of separate payment for the new PCM codes, particularly with the revised list of required elements which better distinguish PCM services from CCM. However, we also agree with commenters that PCM services should not be furnished with other care management services by the same practitioner for the same beneficiary, nor should PCM services be furnished at the same time as interprofessional consultations for the same condition by the same practitioner for the same patient. However, we are convinced by stakeholders who stated that RPM services are distinct from PCM and could be billed concurrently by the same practitioner for the same beneficiary provided that the time is not counted twice. We will also be monitoring billing of these services. We will appreciate continued input and engagement on these issues with the public and stakeholder community, and may make refinements to these policies in future rulemaking.

With regard to the relationship between PCM services and HCPCS code GPC1X, we do not believe there is any overlap. We note that PCM describes ongoing care management services and is billed monthly, whereas HCPCS code GPC1X is an adjustment to an office/outpatient E/M visit (which are separately billable alongside PCM) to capture additional resource costs associated with performing either a primary care visit or a visit that is part of ongoing care of a patient's single, serious, or complex condition.

Comment: A commenter requested that RHCs and FQHCs be allowed to furnish and report PCM services.

Response: We thank the commenter for the suggestion. While we did not propose a new mechanism for RHCs and FQHCs to report PCM services specifically, we recognize that the requirements for the new PCM codes are similar to the requirements for the services described by HCPCS code G0511, which is the RHC/FQHC-specific general care management code, and will consider adding PCM to G0511 in future rulemaking.

5. Chronic Care Remote Physiologic Monitoring Services

Chronic care remote physiologic monitoring (RPM) services involve the collection, analysis, and interpretation of digitally collected physiologic data, followed by the development of a treatment plan, and the managing of a patient under the treatment plan. The current CPT code 99457 is a treatment management code, billable after 20 minutes or more of clinical staff/physician/other qualified professional time with a patient in a calendar month.

In September 2018, the CPT Editorial Panel revised the CPT code structure for CPT code 99457 effective beginning CY 2020. The new code structure retains CPT code 99457 as a base code that describes the first 20 minutes of the treatment management services, and uses a new add-on code to describe subsequent 20 minute intervals of the service. The new code descriptors for CY 2020 are: CPT code 99457 (*Remote physiologic monitoring treatment management services, clinical staff/physician/other qualified health care professional time in a calendar month requiring interactive communication with the patient/caregiver during the month; initial 20 minutes*) and CPT code 99458 (*Remote physiologic monitoring treatment management services, clinical staff/physician/other qualified health care professional time in a calendar month requiring interactive communication with the patient/caregiver during the month; additional 20 minutes*).

In considering the work RVUs for the new add-on CPT code 99458, we first considered the value of its base code. We previously valued the base code at 0.61 work RVUs. Given the value of the base code, we did not agree with the RUC-recommended work RVU of 0.61 for CPT code 99458. Instead, we proposed a work RVU of 0.50 for the add-on code, which we believed was supported by CPT code 88381 (*Microdissection (i.e., sample preparation of microscopically identified target); manual*) and which has the same intraservice and total times of 20 minutes with an XXX global period and work RVU of 0.53, as well as the survey value at the 25th percentile. We proposed the RUC-recommended direct PE inputs for CPT code 99458.

Finally, we proposed that RPM services could be furnished under general supervision. Because care management services include establishing, implementing, revising, or monitoring treatment plans, as well as providing support services, and because

RPM services include establishing, implementing, revising, and monitoring a specific treatment plan for a patient related to one or more chronic conditions that are monitored remotely, we believed that CPT codes 99457 and 99458 should be included as designated care management services. Designated care management services can be furnished under general supervision. Section 410.26(b)(5) of our regulations states that designated care management services can be furnished under the general supervision of the “physician or other qualified health care professional (who is qualified by education, training, licensure/regulation and facility privileging)” (see also 2019 CPT Codebook, page xii) when these services or supplies are provided incident to the services of a physician or other qualified healthcare professional. The physician or other qualified healthcare professional supervising the auxiliary personnel need not be the same individual treating the patient more broadly. However, only the supervising physician or other qualified healthcare professional may bill Medicare for incident to services.

We received public comments on the proposed valuation of the RPM add-on CPT code 99458 and our proposal to designate CPT codes 99457 and 99458 as care management services. The following is a summary of the comments we received in response to our two proposals, as well as our responses.

Comment: We received numerous comments regarding our valuation of the new RPM code, CPT code 99458. Commenters uniformly disagreed with our proposed work RVU of 0.50 writing that there are no efficiencies to be gained when continuing the same treatment management service for an additional 20 minutes. Some commenters questioned our use of CPT code 88381 (*Microdissection (i.e., sample preparation of microscopically identified target); manual*) as a reference code, a code that does not resemble the work and the intensity of the work furnished during a care management session.

Response: We thank the many commenters for their insights into the work required for CPT codes 99457 and 99458.

Comment: Commenters uniformly agreed with our proposal to designate CPT codes 99457 and 99458 as care management services so that the services can be furnished under general supervision.

Response: We agree with commenters that the add-on code requires the same work time and intensity as the RPM base code. Therefore, we are finalizing

the RUC-recommended work RVU 0.61 for CPT code 99458. We are also finalizing the RUC-recommended direct PE. In addition, we are finalizing our proposal to designate both CPT code 99457 and CPT code 99458 care management codes as defined in § 410.26(b)(5) of our regulations.

Comment: Several commenters expressed concerns about the ambiguity of the code descriptors for the RPM codes. Commenters requested that CMS define what is meant by “physiologic parameters”, “digitally transmitted data” (as opposed to patient-reported data), “medical device,” and “interactive communication”. Several commenters asked if we could expand the list of practitioners allowed to furnish RPM services, while others requested that we clarify who can furnish and bill for the RPM services. One commenter stated that the prefatory language for the codes should state explicitly that an established patient-practitioner relationship must exist prior to billing for RPM services. Another commenter recommended that we provide guidance related to billing and documentation for RPM. Some commenters questioned whether the codes could be used for patients that without chronic conditions.

Response: We appreciate the many questions raised by commenters about the set of RPM codes and understand the frustration commenters expressed with the current code descriptors. Therefore, given the numerous questions raised by commenters, we plan to consider these and other questions related to RPM in future rulemaking.

Comment: We received a few comments asking whether RPM is a billable service in RHCs and FQHCs.

Response: RHCs are paid an all-inclusive rate (AIR) when a medically necessary, face-to-face visit is furnished by an RHC practitioner. FQHCs are paid the lesser of their charges or the FQHC PPS rate when a medically-necessary, face-to-face visit is furnished by an FQHC practitioner. Both the RHC AIR and the FQHC PPS rate include all services and supplies furnished incident to the visit. Services such as RPM are not separately billable because they are already included in the RHC AIR or FQHC PPS payment.

6. Comment Solicitation on Consent for Communication Technology-Based Services

In the CY 2019 PFS final rule, we finalized separate payment for a number of services that could be furnished via telecommunications technology. Specifically, we finalized HCPCS code

G2010 (*Remote evaluation of recorded video and/or images submitted by an established patient (e.g., store and forward), including interpretation with follow-up with the patient within 24 business hours, not originating from a related E/M service provided within the previous 7 days nor leading to an E/M service or procedure within the next 24 hours or soonest available appointment*)), HCPCS code G2012 (*Brief communication technology-based service, e.g., virtual check-in, by a physician or other qualified health care professional who can report evaluation and management services, provided to an established patient, not originating from a related E/M service provided within the previous 7 days nor leading to an E/M service or procedure within the next 24 hours or soonest available appointment; 5–10 minutes of medical discussion*)), CPT codes 99446–99449 (*Interprofessional telephone/internet/electronic health record assessment and management service provided by a consultative physician, including a verbal and written report to the patient’s treating/requesting physician or other qualified health care professional*), CPT code 99451 (*Interprofessional telephone/internet/electronic health record assessment and management service provided by a consultative physician, including a written report to the patient’s treating/requesting physician or other qualified health care professional, 5 minutes or more of medical consultative time*), and CPT code 99452 (*Interprofessional telephone/internet/electronic health record referral service(s) provided by a treating/requesting physician or other qualified health care professional, 30 minutes*).

As discussed in that rule, (83 FR 59490 through 59491), while a few commenters suggested that it would be less burdensome to obtain a general consent for multiple services at once, we stipulated that verbal consent must be documented in the medical record for each service furnished so that the beneficiary is aware of any applicable cost sharing. This is similar to the requirements for other non-face-to-face care management services under the PFS.

We have continued to hear from stakeholders that requiring advance beneficiary consent for each of these services is burdensome. For HCPCS codes G2010 and G2012, stakeholders have stated that it is difficult and burdensome to obtain consent at the outset of each of what are meant to be brief check-in services. For CPT codes 99446–99449, 99451 and 99452, practitioners have informed us that it is

particularly difficult for the consulting practitioner to obtain consent from a patient they have never seen. Given our longstanding goals to reduce burden and promote the use of communication technology-based services (CTBS), we sought comment in the CY 2020 PFS proposed rule on whether a single advance beneficiary consent could be obtained for a number of communication technology-based services. During the consent process, the practitioner will make sure the beneficiary is aware that utilization of these services will result in a cost sharing obligation. We solicited comment on the appropriate interval of time or number of services for which consent could be obtained, for example, for all these services furnished within a 6-month or 1-year period, or for a set number of services, after which a new consent will need to be obtained. We also solicited comment on the potential program integrity concerns associated with allowing advance consent and how best to minimize those concerns.

We received public comments on the appropriate interval of time or number of services for which consent could be obtained and the potential program integrity concerns associated with allowing advance consent and how best to minimize those concerns. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported requiring a generalized consent for multiple communication technology-based services or interprofessional consultations. Most commenters suggested that a year was an appropriate interval for which consent should be obtained, although some commenters suggested other time intervals, such as every 6 months, quarterly, or no requirement at all.

A few commenters suggested that there should be separate consent processes for services that involve an interaction with the patient, such as HCPCS codes G2010 to report the remote evaluation of recorded video and/or images for an established patient and G2012 to report brief communication technology-based service for an established patient, and services that do not involve direct interaction with the patient, such as CPT codes 99446 through 99449, 99451 and 99452, which describe services such as electronic assessment and management by a consultative physician.

Other commenters raised more general concerns with beneficiary cost sharing, pointing out that beneficiaries may not be accustomed to being charged cost sharing for non-face-to-face

services. These commenters urged CMS to eliminate cost sharing for these services.

Response: We appreciate commenters' support for allowing a single consent to be obtained for multiple CTBS or interprofessional consultation services over an interval of time, rather than requiring consent to be obtained prior to each service. Given the commenters' support, we are finalizing a policy to permit a single consent to be obtained for multiple CTBS or interprofessional consultation services. Based on feedback from commenters, we believe an appropriate interval for the single consent is one year, and we are finalizing that the single consent must be obtained at least annually. We will continue to consider whether a separate consent should be obtained for services that involve direct interaction between the patient and practitioner, and those that do not involve interaction such as interprofessional services; and we may address this issue in potential future rulemaking.

We also appreciate commenters' continued concerns about the burden associated with cost sharing for CTBS and interprofessional consultation services. Although we do not have statutory authority to eliminate cost sharing for these services, we appreciate the continued input from the public as to how best to educate both practitioners and beneficiaries to reduce instances of unexpected bills.

7. Rural Health Clinics (RHCs) and Federally-Qualified Health Centers (FQHCs)

RHCs and FQHCs are paid for general care management services using HCPCS code G0511, which is an RHC and FQHC-specific G-code for 20 minutes or more of CCM services, complex CCM services, CCM furnished by a physician or other qualified health care professional, or general behavioral health services, and we are allowing G0511 to also be billed when the requirements for PCM are met. Payment for this service is set at the average of the national, non-facility payment rates for CPT codes 99490, 99487, 99491, and 99484. We proposed to use the non-facility payment rates for HCPCS codes G0511 and G0512 instead of the non-facility payment rates for CPT codes 99490 and 99487, respectively, if these changes were finalized for practitioners billing under the PFS; as indicated above, these codes were not finalized. We note that we did not propose any changes in the valuation of these codes.

Comment: Regarding the use HCPCS codes G0511 and G0512, commenters noted they would be supportive of this

change if they were finalized for practitioners billing under the PFS for RHCs and FQHCs.

Response: Since HCPCS codes G0511 and G0512 are not being finalized for use under the PFS, we are not finalizing this change for RHCs and FQHCs. Therefore, payment for HCPCS G0511 will continue to set based on the average of the national, non-facility payment rates for CPT codes 99490, 99487, 99491, and 99484.

L. Coinsurance for Colorectal Cancer Screening Tests

Section 1861(pp) of the Act defines "colorectal cancer screening tests" and, under sections 1861(pp)(1)(B) and (C) of the Act, "screening flexible sigmoidoscopy" and "screening colonoscopy" are two of the recognized procedures. Among other things, section 1861(pp)(1)(D) of the Act authorizes the Secretary to include other tests or procedures in the definition, and modifications to the tests and procedures described under this subsection, "with such frequency and payment limits, as the Secretary determines appropriate, in consultation with appropriate organizations." Section 1861(s)(2)(R) of the Act includes these colorectal cancer screening tests in the definition of the medical and other health services that fall within the scope of Medicare Part B benefits described in section 1832(a)(1) of the Act. Section 1861(ddd)(3) of the Act includes these colorectal cancer screening services within the definition of "preventive services." In addition, section 1833(a)(1)(Y) of the Act provides for payment for preventive services recommended by the United States Preventive Services Task Force (USPSTF) with a grade of A or B under the PFS at 100 percent of the lesser of the actual charge or the fee schedule amount for these colorectal cancer screening tests, and under the OPPS at 100 percent of the OPPS payment amount. As such, there is no beneficiary responsibility for coinsurance for recommended colorectal cancer screening tests as defined in section 1861(pp)(1) of the Act.

Under these statutory provisions, we have issued regulations governing payment for colorectal cancer screening tests at 42 CFR 410.152(l)(5). We pay 100 percent of the Medicare payment amount established under the applicable payment methodology for the setting for providers and suppliers, and beneficiaries are not required to pay Part B coinsurance.

In addition to screening tests, which typically are furnished to patients in the absence of signs or symptoms of illness

or injury, Medicare also covers various diagnostic tests (§ 410.32). In general, diagnostic tests must be ordered by the physician or practitioner who is treating the beneficiary, and who uses the results of the diagnostic test in the management of the patient's specific medical problem. Under Part B, Medicare may cover flexible sigmoidoscopies and colonoscopies as diagnostic tests when those tests are reasonable and necessary as specified in section 1862(a)(1)(A) of the Act. When these services are furnished as diagnostic tests rather than as screening tests, patients are responsible for the Part B coinsurance (normally 20 percent) associated with these services.

We define "colorectal cancer screening tests" in our regulation at § 410.37(a)(1) to include "flexible screening sigmoidoscopies" and "screening colonoscopies, including anesthesia furnished in conjunction with the service." Under our current policies, we exclude from the definition of colorectal screening services colonoscopies and sigmoidoscopies that begin as a screening service, but where a polyp or other growth is found and removed as part of the procedure. The exclusion of these services from the definition of colorectal cancer screening services is based upon separate provisions of the statute dealing with the detection of lesions or growths during procedures (62 FR 59048, 59082, October 31, 1997). Section 1834(d)(2)(D) of the Act provides that if, during the course of a screening flexible sigmoidoscopy, a lesion or growth is detected which results in a biopsy or removal of the lesion or growth, payment under Medicare Part B shall not be made for the screening flexible sigmoidoscopy but shall be made for the procedure classified as a flexible sigmoidoscopy with such biopsy or removal. Similarly, section 1834(d)(3)(D) of the Act that provides if, during the course of a screening colonoscopy, a lesion or growth is detected which results in a biopsy or removal of the lesion or growth, payment under Medicare Part B shall not be made for the screening colonoscopy but shall be made for the procedure classified as a colonoscopy with such biopsy or removal.

Because we interpret sections 1834(d)(2)(C)(ii) and 1834(d)(3)(C)(ii) of the Act to require us to pay for these tests as diagnostic tests, rather than as screening tests, the 100 percent payment rate for recommended preventive services under section 1833(a)(1)(Y) of the Act, as codified in our regulation at § 410.152(l)(5), would not apply to those diagnostic procedures. As such,

beneficiaries are responsible for the usual coinsurance that applies to the services (20 or 25 percent of the cost of the services depending on the setting).

Under section 1833(b) of the Act, before making payment under Medicare Part B for expenses incurred by a beneficiary for covered Part B services, beneficiaries must first meet the applicable deductible for the year. Section 4104 of the Affordable Care Act (that is, the Patient Protection and Affordable Care Act (Pub. L. 111–148, enacted March 23, 2010), and the Health Care and Education Reconciliation Act of 2010 (Pub. L. 111–152, enacted March 30, 2010), collectively referred to as the "Affordable Care Act") amended section 1833(b)(1) of the Act to make the deductible inapplicable to expenses incurred for certain preventive services that are recommended with a grade of A or B by the USPSTF, including colorectal cancer screening tests as defined in section 1861(pp) of the Act. Section 4104 of the Affordable Care Act also added a sentence at the end of section 1833(b)(1) of the Act specifying that the exception to the deductible shall apply with respect to a colorectal cancer screening test regardless of the code that is billed for the establishment of a diagnosis as a result of the test, or for the removal of tissue or other matter or other procedure that is furnished in connection with, as a result of, and in the same clinical encounter as the screening test. Although the Affordable Care Act addressed the applicability of the deductible in the case of a colorectal cancer screening test that involves biopsy or tissue removal, it did not alter the coinsurance provision in section 1833(a) of the Act for such procedures. Although public commenters encouraged the agency to also eliminate the coinsurance in these circumstances, the agency found that the statute did not provide for elimination of the coinsurance (75 FR 73170, 73431, November 29, 2010).

Beneficiaries have continued to contact us noting their "surprise" that a coinsurance (20 or 25 percent depending on the setting) applies when they expected to receive a colorectal screening procedure to which coinsurance does not apply, but instead received what Medicare considers to be a diagnostic procedure because polyps were discovered and removed. Similarly, physicians have also expressed concerns about the reactions of beneficiaries when they are informed that they will be responsible for coinsurance if polyps are discovered and removed during what they expected to be a screening procedure to which coinsurance does not apply. Other

stakeholders and some members of Congress have regularly expressed to us that they consider the agency's policy on coinsurance for colorectal screening procedures during which tissue is removed to be a misinterpretation of the law.

Over the years, we have released a wide variety of publicly available educational materials that explain the Medicare preventive services benefits as part of our overall outreach activities to Medicare beneficiaries. These materials contain a complete description of the Medicare preventive services benefits, including information on colorectal cancer screening, and also provide relevant details on the applicability of cost sharing. These materials are available at <https://www.cms.gov/Outreach-and-Education/Medicare-Learning-Network-MLN/MLNProducts/MLN-Publications-Items/CMS1243319.html>. We believe that the information in these materials can be instrumental in continuing to educate physicians and beneficiaries about cost sharing obligations in order to mitigate instances of "surprise" billing. In the CY 2020 PFS proposed rule (84 FR 40556), we solicited comment on whether we should consider establishing a requirement that the physician who plans to furnish a colorectal cancer screening notify the patient in advance that a screening procedure could result in a diagnostic procedure if polyps are discovered and removed, and that coinsurance may apply. Specifically, we solicited comment on whether we should require the physician, or their staff, to provide a verbal notice with a notation in the medical record, or whether we should consider a different approach to informing patients of the copy implications, such as a written notice with standard language that we would require the physician, or their staff, to provide to patients prior to a colorectal cancer screening. We also solicited comment on what mechanism, if any, we should consider using to monitor compliance with a notification requirement if we decide to finalize one for CY 2020 or through future rulemaking.

We received over 1,600 public comments on the requirements for coinsurance for colorectal cancer screening tests.

Comment: Many comments were on coverage and statutory issues, such as coverage for colorectal cancer screening more frequently and not requiring coinsurance for diagnostic colonoscopy.

Response: These comments are out of scope.

Comment: Many commenters were on professionals providing information to individuals receiving a screening colonoscopies. Several commenters noted that Medicare could do a better job of educating beneficiaries about when screening colonoscopies become diagnostic colonoscopies, and therefore, coinsurance applies. In addition to not understanding that when removal of a polyp, lesion or growth is discovered a screening colonoscopy becomes a diagnostic one, some commenters misunderstood that a screening colonoscopy can only occur every 10 years for most individuals, or the appropriate frequency for a high risk individual. Many commenters were confused that a diagnostic colonoscopy occurs after a positive Cologuard® or fetal occult blood tests rather than a screening colonoscopy.

Response: As a result of our review of the public comments, we intend to undertake a comprehensive review of all of our outreach materials, such as the Medicare & You Handbook and Medicare Preventive Services, to see if Medicare policies on payment and coverage for screening colonoscopies can be made clearer. We believe this would be a service to Medicare beneficiaries.

M. Therapy Services

1. Repeal of the Therapy Caps and Limitation To Ensure Appropriate Therapy

a. Background

In the CY 2019 PFS proposed and final rules (83 FR 34850; 83 FR 59654 and 59661), we discussed the statutory requirements of section 50202 of the Bipartisan Budget Act of 2018 (BBA of 2018) (Pub. L. 115–123, February 9, 2018). Beginning January 1, 2018, section 50202 of the BBA of 2018 repealed the Medicare outpatient therapy caps and the therapy cap exceptions process, while retaining the cap amounts as limitations and requiring medical review to ensure that therapy services are furnished when appropriate. Section 50202 of the BBA of 2018 amended section 1833(g) of the Act by adding a new paragraph (7)(A) requiring that after expenses incurred for the beneficiary's outpatient therapy services for the year have exceeded one or both of the previous therapy cap amounts, all therapy suppliers and providers must continue to use an appropriate modifier on claims. We implemented this provision by continuing to require use of the existing KX modifier. By using the KX modifier on the claim, the therapy supplier or provider is attesting that the services are

medically necessary and that supportive justification is documented in the medical record. As with the incurred expenses for the prior therapy cap amounts, there is one amount for physical therapy (PT) and speech language pathology (SLP) services combined, and a separate amount for occupational therapy (OT) services. These KX modifier threshold amounts are indexed annually by the Medicare Economic Index (MEI). After the beneficiary's incurred expenditures for outpatient therapy services exceed the KX modifier threshold amount for the year, claims for outpatient therapy services without the KX modifier are denied.

Section 50202 of the BBA of 2018 also added a new paragraph 7(B) to section 1833(g) of the Act which retained the targeted medical review (MR) process for 2018 and subsequent years, but established a lower threshold amount of \$3,000 rather than the \$3,700 threshold amount that had applied for the original manual MR process established by section 3005(g) of the Middle Class Tax Relief and Jobs Creation Act of 2012 (MCTRJCA) (Pub. L. 112–96, February 22, 2012). The manual MR process with a threshold amount of \$3,700 was replaced by the targeted MR process with the same threshold amount through amendments made by section 202 of the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA) (Pub. L. 114–10, April 16, 2015).

With the latest amendments made by the BBA of 2018, for CY 2018 (and each successive calendar year until 2028, at which time it is indexed annually by the MEI), the MR threshold is \$3,000 for PT and SLP services and \$3,000 for OT services. For purposes of applying the targeted MR process, we use a criteria-based process for selecting providers and suppliers that includes factors such as a high percentage of patients receiving therapy beyond the medical review threshold as compared to peers. For information on the targeted medical review process, please visit <https://www.cms.gov/Research-Statistics-Data-and-Systems/Monitoring-Programs/Medicare-PFS-Compliance-Programs/Medical-Review/TherapyCap.html>.

In the CY 2019 PFS final rule (83 FR 59661), when discussing our tracking and accrual process for outpatient therapy services in the section on the KX Threshold Amounts, we noted that we track each beneficiary's incurred expenses for therapy services annually by applying the PFS-based payment amount for each service less any applicable multiple procedure reduction for CMS-designated "always therapy" services. We also stated that we use the

PFS rates to accrue expenses for therapy services provided in critical access hospitals (CAHs) as required by section 1833(g)(6)(B) of the Act, added by section 603(b) of the American Taxpayer Relief Act of 2012 (ATRA) (Pub. L. 112–240, January 2, 2013). As discussed below, we mistakenly indicated that this statutory requirement was extended by subsequent legislation, including section 50202 of the BBA of 2018.

b. Summary of Proposed Regulatory Revisions

While we explained and implemented the changes required by section 50202 of the BBA of 2018 in CY 2019 PFS rulemaking (83 FR 34850; 83 FR 59654 and 59661), we did not codify those changes in regulation text. In the CY 2020 PFS proposed rule, we proposed to revise the regulations at §§ 410.59 (outpatient occupational therapy) and 410.60 (physical therapy and speech-language pathology) to incorporate the changes made by section 50202 of the BBA of 2018. Specifically, we proposed to add a new paragraph (e)(1)(v) to §§ 410.59 and 410.60 to clarify that the specified amounts of annual per-beneficiary incurred expenses are no longer applied as limitations but as threshold amounts above which services require, as a condition of payment, inclusion of the KX modifier; and that use of the KX modifier confirms that the services are medically necessary as justified by appropriate documentation in the patient's medical record. We proposed to amend paragraph (e)(2) in §§ 410.59 and 410.60 to specify the therapy services and amounts that are accrued for purposes of applying the KX modifier threshold, including the continued accrual of therapy services furnished by CAHs directly or under arrangements at the PFS-based payment rates. We also proposed to amend paragraph (e)(3) in §§ 410.59 and 410.60 for the purpose of applying the medical review threshold to clarify the threshold amounts and the applicable years for both the manual MR process originally established through section 3005(g) of MCTRJCA and the targeted MR process established by the MACRA, and including the changes made through section 50202 of the BBA of 2018 as discussed previously.

In the CY 2019 PFS final rule (83 FR 59661), we incorrectly stated that section 1833(g)(6)(B) of the Act continues to require that we accrue expenses for therapy services furnished by CAHs at the PFS rate because the provision, originally added by section 603(b) of the ATRA, was extended by subsequent legislation, including section 50202 of the BBA of 2018. The

requirement in section 1833(g)(6)(B) of the Act was actually time-limited to services furnished in CY 2013. To apply the therapy caps (and now the KX modifier thresholds) after the expiration of the requirement in 1833(g)(6)(B) of the Act, we needed a process to accrue the annual expenses for therapy services furnished by CAHs and, in the CY 2014 PFS final rule with comment period, we elected to continue the process prescribed in section 1833(g)(6)(B) of the Act (78 FR 74405 through 74410).

We received public comments on the proposed revisions to regulation text to codify the changes required by section 50202 of the BBA of 2018. The following is a summary of the comments we received and our responses.

Comment: Several commenters appreciated our proposal to clarify and codify the requirements as outlined in section 50202 of the BBA of 2018.

Response: We thank commenters for their support.

After considering the comments, we are finalizing as proposed the changes in regulation text to reflect the requirements of section 50202 of the BBA of 2018.

2. Payment for Outpatient PT and OT Services Furnished by Therapy Assistants

a. Background

Section 53107 of the BBA of 2018 added a new subsection 1834(v) to the Act to require in paragraph (1) that, for services furnished on or after January 1, 2022, payment for outpatient physical and occupational therapy services for which payment is made under sections 1848 or 1834(k) of the Act which are furnished in whole or in part by a therapy assistant must be paid at 85 percent of the amount that is otherwise applicable. Section 1834(v)(2) of the Act further required that we establish a modifier to identify these services by January 1, 2019, and that claims for outpatient therapy services furnished in whole or in part by a therapy assistant must include the modifier effective for dates of service beginning on January 1, 2020. Section 1834(v)(3) of the Act required that we implement the subsection through notice and comment rulemaking.

In the CY 2019 PFS proposed and final rules (83 FR 35850 through 35852 and 83 FR 59654 through 50660, respectively), we established two modifiers—one to identify services furnished in whole or in part by a physical therapist assistant (PTA) and the other to identify services furnished in whole or in part by an occupational therapy assistant (OTA). The modifiers are defined as follows:

- *CQ Modifier:* Outpatient physical therapy services furnished in whole or in part by a physical therapist assistant.

- *CO Modifier:* Outpatient occupational therapy services furnished in whole or in part by an occupational therapy assistant.

In the CY 2019 PFS final rule, we clarified that the CQ and CO modifiers are required to be used when applicable for services furnished on or after January 1, 2020, on the claim line of the service alongside the respective GP or GO therapy modifier to identify services furnished under a PT or OT plan of care. The GP and GO therapy modifiers, along with the GN modifier for speech-language pathology (SLP) services, have been used since 1998 to track and accrue the per-beneficiary incurred expenses amounts to different therapy caps, now KX modifier thresholds, one amount for PT and SLP services combined and a separate amount for OT services. We also clarified in the CY 2019 PFS final rule that the CQ and CO modifiers will trigger application of the reduced payment rate for outpatient therapy services furnished in whole or in part by a PTA or OTA, beginning for services furnished in CY 2022.

In response to public comments on the CY 2019 PFS proposed rule, we did not finalize our proposed definition of “furnished in whole or in part by a PTA or OTA” as a service for which any minute of a therapeutic service is furnished by a PTA or OTA. Instead, we finalized a *de minimis* standard under which a service is considered to be furnished in whole or in part by a PTA or OTA when more than 10 percent of the service is furnished by the PTA or OTA.

We also explained in the CY 2019 PFS proposed and final rules (83 FR 35850 through 35852 and 83 FR 59654 through 59660, respectively) that the CQ and CO modifiers would not apply to claims for outpatient therapy services that are furnished by, or incident to the services of, physicians or nonphysician practitioners (NPPs) including nurse practitioners, physician assistants, and clinical nurse specialists. This is because our regulations for outpatient physical and occupational therapy services require that an individual furnishing outpatient therapy services incident to the services of a physician or NPP must meet the qualifications and standards for a therapist. As such, only therapists and not therapy assistants can furnish outpatient therapy services incident to the services of a physician or NPP (83 FR 59655 through 59656); and, the new PTA and OTA modifiers cannot be used on the line of service of the professional claim when the

rendering NPI identified on the claim is a physician or an NPP. We also intend to revise our manual provisions at Pub. 100–02, Medicare Benefit Policy Manual (MBPM), Chapter 15, section 230, as appropriate, to reflect requirements for the new CQ and CO modifiers that will be used to identify services furnished in whole or in part by a PTA or OTA starting in CY 2020. We anticipate amending these manual provisions for CY 2020 to reflect the policies we adopt through the CY 2020 PFS notice and comment rulemaking process.

In PFS rulemaking for CY 2019, we identified certain situations when the therapy assistant modifiers do apply. The modifiers are applicable to:

- Therapeutic portions of outpatient therapy services furnished by PTAs/OTAs, as opposed to administrative or other non-therapeutic services that can be performed by others without the education and training of OTAs and PTAs.

- Services wholly furnished by PTAs or OTAs without physical or occupational therapists.

- Evaluative services that are furnished in part by PTAs/OTAs (keeping in mind that PTAs/OTAs are not recognized to wholly furnish PT and OT evaluation or re-evaluations).

We also identified some situations when the therapy assistant modifiers do not apply. They do not apply when:

- PTAs/OTAs furnish services that can be done by a technician or aide who does not have the training and education of a PTA/OTA.

- Therapists exclusively furnish services without the involvement of PTAs/OTAs.

Finally, we noted that we would be further addressing application of the modifiers for therapy assistant services and the 10 percent *de minimis* standard more specifically in PFS rulemaking for CY 2020, including how the modifiers are applied in different scenarios for different types of services.

b. Applying the CQ and CO Modifiers

We interpreted the references in section 1834(v)(1) and (2) of the Act to outpatient physical therapy “service” and outpatient occupational therapy “service” to mean a specific procedure code that describes a PT or OT service. This interpretation makes sense because section 1834(v)(2) of the Act requires the use of a modifier to identify on each request for payment, or bill submitted for an outpatient therapy service furnished in whole or in part by a PTA/OTA. For purposes of billing, each outpatient therapy service is identified by a procedure code.

To apply the *de minimis* standard under which a service is considered to be furnished in whole or in part by a PTA or OTA when more than 10 percent of the service is furnished by the PTA or OTA, we proposed to make the 10 percent calculation based on the respective therapeutic minutes of time spent by the therapist and the PTA/OTA, rounded to the nearest whole minute. The minutes of time spent by a PTA/OTA furnishing a therapeutic service can overlap partially or completely with the time spent by a physical or occupational therapist furnishing the service. We proposed that the total time for a service would be the total time spent by the therapist (whether independent of, or concurrent with, a PTA/OTA) plus any additional time spent by the PTA/OTA independently furnishing the therapeutic service. When deciding whether the therapy assistant modifiers apply, we proposed that if the PTA/OTA participates in the service concurrently with the therapist for only a portion of the total time that the therapist delivers a service, the CQ/CO modifiers apply when the minutes furnished by the therapy assistant are greater than 10 percent of the total minutes spent by the therapist furnishing the service. If the PTA/OTA

and the therapist each separately furnish portions of the same service, we proposed that the CQ/CO modifiers would apply when the minutes furnished by the therapy assistant are greater than 10 percent of the total minutes—the sum of the minutes spent by the therapist and therapy assistant—for that service. We proposed to apply the CQ/CO modifier policies to all services that would be billed with the respective GP or GO therapy modifier. We believed this was appropriate because it is the same way that CMS currently identifies physical therapy or occupational therapy services for purposes of accruing incurred expenses for the thresholds and targeted review process.

For purposes of deciding whether the 10 percent *de minimis* standard is exceeded, we offered two different ways to compute this. The first is to divide the PTA/OTA minutes by the total minutes for the service—which is (a) the therapist’s total time when PTA/OTA minutes are furnished concurrently with the therapist, or (b) the sum of the PTA/OTA and therapist minutes when the PTA/OTA’s services are furnished separately from the therapist; and then to multiply this number by 100 to calculate the percentage of the service that involves the PTA/OTA. We

proposed to round to the nearest whole number so that when this percentage is 11 percent or greater, the 10 percent *de minimis* standard is exceeded and the CQ/CO modifier is applied. The other method is simply to divide the total time for the service (as described above) by 10 to identify the 10 percent *de minimis* standard, and then to add one minute to identify the number of minutes of service by the PTA/OTA that would be needed to exceed the 10 percent standard. For example, where the total time of a service is 60 minutes, the 10 percent standard is six (6) minutes, and adding one minute yields seven (7) minutes. Once the PTA/OTA furnishes at least 7 minutes of the service, the CQ/CO modifier would be required to be added to the claim for that service. As noted above, we proposed to round the minutes and percentages of the service to the nearest whole integer. For example, when the total time for the service is 45 minutes, the 10 percent calculation would be 4.5 which would be rounded up to 5, and the PTA/OTA’s contribution would need to meet or exceed 6 minutes before the CQ/CO modifier is required to be reported on the claim. See Table 25 for minutes needed to meet or exceed using the “simple” method with typical times for the total time of a therapy service.

TABLE 25: Simple Method for Determining When CQ/CO Modifiers Apply

METHOD TWO: Simple Method to apply 10 Percent <i>De Minimis</i> Standard			
Total Time* Examples Using Typical Service Total Times	Determine the 10 percent standard by dividing service Total Time by 10	Round 10 Percent standard to Next Whole Integer	PTA/OTA Minutes Needed to Exceed -- Apply CQ/CO
10	1.0	1.0	2.0
15	1.5	2.0	3.0
20	2.0	2.0	3.0
30	3.0	3.0	4.0
45	4.5	5.0	6.0
60	6.0	6.0	7.0
75	7.5	8.0	9.0

Total Time equals total therapist minutes plus any PTA/OTA independent minutes. Concurrent minutes: When PTA/OTA’s minutes are furnished concurrently with the therapist, total time equals the total minutes of the therapist’s service. Separate minutes: When PTA/OTA’s minutes are furnished separately from the minutes furnished by the therapist, total time equals the sum of the minutes of the service furnished by the PT/OT plus the minutes of the service furnished separately by the PTA/OTA.

We also clarified that the 10 percent *de minimis* standard, and therefore, the CQ/CO modifiers are not applicable to services in which the PTA/OTA did not participate. To the extent that the PTA/OTA and the physical therapist/occupational therapist (PT/OT)

separately furnish different services that are described by procedure codes defined in 15-minute increments, billing examples and proposed policies are included below in Scenario Two.

We proposed to address more specifically the application of the 10

percent *de minimis* standard in various clinical scenarios to decide when the CQ/CO modifiers apply. We acknowledged that application of the 10 percent *de minimis* standard can work differently depending on the types of services and scenarios involving both

the PTA/OTA and the PT/OT. Therapy services are typically furnished in multiple units of the same or different services on a given treatment day, which can include untimed services (not billable in multiple units) and timed services that are defined by codes described in 15-minute intervals. The majority of the untimed services that therapists bill for fall into three categories: (1) Evaluative procedures, (2) group therapy, and (3) supervised modalities. We discuss each of these in greater detail below. Only one (1) unit can be reported in the claim field labeled “units” for each procedure code representing an untimed service. The preponderance of therapy services, though, are billed using codes that are described in 15-minute increments. These services are typically furnished to a patient on a single day in multiple units of the same and/or different services. Under our current policy, the total number of units of one or more timed services that can be added to a claim depends on the total time for all the 15-minute timed codes that were delivered to a patient on a single date of service. A summary of our proposals for applying the CQ/CO modifiers using the 10 percent *de minimis* standard, along with applicable billing scenarios, are outlined below by category. In each of these scenarios, we assumed that the PTA/OTA minutes are for therapeutic services.

- *Evaluations and re-evaluations: CPT codes 97161 through 97163 for physical therapy evaluations for low, moderate, and high complexity level, and CPT code 97164 for physical therapy re-evaluation; and CPT codes 97165 through 97167 for occupational therapy evaluations for low, moderate, and high complexity level, and CPT 97168 for occupational therapy re-evaluation.* These PT and OT evaluative procedures are untimed codes and cannot be billed in multiple units—one unit is billed on the claim. As discussed in CY 2019 PFS rulemaking (83 FR 35852 and 83 FR 59656) and noted above, PTAs/OTAs are not recognized to furnish evaluative or assessment services, but to the extent that they furnish a portion of an evaluation or re-evaluation (such as completing clinical labor tasks for each code) that exceeds the 10 percent *de minimis* standard, the appropriate therapy assistant modifier (CQ or CO) must be used on the claim. We note that it is possible for the PTA/OTA to furnish these minutes either concurrently or separately from the therapist. For example, when the PTA/OTA assists the PT/OT concurrently for a 5-minute portion of the 30 minutes

that a PT or OT spent furnishing an evaluation (for example, CPT code 97162 for moderate complexity PT evaluation or CPT code 97165 for a low complexity OT evaluation—each have a typical therapist face-to-face time of 30 minutes), the respective CQ or CO modifier is applied to the service because the 5 minutes surpasses the 10 percent *de minimis* standard. In other words, 10 percent of 30 minutes is 3 minutes, and the CQ or CO modifier applies if the PTA/OTA furnishes more than 3 minutes, meaning at least 4 minutes, of the service. If the PTA/OTA separately furnishes a portion of the service that takes 5 minutes (for example, performing clinical labor tasks such as obtaining vital signs, providing self-assessment tool to the patient and verifying its completion), and then the PT/OT separately (without the PTA/OTA) furnishes a 30 minute face-to-face evaluative procedure—bringing the total time of the service to 35 minutes (the sum of the separate PTA/OTA minutes, that is, 5 minutes, plus the 30-minute therapist service), the CQ or CO modifier would be applied to the service because the 5 minutes of OTA/PTA time exceeds 10 percent of the 35 total minutes for the service. In other words, 10 percent of 35 minutes is 3.5 minutes which is rounded up to 4 minutes. The CQ or CO modifier would apply when the PTA/OTA furnishes 5 or more minutes of the service, as discussed above and referenced in Table 25.

- *Group Therapy: CPT code 97150 (requires constant attendance of therapist or assistant, or both).* CPT code 97150 describes a service furnished to a group of 2 or more patients. Like evaluative services, this code is an untimed service and cannot be billed in multiple units on the claim, so one unit of the service is billed for each patient in the group. For the group service, the CQ/CO modifier would apply when the PTA/OTA wholly furnishes the service without the therapist. The CQ/CO modifier would also apply when the total minutes of the service furnished by the PTA/OTA (whether concurrently with, or separately from, the therapist), exceed 10 percent of the total time, in minutes, of the group therapy service (that is, the total minutes of service spent by the therapist (with or without the PTA/OTA) plus any minutes spent by the PTA/OTA separately from the therapist). For example, the modifiers would apply when the PTA/OTA participates concurrently with the therapist for 5 minutes of a total group therapy service time of 40-minutes (based on the time of the therapist); or

when the PTA/OTA separately furnishes 5 minutes of a total group time of 40 minutes (based on the sum of minutes of the PTA/OTA (5) and therapist (35)).

- *Supervised Modalities: CPT codes 97010 through 97028, and HCPCS codes G0281, G0183, and G0329.* Modalities, in general, are physical agents that are applied to body tissue in order to produce a therapeutic change through various forms of energy, including but not limited to thermal, acoustic, light, mechanical or electric. Supervised modalities, for example vasopneumatic devices, paraffin bath, and electrical stimulation (unattended), do not require the constant attendance of the therapist or supervised therapy assistant, unlike the modalities defined in 15-minute increments that are discussed in the below category. When a supervised modality, such as whirlpool (CPT code 97022), is provided without the direct contact of a PT/OT and/or PTA/OTA, that is, it is furnished entirely by a technician or aide, the service is not covered and cannot be billed to Medicare. Supervised modality services are untimed, so only one unit of the service can be billed regardless of the number of body areas that are treated. For example, when paraffin bath treatment is provided to both of the patient’s hands, one unit of CPT code 97018 can be billed, not two. For supervised modalities, the CQ or CO modifier would apply to the service when the PTA/OTA fully furnishes all the minutes of the service, or when the minutes provided by the PTA or OTA exceed 10 percent of total minutes of the service. For example, the CQ/CO modifiers would apply when either (1) the PTA/OTA concurrently furnishes 2 minutes of a total 8-minute service by the therapist furnishing paraffin bath treatment (HCPCS code 97018) because 2 minutes is greater than 10 percent of 8 minutes ((0.8 minute, or 1 minute after rounding); or (2) the PTA/OTA furnishes 3 minutes of the service separately from the therapist who furnishes 5 minutes of treatment for a total time of 8 minutes (total time equals the sum of the PT/OT minutes plus the separate PTA/OTA minutes) because 3 minutes is greater than 10 percent of 8 total minutes (0.8 minute rounded to 1 minute).

- *Services defined by 15-minute increments/units: These timed codes are included in the following current CPT code ranges: CPT codes 97032 through 97542—including the subset of codes for modalities in the series CPT codes 97032 through 97036; and, codes for procedures in the series CPT codes 97110–97542; CPT codes 97750–97755*

for tests and measurements; and CPT codes: 97760–97763 for orthotic management and training and prosthetic training. Based on CPT instructions for these codes, the therapist (or their supervised therapy assistant, as appropriate) is required to furnish the service directly in a one-on-one encounter with the patient, meaning they are treating only one patient during that time. Examples of modalities requiring one-on-one patient contact include electrical stimulation (attended), CPT code 97032, and ultrasound, CPT code 97035. Examples of procedures include therapeutic exercise, CPT code 97110, neuromuscular reeducation, CPT 97112, and gait training, CPT code 97116.

Our policy for reporting of service units with HCPCS codes for both untimed services and timed services (that is, only those therapy services defined in 15-minute increments) is explained in section 20.2 of Chapter 5 of the Medicare Claims Processing Manual (MCPM). To bill for services described by the timed codes (hereafter, those codes described per each 15-minutes) furnished to a patient on a date of service, the therapist or therapy assistant needs to first identify all timed services furnished to a patient on that day, and then total all the minutes of all those timed codes. Next, the therapist or therapy assistant needs to identify the total number of units of timed codes that can be reported on the claim for the physical or occupational therapy services for a patient in one treatment day. Once the number of billable units is identified, the therapist or therapy assistant assigns the appropriate number of unit(s) to each timed service code according to the total time spent furnishing each service. For example, to bill for one 15-minute unit of a timed code, the qualified professional (the therapist or therapy assistant) must furnish at least 8 minutes and up to 22 minutes of the service; to bill for 2 units, at least 23 minutes and up to 37 minutes, and to bill for 3 units, at least 38 minutes and up to 52 minutes. We note that these minute ranges are applicable when one service, or multiple services, defined by timed codes are furnished by the qualified professional on a treatment day. We understand that the therapy industry often refers to these billing conventions as the “eight-minute rule.” The idea is that when a therapist or therapy provider bills for one or more units of services that are described by timed codes, the therapist’s direct, one-on-one patient contact time would average 15 minutes per unit. This idea is also the

basis for the work values we have established for these timed codes. Our current policies for billing of timed codes and related documentation do not take into consideration whether a service is furnished “in whole or in part” by a PTA/OTA, or otherwise address the application of the CQ/CO modifier when the 10 percent *de minimis* standard is exceeded, for those services in which both the PTA/OTA and the PT/OT work together to furnish a service or services.

To support the number of 15-minute timed units billed on a claim for each treatment day, we require that the total timed-code treatment time be documented in the medical record, and that the treatment note must document each timed service, whether or not it is billed, because the unbilled timed service(s) can impact billing. The minutes that each service is furnished can be, but are not required to be, documented. We also require that each untimed service be documented in the treatment note in order to support these services billed on the claim; and, that the total treatment time for each treatment day be documented—including minutes spent providing services represented by the timed codes (the total timed-code treatment time) and the untimed codes. To minimize burden, we are not proposing changes to these documentation requirements in this proposed rule.

Beginning January 1, 2020, in order to provide support for application of the CQ/CO modifier(s) to the claim as required by section 1834(v)(2)(B) of the Act and our regulations at §§ 410.59(a)(4) and 410.60(a)(4), we proposed to add a requirement that the treatment notes explain, via a short phrase or statement, the application or non-application of the CQ/CO modifier for each service furnished that day. We would include this documentation requirement in subsection in Chapter 15, MBPM, section 220.3.E on treatment notes. Because the CQ/CO modifiers also apply to untimed services, our proposed revision to the documentation requirement for the daily treatment note would extend to those codes and services as well. For example, when PTAs/OTAs assist PTs/OTs to furnish services, the treatment note could state one of the following, as applicable: (a) “Code 97110: CQ/CO modifier applied – PTA/OTA wholly furnished” or, (b) “Code 97150: CQ/CO modifier applied – PTA/OTA minutes = 15%” or “Code 97530: CQ/CP modifier not applied – PTA/OTA minutes less than 10% standard.” For those therapy services furnished exclusively by therapists without the use of PTAs/OTA, the PT/

OT could note one of the following: “CQ/CO modifier NA”, or “CQ/CO modifier NA – PT/OT fully furnished all services.” Given that the minutes of service furnished by or with the PTA/OTA and the total time in minutes for each service (timed and untimed) are used to decide whether the CQ/CO modifier is applied to a service, we sought comment on whether it would be appropriate to require documentation of the minutes as part of the CQ/CO modifier explanation as a means to avoid possible additional burden associated with a contractor’s medical review process conducted for these services. We solicited comment from therapists and therapy providers about current burden associated with the medical review process based on our current policy that does not require the times for individual services to be documented. Based on comments received, if we were to adopt a policy to include documentation of the PTA/OTA minutes and total time (TT) minutes, the CQ/CO modifier explanation could read similar to the following: “Code 97162 (TT = 30 minutes): CQ/CO modifier not applied – PTA/OTA minutes (3) did not exceed the 10 percent standard.”

To recap, under our policy, therapists or therapy assistants would apply the therapy assistant modifiers to the timed codes by first following the usual process to identify all procedure codes for the 15-minute timed services furnished to a beneficiary on the date of service, add up all the minutes of the timed codes furnished to the beneficiary on the date of service, decide how many total units of timed services are billable for the beneficiary on the date of service (based on time ranges in the chart in the manual), and assign billable units to each billable procedure code. The therapist or therapy assistant would then need to decide for each billed procedure code whether or not the therapy assistant modifiers apply.

As previously explained, the CQ/CO modifier does not apply if all units of a procedure code were furnished entirely by the therapist; and, where all units of the procedure code were furnished entirely by the PTA/OTA, the appropriate CQ/CO modifier would apply. When some portion of the billed procedure code is furnished by the PTA/OTA, the therapist or therapy assistant would need to look at the total minutes for all the billed units of the service, and compare it to the minutes of the service furnished by the PTA/OTA as described above in order to decide whether the 10 percent *de minimis* standard is exceeded. If the minutes of the service furnished by the

PTA/OTA are more than 10 percent of the total minutes of the service, the therapist or therapy assistant would assign the appropriate CQ or CO modifier. We would make clarifying technical changes to chapter 5, section 20.2 of the MCPM to reflect the policies adopted through in this rulemaking related to the application or non-application of the therapy assistant modifiers. We anticipated that we would add examples to illustrate when the applicable therapy assistant modifiers must be applied, similar to the examples provided below.

In the CY 2020 PFS proposed rule, we provided detailed examples of clinical scenarios to illustrate how the 10 percent *de minimis* standard would be applied under our proposals when therapists and their assistants work together concurrently or separately to treat the same patient on the same day (84 FR 40562 through 40564).

c. Regulatory Provisions

In accordance with section 1834(v)(2)(B) of the Act, we proposed to amend §§ 410.59(a)(4) and 410.60(a)(4) for outpatient physical and occupational therapy services, respectively, and § 410.105(d) for physical and occupational therapy services furnished by comprehensive outpatient rehabilitation facilities (CORFs) as authorized under section 1861(cc) of the Act, to establish as a condition of payment that claims for services furnished in whole or in part by an OTA or PTA must include a prescribed modifier; and that services will not be considered furnished in part by an OTA or PTA unless they exceed 10 percent of the total minutes for that service, beginning for services furnished on and after January 1, 2020. To implement section 1834(v)(1) of the Act, we proposed to amend §§ 410.59(a)(4) and 410.60(a)(4) for outpatient physical and occupational therapy services, respectively, and at § 410.105(d) for physical and occupational therapy services furnished by CORFs to specify that claims from physical and occupational therapists in private practice paid under section 1848 of the Act and from providers paid under section 1834(k) of the Act for physical therapy and occupational therapy services that contain a therapy assistant modifier, are paid at 85 percent of the otherwise applicable payment amount for the service for dates of service on and after January 1, 2022. As specified in the CY 2019 PFS final rule, we also noted that the CQ or CO modifier is to be applied alongside the corresponding GP or GO therapy modifier that is required on each claim line of service

for physical therapy or occupational therapy services. Beginning for dates of service and after January 1, 2020, claims missing the corresponding GP or GO therapy modifier will be rejected/ returned to the therapist or therapy provider so they can be corrected and resubmitted for processing.

As discussed in the CY 2019 PFS proposed and final rules (*see* 83 FR 35850 and 83 FR 59654), we established that the reduced payment rate under section 1834(v)(1) of the Act for the outpatient therapy services furnished in whole or in part by therapy assistants is not applicable to outpatient therapy services furnished by CAHs, for which payment is made under section 1834(g) of the Act. We clarified that we do not interpret section 1834(v) of the Act to apply to outpatient physical therapy or occupational therapy services furnished by CAHs, or by other providers for which payment for outpatient therapy services is not made under section 1834(k) of the Act based on the PFS rates.

We received almost 9,000 public comments on the proposed payment provisions for outpatient PT and OT services furnished in whole or in part by therapy assistants. The following is a summary of the comments we received and our responses.

Comment: Many commenters objected to our proposal that the time for the therapeutic service furnished “in part” by the PTA/OTA that counts towards the 10 percent standard includes both the minutes spent concurrently with and separately from the therapist. These commenters also expressed concerns that this unfairly discounts services that are fully furnished by therapists in which the therapy assistant supports them while providing a service. Some of these commenters stated that section 53107 of the BBA of 2018 does not permit the application of the assistant modifier for a PT or OT service furnished by the respective physical or occupational therapist and that CMS exceeded its authority in proposing to do so.

Many commenters stated that when a therapy assistant and therapist furnish care to a patient at the same time, it is apparent the patient requires both professionals; and, that this clinical scenario either represents a highly skilled procedure or one where such services are required for safety reasons. Commenters stated their belief that applying the therapy assistant modifiers to discount payment for these services is not justified.

Many commenters stated they objected to the use of the term “concurrent” when applying the 10

percent standard for purposes of outpatient therapy services because it conflicts with the definition of “concurrent” as it applies to the SNF Part A patient. The SNF Minimum Data Set Resident Assessment Instrument (MDS–RAI) manual guidance defines “concurrent” to include the number of minutes of therapy when the therapist or assistant is treating two residents at the same time. Some commenters also disagreed with our use of the term “concurrent” because that term is not currently defined for outpatient therapy services in statute, regulation, or in our manuals to “reflect when two clinicians (therapist and therapist assistant) are providing care to a beneficiary at the same time.” These commenters recommended that CMS adopt the term “team” instead, based on a reference to a document on the CMS therapy services website titled “11 Part B Billing Scenarios,” because they stated it describes care being delivered to one patient at the same time by two professionals as “team-based therapy.”

Other commenters suggested that instead of “concurrent,” that we use the term “in tandem” to describe the cases where a therapist and a therapy/ therapist assistant are jointly furnishing services to a patient at the same time. One commenter recommended that CMS reconsider its definition of “concurrent” therapy and align it with the definition in Part A.

Some commenters supported our proposal including a few commenters that agreed there should be a payment differential for the services furnished by a therapy assistant; and, several stated they fully supported of all of the proposals. A few commenters shared their concerns that they have observed therapy assistants practicing outside their scope of practice and their level of training—such as managing a patient’s plans of care, some without any therapist supervision.

Many commenters urged CMS to restructure the proposal to recognize as services furnished in whole or in part by therapy assistants only those minutes that the therapy assistant spends independently with the patient when the therapist is absent.

Response: After a review of commenters’ concerns and our current policies, we are persuaded to reconsider our interpretation of what time counts as services furnished in whole or in part by therapy assistants, including for purposes of applying the 10 percent standard. We agree with commenters that we should not count the time when a therapist and a therapist assistant furnish services to the same patient at the same time. We believe this

interpretation is appropriate because we agree with commenters that when a therapist and therapist assistant furnish services together, the therapist is fully furnishing the service. Also, any time that the therapy assistant furnishes services alone or independent of the therapist is time that the therapist can be credited for furnishing services to a different patient. We also note the commenters' incorrect use of the term "clinicians" to refer to the both the therapist and the therapy assistant. We clarify that the term clinician refers only the physical or occupational therapist and that a therapy assistant is considered a qualified professional when furnishing services under the supervision of a therapist. For purposes of Medicare, therapy assistants are limited in the services they may furnish and may not supervise other therapy caregivers (see MBPM, Chapter 15, section 230.1 and 230.2).

We agree with commenters that using the term "concurrent" could be confusing because it is used for the SNF Part A patient to represent the number of minutes that a therapist or therapy assistant is treating two patients at the same time. Given that we are not finalizing the proposal to count the minutes of service furnished by the assistant together with the therapist, we no longer have a need to use the "concurrent" term. Regarding the suggestion that we use the term "team" instead of concurrent, we also do not define in our manuals the term "team" because we believe it is ambiguous. We have only used the term "team" in the "Team" billing scenario in one of the "11 Billing Scenarios" where it is used in an example in which the physical therapist and occupational therapist furnish all the minutes of a 30-minute service together—only the physical therapist or occupational therapist can bill for each 15 minute unit, but not both.

We find the commenters' concerns persuasive and are revising our proposed policy so that the time spent by a PTA/OTA furnishing a therapeutic service "concurrently," or at the same time, with the therapist will not count for purposes of assessing whether the 10 percent standard has been met. Instead, we are finalizing a policy that only the minutes that the PTA/OTA spends independent of the therapist will count towards the 10 percent *de minimis* standard. We are revising our regulation text at §§ 410.59 (outpatient occupational therapy), 410.60 (physical therapy), and 410.105 (for PT and OT CORF services) accordingly. In the CY 2020 PFS proposed rule, we provided detailed examples of clinical scenarios

to illustrate how the 10 percent *de minimis* standard would be applied under our proposals when therapists and their assistants work together concurrently or separately to treat the same patient on the same day (84 FR 40562 through 40564). We intend to provide further detail regarding examples of clinical scenarios to illustrate our final policies regarding the applicability of the therapy assistant modifiers through information that we will post on the *cms.gov* website.

Comment: Commenters opposed our proposal to apply the 10 percent time standard, for billing purposes, to all the billed units of a service defined by a single procedure code, and urged CMS to not finalize the proposal. These commenters requested that instead CMS finalize a policy that assesses the 10 percent standard for each 15-minute unit of each procedure code. Commenters noted that the proposal was contrary to the response to comments in the CY 2019 PFS final rule (83 FR 59659) in which we provided an example of how our systems would allow them to bill for 15-minute units of a timed service on 2 separate claim lines—one with an assistant modifier and the other without. Some commenters stated that the proposal would not allow proper payment when a therapist fully furnishes 30 minutes of a timed service, then hands off to a therapy assistant who fully performs another 15 minutes of the same service. Many commenters stated that the proposed policy does not reflect congressional intent because it would discount the therapists' services, rather than therapy assistants' services.

Response: We acknowledge that we provided a hypothetical billing example in the CY 2019 PFS final rule suggesting that our policy would allow the number of 15-minute units of a code furnished by the PT/OT and the PTA/OTA to be listed separately on two different claim lines, and that the example differed from the proposal we developed for the CY 2020 PFS proposed rule. As the commenters noted, we proposed, for billing purposes, that each outpatient therapy service that is subject to the 10 percent *de minimis* standard would be identified on the claim by a single procedure code, for both untimed codes and codes described in 15-minute-unit increments. After consideration of the public comments on our proposal and further reflection on our manual requirements to document timed codes, we find the commenters' concerns persuasive and, for purposes of billing, we are finalizing a revised definition of a service to which the *de minimis* standard is applied to include untimed

codes and each 15-minute unit of codes described in 15-minute increments as a service. Accordingly, we are revising our final policy in response to comments to allow the separate reporting, on two different claim lines, of the number of 15-minute units of a code to which the therapy assistant modifiers do not apply, and the number of 15-minute units of a code to which the therapy assistant modifiers do apply. In the CY 2020 PFS proposed rule, we provided detailed examples of clinical scenarios to illustrate how the 10 percent *de minimis* standard would be applied under our proposals (84 FR 40562 through 40564). The revised policy we are finalizing here will apply generally in the same way as illustrated in those examples, except for the difference in the minutes of time that are counted toward the 10 percent standard (not counting the minutes furnished together by a therapist and therapy assistant), the application of the 10 percent standard to each billed unit of a timed code rather than to all billed units of a timed code, and the billing on two separate claim lines of the units of a timed code to which the therapy assistant modifiers do and do not apply. We intend to provide further detail regarding examples of clinical scenarios to illustrate our final policies regarding the applicability of the therapy assistant modifiers through information that we will post on the *cms.gov* website.

Comment: Nearly all commenters opposed our proposal to require that the treatment notes explain, in a short phrase or statement, the application or non-application of the therapy assistant modifier for each therapy service furnished. Many of these commenters stated that the statute does not require documentation to explain why a modifier was or was not applied for each code. Most commenters stated that the proposed documentation requirements associated with the *de minimis* standard for the therapy assistant modifiers are exceedingly burdensome and conflict with the Administration's "Patients over Paperwork Initiative." The commenters stated that it is unreasonable to impose a new documentation requirement on therapists and therapy providers that is duplicative of current requirements. Many commenters stated that the Medicare Benefit Policy Manual (MBPM) already includes extensive documentation requirements, and that the Medicare Claims Processing Manual (MCPM) includes extensive detail on how to count minutes for therapy services.

Many commenters stated that if a therapist or therapy provider has a

mechanism to provide evidence as to whether a specific service was furnished independently by a therapist or an assistant, or was furnished “in part” by an assistant, in sufficient detail to permit a medical record reviewer to determine whether the *de minimis* threshold was met, they should not also be required to separately document this information in a narrative note. A few of the commenters opposing the addition of narrative phrases for each service stated that we should revise our current subregulatory guidance to include a statement such as the following: “The provider should have a mechanism in place to provide evidence whether a specific service was furnished independently by a therapist or an assistant, or was furnished “in part” by an assistant in sufficient detail to permit the determination of whether the “*de minimis*” threshold was met.” Another commenter stated that it is expected and appropriate for the documentation in the medical record to specify whether a certain service was furnished independently by a therapist or an assistant or was furnished “in part” by an assistant in enough detail to permit a medical record reviewer to determine whether the *de minimis* threshold was met.

Many commenters stated that they believe our proposed documentation requirement to explain in the medical record the use or non-use of the modifiers would serve as another tool for medical reviewers to use against therapy providers to justify a technical denial even though the medical record may otherwise contain sufficient documentation to justify the use or non-use of the CQ/CO modifier.

Many commenters submitted comments that were specific to our request for comment on documentation of the minutes for services furnished by the PTA/OTA as a means to avoid possible additional burden associated with a contractor’s medical review process conducted for these services. Nearly all of the commenters stated they opposed adding a requirement to include a narrative phrase in the treatment note and requiring documentation of the minutes as duplicative of existing documentation requirements. One commenter, also not in favor of requiring the addition of narrative phrases to the medical record because they do not believe such phrases provide value to patient care or providers, stated that the therapy provider should document the number of minutes provided solely by the assistant and that this should be adequate to support the use and nonuse of the CO/CQ modifiers—citing an

example that included “CPT 97110—Assistant provided 8 minutes, Therapist provided 24 minutes” and “CPT 97530—Assistant provided 22 minutes, Therapist provided 0 minutes.”

Several commenters supported the proposed documentation requirements. One commenter stated they have already begun taking steps to support billing compliance via their electronic health record that creates a selection to attach the appropriate PTA/OTA modifier and includes the creation of a “smart phrase” which the therapist can document to support compliance of billing and review.

Response: We appreciate the comments regarding our documentation proposal. After consideration of the comments and a review of our manual provisions, we find many of the commenters’ suggestions persuasive. We agree that the addition of narrative phrases for each service may be duplicative of existing documentation requirements in the MBPM, chapter 15, section 220 and in Chapter 5, MCPM. Although a few commenters supported the addition of narratives, we also took note of the many commenters who told us that therapists and therapy providers should not be required to include a narrative for each service explaining the application or non-application of the therapy assistant modifiers when the medical record contains evidence as to whether a specific service was furnished independently by a therapist or an assistant, or was furnished “in part” by an assistant, in sufficient detail to permit a medical record reviewer to determine whether the *de minimis* threshold was met.

As a result, we are not finalizing the proposed documentation requirement to explain in the treatment note, in a short phrase or statement, the application or non-application of the therapy assistant modifier for each therapy service furnished; nor are we finalizing a requirement that the therapist and therapy assistant minutes be included in the documentation. Instead, we remind therapists and therapy providers that correct billing requires sufficient documentation in the medical record to support the codes and units reported on the claim, including those reported with and without an assistant modifier.

Further, we clarify that we would expect the documentation in the medical record to be sufficient to know whether a specific service was furnished independently by a therapist or a therapist assistant, or was furnished “in part” by a therapist assistant, in sufficient detail to permit the determination of whether the 10 percent standard was exceeded.

Comment: Many commenters expressed concern that the application of the therapy assistant modifiers is likely to result in drastic underpayments for outpatient therapy services beginning in 2022, which they believe would severely restrict beneficiary access to vital therapy services, particularly in rural and underserved areas. Other commenters specifically requested that CMS exempt rural areas from the therapy assistant modifier policy.

Response: While we appreciate the concerns raised about the potential effects of the therapy assistant modifier policy, we do not believe that section 1834(v) of the Act permits us to exempt the application of the PTA/OTA modifier policies in rural and underserved areas. We intend to monitor the implementation of the therapy assistant modifiers, including any changes to access to outpatient therapy services.

Comment: One commenter stated their concerns about the correct ordering of modifiers on claims for therapy services to assure correct payment, but without adding to therapists’ or therapy providers’ administrative burden. They based their concerns on a CMS longstanding FAQ, which states that modifiers that impact payment should be in the first position, and are seeking clarification as to whether the CQ or CO modifier would need to be in the first position on claims for PT services (modifier GP) and OT services (modifier GO) where one of those new modifiers applies. The commenters stated that if the CQ or CO modifier is required to be in the first position, that would need to be done manually because therapists and therapy providers are not able to program their chargemasters to accommodate every possible modifier combination to meet Medicare and non-Medicare reporting requirements.

Response: We appreciate the commenter’s comments. We note that we do not have central standard systems edits in place to reject or return claims for PT or OT services if the CQ or CO modifier is not in the first modifier position. However, some CMS contractors processing professional claims may have systems logic in place that would do so. We recently issued instructions to our contractors to reorder modifiers for PT and OT services so that claims with the therapy assistant modifiers are not returned. This reordering will be effective for claims containing CQ and CO modifiers with dates of service on and after January 1, 2020.

3. Therapy KX Modifier Threshold Amounts

The KX modifier thresholds, as discussed above in this section, were established through section 50202 of the Bipartisan Budget Act (BBA) of 2018. Formerly referred to as therapy caps, these KX modifier thresholds are a permanent provision of the law, meaning that the statute does not specify an end date. These per-beneficiary amounts under section 1833(g) of the Act (as amended by section 4541 of the Balanced Budget Act of 1997) (Pub. L. 105–33, August 5, 1997) are updated each year based on the MEI. Specifically, these amounts are calculated by updating the previous year's amount by the MEI for the upcoming calendar year and rounding to the nearest \$10.00. Increasing the CY 2019 KX modifier threshold amount of \$2,040 by the CY 2020 MEI of 1.9 percent and rounding to the nearest \$10.00 results in a CY 2020 KX threshold amount of \$2,080 for PT and SLP services combined and \$2,080 for OT services.

Section 50202 of the Bipartisan Budget Act of 2018 also added section 1833(g)(7)(B) of the Act which retains the targeted medical review process, but at a lower threshold amount of \$3,000 (until CY 2028) as detailed above in this section. Accordingly, for CY 2020, the MR threshold is \$3,000 for PT and SLP services combined and \$3,000 for OT services. Some, but not all claims exceeding the MR threshold amount are subject to review, under the established targeted review process. For information on the targeted manual medical review process, go to <https://www.cms.gov/ResearchStatistics-Data-and-Systems/MonitoringPrograms/Medicare-FFS-CompliancePrograms/Medical-Review/TherapyCap.html>.

We track each beneficiary's incurred expenses for therapy services annually and counts them toward the KX modifier and MR thresholds by applying the PFS rate for each service less any applicable multiple procedure payment reduction (MPPR) amount for services of CMS-designated "always therapy" services. As explained previously in this section, we apply the PFS-rate accrual process to outpatient therapy services furnished by critical access hospitals (CAHs) even though they may be paid on a cost basis (effective January 1, 2014).

When the expenses incurred for the beneficiary's outpatient therapy services for the year have exceeded one or both of the KX modifier thresholds, therapy suppliers and providers use the KX modifier on claims for subsequent

medically necessary services. By using the KX modifier, the therapist and therapy provider attest that the services above the KX modifier thresholds are reasonable and necessary and that documentation of the medical necessity for the services is in the beneficiary's medical record. Claims for outpatient therapy services that exceed the KX modifier thresholds but do not include the KX modifier are denied.

N. Valuation of Specific Codes

1. Background: Process for Valuing New, Revised, and Potentially Misvalued Codes

Establishing valuations for newly created and revised CPT codes is a routine part of maintaining the PFS. Since the inception of the PFS, it has also been a priority to revalue services regularly to make sure that the payment rates reflect the changing trends in the practice of medicine and current prices for inputs used in the PE calculations. Initially, this was accomplished primarily through the 5-year review process, which resulted in revised work RVUs for CY 1997, CY 2002, CY 2007, and CY 2012, and revised PE RVUs in CY 2001, CY 2006, and CY 2011, and revised MP RVUs in CY 2010 and CY 2015. Under the 5-year review process, revisions in RVUs were proposed and finalized via rulemaking. In addition to the 5-year reviews, beginning with CY 2009, CMS and the RUC identified a number of potentially misvalued codes each year using various identification screens, as discussed in section II.E. of this final rule, Potentially Misvalued Services under the PFS. Historically, when we received RUC recommendations, our process had been to establish interim final RVUs for the potentially misvalued codes, new codes, and any other codes for which there were coding changes in the final rule with comment period for a year. Then, during the 60-day period following the publication of the final rule with comment period, we accepted public comment about those valuations. For services furnished during the calendar year following the publication of interim final rates, we paid for services based upon the interim final values established in the final rule. In the final rule with comment period for the subsequent year, we considered and responded to public comments received on the interim final values, and typically made any appropriate adjustments and finalized those values.

In the CY 2015 PFS final rule with comment period (79 FR 67547), we finalized a new process for establishing values for new, revised and potentially

misvalued codes. Under the new process, we include proposed values for these services in the proposed rule, rather than establishing them as interim final in the final rule with comment period. Beginning with the CY 2017 PFS proposed rule (81 FR 46162), the new process was applicable to all codes, except for new codes that describe truly new services. For CY 2017, we proposed new values in the CY 2017 PFS proposed rule for the vast majority of new, revised, and potentially misvalued codes for which we received complete RUC recommendations by February 10, 2016. To complete the transition to this new process, for codes for which we established interim final values in the CY 2016 PFS final rule with comment period (81 FR 80170), we reviewed the comments received during the 60-day public comment period following release of the CY 2016 PFS final rule with comment period (80 FR 70886), and re-proposed values for those codes in the CY 2017 PFS proposed rule.

We considered public comments received during the 60-day public comment period for the proposed rule before establishing final values in the CY 2017 PFS final rule. As part of our established process, we will adopt interim final values only in the case of wholly new services for which there are no predecessor codes or values and for which we do not receive recommendations in time to propose values.

As part of our obligation to establish RVUs for the PFS, we thoroughly review and consider available information including recommendations and supporting information from the RUC, the Health Care Professionals Advisory Committee (HCPAC), public commenters, medical literature, Medicare claims data, comparative databases, comparison with other codes within the PFS, as well as consultation with other physicians and healthcare professionals within CMS and the federal government as part of our process for establishing valuations. Where we concur that the RUC's recommendations, or recommendations from other commenters, are reasonable and appropriate and are consistent with the time and intensity paradigm of physician work, we proposed those values as recommended. Additionally, we continually engage with stakeholders, including the RUC, with regard to our approach for accurately valuing codes, and as we prioritize our obligation to value new, revised, and potentially misvalued codes. We continue to welcome feedback from all interested parties regarding valuation of

services for consideration through our rulemaking process.

2. Methodology for Establishing Work RVUs

For each code identified in this section, we conduct a review that included the current work RVU (if any), RUC-recommended work RVU, intensity, time to furnish the preservice, intraservice, and postservice activities, as well as other components of the service that contribute to the value. Our reviews of recommended work RVUs and time inputs generally include, but have not been limited to, a review of information provided by the RUC, the HCPAC, and other public commenters, medical literature, and comparative databases, as well as a comparison with other codes within the PFS, consultation with other physicians and health care professionals within CMS and the federal government, as well as Medicare claims data. We also assess the methodology and data used to develop the recommendations submitted to us by the RUC and other public commenters and the rationale for the recommendations. In the CY 2011 PFS final rule with comment period (75 FR 73328 through 73329), we discussed a variety of methodologies and approaches used to develop work RVUs, including survey data, building blocks, crosswalks to key reference or similar codes, and magnitude estimation (see the CY 2011 PFS final rule with comment period (75 FR 73328 through 73329) for more information). When referring to a survey, unless otherwise noted, we mean the surveys conducted by specialty societies as part of the formal RUC process.

Components that we use in the building block approach may include preservice, intraservice, or postservice time and post-procedure visits. When referring to a bundled CPT code, the building block components could include the CPT codes that make up the bundled code and the inputs associated with those codes. We use the building block methodology to construct, or deconstruct, the work RVU for a CPT code based on component pieces of the code. Magnitude estimation refers to a methodology for valuing work that determines the appropriate work RVU for a service by gauging the total amount of work for that service relative to the work for a similar service across the PFS without explicitly valuing the components of that work. In addition to these methodologies, we frequently utilize an incremental methodology in which we value a code based upon its incremental difference between another code and another family of codes. The

statute specifically defines the work component as the resources in time and intensity required in furnishing the service. Also, the published literature on valuing work has recognized the key role of time in overall work. For particular codes, we refine the work RVUs in direct proportion to the changes in the best information regarding the time resources involved in furnishing particular services, either considering the total time or the intraservice time.

Several years ago, to aid in the development of preservice time recommendations for new and revised CPT codes, the RUC created standardized preservice time packages. The packages include preservice evaluation time, preservice positioning time, and preservice scrub, dress and wait time. Currently, there are preservice time packages for services typically furnished in the facility setting (for example, preservice time packages reflecting the different combinations of straightforward or difficult procedure, and straightforward or difficult patient). Currently, there are three preservice time packages for services typically furnished in the nonfacility setting.

We developed several standard building block methodologies to value services appropriately when they have common billing patterns. In cases where a service is typically furnished to a beneficiary on the same day as an evaluation and management (E/M) service, we believe that there is overlap between the two services in some of the activities furnished during the preservice evaluation and postservice time. Our longstanding adjustments have reflected a broad assumption that at least one-third of the work time in both the preservice evaluation and postservice period is duplicative of work furnished during the E/M visit.

Accordingly, in cases where we believe that the RUC has not adequately accounted for the overlapping activities in the recommended work RVU and/or times, we adjust the work RVU and/or times to account for the overlap. The work RVU for a service is the product of the time involved in furnishing the service multiplied by the intensity of the work. Preservice evaluation time and postservice time both have a long-established intensity of work per unit of time (IWPUT) of 0.0224, which means that 1 minute of preservice evaluation or postservice time equates to 0.0224 of a work RVU.

Therefore, in many cases when we remove 2 minutes of preservice time and 2 minutes of postservice time from a procedure to account for the overlap with the same day E/M service, we also

remove a work RVU of 0.09 (4 minutes \times 0.0224 IWPUT) if we do not believe the overlap in time had already been accounted for in the work RVU. The RUC has recognized this valuation policy and, in many cases, now addresses the overlap in time and work when a service is typically furnished on the same day as an E/M service.

The following paragraphs contain a general discussion of our approach to reviewing RUC recommendations and developing proposed values for specific codes. When they exist we also include a summary of stakeholder reactions to our approach. We note that many commenters and stakeholders have expressed concerns over the years with our ongoing adjustment of work RVUs based on changes in the best information we had regarding the time resources involved in furnishing individual services. We have been particularly concerned with the RUC's and various specialty societies' objections to our approach given the significance of their recommendations to our process for valuing services and since much of the information we used to make the adjustments is derived from their survey process. We are obligated under the statute to consider both time and intensity in establishing work RVUs for PFS services. As explained in the CY 2016 PFS final rule with comment period (80 FR 70933), we recognize that adjusting work RVUs for changes in time is not always a straightforward process, so we have applied various methodologies to identify several potential work values for individual codes.

We have observed that for many codes reviewed by the RUC, recommended work RVUs have appeared to be incongruous with recommended assumptions regarding the resource costs in time. This has been the case for a significant portion of codes for which we recently established or proposed work RVUs that are based on refinements to the RUC-recommended values. When we have adjusted work RVUs to account for significant changes in time, we have started by looking at the change in the time in the context of the RUC-recommended work RVU. When the recommended work RVUs do not appear to account for significant changes in time, we have employed the different approaches to identify potential values that reconcile the recommended work RVUs with the recommended time values. Many of these methodologies, such as survey data, building block, crosswalks to key reference or similar codes, and magnitude estimation have long been used in developing work RVUs under

the PFS. In addition to these, we sometimes use the relationship between the old time values and the new time values for particular services to identify alternative work RVUs based on changes in time components.

In so doing, rather than ignoring the RUC-recommended value, we have used the recommended values as a starting reference and then applied one of these several methodologies to account for the reductions in time that we believe were not otherwise reflected in the RUC-recommended value. If we believe that such changes in time are already accounted for in the RUC's recommendation, then we do not make such adjustments. Likewise, we do not arbitrarily apply time ratios to current work RVUs to calculate proposed work RVUs. We use the ratios to identify potential work RVUs and consider these work RVUs as potential options relative to the values developed through other options.

We do not imply that the decrease in time as reflected in survey values should always equate to a one-to-one or linear decrease in newly valued work RVUs. Instead, we believe that, since the two components of work are time and intensity, absent an obvious or explicitly stated rationale for why the relative intensity of a given procedure has increased, significant decreases in time should be reflected in decreases to work RVUs. If the RUC's recommendation has appeared to disregard or dismiss the changes in time, without a persuasive explanation of why such a change should not be accounted for in the overall work of the service, then we have generally used one of the aforementioned methodologies to identify potential work RVUs, including the methodologies intended to account for the changes in the resources involved in furnishing the procedure.

Several stakeholders, including the RUC, have expressed general objections to our use of these methodologies and deemed our actions in adjusting the recommended work RVUs as inappropriate; other stakeholders have also expressed general concerns with CMS refinements to RUC-recommended values in general. In the CY 2017 PFS final rule (81 FR 80272 through 80277), we responded in detail to several comments that we received regarding this issue. In the CY 2017 PFS proposed rule (81 FR 46162), we requested comments regarding potential alternatives to making adjustments that would recognize overall estimates of work in the context of changes in the resource of time for particular services; however, we did not receive any

specific potential alternatives. As described earlier in this section, crosswalks to key reference or similar codes are one of the many methodological approaches we have employed to identify potential values that reconcile the RUC-recommended work RVUs with the recommended time values when the RUC-recommended work RVUs did not appear to account for significant changes in time.

We received several comments regarding our methodologies for work valuation in response to the CY 2020 PFS proposed rule and those comments are summarized below.

Comment: Several commenters disagreed with our reference to older work time sources, and stated that their use led to the proposal of work RVUs based on flawed assumptions. Commenters stated that codes with "CMS/Other" or "Harvard" work time sources, used in the original valuation of certain older services, were not surveyed, and therefore, were not resource-based. Commenters also stated that it was invalid to draw comparisons between the current work time and work RVUs of these services to the newly surveyed work time and work RVUs as recommended by the RUC.

Response: We agree that it is important to use the recent data available regarding work times, and we note that when many years have passed between when time is measured, significant discrepancies can occur. However, we also believe that our operating assumption regarding the validity of the existing values as a point of comparison is critical to the integrity of the relative value system as currently constructed. The work times currently associated with codes play a very important element in PFS ratesetting, both as points of comparison in establishing work RVUs and in the allocation of indirect PE RVUs by specialty. If we were to operate under the assumption that previously recommended work times had routinely been overestimated, this would undermine the relativity of the work RVUs on the PFS in general, given the process under which codes are often valued by comparisons to codes with similar times. It also would undermine the validity of the allocation of indirect PE RVUs to physician specialties across the PFS. Instead, we believe that it is crucial that the code valuation process take place with the understanding that the existing work times, used in the PFS ratesetting processes, are accurate. We recognize that adjusting work RVUs for changes in time is not always a straightforward process and that the intensity associated with changes in

time is not necessarily always linear, which is why we apply various methodologies to identify several potential work values for individual codes. However, we reiterate that we believe it would be irresponsible to ignore changes in time based on the best data available and that we are statutorily obligated to consider both time and intensity in establishing work RVUs for PFS services. For additional information regarding the use of old work time values that were established many years ago and have not since been reviewed in our methodology, we refer readers to our discussion of the subject in the CY 2017 PFS final rule (81 FR 80273 through 80274).

Comment: Several commenters disagreed with the use of time ratio methodologies for work valuation. Commenters stated that this use of time ratios is not a valid methodology for valuation of physician services. Commenters stated that treating all components of physician time (preservice, intraservice, postservice and post-operative visits) as having identical intensity is incorrect, and inconsistently applying it to only certain services under review creates inherent payment disparities in a payment system which is based on relative valuation. Commenters stated that in many scenarios, CMS selects an arbitrary combination of inputs to apply rather than seeking a valid clinically relevant relationship that would preserve relativity. Commenters urged CMS to determine the work valuation for each code based not only on surveyed work times, but also the intensity and complexity of the service and relativity to other similar services, rather than basing the work value entirely on time.

Response: We disagree and continue to believe that the use of time ratios is one of several appropriate methods for identifying potential work RVUs for particular PFS services, particularly when the alternative values recommended by the RUC and other commenters do not account for information provided by surveys that suggests the amount of time involved in furnishing the service has changed significantly. We reiterate that, consistent with the statute, we are required to value the work RVU based on the relative resources involved in furnishing the service, which include time and intensity. When our review of recommended values reveals that changes in the resource of time have been unaccounted for in a recommended RVU, then we believe we have the obligation to account for that change in establishing work RVUs since

the statute explicitly identifies time as one of the two elements of the work RVUs.

We recognize that it would not be appropriate to develop work RVUs solely based on time given that intensity is also an element of work, but in applying the time ratios, we are using derived intensity measures based on current work RVUs for individual procedures. We clarify again that we do not treat all components of physician time as having identical intensity. If we were to disregard intensity altogether, the work RVUs for all services would be developed based solely on time values and that is definitively not the case, as indicated by the many services that share the same time values but have different work RVUs. For example, among the codes reviewed in this current CY 2020 PFS final rule, CPT codes 52442 (*Cystourethroscopy, with insertion of permanent adjustable transprostatic implant; each additional permanent adjustable transprostatic implant*) and 92627 (*Evaluation of auditory function for surgically implanted device(s) candidacy or post-operative status of a surgically implanted device(s); each additional 15 minutes*) share the identical work time of 15 minutes but have very different work RVUs of 1.01 and 0.33 respectively. In addition, CPT codes 11983 (*Removal with reinsertion, non-biodegradable drug delivery implant*), 64446 (*Injection(s), anesthetic agent(s) and/or steroid; sciatic nerve, continuous infusion by catheter (including catheter placement)*), and 78804 (*Rp L.T.I.D. w/ flow when performed, wholebody 2 or more days*) all share the same intraservice work time of 15 minutes and total work time of 40 minutes but each code has a different work RVU. These examples demonstrate that we do not value services purely based on work time; instead, we incorporate time as one of multiple different factors employed in our review process. Furthermore, we reiterate that we use time ratios to identify potentially appropriate work RVUs, and then use other methods (including estimates of work from CMS medical personnel and crosswalks to key reference or similar codes) to validate these RVUs. For more details on our methodology for developing work RVUs, we direct readers to the discussion CY 2017 PFS final rule (81 FR 80272 through 80277).

We also want to clarify for the commenters that our review process is not arbitrary in nature. Our reviews of recommended work RVUs and time inputs generally include, but have not been limited to, a review of information provided by the RUC, the HCPAC, and

other public commenters, medical literature, and comparative databases, as well as a comparison with other codes within the PFS, consultation with other physicians and health care professionals within CMS and the federal government, as well as Medicare claims data. We also assess the methodology and data used to develop the recommendations submitted to us by the RUC and other public commenters and the rationale for the recommendations. In the CY 2011 PFS final rule with comment period (75 FR 73328 through 73329), we discussed a variety of methodologies and approaches used to develop work RVUs, including survey data, building blocks, crosswalks to key reference or similar codes, and magnitude estimation (see the CY 2011 PFS final rule with comment period (75 FR 73328 through 73329) for more information). With regards to the invocation of clinically relevant relationships by the commenters, we emphasize that we continue to believe that the nature of the PFS relative value system is such that all services are appropriately subject to comparisons to one another. Although codes that describe clinically similar services are sometimes stronger comparator codes, we do not agree that codes must share the same site of service, patient population, or utilization level to serve as an appropriate crosswalk.

Comment: Several commenters discouraged the use of valuation based on work RVU increments. Commenters stated that this methodology inaccurately treats all components of the physician time as having identical intensity and would lead to incorrect work valuations. Commenters stated that CMS should carefully consider the clinical information justifying the changes in physician work intensity provided by the RUC and other stakeholders.

Response: We believe the use of an incremental difference between codes is a valid methodology for setting values, especially in valuing services within a family of revised codes where it is important to maintain appropriate intra-family relativity. Historically, we have frequently utilized an incremental methodology in which we value a code based upon its incremental difference between another code or another family of codes. We note that the RUC has also used the same incremental methodology on occasion when it was unable to produce valid survey data for a service. We have no evidence to suggest that the use of an incremental difference between codes conflicts with the statute's definition of the work

component as the resources in time and intensity required in furnishing the service. We do consider clinical information associated with physician work intensity provided by the RUC and other stakeholders as part of our review process, although we remind readers again that we do not agree that codes must share the same site of service, patient population, or utilization level to serve as an appropriate crosswalk.

In response to comments, in the CY 2019 PFS final rule (83 FR 59515), we clarified that terms "reference services", "key reference services", and "crosswalks" as described by the commenters are part of the RUC's process for code valuation. These are not terms that we created, and we do not agree that we necessarily must employ them in the identical fashion for the purposes of discussing our valuation of individual services that come up for review. However, in the interest of minimizing confusion and providing clear language to facilitate stakeholder feedback, we will seek to limit the use of the term, "crosswalk," to those cases where we are making a comparison to a CPT code with the identical work RVU. We also occasionally make use of a "bracket" for code valuation. A "bracket" refers to when a work RVU falls between the values of two CPT codes, one at a higher work RVU and one at a lower work RVU.

We look forward to continuing to engage with stakeholders and commenters, including the RUC, as we prioritize our obligation to value new, revised, and potentially misvalued codes; and will continue to welcome feedback from all interested parties regarding valuation of services for consideration through our rulemaking process. We refer readers to the detailed discussion in this section of the valuation considered for specific codes. Table 26 contains a list of codes and descriptors for which we are finalizing work RVUs; this includes all codes for which we received RUC recommendations by February 10, 2019. The work RVUs, work time and other payment information for all CY 2020 payable codes are available on the CMS website under downloads for the CY 2020 PFS final rule at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/index.html>.

3. Methodology for the Direct PE Inputs to Develop PE RVUs

a. Background

On an annual basis, the RUC provides us with recommendations regarding PE inputs for new, revised, and potentially

misvalued codes. We review the RUC-recommended direct PE inputs on a code by code basis. Like our review of recommended work RVUs, our review of recommended direct PE inputs generally includes, but is not limited to, a review of information provided by the RUC, HCPAC, and other public commenters, medical literature, and comparative databases, as well as a comparison with other codes within the PFS, and consultation with physicians and health care professionals within CMS and the federal government, as well as Medicare claims data. We also assess the methodology and data used to develop the recommendations submitted to us by the RUC and other public commenters and the rationale for the recommendations. When we determine that the RUC's recommendations appropriately estimate the direct PE inputs (clinical labor, disposable supplies, and medical equipment) required for the typical service, are consistent with the principles of relativity, and reflect our payment policies, we use those direct PE inputs to value a service. If not, we refine the recommended PE inputs to better reflect our estimate of the PE resources required for the service. We also confirm whether CPT codes should have facility and/or nonfacility direct PE inputs and refine the inputs accordingly.

Our review and refinement of the RUC-recommended direct PE inputs includes many refinements that are common across codes, as well as refinements that are specific to particular services. Table 27 details our refinements of the RUC's direct PE recommendations at the code-specific level. In section II.B. of this final rule, Determination of Practice Expense Relative Value Units (PE RVUs), we address certain refinements that would be common across codes. Refinements to particular codes are addressed in the portions of this section that are dedicated to particular codes. We note that for each refinement, we indicate the impact on direct costs for that service. We note that, on average, in any case where the impact on the direct cost for a particular refinement is \$0.35 or less, the refinement has no impact on the PE RVUs. This calculation considers both the impact on the direct portion of the PE RVU, as well as the impact on the indirect allocator for the average service. We also note that approximately half of the refinements listed in Table 27 result in changes under the \$0.35 threshold and are unlikely to result in a change to the RVUs.

We also note that the direct PE inputs for CY 2020 are displayed in the CY

2020 direct PE input files, available on the CMS website under the downloads for the CY 2020 PFS final rule at <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html>. The inputs displayed there have been used in developing the CY 2020 PE RVUs as displayed in Addendum B.

b. Common Refinements

(1) Changes in Work Time

Some direct PE inputs are directly affected by revisions in work time. Specifically, changes in the intraservice portions of the work time and changes in the number or level of postoperative visits associated with the global periods result in corresponding changes to direct PE inputs. The direct PE input recommendations generally correspond to the work time values associated with services. We believe that inadvertent discrepancies between work time values and direct PE inputs should be refined or adjusted in the establishment of proposed direct PE inputs to resolve the discrepancies.

(2) Equipment Time

Prior to CY 2010, the RUC did not generally provide CMS with recommendations regarding equipment time inputs. In CY 2010, in the interest of ensuring the greatest possible degree of accuracy in allocating equipment minutes, we requested that the RUC provide equipment times along with the other direct PE recommendations, and we provided the RUC with general guidelines regarding appropriate equipment time inputs. We appreciate the RUC's willingness to provide us with these additional inputs as part of its PE recommendations.

In general, the equipment time inputs correspond to the service period portion of the clinical labor times. We clarified this principle over several years of rulemaking, indicating that we consider equipment time as the time within the intraservice period when a clinician is using the piece of equipment plus any additional time that the piece of equipment is not available for use for another patient due to its use during the designated procedure. For those services for which we allocate cleaning time to portable equipment items, because the portable equipment does not need to be cleaned in the room where the service is furnished, we do not include that cleaning time for the remaining equipment items, as those items and the room are both available for use for other patients during that time. In addition, when a piece of equipment is typically

used during follow-up postoperative visits included in the global period for a service, the equipment time would also reflect that use.

We believe that certain highly technical pieces of equipment and equipment rooms are less likely to be used during all of the preservice or postservice tasks performed by clinical labor staff on the day of the procedure (the clinical labor service period) and are typically available for other patients even when one member of the clinical staff may be occupied with a preservice or postservice task related to the procedure. We also note that we believe these same assumptions would apply to inexpensive equipment items that are used in conjunction with and located in a room with non-portable highly technical equipment items since any items in the room in question would be available if the room is not being occupied by a particular patient. For additional information, we refer readers to our discussion of these issues in the CY 2012 PFS final rule with comment period (76 FR 73182) and the CY 2015 PFS final rule with comment period (79 FR 67639).

(3) Standard Tasks and Minutes for Clinical Labor Tasks

In general, the preservice, intraservice, and postservice clinical labor minutes associated with clinical labor inputs in the direct PE input database reflect the sum of particular tasks described in the information that accompanies the RUC-recommended direct PE inputs, commonly called the "PE worksheets." For most of these described tasks, there is a standardized number of minutes, depending on the type of procedure, its typical setting, its global period, and the other procedures with which it is typically reported. The RUC sometimes recommends a number of minutes either greater than or less than the time typically allotted for certain tasks. In those cases, we review the deviations from the standards and any rationale provided for the deviations. When we do not accept the RUC-recommended exceptions, we refine the proposed direct PE inputs to conform to the standard times for those tasks. In addition, in cases when a service is typically billed with an E/M service, we remove the preservice clinical labor tasks to avoid duplicative inputs and to reflect the resource costs of furnishing the typical service.

We refer readers to section II.B. of this final rule, Determination of Practice Expense Relative Value Units (PE RVUs), for more information regarding the collaborative work of CMS and the

RUC in improvements in standardizing clinical labor tasks.

(4) Recommended Items That Are Not Direct PE Inputs

In some cases, the PE worksheets included with the RUC's recommendations include items that are not clinical labor, disposable supplies, or medical equipment or that cannot be allocated to individual services or patients. We addressed these kinds of recommendations in previous rulemaking (78 FR 74242), and we do not use items included in these recommendations as direct PE inputs in the calculation of PE RVUs.

(5) New Supply and Equipment Items

The RUC generally recommends the use of supply and equipment items that already exist in the direct PE input database for new, revised, and potentially misvalued codes. However, some recommendations include supply or equipment items that are not currently in the direct PE input database. In these cases, the RUC has historically recommended that a new item be created and has facilitated our pricing of that item by working with the specialty societies to provide us copies of sales invoices. For CY 2020, we received invoices for several new supply and equipment items. Tables 28 and 29 detail the invoices received for new and existing items in the direct PE database. As discussed in section II.B. of this final rule, Determination of Practice Expense Relative Value Units, we encouraged stakeholders to review the prices associated with these new and existing items to determine whether these prices appear to be accurate. Where prices appear inaccurate, we encouraged stakeholders to submit invoices or other information to improve the accuracy of pricing for these items in the direct PE database by February 10th of the following year for consideration in future rulemaking, similar to our process for consideration of RUC recommendations.

We remind stakeholders that due to the relativity inherent in the development of RVUs, reductions in existing prices for any items in the direct PE database increase the pool of direct PE RVUs available to all other PFS services. Tables 28 and 29 also include the number of invoices received and the number of nonfacility allowed services for procedures that use these equipment items. We provide the nonfacility allowed services so that stakeholders will note the impact the particular price might have on PE relativity, as well as to identify items that are used frequently, since we

believe that stakeholders are more likely to have better pricing information for items used more frequently. A single invoice may not be reflective of typical costs and we encourage stakeholders to provide additional invoices so that we might identify and use accurate prices in the development of PE RVUs.

In some cases, we do not use the price listed on the invoice that accompanies the recommendation because we identify publicly available alternative prices or information that suggests a different price is more accurate. In these cases, we include this in the discussion of these codes. In other cases, we cannot adequately price a newly recommended item due to inadequate information. Sometimes, no supporting information regarding the price of the item has been included in the recommendation. In other cases, the supporting information does not demonstrate that the item has been purchased at the listed price (for example, vendor price quotes instead of paid invoices). In cases where the information provided on the item allows us to identify clinically appropriate proxy items, we might use existing items as proxies for the newly recommended items. In other cases, we included the item in the direct PE input database without any associated price. Although including the item without an associated price means that the item does not contribute to the calculation of the final PE RVU for particular services, it facilitates our ability to incorporate a price once we obtain information and are able to do so.

(6) Service Period Clinical Labor Time in the Facility Setting

Generally speaking, our direct PE inputs do not include clinical labor minutes assigned to the service period because the cost of clinical labor during the service period for a procedure in the facility setting is not considered a resource cost to the practitioner since Medicare makes separate payment to the facility for these costs. We address code-specific refinements to clinical labor in the individual code sections.

(7) Procedures Subject to the Multiple Procedure Payment Reduction (MPPR) and the OPFS Cap

We note that the public use files for the PFS proposed and final rules for each year display the services subject to the MPPR for diagnostic cardiovascular services, diagnostic imaging services, diagnostic ophthalmology services, and therapy services. We also include a list of procedures that meet the definition of imaging under section 1848(b)(4)(B) of the Act, and therefore, are subject to the OPFS cap for the upcoming calendar

year. The public use files for CY 2020 are available on the CMS website under downloads for the CY 2020 PFS final rule at <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html>. For more information regarding the history of the MPPR policy, we refer readers to the CY 2014 PFS final rule with comment period (78 FR 74261 through 74263). For more information regarding the history of the OPFS cap, we refer readers to the CY 2007 PFS final rule with comment period (71 FR 69659 through 69662).

4. Proposed Valuation of Specific Codes for CY 2020

(1) Tissue Grafting Procedures (CPT Codes 15769, 15771, 15772, 15773, and 15774)

CPT code 20926 (*Tissue grafts, other (e.g., paratenon, fat, dermis)*), was identified through a review of services with anomalous sites of service when compared to Medicare utilization data. The CPT Editorial Panel subsequently replaced CPT code 20926 with five codes in the Integumentary section to better describe tissue grafting procedures.

We proposed the RUC-recommended work RVUs of 6.68 for CPT code 15769 (*Grafting of autologous soft tissue, other, harvested by direct excision (e.g., fat, dermis, fascia)*), 6.73 for CPT code 15771 (*grafting of autologous fat harvested by liposuction technique to trunk, breasts, scalp, arms, and/or legs; 50cc or less injectate*), 2.50 for CPT code 15772 (*grafting of autologous fat harvested by liposuction technique to trunk, breasts, scalp, arms, and/or legs; each additional 50cc injectate, or part thereof (list separately in addition to code for primary procedure)*), 6.83 for CPT code 15773 (*grafting of autologous fat harvested by liposuction technique to face, eyelids, mouth, neck, ears, orbits, genitalia, hands, and/or feet; 25cc or less injectate*), and 2.41 for CPT code 15774 (*grafting of autologous fat harvested by liposuction technique to face, eyelids, mouth, neck, ears, orbits, genitalia, hands, and/or feet; each additional 25cc injectate, or part thereof (list separately in addition to code for primary procedure)*).

We proposed the RUC-recommended direct PE inputs for this code family without refinement.

We received public comments on the proposed valuation of the codes in the Tissue Grafting Procedures family. The following is a summary of the comments we received and our responses.

Comment: A commenter stated that they supported our proposal to use the RUC-recommended work RVUs for these codes.

Response: We appreciate the support for our proposal from the commenter. After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the Tissue Grafting Procedures family as proposed.

(2) Drug Delivery Implant Procedures (CPT Codes 11981, 11982, 11983, 20700, 20702, 20704, 20701, 20703, and 20705)

CPT codes 11980–11983 were identified as potentially misvalued since the majority specialty found in recent claims data differs from the two specialties that originally surveyed the codes. The current valuation of CPT code 11980 (*Subcutaneous hormone pellet implantation (implantation of estradiol and/or testosterone pellets beneath the skin)*) was reaffirmed by the RUC as the physician work had not changed since the last review. The CPT Editorial Panel revised the other three existing codes in the family and created six additional add-on codes to describe orthopaedic drug delivery. These codes were surveyed and reviewed for the October 2018 RUC meeting.

CPT code 11980 (*Subcutaneous hormone pellet implantation (implantation of estradiol and/or testosterone pellets beneath the skin)*) with the current work value of 1.10 RVUs and 12 minutes of intraservice time, and 27 minutes of total time, was determined to be unchanged since last reviewed and was recommended by the RUC to be maintained. We concur. We did not propose any direct PE refinements to CPT code 11980. CPT code 11981 (*Insertion, non-biodegradable drug delivery implant*) has a current work RVU of 1.48, with 39 minutes of total physician time. The specialty society survey recommended a work RVU of 1.30, with 31 minutes of total physician time and 5 minutes of intraservice time. The RUC recommended a work RVU of 1.30 (25th percentile), with 30 minutes of total physician time and 5 minutes of intraservice time. For comparable reference CPT codes to CPT code 11981, the RUC and the survey respondents had selected CPT code 55876 (*Placement of interstitial device(s) for radiation therapy guidance (e.g., fiducial markers, dosimeter), prostate (via needle, any approach), single or multiple (work RVU = 1.73, 20 minutes intraservice time and 59 total minutes)*) and CPT code 57500 (*Biopsy of cervix, single or multiple, or local excision of lesion, with or without fulguration*

(*separate procedure*) (work RVU = 1.20, 15 minutes intraservice time and 29 total minutes)). The RUC further offered for comparison, CPT code 67515 (*Injection of medication or other substance into Tenon's capsule (work RVU = 1.40 (from CY 2018), 5 minutes intraservice time and 21 minutes total time)*), CPT code 12013 (*Simple repair of superficial wounds of face, ears, eyelids, nose, lips and/or mucous membranes; 2.6 cm to 5.0 cm (work RVU = 1.22 and 27 total minutes)*) and CPT code 12004 (*Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 7.6 cm to 12.5 cm (work RVU = 1.44 and 29 total minutes)*). In addition, we offered CPT code 67500 (*Injection of medication into cavity behind eye (work RVU = 1.18 and 5 minutes intraservice time and 33 total minutes)*) for reference. Given that the CPT code 11981 incurs a 23 percent reduction in the new total physician time and with reference to CPT code 67500, we proposed a work RVU of 1.14, and accepted the survey-recommended 5 minutes for intraservice time and 30 minutes of total time. We did not propose any direct PE refinements to CPT code 11981.

CPT code 11982 (*Removal, non-biodegradable drug delivery implant*) has a current work RVU of 1.78, with 44 minutes of total physician time. The specialty society survey recommended a work RVU of 1.70 RVU, with 10 minutes of intraservice time and 34 minutes of total physician time. The RUC also recommended a work RVU of 1.70, with 10 minutes of intraservice time and 33 minutes of total physician time. The RUC confirmed that removal (CPT code 11982), requires more intraservice time to perform than the insertion (CPT code 11981). For comparable reference codes to CPT code 11982, the RUC and the survey respondents had selected CPT code 54150 (*Circumcision, using clamp or other device with regional dorsal penile or ring block (work RVU = 1.90, 15 minutes intraservice time and 45 total minutes)*) and CPT code 12004 (*Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 7.6 cm to 12.5 cm (work RVU = 1.44, with 17 minutes intraservice time and 29 minutes total time)*). We offered CPT code 64486 (*Injections of local anesthetic for pain control and abdominal wall analgesia on one side (work RVU = 1.27, 10 minutes intraservice time and 35 total minutes)*) for reference. Given that the CPT code 11982 incurs a 25 percent

reduction in the new total physician time and with reference to CPT code 64486, we proposed a work RVU of 1.34, and accepted the RUC-recommended 10 minutes for intraservice time and 33 minutes of total time. We did not propose any direct PE refinements to CPT code 11982.

CPT code 11983 (*Removal with reinsertion, non-biodegradable drug delivery implant*) has a current work RVU of 3.30, with 69 minutes of total physician time. The specialty society survey recommended a work RVU of 2.50 RVU, with 15 minutes of intraservice time and 41 minutes of total physician time. The RUC also recommended a work RVU of 2.10, with 15 minutes of intraservice time and 40 minutes of total physician time. The RUC confirmed that CPT code 11983 requires more intraservice time to perform than the insertion CPT code 11981. For comparable reference codes to CPT code 11983, the RUC and the survey respondents had selected CPT code 55700 (*Biopsy, prostate; needle or punch, single or multiple, any approach (work RVU = 2.50, 15 minutes intraservice time and 35 total minutes)*), CPT code 54150 (*Circumcision, using clamp or other device with regional dorsal penile or ring block (work RVU = 1.90, 15 minutes intraservice time and 45 total minutes)*) and CPT code 52281 (*Cystourethroscopy, with calibration and/or dilation of urethral stricture or stenosis, with or without meatotomy, with or without injection procedure for cystography, male or female (work RVU = 2.75 and 20 minutes intraservice time and 46 minutes total time)*). We offered CPT code 62324 (*Insertion of indwelling catheter and administration of substance into spinal canal of upper or middle back (work RVU = 1.89, 15 minutes intraservice time and 43 total minutes)*) for reference. Given that the CPT code 11983 incurs a 42 percent reduction in new total physician time and with reference to CPT code 62324, we proposed a work RVU of 1.91, and accepted the RUC-recommended 15 minutes for intraservice time and 40 minutes of total time. We did not propose any direct PE refinements to CPT code 11983.

The new proposed add-on CPT codes 20700–20705 are intended to be typically reported with CPT codes 11981–11983, with debridement or arthroscopy procedures done primarily by orthopedic surgeons. The specialty society's survey for CPT code 20700 (*Manual preparation and insertion of drug delivery device(s), deep (e.g., subfascial)*) found a 2.00 work RVU value at the median and a 1.50 work

RVU value at the 25th percentile, with 20 minutes of intraservice time and 30 minutes of total physician time, for the preparation of the antibiotic powder and cement, rolled into beads and threaded onto suture for insertion into the infected bone. The RUC recommended a work RVU of 1.50, with 20 minutes of intraservice time and 27 minutes of total physician time. The RUC's reference CPT codes included CPT code 11047 (*Debridement, bone (includes epidermis, dermis, subcutaneous tissue, muscle and/or fascia, if performed); each additional 20 sq cm, or part thereof*) (work RVU = 1.80, and 30 minutes intraservice time), CPT codes 64484 (*Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); lumbar or sacral, each additional level*) (work RVU = 1.00 and 10 minutes intraservice time), and CPT code 36227 (*Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation*) (work RVU = 2.09 and 20 minutes intraservice time). Our review of similar add-on CPT codes yielded CPT code 64634 (*Destruction of upper or middle spinal facet joint nerves with imaging guidance*) (work RVU = 1.32 and 20 minutes intraservice time). We proposed for CPT code 20700, a work RVU of 1.32, and accept the RUC-recommended 20 minutes of intraservice time and 27 minutes of total time.

The specialty society's survey for CPT code 20702 (*Manual preparation and insertion of drug delivery device(s), intramedullary*) found a 3.25 work RVU value at the median and a 2.50 work RVU value at the 25th percentile, with 25 minutes of intraservice time and 32 minutes of total physician time, for the preparation of the "antibiotic nail" ready for insertion into the intramedullary canal with fluoroscopic guidance. The RUC recommended a work RVU of 2.50, with 25 minutes of intraservice time and 32 minutes of total physician time. The RUC's reference CPT codes included CPT code 11047 (*Debridement, bone (includes epidermis, dermis, subcutaneous tissue, muscle and/or fascia, if performed); each additional 20 sq cm, or part thereof*) (work RVU = 1.80, and 30 minutes intraservice time), CPT code 57267 (*Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach*) (work RVU = 4.88 and 45 minutes intraservice time), and CPT code 36227 (*Selective*

catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation) (work RVU = 2.09 and 15 minutes intraservice time). We find that the reference CPT code 11047, with 30 minutes of intraservice time, is suitable, but we adjust our proposed work RVU of 1.70 to account for the 25 minutes, instead of our reference code's 30 minutes of intraservice time (and the 32 minutes of total time), for CPT code 20702.

The specialty society's survey for CPT code 20704 (*Manual preparation and insertion of drug delivery device(s), intra-articular*) found a 4.00 work RVU value at the median and a 2.60 work RVU value at the 25th percentile, with 30 minutes of intraservice time and 37 minutes of total physician time, for the preparation of the antibiotic cement inserted into a pre-fabricated silicone mold, when after setting up, will be cemented to the end of the bone (with the joint). The RUC recommended a work RVU of 2.60, with 30 minutes of intraservice time and 37 minutes of total physician time. The RUC's reference CPT codes included CPT code 11047 (*Debridement, bone (includes epidermis, dermis, subcutaneous tissue, muscle and/or fascia, if performed); each additional 20 sq cm, or part thereof*) (work RVU = 1.80, and 30 minutes intraservice time), CPT code 57267 (*Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach*) (work RVU = 4.88 and 45 minutes intraservice time), and CPT code 36227 (*Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation*) (work RVU = 2.09 and 20 minutes intraservice time). We find that the reference CPT code 11047, with 30 minutes of intraservice time, is a suitable guide and we proposed the work RVU of 1.80 with the RUC-recommended 30 minutes of intraservice time and 37 minutes of total time, for CPT code 20704.

The specialty society's survey for CPT code 20701 (*Removal of drug delivery device(s), deep (e.g., subfascial)*) found a 1.75 work RVU value at the median and a 1.13 work RVU value at the 25th percentile, with 15 minutes of intraservice time and 18 minutes of total physician time. The work includes a marginal dissection to expose the drug delivery device and to remove it. The RUC recommended a work RVU of 1.13,

with 18 minutes of total physician time and 15 minutes of intraservice time. The RUC's reference CPT codes included CPT code 11047 (*Debridement, bone (includes epidermis, dermis, subcutaneous tissue, muscle and/or fascia, if performed); each additional 20 sq cm, or part thereof*) (work RVU = 1.80, and 30 minutes intraservice time), CPT code 64484 (*Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); lumbar or sacral, each additional level*) (work RVU = 1.00 and 10 minutes intraservice time), and CPT code 64480 (*Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); cervical or thoracic, each additional level*) (work RVU = 1.20 and 15 minutes intraservice time). We proposed the RUC-recommended work RVU of 1.13 with 15 minutes of intraservice time and 18 minutes of total time for 20701.

The specialty society's survey for CPT code 20703 (*Removal of drug delivery device(s), intramedullary*) found a 2.50 work RVU value at the median and a 1.80 work RVU value at the 25th percentile, with 20 minutes of intraservice time and 23 minutes of total physician time. The work includes a marginal dissection, in addition to what was in the base procedure, to loosen and expose the drug delivery device and to remove it, any remaining drug delivery device shards that may have broken off. The RUC recommended a work RVU of 1.80, with 20 minutes of intraservice time and 23 minutes of total physician time. The RUC's reference CPT codes included CPT code 11047 (*Debridement, bone (includes epidermis, dermis, subcutaneous tissue, muscle and/or fascia, if performed); each additional 20 sq cm, or part thereof*) (work RVU = 1.80, and 30 minutes intraservice time), CPT codes 37253 (*Intravascular ultrasound (noncoronary vessel) during diagnostic evaluation and/or therapeutic intervention, including radiological supervision and interpretation; each additional noncoronary vessel*) (work RVU = 1.44 and 20 minutes intraservice time), and CPT code 36227 (*Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation*) (work RVU = 2.09 and 15 minutes intraservice time). We proposed the RUC-recommended work RVU of 1.80 with 20 minutes of intraservice time and 23 minutes of total time for 20703.

The specialty society's survey for CPT code 20705 (*Removal of drug delivery*

device(s), intra-articular) found a 3.30 work RVU value at the median and a 2.15 work RVU value at the 25th percentile, with 25 minutes of intraservice time and 28 minutes of total physician time. The work includes the removal of the intra-articular drug delivery device that is cemented to both sides of the joint without removing too much bone in the process. The RUC recommended a work RVU of 2.15, with 25 minutes of intraservice time and 28 minutes of total physician time. The RUC's reference CPT codes included CPT code 11047 (*Debridement, bone (includes epidermis, dermis, subcutaneous tissue, muscle and/or fascia, if performed); each additional 20 sq cm, or part thereof (work RVU = 1.80, and 30 minutes intraservice time)*), CPT code 36476 (*Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (work RVU = 2.65 and 30 minutes intraservice time)*), and CPT code 36227 (*Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation (work RVU = 2.09 and 15 minutes intraservice time)*). We proposed the RUC-recommended work RVU of 2.15 with 25 minutes of intraservice time and 28 minutes of total time for 20705.

We received public comments on the proposed valuation of the codes in the Drug Delivery Implant Procedures family. The following is a summary of the comments we received and our responses.

Comment: In an overall comment to code valuations, but also pertinent to this section, one commenter stated that they are increasingly concerned that CMS is eschewing the bedrock principles of valuation within the RBRVS (namely, magnitude estimation, survey data and clinical expertise) in favor of arbitrary mathematical formulas and in their opinion, make a distinction in the different types of physician time, which are "CMS/Other" time source, "Harvard" time source, and "RUC" time source (from physician surveys).

Response: As we have discussed in previous rules, we agree that it is important to use the most recent data available regarding time, and we note that when many years have passed between when physician times are measured, significant discrepancies can occur. However, we also continue to believe that our operating assumption

regarding the validity of the existing time values as a point of comparison is critical to the integrity of the current relative value system.

The physician times and intensities currently associated with codes, play important roles in PFS ratesetting in their comparativeness to each other, in establishing work RVUs. If we were to operate under the assumption that previously recommended work times had routinely been overestimated, this would undermine the relativity of the work RVUs on the PFS. Given that the process under which codes are often valued by comparison to codes with similar times, we acknowledge the distinction between "CMS/Other" times, "Harvard" times, and "RUC" physician surveyed times, but we cannot apply different validation weights to any of these labels. They are all physician times data collected over many years. We understand that some time values may not have been reviewed or re-surveyed in a number of years, but that alone is not an indicator of how accurate or inaccurate a time value may be. We believe that over the years as more codes are being reviewed and examined, that collectively the entire fee schedule of procedure codes should all naturally align themselves into a very reliable and more accurate system reflecting every code's relativity to one another (in their work RVUs, in their procedure times, and in their work intensities).

We believe that it is crucial that the code valuation process with existing work times and work RVUs in the PFS ratesetting processes are accurate. We recognize that adjusting work RVUs for changes in physician times is not always a straightforward process and that the intensity associated with changes in time is not necessarily always linear, which is why we always try to apply various methodologies to identify several potential work values for individual codes. CMS CPT code review not only examines the relationships between work, time, and intensity, but we also look at magnitude and rank order anomalies particularly in families or groups of codes that are closely related, but may differ slightly in degrees found in their clinical descriptions and possibly in the typical beneficiary populations that each code might serve. Among these codes, we try to keep the differences in times, work, and intensity properly distant between each other. In some cases, where there are marked improvements in medical techniques and technological assistance, we may see better efficiencies in physician's work, and thus decreases in physician's times, but we also recognize

that some improvements may introduce greater complexity and either a greater intensity and/or increase in physician times.

We reiterate that we believe it would be irresponsible to ignore or discount "CMS/Other" times or "Harvard" times in our data system and that we need to consider all times and all intensities and all procedure code's clinically relevant relatedness (or non-relatedness) to each other, in establishing more refined work RVUs for PFS services. Also note that "RUC" physician times are not always necessarily AMA RUC surveyed times. CMS may have adjusted AMA RUC surveyed times in our annual review of all HCPCS codes, as well as times that the AMA labels as "Harvard" or "CMS/Other" physician times.

Comment: One commenter stated the current source of time for CPT code 11981 is CMS/Other. The commenter also stated the crosswalk or methodology used in the original valuation of this service is unknown and not resource-based; therefore, it is invalid to compare the current time and work to the surveyed time and work. The commenter noted this code's source of time is CMS/Other, implying that the time was merely crosswalked or selected by a single CMS staffer some time ago, and CMS should not compare the valid survey time to the initial CMS/Other time because the initial CMS/Other source data is flawed and has no validity for comparison.

Response: The current physician time for CPT code 11981 is 39 minutes of total time and the current work RVUs is 1.48. The AMA RUC's new recommended times are 5 minutes intraservice time and 30 minutes total time (surveyed total time was 31 minutes). We accept the AMA RUC newly surveyed-recommended times. The AMA RUC selected multiple reference CPT codes 55876, 57500, 67515, 12013, and 12004 that they believe to be comparable to CPT code 11981. We selected the reference CPT code 67500, with 5 minutes intra-time and 33 minutes total time, which we believe to be a better reference code and is clearly comparable to the accepted recommended times for CPT code 11981. CPT code 67500 was last reviewed in 2005 and the time source was from the "RUC" who no doubt surveyed this code at that time, so CPT code 67500's time source is not "CMS/Other", which we do not believe is material to selecting a reference code for physician work and time. As discussed above, we believe there is no comparison flaw in time or work RVUs, based on the AMA RUC's distinction labeling of "RUC" times, "CMS/Other

times”, or “Harvard” times. We believe that it is crucial that the code valuation process take place with the understanding that all existing work times, used in the PFS ratesetting processes, are accurate. Our reference CPT code 67500’s work RVU is 1.18.

Comment: Some commenters stated that CPT code 11981 is not clinically related to our reference code of CPT code 67500, as it relates to both the physician description of work and the typical patient population treated with this service.

Response: As part of our review, we look for comparable codes that are similar in physician service times, work RVUs, work intensity, and clinical similarity. As discussed above, we believe there is no comparison flaw in time or work RVUs, based on the AMA RUC’s distinction labeling of “RUC” times, “CMS/Other times”, or “Harvard” times. We believe that it is crucial that the code valuation process take place with the understanding that all existing work times, used in the PFS ratesetting processes, are accurate. We continue to believe that CPT code 67500 is the better reference code for us to use to establish an appropriate valuation for CPT code 11981. Both codes require 5 minutes intra-service time and CPT code 11981 takes 30 minutes total time while CPT code 67500 takes a similar amount of 33 minutes of total time.

While the commenters object to CMS’ reference CPT code of 67500 as being clinically related to CPT code 11981, the commenter’s additional selected CPT reference codes of 67515, 12013, and 12004, are also very different from CPT code 11981. There appears to be a discrepancy in the AMA RUC’s CPT (referencing) code 67515 (*Injection of medication or other substance into Tenon’s capsule, work RVU = 1.40, 5 minutes intra-service time and 21 minutes total time*). CMS’ data indicates a different work RVU and physician times for this code. For CPT code 67515, we have on record for work RVU = 0.75, 3 minutes intra-service time and 13 minutes total time.

The AMA RUC CPT (referencing) codes 12013 and 12004 appears to be at least partially valued on the length of a wound repair (2.6 cm to 5.0 cm or 7.6 cm to 12.5 cm), and assuming that the longer the wound repair is, the more work and physician time is required to perform the procedure. CPT code 11981 does not have this “size length” characteristic, so we question if CPT codes 12013 or 12004 more or less are a valid comparison referencing codes to CPT code 11981 where there is not this “size length” characteristic. As we have stated, the clinical relatedness of codes

are not always exact, nor always available.

Comment: The RUC survey respondents offered CPT code 55876 (*Placement of interstitial device(s) for radiation therapy guidance (e.g., fiducial markers, dosimeter), prostate (via needle, any approach), single or multiple (work RVU = 1.73, 20 minutes intra-service time and 59 total minutes)*) and 57500 (*Biopsy of cervix, single or multiple, or local excision of lesion, with or without fulguration (separate procedure) (work RVU = 1.20, 15 minutes intra-service time and 29 total minutes)*) as referencing codes to CPT code 11981.

The AMA RUC recommendation offered CPT code 67515 (*Injection of medication or other substance into Tenon’s capsule (work RVU = 1.40, 5 minutes intra-service time and 21 minutes total time)*), MPC codes 12013 (*Simple repair of superficial wounds of face, ears, eyelids, nose, lips and/or mucous membranes; 2.6 cm to 5.0 cm (work RVU = 1.22, 15 minutes intra-service time and 27 total minutes)*) and 12004 (*Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 7.6 cm to 12.5 cm (work RVU = 1.44 15 minutes intra-service time and 29 total minutes)*). The AMA RUC offer these reference codes to have similar physician work and total time to CPT code 11981.

Response: All of the commenter’s reference comparison CPT codes have far more intra-service time than CPT code 11981 intra-service time of 5 minutes, except for CPT code 67515, but this code appears to only have 3 minutes of intra-service time and 0.75 work RVUs. CMS’ CPT (reference) code of 67500 appears to have the closest physician times to CPT code 11981 and their work RVUs should be similar.

After consideration of the public comments for CPT code 11981, we are finalizing the proposed work RVU as 1.14.

Comment: Several commenters stated the current source of time for CPT code 11982 is CMS/Other. Commenters also stated the crosswalk or methodology used in the original valuation of this service is unknown and not resource-based; therefore, it is invalid to compare the current time and work to the surveyed time and work. Commenters noted this code’s source of time is CMS/Other, implying that the time was merely crosswalked or selected by a single CMS staffer some time ago. CMS should not compare the valid survey time to the initial CMS/Other time because the initial CMS/Other source

data is flawed and has no validity for comparison.

Response: The current physician times for CPT code 11982 are 44 minutes of total time and the current work RVUs is 1.78. The AMA RUC’s new recommended times are 10 minutes intra-service time and 33 minutes total time (surveyed total time was 34 minutes). CMS accepts the AMA RUC newly surveyed recommended times and used CPT reference code 64486, with 10 minutes intra-service time and 35 minutes total time, which are clearly comparable to the accepted recommended times for CPT code 11982. CPT code 64486 was introduced by CPT in 2014 and the time source was from the “RUC” who no doubt surveyed this code at that time, so CPT code 64486’s time source is not “CMS/Other”, which we do not believe is material to selecting a reference code for physician work and time. As part of our review, we look for comparable codes that are similar in physician service times, work RVUs, work intensity, and clinical relatedness. As discussed above, we believe there is no comparison flaw in time or work RVUs, based on the AMA RUC’s distinction labeling of “RUC” times, “CMS/Other times”, or “Harvard” times. We believe that it is crucial that the code valuation process take place with the understanding that all existing work times, used in the PFS ratesetting processes, are accurate and there is no comparison flaw. Our reference CPT code 64486’s work RVU is 1.27.

Comment: Commenters stated that CPT code 11982 is essentially not clinically related to our reference code of CPT code 64486, in physician description of work and the typical patient population that they treat.

Response: As part of our review, we look for comparable codes that are similar in physician service times, work RVUs, work intensity, and are clinically related. As discussed above, we believe there is no comparison flaw in time or work RVUs, based on the AMA RUC’s distinction labeling of “RUC” times, “CMS/Other times”, or “Harvard” times. We believe that it is crucial that the code valuation process take place with the understanding that all existing work times, used in the PFS ratesetting processes, are accurate. CPT codes 11982 and 64486 are not clinically related, but their work times and work RVUs are similar. The commenter’s selected reference CPT codes of 54150 and 12004, can also be said to be very similar to CPT code 11982 as well. CPT (referencing) code 54150 appears to apply only to the male patient population, where CPT code 11982

applies to both the male and female population. CPT (referencing) code 12004 appears to be at least partially valued on the length of a wound repair (7.6 cm to 12.5 cm), assuming that the longer the wound repair is, the more work and physician time is required to perform the procedure, but CPT code 11982 does not have this “size length” characteristic. As previously stated, clinical relatedness between codes are not always exact, nor always available for exact comparison and we continue to believe that CMS’ reference CPT code 64486 is equally as valid as the AMA RUC’s reference CPT codes.

Comment: The AMA RUC and the survey respondents offered CPT code 54150 (*Circumcision, using clamp or other device with regional dorsal penile or ring block (work RVU = 1.90, 15 minutes intra-service time and 45 total minutes)*) and CPT code 12004 (*Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 7.6 cm to 12.5 cm (work RVU = 1.44, with 17 minutes intra-service time and 29 minutes total time)*) as comparable reference codes to CPT code 11982.

Response: Both AMA RUC reference codes have more intra-service times than CPT code 11982, so accordingly, they have more work RVUs. We believe CPT code 11982 with 10 minutes of intra-service time should have a work RVU value that is less than the AMA RUC reference codes and less than their recommended 1.70 RVUs. CPT code 64486 physician times are very similar to CPT code 11982’s physician times and their work RVUs should be similar.

After consideration of the public comments for CPT code 11982, we are finalizing its work RVU, as proposed, to 1.34 RVUs.

Comment: One commenter stated the current source of time for CPT code 11983 is CMS/Other and the crosswalk or methodology used in the original valuation of this service is unknown and not resource-based; therefore, it is invalid to compare the current time and work to the surveyed time and work. The commenter further stated this code’s source of time is CMS/Other, implying that the time was merely crosswalked or selected by a single CMS staffer some time ago. CMS should not compare the valid survey time to the initial CMS/Other time because the initial CMS/Other source data is flawed and has no validity for comparison.

Response: The current physician times for CPT code 11983 are 49 minutes of total time and the current work RVUs is 3.30. The AMA RUC’s new recommended times are 15 minutes

intra-service time and 40 minutes total time (surveyed total time was 41 minutes). We accept the AMA RUC newly surveyed recommended times and used CPT code 62324, with 15 minutes intra-service time and 43 minutes total time, which are comparable to the AMA RUC recommended times for CPT code 11983. CPT code 62324 was introduced by CPT in 2017 and the time source was from the “RUC” who no doubt surveyed this code at that time, so CPT code 62324’s time source is not “CMS/Other”, which we do not believe is material to selecting a reference code for physician work and time. As part of our review, we look for comparable codes that are similar in physician service times, work RVUs, work intensity, and clinically similarity. As discussed above, we believe there is no comparison flaw in time or work RVUs, based on the AMA RUC’s distinction labeling of “RUC” times, “CMS/Other times”, or “Harvard” times. We believe that it is crucial that the code valuation process take place with the understanding that all existing work times, used in the PFS ratesetting processes, are accurate. We continue to believe that CPT code 62324 is the better reference code to CPT code 11983. Our reference CPT code 62324’s work RVU is 1.89.

Comment: Commenters stated that the intensity of the work required to perform CPT code 11983 is not comparable to CMS’ reference to injection of anesthetic code 62324 and yet in their original AMA RUC survey for CPT code 11983, the commenter stated the survey respondents indicated that CPT code 11983 (originally 15 minutes intra-service time, 69 minutes total time, and 3.30 work RVUs) overall requires the same or more intensity and complexity to perform as CPT code 55700 (15 minutes of intra-service time, 35 minutes of total time, and 2.50 work RVUs). The RUC noted that since CPT code 11983 has such a low intra-service time and is a 000-day service comparing the intra-service per unit of time (IWPUT) is not a useful comparison.

Response: The commenters stated that CPT (CMS reference) code 62324 (15 minutes intra-service time, 43 minutes total time and their work RVU is 1.89) is less intensive than CPT code 11983 and thus their work RVUs are not comparable. But, the original selected surveyees’ reference CPT code of 55700 (15 minutes intra-service time, 35 minutes total time and work RVU is 2.50) has been stated as the same or less intensive than CPT code 11983. Therefore, we question if that is true. If CPT code 55700 (2.50 work RVUs) is the

same or less intensive than CPT code 11983, CPT code 11983’s proposed work RVU should be 2.50 or greater. The RUC recommended work RVU for CPT code 11983 is 2.10. This is less than 2.50. The survey median yielded 2.50. Further, the AMA RUC asserts that the work RVU for CPT code 11983 should be higher than 1.89 (62324) and also higher than 2.50 (55700) but recommends a proposed work RVU of 2.10. The AMA RUC noted that since CPT code 11983 has such a low intra-service time and is a 000-day service, comparing the intra-service per unit of time (IWPUT) is not a useful comparison. (The AMA RUC also referenced CPT code 54150 (work RVU is 1.90) and CPT code 52281 (work RVU is 2.75) as potential reference codes.

As part of our review, we look for comparable codes that are similar in physician service times, work RVUs, work intensity, and are clinical related. As discussed above, we believe there is no comparison flaw in time or work RVUs, based on the AMA RUC’s distinction labeling of “RUC” times, “CMS/Other times”, or “Harvard” times. We believe that it is crucial that the code valuation process take place with the understanding that all existing work times, used in the PFS ratesetting processes, are accurate and there is no comparison flaw. As for the question of our selection of CPT code 62324 being more or less clinically related to CPT code 11983, as we have previously stated in this regard, perfect clinical relatedness is not always available in selecting a reference code. The same is true with the AMA RUC selection of reference code(s).

After consideration of the public comments for CPT code 11983, we are finalizing the work RVU, as proposed, of 1.91 RVUs.

Comment: One commenter stated that CMS may have a typo in the text of the proposed rule because the CY 2020 PFS proposed rule Physician Time file indicated the same time as the RUC recommended with a total of 27 minutes for CPT code 20700.

Response: The commenter is correct that there was a typo in the text concerning CPT code 20700 (206X0) where in one sentence the total physician time was stated as 27 minutes and then in a subsequent sentence it was stated as 20 minutes. The typo has been corrected. Upon further review of the AMA RUC recommendations and CMS own examination, we believe that our proposed RVU value of 1.32 work RVUs on balance is not entirely supportable, and we are instead adopting the AMA RUC recommended

value of 1.50 work RVUs for CPT code 20700.

Comment: Concerning the paragraph on CPT code 20702 (206X1), commenters noted that there were two typos in the proposed rule for the CMS reference CPT code 11047. The commenter stated that the RUC total time recommended for CPT code 20702 (206X1) is 32 minutes not 38 minutes and the total time for CMS reference code 11047 is 31 minutes not 32 minutes, but both are listed correctly in the CY 2020 PFS proposed rule Physician Time file.

Response: The commenter is correct that there was a typo in the text concerning CPT code 20702 (206X1) where in one sentence the total physician time was stated as 38 minutes when it was actually 32 minutes. The 38 minutes was from the survey total time for this code, and it was inadvertently used. The typo has been corrected.

Upon further review of the AMA RUC recommendations and CMS' own examination, we believe that our proposed value of 1.70 work RVUs on balance is not entirely supportable, and we are instead adopting the AMA RUC recommended value of 2.50 work RVUs for CPT code 20702.

Comment: One commenter noted that there is a typo in the text of the proposed rule for CPT code 20704 (206X2). The commenter stated the RUC recommended 5 minutes evaluation pre-service time, 30 minutes intra-service time and 2 minutes post-service time, totaling 37 minutes for CPT code 20704 (206X2), not 45 minutes. The physician time for CPT code 20704 (206X2) is listed correctly in the CY 2020 PFS proposed rule Physician Time file.

Response: The commenter is correct that there was a typo in the text concerning CPT code 20704 (206X2) where in one sentence the total physician time was stated as 45 minutes when it was actually 37 minutes. The 45 minutes was this from this CPT code's surveyed total time and the actual AMA RUC recommended total time was 37 minutes. The typo has been corrected. Upon further review of the AMA RUC recommendations and CMS' own examination, we believe our proposed value of 1.80 work RVUs on balance is not entirely supportable and we are instead adopting the AMA RUC recommended value of 2.60 work RVUs for CPT code 20704.

After consideration of the public comments, we are accepting the AMA RUC's surveyed times for CPT codes 11981, 11982, and 11983, however, we do not agree with the AMA RUC recommended work RVUs, and we are finalizing our proposed work RVUs of

1.14 for CPT code 11981, 1.34 for CPT code 11982, and 1.91 for CPT code 11983. For CPT codes 20700 to 20705, we agree with and are finalizing the AMA RUC's recommended work RVUs of 1.50 for CPT code 20700, 1.13 for CPT code 20701, 2.50 for CPT code 20702, 1.80 for CPT code 20703, 2.60 for CPT code 20704, and 2.15 for CPT code 20705. We recognize that the manual preparation and insertion of drug delivery device(s) should take more time than their removal code counterparts, and while we accepted the work RVUs for the removal codes, on the whole, they did not make as much sense in their relativity to each other, with our proposed work RVUs for the insertions. The AMA RUC recommended insertion work RVUs are a better fit with the removal work RVUs.

(3) Bone Biopsy Trocar-Needle (CPT Codes 20220 and 20225)

In October 2017, CPT code 20225 (*Biopsy, bone, trocar, or needle; deep (e.g., vertebral body, femur)*) was identified as being performed by a different specialty than the one that originally surveyed this service. CPT code 20220 (*Biopsy, bone, trocar, or needle; superficial (e.g., ilium, sternum, spinous process, ribs)*) was added as part of the family, and both codes were surveyed and reviewed for the January 2019 RUC meeting.

We disagree with the RUC-recommended work RVU of 1.93 for CPT code 20220 and we proposed a work RVU of 1.65 based on a crosswalk to CPT code 47000 (*Biopsy of liver, needle; percutaneous*). CPT code 47000 shares the same intraservice time of 20 minutes with CPT code 20220 and has slightly higher total time at 55 minutes as compared to 50 minutes. It is also one of the top reference codes selected by the survey respondents. In our review of CPT code 20220, we noted that the recommended intraservice time is decreasing from 22 minutes to 20 minutes (9 percent reduction), and that the recommended total time is increasing from 49 minutes to 50 minutes (2 percent increase). However, the RUC-recommended work RVU is increasing from 1.27 to 1.93, which is an increase of 52 percent. Although we do not imply that the decrease in time as reflected in survey values must equate to a one-to-one or linear decrease in the valuation of work RVUs, we believe that since the two components of work are time and intensity, changes in surveyed work time should be appropriately reflected in the proposed work RVUs.

In the case of CPT code 20220, we believe that it was more accurate to propose a work RVU of 1.65, based on

a crosswalk to CPT code 47000, to account for the decrease in the surveyed intraservice work time. We believe that the work carried out by the practitioner in CPT code 47000 is potentially more intense than the work performed in CPT code 20220, as the reviewed code is a superficial bone biopsy as opposed to the non-superficial biopsy taking place on an internal organ (the liver) described by CPT code 47000. We also note that the survey respondents considered CPT code 47000 to have similar intensity to CPT code 20220: 50 percent or more of the survey respondents rated the two codes as "identical" under the categories of Mental Effort and Judgment, Physical Effort Required, and Psychological Stress, along with a plurality of survey respondents rating the two codes as identical in the category of Technical Skill Required. We believe that this provides further support for our belief that CPT code 20220 should be crosswalked to CPT code 47000 at the same work RVU of 1.65.

We disagree with the RUC-recommended work RVU of 3.00 for CPT code 20225 and we proposed a work RVU of 2.45 based on a crosswalk to CPT code 30906 (*Control nasal hemorrhage, posterior, with posterior nasal packs and/or cautery, any method; subsequent*). CPT code 30906 shares the same intraservice time of 30 minutes and has 1 fewer minute of total time as compared to CPT code 20225. When reviewing this code, we observed a pattern similar to what we had seen with CPT code 20220. We note that the recommended intraservice time for CPT code 20225 is decreasing from 60 minutes to 30 minutes (50 percent reduction), and the recommended total time is decreasing from 135 minutes to 64 minutes (53 percent reduction); however, the RUC-recommended work RVU is increasing from 1.87 to 3.00, which is an increase of about 60 percent. As we noted earlier, we do not believe that the decrease in time as reflected in survey values must equate to a one-to-one or linear decrease in the valuation of work RVUs, and we did not propose a linear decrease in the work valuation based on these time ratios. Indeed, we agree with the RUC recommendation that the work RVU of CPT code 20225 should increase over the current valuation. However, we believe that since the two components of work are time and intensity, significant decreases in time should be appropriately reflected in changes to the work RVUs, and we do not believe that it would be accurate to propose the recommended work RVU of 3.00 given

the significant decreases in surveyed work time.

Instead, we believe that it would be more accurate to propose a work RVU of 2.45 for CPT code 20225 based on a crosswalk to CPT code 30906. We note that this proposed work RVU is a very close match to the intraservice time ratio between the two codes in the family; we proposed a work RVU of 1.65 for CPT code 20220 with 20 minutes of intraservice work time, and a work RVU of 2.45 for CPT code 20225 with 30 minutes of intraservice work time. (The exact intraservice time ratio calculates to a work RVU of 2.47.) We believe that the proposed work RVUs maintain the relative intensity of the two codes in the family, and better preserve relativity with the rest of the codes on the PFS.

For the direct PE inputs, we proposed to replace the bone biopsy device (SF055) supply with the bone biopsy needle (SC077) in CPT code 20225. We note that this code currently makes use of the bone biopsy needle, and there was no rationale provided in the recommended materials to explain why it would now be typical for the bone biopsy needle to be replaced by the bone biopsy device. We proposed to maintain the use of the current supply item. We are also proposing to adopt a 90 percent utilization rate for the use of the CT room (EL007) equipment in CPT code 20225. We previously finalized a policy in the CY 2010 PFS final rule (74 FR 61754 through 61755) to increase the equipment utilization rate to 90 percent for expensive diagnostic equipment priced at more than \$1 million, and specifically cited the use of CT and MRI equipment which would be subject to this utilization rate.

We received public comments on the proposed valuation of the codes in the Bone Biopsy Trocar-Needle family. The following is a summary of the comments we received and our responses.

Comment: Several commenters disagreed with the CMS proposed work RVU of 1.65 for CPT code 20220 and stated that CMS should instead finalize the RUC-recommended work RVU of 1.93. Commenters stated that a superficial bone biopsy as described in CPT code 20220 is more intense to perform than a liver biopsy as described in the CMS crosswalk code (47000), and that the typical indication for CPT code 20220, a potentially infectious or malignant lesion, requires a biopsy with an 11-gauge Jamshidi bone biopsy needle. Commenters stated that accurate placement and increased risk of adjacent structures results in a greater intensity of physician work relative to CPT code 47000.

Response: We appreciate the additional information from the commenters regarding the relative intensity of CPT codes 20220 and 47000. In light of this additional information, we agree with the commenters that the superficial bone biopsy service described by CPT code 20220 has a higher intensity than the liver biopsy service described by CPT code 47000. Although we stated that the crosswalk code was “potentially more intense” in the proposed rule, we ultimately proposed a higher intensity for CPT code 20220 than CPT code 47000 at our work RVU of 1.65. Based on the information provided by the survey respondents, who considered CPT code 47000 to have similar intensity to CPT code 20220, we continue to disagree with the RUC-recommended work RVU of 1.93, which would assign a significantly higher intensity to CPT code 20220. We continue to believe that it was more accurate to propose a work RVU of 1.65, based on the aforementioned crosswalk to CPT code 47000, which assigns both codes a similar intensity, accounts for the decrease in the surveyed intraservice work time, and incorporates the information provided by the survey respondents.

Comment: Several commenters disagreed with the CMS proposed work RVU of 2.45 for CPT code 20225 and stated that CMS should instead finalize the RUC-recommended work RVU of 3.00. Commenters stated that crosswalking a deep bone biopsy performed on patients with a destructive malignant lesion to CPT code 30906, a service used for controlling an established patient’s nosebleed, was inappropriate. Commenters noted that the proposed intensity of CPT code 20225 was lower than the intensity of the crosswalk code.

Response: We disagree with the commenters that there is a meaningful difference in intensity between CPT code 20225 and our crosswalk CPT code 30906. These two codes share the same intraservice time of 30 minutes and differ by only 1 minute of total time, 64 minutes as compared to 63 minutes. The intensity of these two codes differs by less than one half of one percentage point, and it would be difficult for two procedures to match more closely on intensity (which is itself a derived number not measured directly) without sharing the same work times. We also disagree with the commenters that the choice of CPT code 30906 is an inappropriate crosswalk on clinical grounds. CPT code 30906 is far from a simple “nosebleed”, instead describing a service in which the typical patient

requires repeated treatment for control of nasal hemorrhages using anesthesia and extensive cautery. Like CPT code 20225, CPT code 30906 is a significant 0-day global procedure that requires 30 minutes of intraservice work time. We continue to believe that it was more accurate to propose a work RVU of 2.45 for CPT code 20225, based on the aforementioned crosswalk to CPT code 30906, which we believe better maintains the relative intensity of the two codes in the family, and better preserves relativity with the rest of the codes on the PFS.

Comment: Several commenters stated the crosswalk or methodology used in the original valuation of CPT code 20220 is unknown and not resource-based, and therefore, it was invalid for CMS to compare the current time and work to the surveyed time and work. Commenters stated that referencing physician times and derived intensities created almost 30 years ago under the Harvard study as a method to critique RUC recommendations was not appropriate. Commenters also stated that when CPT code 20225 was last evaluated in 1995, work times were evaluated with much less rigor, and that the near zero intensity of CPT code 20225 indicated a severely anomalous relationship between the current work value and current physician time.

Response: We disagree with the commenter that it was invalid to compare the current time and work to the surveyed time and work. We believe that it is crucial that the code valuation process take place with the understanding that the existing work times, used in the PFS ratesetting processes, are accurate. We recognize that adjusting work RVUs for changes in time is not always a straightforward process and that the intensity associated with changes in time is not necessarily always linear, which is why we apply various methodologies to identify several potential work values for individual codes. However, we reiterate that we believe it would be irresponsible to ignore changes in time based on the best data available and that we are statutorily obligated to consider both time and intensity in establishing work RVUs for PFS services. For additional information regarding the use of old work time values that were established many years ago and have not since been reviewed in our methodology, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section II.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80273 through 80274).

Comment: Several commenters disagreed with the CMS proposal to replace the bone biopsy device (SF055) supply with the bone biopsy needle (SC077) in CPT code 20225.

Commenters stated that the bone biopsy device was necessary to perform this procedure and that the omission of this supply item when this service was last reviewed in 2004 was an oversight. Commenters stated that in the vast majority of cases, deep bone biopsies are performed percutaneously using a bone biopsy drill device that allows for access to sclerotic bony lesions in a manner that a bone biopsy needle cannot, and that failing to accurately include the devices typically used to perform this service in a nonfacility setting would likely result in the procedures being pushed to a more expensive facility setting.

Response: Although we appreciate the additional information about the bone biopsy device provided by the commenters, we disagree that its use would be typical for CPT code 20225. As we stated in the proposed rule, CPT code 20225 currently makes use of the bone biopsy needle and there was no rationale provided in the recommended materials to explain why it would now be typical for the bone biopsy needle to be replaced by the bone biopsy device. We believe it unlikely that the lack of a bone biopsy device in the current direct PE inputs for CPT code 20225 was an accidental omission, given that it has been omitted from the direct PE inputs for the past 15 years—had this been an oversight, we would expect that there would have been a previous attempt to address it. We also note that the clinical description of work for CPT code 20225 makes no mention of a bone biopsy drill, but does repeatedly mention the use of a needle for the bone biopsy. Based on this evidence, we continue to believe that the continued use of the bone biopsy needle supply would be typical for the procedure.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the Bone Biopsy Trocar-Needle family as proposed.

(4) Trigger Point Dry Needling (CPT Codes 20560 and 20561)

For CY 2020, the CPT Editorial Panel approved two new codes to report dry needling of musculature trigger points. These codes were surveyed and reviewed by the HCPAC for the January 2019 RUC meeting.

We disagree with the HCPAC-recommended work RVU of 0.45 for CPT code 20560 (*Needle insertion(s) without injection(s), 1 or 2 muscle(s)*)

and we proposed a work RVU of 0.32 based on a crosswalk to CPT code 36600 (*Arterial puncture, withdrawal of blood for diagnosis*). CPT code 36600 shares the identical intraservice time, total time, and intensity with CPT code 20560, which makes it an appropriate choice for a crosswalk. In our review of CPT code 20560, we compared the procedure to the top reference code chosen by the survey participants, CPT code 97140 (*Manual therapy techniques (e.g., mobilization/manipulation, manual lymphatic drainage, manual traction), 1 or more regions, each 15 minutes*). This therapy procedure has 50 percent more intraservice time than CPT code 20560, as well as higher total time; however, the recommended work RVU of 0.45 was higher than the work RVU of 0.43 for the top reference code from the survey. We did not agree that CPT code 20560 should be valued at a higher rate, and therefore, we proposed a work RVU of 0.32 based on the aforementioned crosswalk to CPT code 36600.

We disagree with the HCPAC-recommended work RVU of 0.60 for CPT code 20561 (*Needle insertion(s) without injection(s), 3 or more muscle(s)*) and we proposed a work RVU of 0.48 based on a crosswalk to CPT codes 97113 (*Therapeutic procedure, 1 or more areas, each 15 minutes; aquatic therapy with therapeutic exercises*) and 97542 (*Wheelchair management (e.g., assessment, fitting, training), each 15 minutes*). Both of these codes share the same work RVU of 0.48 and the same intraservice time of 15 minutes as CPT code 20561, with CPT code 97113 having two fewer minutes of total time and CPT code 97542 having two additional minutes of total time. We note that this proposed work RVU is an exact match of the intraservice time ratio between the two codes in the family; we proposed a work RVU of 0.32 for CPT code 20560 with 10 minutes of intraservice work time, and a work RVU of 0.48 for CPT code 20561 with 15 minutes of intraservice work time. We also considered crosswalking the work RVU of CPT code 20561 to the top reference code from the survey, CPT code 97140, at a work RVU of 0.43. However, we chose to employ the crosswalk to CPT codes 97113 and 97542 at a work RVU of 0.48 instead, due to the fact that the survey respondents indicated that CPT code 20561 was more intense than CPT code 97140.

We also proposed to designate CPT codes 20560 and 20561 as “always therapy” procedures, and we solicited comments on this designation. We

proposed the RUC-recommended direct PE inputs for all codes in the family.

We received public comments on the proposed valuation of the codes in the Trigger Point Dry Needling family. The following is a summary of the comments we received and our responses.

Comment: Several commenters disagreed with the CMS proposed work RVU of 0.32 for CPT code 20560 and stated that CMS should instead finalize the HCPAC-recommended work RVU of 0.45. Commenters stated that CMS disregarded all factors that go into work valuation apart from time, as well as minimized the understanding of the service on the part of the survey respondents. Commenters stated that the survey respondents recognized that CPT code 20560 is more intense and complex to perform than the top reference code, CPT code 97140, because it is an invasive procedure rather than non-invasive manual therapy. Commenters stated that 70 percent of the survey respondents that selected this key reference code indicated that CPT code 20560 requires more mental effort and judgment and 84 percent indicated that more physiological stress is involved. Commenters stated that noninvasive techniques do not have the same risks or skill requirement as procedures described by 20560, and that a higher level of education for the qualified health care professional is required in addition to a higher level of skill and focus during and following the procedure when performing CPT code 20560.

Response: In response to the first issue raised by the commenters regarding work valuation based on time values, we recognize that it would not be appropriate to develop work RVUs solely based on time given that intensity is also an element of work. We clarify again that we do not treat all components of physician time as having identical intensity. If we were to disregard intensity altogether, the work RVUs for all services would be developed based solely on time values and that is definitively not the case, as indicated by the many services that share the same time values but have different work RVUs. For more details on our methodology for developing work RVUs, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section II.N.2 of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80272 through 80277).

We also disagree with the commenters that CPT code 20560 is more intense and complex to perform than the top

reference code, CPT code 97140. Although it is true that a majority of survey respondents stated that CPT code 20560 requires more mental effort/judgment and additional physiological stress, 74 percent of the same survey respondents also stated that CPT code 20560 required less physical effort than CPT code 97140, which would suggest that the reviewed code instead has a lower intensity. We do not agree that the survey responses provide sufficient support for assigning a higher work RVU to CPT 20560 than CPT code 97140, especially given that this top reference code has 50 percent more intraservice time. We similarly do not agree that the intensity of the non-invasive manual therapy procedure described by CPT code 97140 is inherently lower on clinical grounds than the invasive procedure described by CPT code 20560. The manual therapy procedure described by CPT code 97140 has its own distinct type of skill requirements since there is more extensive direct contact between the practitioner and the patient than in CPT code 20560. We continue to believe that CPT code 20560 should not be valued at a higher rate than CPT code 97140, and therefore, we proposed a work RVU of 0.32 based on the aforementioned crosswalk to CPT code 36600.

Comment: Several commenters disagreed with the CMS proposed work RVU of 0.48 for CPT code 20561 and stated that CMS should instead finalize the HCPAC-recommended work RVU of 0.60. Commenters stated that CMS started with the work RVU they assigned to CPT code 20560 and then selected crosswalk codes that matched the intraservice time ratio between the codes in the family. Commenters stated that this is an erroneous methodology and, if finalized, would create a rank order anomaly between this and other similar services.

Response: We clarify that we did not use an intraservice time ratio to determine the work valuation of CPT code 20561. As we stated in the proposed rule, we proposed a work RVU of 0.48 based on a crosswalk to CPT codes 97113 and 97542 as both of these codes share the same work RVU of 0.48 and the same intraservice time of 15 minutes as CPT code 20561, with CPT code 97113 having 2 fewer minutes of total time and CPT code 97542 having 2 additional minutes of total time. We believe that the close match between the surveyed work time for CPT code 20561 and the work times of these two codes indicated that these three services should be valued similarly, and we disagree that the proposed work RVU would create a rank order anomaly due

to the close relationship between the work times of these codes. We noted in the proposed rule that the proposed work RVU of 0.48 for CPT code 20561 is an exact match of the intraservice time ratio between the two codes in the family; however, we cited this fact as supporting evidence and not as the primary basis for valuation. Although we did not use a time ratio for work valuation in this case, we continue to believe that the use of time ratios is one of several appropriate methods for identifying potential work RVUs for particular PFS services. For more details on our methodology for developing work RVUs, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section I.I.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80272 through 80277).

Comment: Several commenters provided the same rationale for CPT code 20561 in relation to the top reference code from the survey, CPT code 97140, as they had made for CPT code 20560. Commenters stated that the survey respondents recognized that CPT code 20561 is more intense and complex to perform than the top reference code, CPT code 97140, because it is an invasive procedure rather than non-invasive manual therapy. Commenters stated that 71 percent of the survey respondents that selected this key reference code indicated that CPT code 20560 requires more mental effort and judgment and 88 percent indicated that more physiological stress is involved. Commenters stated that noninvasive techniques do not have the same risks or skill requirement as procedures described by 20561, and that a higher level of education for the qualified health care professional is required in addition to a higher level of skill and focus during and following the procedure when performing CPT code 20561.

Response: We continue to disagree with the commenters that CPT code 20561 is more intense and complex to perform than the top reference code, CPT code 97140, for many of the same reasons that we cited in our response to the same comments regarding CPT code 20560. As we observed for the first code in the family, 69 percent of the same survey respondents also stated that CPT code 20561 required less physical effort than CPT code 97140, which would again suggest that the reviewed code instead has a lower intensity. Unlike CPT code 20560, we agree that CPT code 20561 should have a higher work RVU than CPT code 97140, which is

why we proposed a work RVU of 0.48 for the procedure. To the extent that the commenters are stating that CPT code 20561 should have a higher work RVU than CPT code 97140, we agree with the commenters and we proposed a work RVU accordingly. We do not agree with the commenters that CPT code 20561 should be valued nearly 50 percent higher than CPT code 97140 given their nearly identical work times and similar overall intensity.

Comment: One commenter agreed with the CMS proposal to designate CPT codes 20560 and 20561 as “always therapy” procedures. The commenter stated that acupuncturists would also use additional modalities and procedures in their scope along with these codes, and that these would not typically be billed independently.

Response: We appreciate the support for our proposals from the commenter.

Comment: Many commenters disagreed with the CMS proposal to designate CPT codes 20560 and 20561 as “always therapy” procedures. Commenters stated that these services may be performed by a wide range of professionals and that it may not be appropriate to bill the service under a therapy plan of care. Commenters also stated that assigning a designation of “always therapy” to these codes would be inconsistent with CMS’ designation of other CPT codes as “sometimes therapy” codes that could be appropriately provided either as therapy services or non-therapy services. Other commenters objected to the proposal by stating that dry needling codes should be placed in the surgical section of the CPT codebook, and that due to the invasive nature of these procedures using needles, they should only be performed by licensed medical physicians or licensed acupuncturists. Commenters urged CMS to change the designation of CPT codes 20560 and 20561 to “sometimes therapy” procedures.

Response: We appreciate the feedback from the commenters in providing additional information about which providers will bill these services, and the fact that it may not be appropriate to bill these service under a therapy plan of care. After consideration of the comments, we are not finalizing our proposal to designate CPT codes 20560 and 20561 as “always therapy” procedures. We believe that a “sometimes therapy” designation would be more appropriate if we were to designate these codes as therapy procedures.

Comment: One commenter stated that if CPT codes 20560 and 20561 are covered services under Medicare then

an acupuncturist should be a qualified health care professional and should be recognized by Medicare to provide this service. The commenter described some of the clinical benefits associated with acupuncture and stated again that acupuncturists should be recognized by Medicare to provide dry needling.

Response: We appreciate the feedback from the commenter regarding the practice of acupuncture. However, we did not make a proposal regarding the classification of acupuncturists, and therefore, this comment is out of scope.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the Trigger Point Dry Needling family as proposed. We are not finalizing these codes as “always” or “sometimes” therapy services because dry needling services are non-covered unless otherwise specified through a national coverage determination (NCD). Please refer to the NCD Manual, Section 30.3 at https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/Downloads/ncd103c1_Part1.pdf.

(5) Closed Treatment Vertebral Fracture (CPT Code 22310)

This service was identified through a screen of services with a negative IWP/UT and Medicare utilization over 10,000 for all services or over 1,000 for Harvard valued and CMS/Other source codes.

For CPT code 22310 (Closed treatment of vertebral body fracture(s), without manipulation, requiring and including casting or bracing), we disagreed with the recommended work-RVU of 3.75, stating that we did not think that this reduction in work RVU from the current value of 3.89 was commensurate with the RUC-recommended 33-minute reduction in intraservice time and 105-minute reduction in total time. We noted that while we understand that the RUC considers the current Harvard study time values for this service to be invalid estimations, we believed that a further reduction in work RVUs is warranted given the significance of the RUC-recommended reduction in physician time. We proposed a work RVU of 3.45 with a crosswalk to CPT code 21073 (*Manipulation of temporomandibular joint(s) (TMJ), therapeutic, requiring an anesthesia service (i.e., general or monitored anesthesia care)*), which has an identical intraservice time and similar total time as those proposed by the RUC for CPT code 22310 to more accurately account for the decrease in the surveyed work time.

For the direct PE inputs, we proposed to refine the equipment time for the

power table (EF031) to conform to our established policies for non-highly technical equipment.

We received public comments on the proposed valuation of the codes in the Closed Treatment Vertebral Fracture family. The following is a summary of the comments we received and our responses.

Comment: A few commenters stated that CMS is inappropriately comparing accurate survey time to Harvard time, which the commenter stated holds zero validity for comparison. The commenters further stated that our proposed value fails to acknowledge that the Harvard work value was much higher based on the Harvard study physician work times than the current work value of the service. One commenter noted that in the June 1991 proposed rule, the work RVU for 22310, based on the Harvard study, was 6.31, then, in the November 1991 final rule for the 1992 PFS, the work RVU was reduced to 1.95, and then in 1997, hospital and office visits were assigned by algorithm for practice expense (PE) purposes. The commenter stated that the entire history of value of this code is fraught with misestimations of time and the current work RVU of 3.89 has nothing to do with the Harvard study.

Response: We believe that it is crucial that the code valuation process take place with the understanding that the existing work times, used in the PFS ratesetting processes, are accurate. We recognize that adjusting work RVUs for changes in time is not always a straightforward process and that the intensity associated with changes in time is not necessarily always linear, which is why we apply various methodologies to identify several potential work values for individual codes. However, we reiterate that we believe it would be irresponsible to ignore changes in time based on the best data available and that we are statutorily obligated to consider both time and intensity in establishing work RVUs for PFS services. For additional information regarding the use of old work time values that were established many years ago and have not since been reviewed in our methodology, we refer readers to our discussion of the subject in the CY 2017 PFS final rule (81 FR 80273 through 80274).

We recognize that this code has undergone revisions and that the work value has changed significantly from the Harvard value. If we accept the commenter’s contention that the current work RVU is unrelated to the original Harvard work RVU, and we compare the time values to the original 1991 Harvard work value of 6.31, our proposed work

RVU continues to appear to be appropriate. A ratio of the change in intraservice time to the original RVU of 6.31 is 3.50; a ratio of the change in total time to the original work RVU of 6.31 is 2.38. These ratios suggest that our proposed RVU of 3.45 is a more accurate valuation than the RUC’s recommended RVU of 3.75. We continue to believe that a crosswalk to CPT code 21073, which describes manipulation under general or monitored care under anesthesia with manipulation of the TMJ, is appropriate. CPT code 22310 involves closed treatment without manipulation and the application of a brace, while CPT code 21073 involves anesthesia and manipulation; we believe the similar work and time of CPT code 21073 validates our work RVU of 3.45 for CPT Code 22310.

Comment: Several commenters stated that they agreed with our proposal to refine the equipment time for the power table (EF031) to conform to our established policies for non-highly technical equipment.

Response: We appreciate the support for our proposal from the commenters.

After consideration of the public comments, we are finalizing our work RVU of 3.45 as proposed. We are also finalizing the direct PE inputs as proposed.

(6) Tendon Sheath Procedures (CPT Codes 26020, 26055, and 26160)

The RUC identified these services through a screen of services with a negative IWP/UT and Medicare utilization over 10,000 for all services or over 1,000 for Harvard valued and CMS/Other source codes. For CPT code 26020 (Drainage of tendon sheath, digit and/or palm, each), we do not agree with the RUC-recommended work RVU of 7.79 based on the survey median. While we agree that the survey data validate an increase in work RVU, we see no compelling reason that this service would be significantly more intense to furnish than services of similar time values. Therefore, we proposed a work RVU of 6.84 which is the survey 25th percentile. As further support for this value, we note that it falls between the work RVUs of CPT code 28122 (*Partial excision (craterization, saucerization, sequestrectomy, or diaphysectomy) bone (e.g., osteomyelitis or bossing); tarsal or metatarsal bone, except talus or calcaneus*), with a work RVU of 6.76, and CPT code 28289 (*Hallux rigidus correction with cheilectomy, debridement and capsular release of the first metatarsophalangeal joint; without implant*), with a work RVU of 6.90; both codes have intraservice time values that are identical to, and total time values

that are similar to, the RUC-recommended time values for CPT code 26020.

For CPT code 26055 (*Tendon sheath incision (e.g., for trigger finger)*), we do not agree with the RUC recommendation to increase the work RVU to 3.75 despite a reduction in physician time. Instead, we proposed to maintain the current work RVU of 3.11; we are supporting this based on a total time increment methodology between the CPT code 26020 and CPT code 26055. The total time ratio between the recommended time of 119 minutes and the recommended 262 minutes for code 26020 equals 45 percent, and 45 percent of our proposed RVU of 6.84 for CPT code 26020 equals a work RVU of 3.10, which we believe validates the current work RVU of 3.11. We proposed the RUC-recommended work RVU of 3.57 for CPT code 26160 (*Excision of lesion of tendon sheath or joint capsule (e.g., cyst, mucous cyst, or ganglion), hand or finger*). We note that our proposed work RVUs validate the RUC's contention that CPT code 26160 is slightly more intense to perform than CPT code 26055.

For the direct PE inputs, we proposed to refine the quantity of the impervious staff gown (SB027) supply from 2 to 1 for CPT codes 26055 and 26160. We believe that the second impervious staff gown supply is duplicative due to the inclusion of this same supply in the surgical cleaning pack (SA043). The recommended materials state that a gown is worn by the practitioner and one assistant, which are provided by one standalone gown and a second gown in the surgical cleaning pack.

We received public comments on the proposed valuation of the codes in the Tendon Sheath Procedures family. The following is a summary of the comments we received and our responses.

Comment: A few commenters stated that, for CPT code 26020, our supporting reference codes, CPT code 28122 and CPT code 28289, are inappropriate in that they have lower total time values than the surveyed total time of CPT code 26020, and that this reflects that these two reference codes typically involve a patient who is discharged within 23 hours of the procedure and are less intense. The commenter stated that the RUC's recommendation of the median survey value for CPT code 26020 is necessary because even at the survey median, the intraoperative intensity (0.027), is so low that there are no comparator codes with a lower work RVU. This commenter also stated that the survey 25th percentile work RVU would vastly underestimate the physician work,

resulting in an intraoperative intensity of 0.006—or essentially zero.

Response: For CPT code 26020, we continue to believe that the RUC's recommended work RVU of 7.79 is disproportionately high, as it represents a 35 percent increase in work despite a 5 minute increase in intraservice time and a 30 minute increase in total time. We believe our proposal to value CPT code 26020 with the survey 25th percentile, which represents a roughly 26 percent increase is more proportionate. Further, we note that our proposed value recognizes the work inherent in this procedure, including the requisite inpatient monitoring, as it lies within the top quartile of all 90-day global period codes with an intraservice time of 45 minutes. We recognize that the relatively high total time value for this code results in a relatively low intensity value, however we continue to believe that our value appears to be consistent with other relatively low-intensity procedures of similar times. The intensity value that results from our proposed work RVU is extremely close to that which results from the RUC's recommended work RVU, and therefore, we continue to think that our value adequately reflects the work inherent in the procedure.

Comment: One commenter stated that our proposal to maintain the current work RVU for CPT code 26055 indicates that we inappropriately noted that the reduction in time should exactly correlate with a reduction in work RVU. The current times are based on a 2005 survey but the current work RVU is based on the Harvard study. The commenter stated that CMS should not compare the old times relative to the work RVU. The commenter disagreed with use of an incremental methodology to value CPT code 26055, as it inaccurately treats all components of the physician time as having identical intensity. In addition, the commenter stated maintaining the current work RVU for CPT code 26055 results in an inappropriately low intensity of 0.011 which does not reflect an open surgical procedure typically performed in a facility under moderate sedation and is not much higher than the assigned value for pre-service scrub/dress/wait time.

Response: We do not believe that our proposal assumes that the reduction in time for this service should exactly correlate with a reduction in work RVU; a proportionate reduction based solely on time would result in a lower RVU than that proposed. As discussed elsewhere in this rule, we believe that our operating assumption regarding the validity of the existing values as a point of comparison is critical to the integrity

of the relative value system as currently constructed. We believe the use of an incremental difference between codes is a valid methodology for setting values, especially in valuing services within a family of revised codes where it is important to maintain appropriate intra-family relativity. Historically, we have frequently utilized an incremental methodology in which we value a code based upon its incremental difference between another code or another family of codes. We note that the RUC has also used the same incremental methodology on occasion when it was unable to produce valid survey data for a service. We have no evidence to suggest that the use of an incremental difference between codes conflicts with the statute's definition of the work component as the resources in time and intensity required in furnishing the service. For more details on our methodology for developing work RVUs, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section II.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80272 through 80277). We continue to believe that our proposed work RVU maintains the proportionate relationship with CPT code 26020.

We continue to believe that comparisons to similar procedures of similar time values indicate that our proposed value accurately reflects the intensity inherent in the procedure.

Comment: Several commenters disagreed with the CMS proposal to refine the quantity of the impervious staff gown (SB027) supply from 2 to 1 for CPT codes 26055 and 26160 and stated that this gown was not duplicative. Commenters stated that two gowns are required in the procedure room (for the practitioner and a clinical staff member) and a separate gown is required, typically for a second clinical staff individual, for the cleaning of instruments in a separate room. Commenters stated that the US Department of Labor, Occupational Safety and Health Administration (OSHA) regulations require that all personal protective equipment must be removed prior to leaving the work area, which includes removing the impervious staff gown worn during the procedure, and therefore, necessitating the inclusion of another gown as a supply input.

Response: We appreciate the additional information provided by the commenters regarding the number of impervious staff gowns typically used in these procedures. As a result of this additional information, we are not

finalizing our proposed refinement to reduce the quantity of the impervious staff gown (SB027) supply from 2 to 1 for CPT codes 26055 and 26160. We are instead finalizing the RUC-recommended direct PE inputs for all three codes in the family.

After consideration of the public comments, we are finalizing our proposed work RVUs of 6.84 for CPT code 26020, 3.11 for CPT code 26055, and 3.57 for CPT code 26160. We are finalizing the RUC-recommended direct PE inputs for all three codes in the family as stated previously.

(7) Closed Treatment Fracture—Hip (CPT Code 27220)

This service was identified through a screen of services with a negative IWP/UT and Medicare utilization over 10,000 for all services or over 1,000 for Harvard valued and CMS/Other source codes. For CPT code 27220 (*Closed treatment of acetabulum (hip socket) fracture(s); without manipulation*), we disagree with the RUC-recommended work RVU of 6.00 based on the survey median value, because we do not believe that this reduction in work RVU from the current value of 6.83 is commensurate with the RUC-recommended a 19-minute reduction in intraservice time and an 80-minute reduction in total time. While we understand that the RUC considers the current Harvard study time values for this service to be invalid estimations, we believe that a further reduction in work RVUs is warranted given the significance of the RUC-recommended reduction in physician time. We believe that it would be more accurate to propose the survey 25th percentile work RVU of 5.50, and we are supporting this value with a crosswalk to CPT code 27267 (*Closed treatment of femoral fracture, proximal end, head; without manipulation*) to account for the decrease in the surveyed work time.

For the direct PE inputs, we proposed to refine the equipment time for the power table (EF031) to conform to our established policies for non-highly technical equipment.

We received public comments on the proposed valuation of the Closed Treatment Fracture—Hip code. The following is a summary of the comments we received and our responses.

Comment: A few commenters disagreed with our proposal, stating that it relies on a comparison of accurate survey time to Harvard time, the latter of which they stated holds zero validity for comparison.

Response: We believe that it is crucial that the code valuation process take place with the understanding that the

existing work times, used in the PFS ratesetting processes, are accurate. We recognize that adjusting work RVUs for changes in time is not always a straightforward process and that the intensity associated with changes in time is not necessarily always linear, which is why we apply various methodologies to identify several potential work values for individual codes. However, we reiterate that we believe it would be irresponsible to ignore changes in time based on the best data available and that we are statutorily obligated to consider both time and intensity in establishing work RVUs for PFS services. For additional information regarding the use of old work time values that were established many years ago and have not since been reviewed in our methodology, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section II.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80273 through 80274).

Comment: One commenter stated that reducing the work RVU of this service based on a comparison to the current work value does not adequately take into account that the current value reflects adjustments made to the original Harvard work RVU in various rule cycles over many years to account for increases in the E/M services included in the global period of this service. A downward adjustment to the work RVU would essentially reverse increases that have been made to account for this post-operative work.

Response: We disagree that reducing the work RVU ignores the value of the E/M services included in the global period; while the Harvard work values for services such as this one have been adjusted upward in previous years to account for these services, we nevertheless have included the surveyed work time in our analysis of this code; and this surveyed time includes post-operative work. Our proposed work RVU was not based solely on the reduction in time. We note that our crosswalk code, CPT code 27267 (*Closed treatment of femoral fracture, proximal end, head; without manipulation*) includes a similar amount of postoperative work, and therefore, we believe that our value adequately reflects this work.

Comment: The RUC commented that our proposed work RVU will inappropriately value this service equally to the work RVU of the survey key reference service, CPT code 27267, and the latter has significantly less pre-service time, and is thus not an appropriate crosswalk. Furthermore, our

proposed value does not adequately correct the negative IWP/UT resulting from the current value, stating that the resulting IWP/UT of 0.008 is essentially zero.

Response: We continue to believe that CPT code 27267 is an appropriate crosswalk; both procedures involve closed treatment of hip without manipulation. While the derived intensity value that results from our proposed value of 5.50 is lower than that which results from the RUC's value, it is only negligibly so, with a difference of 0.033 in IWP/UT.

Comment: A commenter stated that they agreed with our proposal to refine the equipment time for the power table (EF031) to conform to our established policies for non-highly technical equipment.

Response: We appreciate the support for our proposals from the commenter.

After consideration of the public comments, we are finalizing as proposed a work RVU of 5.50 for CPT code 27220. We are also finalizing the direct PE inputs as proposed.

(8) Arthrodesis—Sacroiliac Joint (CPT Code 27279)

In the CY 2018 PFS final rule (82 FR 53017), CPT code 27279 (*Arthrodesis, sacroiliac joint, percutaneous or minimally invasive (indirect visualization), with image guidance, includes obtaining bone graft when performed, and placement of transfixing device*) was nominated for review by stakeholders as a potentially misvalued service. We stated that CPT code 27279 is potentially misvalued, and that a comprehensive review of the code values was warranted. This code was subsequently reviewed by the RUC. According to the specialty societies, the previous 2014 survey of CPT code 27279, was based on flawed methodology that resulted in an underestimation of intraoperative intensity. When CPT code 27279 was surveyed in 2014, there was a low rate of response. Due to the dearth of survey data and the RUC's agreement with the specialty society at the time that the survey respondents had somewhat overvalued the work involved in performing this service, the RUC used a crosswalk to CPT code 62287 (*Decompression procedure, percutaneous, of nucleus pulposus of intervertebral disc, any method utilizing needle based technique to remove disc material under fluoroscopic imaging or other form of indirect visualization, with discography and/or epidural injection(s) at the treated level(s), when performed, single or multiple levels, lumbar*) to recommend a work RVU of 9.03. The

specialty societies indicated that with increased and broader utilization of this technique, the 2018 survey is a more robust assessment of physician work and intensity and provides more data with which to make a crosswalk recommendation. According to the RUC, there is no compelling evidence that the physician work, intensity or complexity has changed for this service.

We proposed to maintain the current work RVU of 9.03 as recommended by the RUC. A stakeholder stated that maintaining this RVU would constitute the continued undervaluation of this service, and that this would incentivize use of a more intensive and invasive procedure, CPT code 27280 (*Arthrodesis, open, sacroiliac joint, including obtaining bone graft, including instrumentation, when performed*), as well as incentivize this service to be inappropriately furnished on an inpatient basis. This stakeholder has requested that, in the interest of protecting patient access, we implement payment parity between the two services by proposing to crosswalk the work RVU of CPT code 27279 to that of CPT code 27280, which has a work RVU of 20.00. While we proposed the RUC-recommended work RVU, we solicited public comment on whether an alternative valuation of 20.00 would be more appropriate. This alternative valuation would recognize relative parity between these two services in terms of the work inherent in furnishing them.

We proposed the RUC-recommended direct PE inputs for CPT code 27279.

We received public comments on the proposed valuation of the Arthrodesis—Sacroiliac Joint code. The following is a summary of the comments we received and our responses.

Comment: A commenter questioned how the most recent stakeholder comment was obtained, since the RUC recommendations are not public until after the publication of the proposed rule. The commenter stated that the recent stakeholder comment could not have been received by CMS via the formal comment process, and questioned if the comment was communicated via the passing of verbal comment between individuals at the RUC meeting or someone gained confidential information inappropriately. The commenter stated the reason this service was reviewed in 2019 is because it was nominated by a stakeholder that it may be undervalued.

Response: This communication between the agency and a stakeholder was not inappropriate. When considering potential valuation for services on the PFS, we may take into

account information provided to us by stakeholders including specialty societies that may have participated in the RUC process but did not agree with what was submitted as part of the RUC's recommendations. In any event, we reiterate that the stakeholder's argument that the service is undervalued refers to the current valuation of the service.

Comment: The RUC restated that it had determined that there is not compelling evidence to revalue this procedure as the intensity required to perform CPT code 27279 has not changed. With no convincing rationale that the physician work, intensity or complexity has changed for this service, the RUC recommended to maintain the work RVU of 9.03 for CPT code 27279. The RUC did not believe that CPT code 27279 should be valued with a direct crosswalk to CPT code 27280, stating that the latter is vastly different than CPT code 27279 because it is an open procedure that includes instrumentation, requires double the amount of intra-service time to perform, and is more intense and complex to perform.

Many commenters stated that the work RVU of CPT code 27279 is undervalued, and stated that the service is complex and intense and involves significant risk and preoperative work. Commenters presented study results that demonstrate the advantages of this procedure over the open procedure, stating that it is minimally invasive and has vastly improved outcomes. Some commenters cited studies that they noted demonstrate cost-effectiveness metrics and patient reported outcome improvements that are better than nearly all orthopaedic and spinal procedures, and more cost-efficient than ongoing nonoperative care. Commenters stated that, while the procedure described by CPT code 27279 is less invasive than the open procedure; it nevertheless is similar in terms of intensity, as it requires significant pre and postoperative care, image guidance, and monitoring. A commenter cited risk associated with placement of the guide wires which may result in damage to vital structures including spinal nerve roots, blood vessels, and viscera. Similarly, commenters cited risks inherent in spinal procedures such as bleeding, infection, and pseudoarthrosis. One commenter discussed insertion of pins and pegs that run the risk of violating the sacral foramina creating radiculopathies. In addition, a commenter mentioned the potential for postoperative hematomas. Other risks cited include considerable risk of nerve damage, vascular compressions and iatrogenic fractures

caused by misplacement of the guide wires, broaches and large implants. According to a commenter, the anatomy involved in this procedure is more complex than for a discectomy or decompression laminectomy. Commenters stated that the procedure is significantly more intense than the crosswalk code that its current value was originally based on, CPT code 62287 (*Decompression procedure, percutaneous, of nucleus pulposus of intervertebral disc, any method utilizing needle based technique to remove disc material under fluoroscopic imaging or other form of indirect visualization, with discography and/or epidural injection(s) at the treated level(s), when performed, single or multiple levels, lumbar*). The commenters stated that this procedure requires special skill given the complexity of the anatomy and extensive preoperative time.

Commenters offered various suggestions for a more appropriate valuation for CPT code 27279; many commenters stated that 27279 is more appropriately valued with a work RVU of 20.00, as it is comparable in time and intensity to CPT code 27280. One commenter suggested a work RVU of 14.23 which resulted from a regression analysis of surveys. Other suggested crosswalk codes offered by commenters include CPT codes 63030 (*Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; 1 interspace, lumbar*), with a work RVU of 13.18, 63047 (*Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [e.g., spinal or lateral recess stenosis]), single vertebral segment; lumbar*), with a work RVU of 15.37, 22551 (*Arthrodesis, anterior interbody, including disc space preparation, discectomy, osteophyctomy and decompression of spinal cord and/or nerve roots; cervical below C2*), with a work RVU of 25.00, 27245 (*Treatment of intertrochanteric, peritrochanteric, or subtrochanteric femoral fracture; with intramedullary implant, with or without interlocking screws and/or cerclage*) with a work RVU of 18.18, 27130 (*Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip arthroplasty), with or without autograft or allograft*), with a work RVU of 20.72, 22612 (*Arthrodesis, posterior or posterolateral technique, single level; lumbar (with lateral transverse technique, when performed)*) with a

work RVU of 23.53, 63040 (*Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc, reexploration, single interspace; cervical*) with an RVU of 20.31, 63042 (*Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc, reexploration, single interspace; lumbar*) with an RVU of 18.76, 63045 (*Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [e.g., spinal or lateral recess stenosis]), single vertebral segment; cervical*) with a work RVU of 17.95, and 63046 (*Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [e.g., spinal or lateral recess stenosis]), single vertebral segment; thoracic*) with a work RVU of 17.25.

Response: Commenters have provided extensive evidence that leads us to believe that the current work RVU understates the inherent intensity of the procedure. We agree with the RUC's longstanding contention that survey data is critical in determining appropriate valuation of services. The fact that this code is valued based on a crosswalk from 2014 rather than on updated survey data raised concerns. The RUC's survey data, as well as extensive stakeholder comment indicates to us that this service continues to be undervalued.

We agree with the RUC that CPT code 27279 would not be accurately valued identically to the analogous open procedure CPT code 27280, as the latter is substantially more complex and requires twice the amount of intraservice time to perform. Therefore, finalizing an equivalent value for these two services would introduce a rank-order anomaly. While we are persuaded by extensive public comment that this service as currently valued does not adequately reflect the work inherent in performing the procedure, we note that all of the crosswalk codes recommended by commenters involve significantly more physician time than that required for CPT code 27279, and values crosswalked to these codes would not maintain appropriate rank-order between CPT codes 27279 and 27280, and would in many instances result in a valuation that is higher than that of the open procedure, CPT code 27280. We believe it is preferable to value this

service in close adherence to the surveyed time values. After consideration of the comments, we are finalizing a work RVU of 12.13 with a direct crosswalk to CPT code 57288 (*Sling operation for stress incontinence (e.g., fascia or synthetic)*), which describes an open procedure of similar intensity. This procedure has an identical intraservice time value and similar total time value. We believe that the description of this service and its work and time values indicate that it is a strong crosswalk and a work RVU of 12.13 is a more accurate valuation for this service. We believe a value crosswalked to this service more accurately reflects the work inherent in performing the procedure while accounting for the surveyed work time.

After consideration of the public comments, we are finalizing a work RVU of 12.13 for this service. We are also finalizing the direct PE inputs as proposed.

(9) Pericardiocentesis and Pericardial Drainage (CPT Code 33016, 33017, 33018, and 33019)

CPT code 33015 (*Tube pericardiostomy*) was identified as potentially misvalued on a Relativity Assessment Workgroup (RAW) screen of codes with a negative IWPUT and Medicare utilization over 10,000 for all services or over 1,000 for Harvard valued and CMS or other source codes. In September 2018, the CPT Editorial Panel deleted four existing codes and created four new codes to describe pericardiocentesis drainage procedures to differentiate by age and to include imaging guidance.

We proposed to refine the work RVU for all four codes in the family. We disagree with the RUC-recommended work RVU of 5.00 for CPT code 33016 (*Pericardiocentesis, including imaging guidance, when performed*) and proposed a work RVU of 4.40 based on a crosswalk to CPT code 43244 (*Esophagogastroduodenoscopy, flexible, transoral; with band ligation of esophageal/gastric varices*). CPT code 43244 shares the same intraservice time of 30 minutes with CPT code 33016 and has a slightly longer total time of 81 minutes as compared to 75 minutes for the reviewed code. In our review of CPT code 33016, we noted that the recommended intraservice time as compared to the current initial pericardiocentesis procedure (CPT code 33010) is increasing from 24 minutes to 30 minutes (25 percent), and the recommended total time is remaining the same at 75 minutes; however, the RUC-recommended work RVU is increasing from 1.99 to 5.00, which is an

increase of 151 percent. Although we did not imply that the decrease in time as reflected in survey values must equate to a one-to-one or linear increase in the valuation of work RVUs, we believe that since the two components of work are time and intensity, modest increases in time should be appropriately reflected with a commensurate increase the work RVUs. We also conducted a search in the RUC database among 0-day global codes with 30 minutes of intraservice time and comparable total time of 65–85 minutes. Our search identified 49 codes and all 49 of these codes had a work RVU lower than 5.00. We do not believe that it would serve the interests of relativity to establish a new maximum work RVU for this range of time values.

As a result, we believe that it is more accurate to propose a work RVU of 4.40 for CPT code 33016 based on a crosswalk to CPT code 43244 to account for these modest increases in the surveyed work time as compared to the predecessor pericardiocentesis codes. We are aware that CPT code 33016 is bundling imaging guidance into the new procedure, which was not included in the previous pericardiocentesis codes. However, we do not believe that the recoding of the services in this family has resulted in an increase in their intensity, only a change in the way in which they will be reported, and therefore, we do not believe that it would serve the interests of relativity to propose the RUC-recommended work values for all of the codes in this family. We also note that, through the bundling of some of these frequently reported services, it is reasonable to expect that the new coding system will achieve savings via elimination of duplicative assumptions of the resources involved in furnishing particular services. For example, a practitioner would not be carrying out the full preservice work twice for CPT codes 33010 and 76930, but preservice times were assigned to both codes under the old coding. We believe the new coding assigns more accurate work times, and thus, reflects efficiencies in resource costs that existed but were not reflected in the services as they were previously reported. If the addition of imaging guidance had made the new CPT codes significantly more intense to perform, we believe that this would have been reflected in the surveyed work times, which were largely unchanged from the predecessor codes.

We disagree with the RUC-recommended work RVU of 5.50 for CPT code 33017 (*Pericardial drainage with insertion of indwelling catheter, percutaneous, including fluoroscopy*

and/or ultrasound guidance, when performed; 6 years and older without congenital cardiac anomaly) and proposed a work RVU of 4.62 based on a crosswalk to CPT code 52234 (*Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; SMALL bladder tumor(s) (0.5 up to 2.0 cm)*). CPT code 52234 shares the same intraservice time of 30 minutes with CPT code 33017 and has 2 additional minutes of total time at 79 minutes as compared to 77 minutes for the reviewed code. In our review of CPT code 33017, we noted many of the same issues that we had raised with CPT code 33016, in particular with the increase in the work RVU greatly exceeding the increase in the surveyed work times as compared to the predecessor pericardiocentesis codes. We searched the RUC database again for 0-day global codes with 30 minutes of intraservice time and comparable total time of 67–87 minutes. Our search identified 43 codes and again all 43 of these codes had a work RVU lower than 5.0. As we stated with regard to CPT code 33016, we do not believe that it would serve the interests of relativity to establish a new maximum work RVU for this range of time values. We believe that it is more accurate to propose a work RVU of 4.62 for CPT code 33017 based on a crosswalk to CPT code 52234 based on the same rationale that we detailed with regards to CPT code 33016.

We disagree with the RUC-recommended work RVU of 6.00 for CPT code 33018 (*Pericardial drainage with insertion of indwelling catheter, percutaneous, including fluoroscopy and/or ultrasound guidance, when performed; birth through 5 years of age, or any age with congenital cardiac anomaly*) and proposed a work RVU of 5.00 based on the survey 25th percentile value. In our review of CPT code 33018, we noted many of the same issues that we had raised with CPT codes 33016 and 33017, in particular with the increase in the work RVU greatly exceeding the increase in the surveyed work times as compared to the predecessor pericardiocentesis codes. The recommended work RVU of 6.00 was based on a crosswalk to CPT code 31603 (*Tracheostomy, emergency procedure; transtracheal*), which shares the same intraservice time of 30 minutes with CPT code 33018 and very similar total time. While we agree that CPT code 31603 is a close match to the surveyed work times for CPT code 33018, we do not believe that it is the most accurate choice for a crosswalk due to the fact that CPT code 31603 is

a clear outlier in work valuation. We searched for 0-day global codes in the RUC database with 30 minutes of intraservice time and a comparable 90–120 minutes of total time. There were 21 codes that met this criteria, and the recommended crosswalk to CPT code 31603 had the highest work RVU of any of these codes at the recommended 6.00. Furthermore, there was only one other code with a work RVU above 5.00, another tracheostomy procedure described by CPT code 31600 (*Tracheostomy, planned (separate procedure)*) at a work RVU of 5.56. None of the other codes had a work RVU higher than 4.69, and the median work RVU of the group comes out to only 4.00. The two tracheostomy procedures have work RVUs more than a full standard deviation above any of the other codes in this group of 0-day global procedures.

We do not mean to suggest that the work RVU for a given service must always fall in the middle of a range of codes with similar time values. We recognize that it would not be appropriate to develop work RVUs solely based on time given that intensity is also an element of work. Were we to disregard intensity altogether, the work RVUs for all services would be developed based solely on time values and that is definitively not the case, as indicated by the many services that share the same time values but have different work RVUs. However, we also do not believe that it would serve the interests of relativity by crosswalking the work RVU of CPT code 33018 to tracheostomy procedures that are higher than anything else in this group of codes, procedures that we believe to be outliers due to the serious risk of patient mortality associated with their performance. We believe that it is this patient risk which is responsible for the otherwise anomalously high intensity in CPT codes 31600 and 31603. Therefore, we proposed a work RVU of 5.00 for CPT code 33018 based on the survey 25th percentile, which we believe more accurately captures both the time and intensity associated with the procedure.

We disagree with the RUC-recommended work RVU of 5.00 for CPT code 33019 (*Pericardial drainage with insertion of indwelling catheter, percutaneous, including CT guidance*) and proposed a work RVU of 4.29 based on the survey 25th percentile value. In our review of CPT code 33019, we noted many of the same issues that we had raised with CPT codes 33016–33018, in particular with the increase in the work RVU greatly exceeding the increase in the surveyed work times as compared to the predecessor pericardiocentesis

codes. We searched for 0-day global codes in the RUC database with 30 minutes of intraservice time (slightly higher than the 28 minutes of intraservice time in CPT code 33019) and a comparable 70–100 minutes of total time. Our search identified 45 codes and again all 45 of these codes had a work RVU lower than 5.00, which led us to believe that the recommended work RVU for CPT code 33019 was overvalued. We also compared CPT code 33019 to the most similar code in the family, CPT code 33017, and noted that the survey respondents indicated that CPT code 33019 should have a lower work RVU at both the survey 25th percentile and survey median values. Therefore, we proposed a work RVU of 4.29 for CPT code 33019 based on the survey 25th percentile value. We are supporting this proposal with a reference to CPT code 31254 (*Nasal/sinus endoscopy, surgical with ethmoidectomy; partial (anterior)*), a recently-reviewed code with an intraservice work time of 30 minutes, a total time of 84 minutes, and a work RVU of 4.27.

The RUC did not recommend and we did not propose any direct PE inputs for the codes in this family.

We received public comments on the proposed valuation of the codes in the Pericardiocentesis and Pericardial Drainage family. The following is a summary of the comments we received and our responses.

Comment: Several commenters stated the crosswalk or methodology used in the original valuation of CPT code 33015 is unknown and not resource-based, and therefore, it was invalid for CMS to compare the current time and work to the surveyed time and work of the newly created codes in the family. Commenters also stated since CPT codes 33010 and 33015 were last valued, there has been a change in the patient population; patients who receive these services have become more complex, acute, and heterogeneous. Commenters stated that several of these deleted codes being bundled into the new codes have negative intensities, which indicated a very anomalous relationship between the current work RVUs and the current work times.

Response: We disagree with the commenter that it was invalid to compare the current time and work to the surveyed time and work. We believe it is crucial that the code valuation process take place with the understanding that the existing work times used in the PFS ratesetting processes are accurate. We recognize that adjusting work RVUs for changes in time is not always a straightforward

process and that the intensity associated with changes in time is not necessarily always linear. That is why we apply various methodologies to identify several potential work values for individual codes. However, we reiterate that we believe it would be irresponsible to ignore changes in time based on the best data available, and that we are statutorily obligated to consider both time and intensity in establishing work RVUs for PFS services. For additional information regarding the use of old work time values that were established many years ago and have not since been reviewed in our methodology, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section II.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80273 through 80274).

Comment: Several commenters disagreed with the CMS proposed work RVU of 4.40 for CPT code 33016 and stated that CMS should instead finalize the RUC-recommended work RVU of 5.00. Commenters stated that CPT code 33016 is one of the more intense procedures that interventional cardiologists perform, with two of the most common complications being either lacerating the coronary artery or puncturing the right ventricle, either of which can be fatal. Commenters stated that the reduction in intensity for CPT code 33016 proposed by CMS would establish this service out of rank order with other services in the PFS, including the proposed crosswalk code. Commenters stated that the upper endoscopy service described by CPT code 43244 involves less work and less risk than performing CPT code 33016, even considering that the typical patient for CPT code 43244 presents with hematemesis, and therefore, it is not an appropriate crosswalk.

Response: We agree with the commenters that CPT code 33016 is a highly intense procedure with life-threatening risks to the patient. This is the reason we crosswalked the work RVU to CPT code 43244, a similarly high intensity Esophagogastroduodenoscopy procedure that involves inserting a flexible upper endoscope through the mouth and esophagus into the proximal stomach, then insufflating the stomach with air after suctioning its liquid contents to perform an examination of the entire stomach in the forward and retroflexed position. We note as well that our proposed work RVU of 4.40 for CPT code 33016 results in a higher intensity for the code than for CPT code 43244. We agree with the commenters

that CPT code 33016 should have the higher intensity between the two codes, which is what we proposed.

We also mentioned in the proposed rule that we had conducted a search in the RUC database among 0-day global codes with 30 minutes of intraservice time and comparable total time of 65–85 minutes. We mentioned that our search identified 49 codes and all 49 of these codes had a work RVU lower than the recommended 5.00. We add that out of those 49 codes identified by our search, only 3 of them had a work RVU higher than the proposed 4.40: CPT code 37191 (*Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed*) at a work RVU of 4.46, CPT code 45385 (*Colonoscopy, flexible; with removal of tumor(s), polyp(s), or other lesion(s) by snare technique*) at a work RVU of 4.57, and CPT code 52234 (*Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; SMALL bladder tumor(s) (0.5 up to 2.0 cm)*) at a work RVU of 4.62. Our proposed valuation for CPT code 33016 recognizes the dangerous nature of the procedure and places it above the 90th percentile of the distribution of codes with similar work times. However, as we stated in the proposed rule, we do not believe that it would serve the interests of relativity to establish a new maximum work RVU that goes beyond this range of time values. We do not believe that the recoding of the services in this family has resulted in an increase in their intensity, only a change in the way in which they will be reported, and through the bundling of some of these frequently reported services, it is reasonable to expect that the new coding system will achieve savings via elimination of duplicative assumptions of the resources involved in furnishing particular services. We believe the new coding assigns more accurate work times, and thus, reflects efficiencies in resource costs that existed but were not reflected in the services as they were previously reported. If the addition of imaging guidance had made the new CPT codes significantly more intense to perform, we believe that this would have been reflected in the surveyed work times, which were largely unchanged from the predecessor codes.

Comment: Several commenters disagreed with the CMS proposed work RVU of 4.62 for CPT code 33017 and stated that CMS should instead finalize the RUC-recommended work RVU of

5.50. Commenters stated that CPT code 52234 was not an appropriate crosswalk code as it is a planned procedure, whereas code 33017 is typically emergent and more intense as the patient has acute hemodynamic instability.

Response: We disagree with the commenters that CPT code 52234 is not an appropriate crosswalk code on the grounds that it is a planned procedure. We continue to believe that the nature of the PFS relative value system is that all services are appropriately subject to comparisons to one another. Although codes that describe clinically similar services are sometimes stronger comparator codes, we do not agree that codes must share the same site of service, patient population, or utilization level to serve as an appropriate crosswalk. To the extent that commenters stated that CPT code 33017 is a more intense procedure than CPT code 52234, we agree with the commenters, which is why we proposed a higher intensity for CPT code 33017 in the proposed rule.

Comment: Several commenters stated that the proposed work RVU increment between CPT codes 33016 and 33017 (0.22) does not align with the relative increased difficulty and additional work involved in performing CPT code 33017. Commenters stated that CPT code 33017 includes all work of CPT code 33016, with the addition of suturing an indwelling catheter in place, as well as the work of managing that catheter, and is an emergent procedure as opposed to a planned procedure. Commenters stated that the intensity of the proposed value for CPT code 33017 is only 5 percent higher than CPT code 33016, and that this would be insufficient.

Response: We agree with the commenters that CPT code 33017 is a more intense procedure than CPT code 33016, which is why we proposed a higher intensity for this emergent procedure. However, we do not agree with the commenters that this greater intensity justifies the RUC-recommended work increment of 0.50 work RVUs between the two procedures. We believe that if CPT code 33017 typically required a significant amount of additional work in comparison to CPT code 33016, it would have been reflected in the surveyed work times for the two procedures. Instead, the surveyed work times are nearly identical between the two procedures, with the same intraservice time and only 2 additional minutes of total time for CPT code 33017, 77 minutes in comparison to 75 minutes. Absent evidence of additional work time from the survey respondents,

we continue to believe that the proposed work RVU and proposed intensity for CPT code 33017 accurately capture the increased difficulty of the procedure in comparison to CPT code 33016.

Comment: Several commenters disagreed with the CMS proposed work RVU of 5.00 for CPT code 33018 and stated that CMS should instead finalize the RUC-recommended work RVU of 6.00. Commenters stated that the typical patient for CPT code 33018 is a small child, and that since there is less space for fluid to accumulate in a small child, the target-zone is smaller for the needle, and therefore, the procedure is more intense than the other codes in the family. Commenters stated that the proposed intensity of CPT code 33018 is nearly identical to the proposed intensity for CPT code 33016, a relatively less intense service to perform, which would create a rank order anomaly within the family with respect to intensity.

Response: We appreciate the additional information from the commenters highlighting the pediatric nature of the patient population for CPT code 33018, and the potential for a rank order anomaly within the family with respect to intensity at the proposed work valuation. We agree with the commenters that CPT code 33018 should have the highest intensity among the four codes in this family.

Therefore, we are finalizing a work RVU of 5.40 for CPT code 33018 based on the RUC-recommended incremental relationship between this code and CPT code 33016 (a difference of 1.00 RVUs), which we are applying to our proposed value for the latter code. This work RVU will result in CPT code 33018 having the highest intensity out of the four codes in the family, in recognition of the additional difficulty and complexity of its pediatric patient population. We considered finalizing the RUC-recommended work RVU of 6.00 for CPT code 33018, which is based on a crosswalk to the emergency tracheostomy procedure described by CPT code 31603. However, we continue to have reservations about the use of this code as a crosswalk, as we believe that CPT code 31603 is a clear outlier in work valuation. As we stated in the proposed rule, the recommended crosswalk to CPT code 31603 had the highest work RVU among all of the codes in the RUC database with similar work time values, with only one other code in this group (CPT code 31600, another emergency tracheostomy procedure) having a work RVU higher than 4.69. These two tracheostomy procedures have work RVUs more than

a full standard deviation above any of the other codes in this group of 0-day global procedures, and we believe these two codes to be outliers due to the serious risk of patient mortality associated with their performance. We believe that it is more accurate to use the RUC-recommended incremental relationship between this code and CPT code 33016 and finalize a work RVU of 5.40 for CPT code 33018, which recognizes the increased intensity of the procedure without crosswalking it to an outlier code with much greater risk of patient mortality.

Comment: Several commenters disagreed with the CMS proposed work RVU of 4.29 for CPT code 33019 and stated that CMS should instead finalize the RUC-recommended work RVU of 5.00. Commenters stated that the proposed work RVU for CPT code 33019 would create a rank order anomaly with respect to CPT code 33016. Commenters stated that although both procedures have distinct attributes, they both involve an identical amount of physician work.

Response: We disagree with the commenters that CPT codes 33016 and 33019 involve the identical amount of work. The survey respondents clearly did not believe that these two codes shared the same amount of work, as the surveys produced distinctly different work RVUs at the 25th percentile (5.00 against 4.29), the median (6.00 against 5.00), and the 75th percentile (7.85 against 5.44) for CPT codes 33016 and 33019, respectively. The survey respondents also recorded different intraservice times (30 minutes against 28 minutes) and total times (75 minutes against 84 minutes) for the two procedures. We believe that the survey data clearly demonstrates that CPT code 33019 should be valued at a lower work RVU than 33016, and we continue to believe that it was more accurate to propose a work RVU of 4.29 based on the survey 25th percentile.

After consideration of the public comments, we are finalizing the work RVUs for the codes in the Pericardiocentesis and Pericardial Drainage family as proposed, with the exception of CPT code 33018 where we are instead finalizing a work RVU of 5.40. We are also finalizing our proposal to have no direct PE inputs for these codes.

(10) Pericardiotomy (CPT Codes 33020 and 33025)

The RUC identified services with a negative IWP/UT and Medicare utilization over 10,000 for all services or over 1,000 for Harvard valued and CMS/Other source codes. CPT code 33020

(*Pericardiotomy for removal of clot or foreign body (primary procedure)*) and CPT code 33025 (*Creation of pericardial window or partial resection for drainage*) were surveyed for April 2018.

We disagreed with the RUC-recommended work RVU of 14.31 (25th percentile survey value) for CPT code 33020 and proposed a work RVU of 12.95. Our proposed work RVU is based on a crosswalk to CPT code 58700 (*Salpingectomy, complete or partial, unilateral or bilateral (separate procedure)*), which has an identical work RVU of 12.95, identical 60 minutes intraservice time, and near identical total time values as CPT code 33020.

In our review of CPT code 33020, we noted that the RUC-recommended intraservice time is decreasing from 85 minutes to 60 minutes (29 percent reduction), and that the RUC-recommended total time is decreasing from 565 minutes to 321 minutes (43 percent reduction). However, the RUC-recommended work RVU is only decreasing from 14.95 to 14.31, which is a reduction of less than 5 percent. Although we did not imply that the decrease in time as reflected in survey values must equate to a one-to-one or linear decrease in the valuation of work RVUs, we believe that since the two components of work are time and intensity, significant decreases in time should be appropriately reflected in decreases to work RVUs. In the case of CPT code 33020, we believed that it would be more accurate to propose a work RVU of 12.95, based on a crosswalk to CPT code 58700 to account for these decreases in surveyed work times.

For CPT code 33025, the RUC recommended a work RVU of 13.20 (survey 25th percentile value). Although we disagreed with the RUC-recommended work RVU of 13.20, based on RUC survey results and the time resources involved in furnishing these two procedures we agreed that the relative difference in work RVUs between CPT codes 33020 and 33025 is equivalent to the RUC-recommended incremental difference of 1.11 less work RVUs. Therefore, we proposed a work RVU of 11.84 based on a reference to CPT code 34712 (*Transcatheter delivery of enhanced fixation devices(s) to the endograft (e.g., anchor, screw, tack) and all associated radiological supervision and interpretation*), which has a work RVU of 12.00, identical intraservice time of 60 minutes, and similar total time as CPT code 33025.

In reviewing CPT code 33025, we noted that the RUC-recommended intraservice time is decreasing from 66

minutes to 60 minutes (9 percent reduction), and that the RUC-recommended total time is decreasing from 410 minutes to 301 minutes (27 percent reduction). However, the RUC-recommended work RVU is only decreasing from 13.70 to 13.20, which is a reduction of less than 5 percent. Although we did not imply that the decrease in time as reflected in survey values must equate to a one-to-one or linear decrease in the valuation of work RVUs, we believe that since the two components of work are time and intensity, significant decreases in time should be appropriately reflected in decreases to work RVUs. In the case of CPT code 33025, we believed that it would be more accurate to propose a work RVU of 11.84, based on less the incremental difference of 1.11 work RVUs between CPT codes 33020 and 33025 and a crosswalk to CPT code 34712 to account for these decreases in surveyed work times.

We proposed the RUC-recommended direct PE inputs for all the codes in this family.

We received public comments on the proposed valuation of the codes in the Pericardiectomy family. The following is a summary of the comments we received and our responses.

Comment: A commenter noted that CMS misstated which code was identified via the RUC screen.

Response: We thank the commenter for bringing this to our attention. We have clarified how these codes came under review to reflect, as written in the RUC recommendations, that the RUC identified services with a negative IWP/UT and Medicare utilization over 10,000 for all services or over 1,000 for Harvard valued and CMS/Other source codes. The RUC recommended that these services be surveyed for April 2018.

Comment: Several commenters disagreed with the CMS-proposed work RVU of 12.95 for CPT code 33020 and stated that CMS should instead finalize the RUC-recommended work RVU of 14.31. Commenters stated the typical patient for CPT code 33020 is acutely ill and has typically encountered some type of trauma resulting in the need for intensive short-term care prior to and immediately following the procedure. A commenter further noted that CPT code 33020 requires more physician work and is more intense than the CMS cross walk, CPT code 58700, because during both the pre-service and intra-service time, continual monitoring of the patient's hemodynamics is required because of the risk of imminent cardiac tamponade.

Response: We appreciate the additional information from the commenters regarding the relative intensity of CPT codes 33020 and 58700. In light of this additional information, we agree with the commenters that CPT code 33020 has a higher intensity than CPT code 58700.

Comment: Several commenters stated that the incremental methodology used in valuing these services was flawed; commenters did not agree that it was appropriate to reduce the work RVU for CPT code 33025 from the value proposed by the RUC, relative to the RUC's recommended difference in work between this code and CPT code 33020. Commenters also noted that it is imperative to employ RUC survey data to value these codes, and that using an incremental approach in lieu of survey data, strong crosswalks, and input from the practitioners providing these services was unjustified.

Response: We appreciate the commenters' concerns regarding our use of time ratio methodologies in the code valuation process for establishing work RVUs. We have responded to concerns about our methodology earlier in this section of this final rule. For more details on our methodology for developing work RVUs, we refer readers to our discussion of the subject in the "Methodology for Establishing Work RVUs" section of this rule (section I.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80272 through 80277).

After consideration of the public comments, we are not finalizing the proposed work RVUs for CPT codes 33020 and 33025, and instead are finalizing the RUC-recommended RVUs for the codes in the Pericardiectomy family. We are finalizing the direct PE inputs as proposed.

(11) Transcatheter Aortic Valve Replacement (TAVR) (CPT Codes 33361, 33362, 33363, 33364, 33365, and 33366)

In October 2016, the RUC's RAW reviewed codes that had been flagged in the period from October 2011 to April 2012, using 3 years of available Medicare claims data (2013, 2014 and preliminary 2015 data). The RUC workgroup concluded that the technology for these transcatheter aortic valve replacement (TAVR) services was evolving, as the typical site of service had shifted from being provided in academic centers to private centers, and the RUC recommended that CPT codes 33361–33366 be resurveyed for physician work and PE. These six codes were surveyed and reviewed at the April 2018 RUC meeting using a survey methodology that reflected the unique

nature of these codes. CPT codes 33361–33366 are currently the only codes on the PFS where the -62 co-surgeon modifier is required 100 percent of the time.

We proposed the RUC-recommended work RVU for all six of the codes in this family. We proposed a work RVU of 22.47 for CPT code 33361 (*Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; percutaneous femoral artery approach*), a work RVU of 24.54 for CPT code 33362 (*Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open femoral artery approach*), a work RVU of 25.47 for CPT code 33363 (*Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open axillary artery approach*), a work RVU of 25.97 for CPT code 33364 (*Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open iliac artery approach*), a work RVU of 26.59 for CPT code 33365 (*Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transaortic approach (e.g., median sternotomy, mediastinotomy)*), and a work RVU of 29.35 for CPT code 33366 (*Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transapical exposure (e.g., left thoracotomy)*).

Although we have some concerns that the RUC-recommended work RVUs for these six codes do not match the decreases in surveyed work time, we recognize that the technology described by the TAVR procedures is in the process of being adopted by a much wider audience, and that there will be greater intensity on the part of the practitioner when this particular new technology is first being adopted. However, we intend to continue examining whether these services are appropriately valued, in light of the proposed national coverage determination proposing to use TAVR for the treatment of symptomatic aortic valve stenosis that we posted on March 26, 2019. We will also consider any further improvements to the valuation of these services, as their use becomes more commonplace, through future notice and comment rulemaking. The text of the proposed national coverage determination is available on the CMS website at <https://www.cms.gov/medicare-coverage-database/details/nca-proposed-decision-memo.aspx?NCAId=293>.

We proposed the RUC-recommended direct PE inputs for all codes in the family.

We received public comments on the proposed valuation of the codes in the

Transcatheter Aortic Valve Replacement family. The following is a summary of the comments we received and our responses.

Comment: A commenter stated that they appreciate recognition of the complexities of this evolving technology by CMS and agreed with the proposal of the RUC-recommended work RVUS for all six of these codes.

Response: We appreciate the support for our proposals from the commenter.

Comment: Several commenters disagreed with the proposed work RVUs. Commenters disagreed with the proposed reduction in work RVUs for CPT codes 33361–33366 on the basis that the proposed values were too low and did not accurately reflect the actual work time and intensity required to perform all aspects of the procedures. Commenters stated that the amount of effort spent is not decreasing, and RVUs are shared equally between the surgeon and cardiologist. A commenter stated that the number of Medicare beneficiaries receiving TAVR was increasing rapidly due to FDA approval of an expanded TAVR indication in low surgical risk patients and a revised National Coverage Determination (NCD) published by CMS. This commenter stated that the RUC-recommended and CMS-proposed valuations do not include the time and PE costs associated with physicians' TAVR-related data requirements, and the commenter recommended delaying the adoption of the new work RVUs.

Response: We disagree with the commenters that the proposed work RVUs for CPT codes 33361–33366 were too low and that the implementation of these work RVUs should be delayed. The work surveys conducted by the RUC indicated that the typical intraservice work time decreased substantially for each code in the family since the last time of review in 2012. For example, CPT code 33361 decreased from a previous intraservice work time of 135 minutes to a newly surveyed intraservice work time of 90 minutes. Although we do not imply that the decrease in time as reflected in survey values must equate to a one-to-one or linear decrease in the valuation of work RVUs, we believe that since the two components of work are time and intensity, significant decreases in time should be appropriately reflected in decreases to work RVUs. This was the rationale for the RUC's recommendation of decreased work RVUs for the six codes in the family, which we shared in proposing these valuations. We also do not agree that an increase in utilization for the TAVR codes would necessarily be sufficient rationale for delaying their

implementation, as there are many other services experiencing a high rate of growth for which we have not proposed a delay in valuation.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the Transcatheter Aortic Valve Replacement family as proposed.

(12) Aortic Graft Procedures (CPT Codes 33858, 33859, 33863, 33864, 33871, and 33866)

In 2017, CPT created a new add-on code, CPT code 33866 (*Aortic hemiarch graft including isolation and control of the arch vessels, beveled open distal aortic anastomosis extending under one or more of the arch vessels, and total circulatory arrest or isolated cerebral perfusion (List separately in addition to code for primary procedure)*). For CY 2019, we finalized the RUC's recommended work RVU for this code as proposed, and indicated that we would consider any coding changes or RUC recommendations in future rulemaking (83 FR 59528). CPT revised the code set to develop distinct codes for ascending aortic repair for dissection and ascending aortic repair for other ascending aortic disease such as aneurysms and congenital anomalies, creating two new codes, as well as reevaluating the two other codes in the family.

For CPT code 33858 (*Ascending aorta graft, with cardiopulmonary bypass, includes valve suspension, when performed; for aortic dissection*), we disagree with the RUC-recommended work RVU of 65.00, because the RUC is recommending an increase in work RVU that is not commensurate with a reduction in physician time, and because we do not believe that the RUC's recommendation that this service be increased to a value that would place it among the highest valued of all services of similar physician time is appropriate; we believe a comparison to other services of similar time indicates that the RUC's recommended increase overstates the work. Instead, we proposed to increase the work RVU to 63.40 based on a crosswalk to CPT code 61697 (*Surgery of complex intracranial aneurysm, intracranial approach; carotid circulation*).

For CPT code 33859 (*Ascending aorta graft, with cardiopulmonary bypass, includes valve suspension, when performed; for aortic disease other than dissection (e.g., aneurysm)*), we disagree with the RUC-recommended work RVU of 50.00, because we do not believe it adequately reflects the recommended decrease in physician time, and because we do not believe this service should be

assigned a value that is among the highest of all 90-day global services with similar physician time values. Instead, we proposed a work RVU of 45.13 based on a crosswalk to CPT code 33468 (*Tricuspid valve repositioning and plication for Ebstein anomaly*), which is a code with an identical intraservice time and similar total time value.

For CPT code 33863 (*Ascending aorta graft, with cardiopulmonary bypass, with aortic root replacement using valved conduit and coronary reconstruction (e.g., Bentall)*), according to the RUC, the survey respondents underestimated the intraservice time of the procedure and the RUC recommended a work RVU of 59.00 based on the 75th percentile of survey responses for intraservice time. We believe the use of the survey 75th percentile value to be problematic, as the intraservice time values should generally reflect the survey median. We are requesting that this code be resurveyed to determine more accurate physician time values, and we proposed to maintain the current RVU of 58.79 for CY 2020.

For CPT code 33864 (*Ascending aorta graft, with cardiopulmonary bypass with valve suspension, with coronary reconstruction and valve-sparing aortic root remodeling (e.g., David Procedure, Yacoub procedure)*), we do not agree with the RUC-recommended work RVU of 63.00, because we believe this increase is not justified given that the intraservice time is not changing from its current value, and the physician total time value is decreasing. Therefore, we proposed to maintain the current work RVU of 60.08 for this service.

For CPT code 33871 (*Transverse aortic arch graft, with cardiopulmonary bypass, with profound hypothermia, total circulatory arrest and isolated cerebral perfusion with reimplantation of arch vessel(s) (e.g., island pedicle or individual arch vessel reimplantation)*), we disagree with the RUC's recommended work RVU of 65.75.

While we agree that an increase in work RVU is justified, as discussed above, we believe that the use of the 75th percentile of physician intraservice work time is problematic, and believe such a significant increase in work RVU is not validated. Therefore, we proposed a less significant increase to 60.88 using the RUC-recommended difference in work value between CPT code 33859 and the code in question, CPT code 33871 (a difference of 15.75). As further support for this value, we note that it falls between CPT codes 33782 (*Aortic root translocation with ventricular septal defect and pulmonary stenosis*

repair (i.e., *Nikaidoh procedure*); without coronary ostium reimplantation), which has a work RVU of 60.08, and CPT code 43112 (*Total or near total esophagectomy, with thoracotomy; with pharyngogastrostomy or cervical esophagogastronomy, with or without pyloroplasty (i.e., McKeown esophagectomy or tri-incisional esophagectomy)*), which has a work RVU of 62.00. Both of these bracketing reference codes have similar intraservice and total time values.

For CPT code 33866 (*Aortic hemiarch graft including isolation and control of the arch vessels, beveled open distal aortic anastomosis extending under one or more of the arch vessels, and total circulatory arrest or isolated cerebral perfusion (List separately in addition to code for primary procedure)*), we proposed the RUC-recommended work RVU of 17.75.

For the direct PE inputs, we proposed to refine the clinical labor to align with the number of post-operative visits. Thus, we proposed to add 12 minutes of clinical labor time for “Discharge day management” for CPT codes 33859, 33863, 33864, and 33871, as each of these codes include a 99238 discharge visit within their global periods that should be reflected in the clinical labor inputs.

We received public comments on the proposed valuation of the codes in the Aortic Graft Procedures family. The following is a summary of the comments we received and our responses.

Comment: One commenter disagreed with our proposed value for CPT Code 33858, and stated that our proposal ignores that deleted CPT code 33860 is a more general code than CPT code 33858, as 33860 is both used for emergent procedures (e.g., repairs for aortic dissection) and for planned procedures (e.g., repair for aortic diseases other than dissection), whereas CPT code 33858 is only the portion of CPT code 33860’s volume that is emergent. Therefore, the commenter suggested that we should not compare physician times for the two codes as they describe different intensities. This commenter stated that CMS inappropriately rejected the RUC recommendation and instead picked an arbitrary low-volume crosswalk, last reviewed almost 15 years ago, with a work RVU only 2.5 percent less than the RUC recommendation. Furthermore, the commenter stated that this selected crosswalk is not an appropriate comparator, as CPT code 33858 involves three critical care visits, whereas the crosswalk code 61697 does not include any critical care.

Response: As we explained in the CY 2020 PFS proposed rule (84 FR 40575), our determination that the RUC’s value overstates the work was based on an analysis of all codes with 90-day global periods. Our use of a crosswalk based on physician time is consistent with longstanding valuation methodology. We note that crosswalk CPT code 61697 has an intraservice time value that is identical to that of CPT code 33858, and a total time value that is over 20 percent higher than that of CPT code 33858; thus, we believe that the critical care component is adequately reflected in this value. The vignettes for CPT code 33858 and our crosswalk code, CPT code 61697, both describe complicated procedures for acutely ill patients; both involve significant vascular structures and are performed on urgent or emergent bases. Our examination of time values indicated that the RUC’s work RVU was somewhat overstated, and we continue to believe that CPT code 61697 provides an appropriate crosswalk.

Comment: For CPT Code 33859, a commenter questioned our statement that we did not believe that the RUC-recommended work RVU adequately reflects the recommended decrease in physician time, stating that the change in total time from 931 minutes to 778 minutes is in close proportion to the change in value from the current value of 59.46 for the deleted code to the RUC recommendation of 50.00. This commenter stated that our proposed value for CPT 33871 is also flawed as it is based on an increment to CPT 33859.

Response: We disagree that the RUC’s recommended reduction in work RVU is closely proportionate to the decrease in time. We disagree that physician time ratios indicate that the RUC-recommended value is closely proportionate to the time decrease. We note that, while the commenter cites the total time ratio, the intraservice time ratio indicate that the RUC’s recommended value is somewhat overstated. Our crosswalk code CPT code 33468 and CPT code 33859 both involve bypass procedures, and have similar time values; CPT code 33468 has more total time than CPT code 33859. We continue to believe, given the time values and intensity involved in the two procedures, that CPT code 33468 is a strong crosswalk. For CPT code 33871, we note that our reference code CPT code 43112 has almost the same intraservice time value and 196 more minutes of total time, and further validates our proposed work RVU.

Comment: For CPT codes 33863 and 33871, a commenter stated that our rationales, which in part included an

assumption on our part that the physician intraservice times were overstated in that they are the 75th percentile survey values, neglected to acknowledge or account for the STS Database intra-service times for these codes, which in the commenter’s view support the RUC’s recommended intra-service times. The commenter suggested that our request that these services be resurveyed ignores the RUC’s rationale regarding the STS database times.

Response: We note that we did not ignore the STS database time data, and our proposed values for CPT codes 33863 and 33871 rely on times from this database, and we are finalizing the time values as recommended for these codes. We primarily rely on survey data for time values, however we continue to remain interested in a range of data sources and how to integrate these data sources into our ratesetting process.

Comment: A commenter disagreed with our proposal to maintain the current work RVU for CPT code 33864, and stated that our proposed value for CPT code 33864 would not have appropriate relativity compared to our proposed value for CPT code 33863, and that the former service involves more difficult and intense work than the latter. The commenter stated that CPT code 33864 involves replacing the aortic root and ascending aorta, but unlike CPT code 33863, attempts to preserve the patient’s own native aortic valve—a procedure far more complex and skill-intensive than aortic valve replacement reflected in CPT code 33863. The increment of the RUC recommendations between these two services is 4.00 RVUs, whereas the increment for the CMS-proposed values is only 1.29 RVUs, which is not sufficient to account for the difference in work between these two services.

Response: We agree that CPT code 33864 is a more intense procedure than CPT code 33863, which is why we proposed a higher intensity for this procedure. However, we do not agree with the commenters that this greater intensity justifies the RUC-recommended work increment of 4.00 work RVUs between the two procedures. We believe that if CPT code 33864 typically required a significant amount of additional work in comparison to CPT code 33863, that work would have been reflected in the surveyed work times for the two procedures. Instead, the surveyed work times are identical between the two procedures. Absent evidence of additional work time from the survey respondents, we continue to believe that the proposed work RVU and proposed intensity for CPT code 33864 accurately

capture the increased difficulty of the procedure in comparison to CPT code 33863.

Comment: One commenter stated that they agreed with the proposed direct PE clinical labor refinements for these codes.

Response: We appreciate the support for our proposals from the commenter.

After consideration of the public comments, we are finalizing work RVUs of 63.40 for 33858, 45.13 for 33859, 58.79 for CPT code 33863, 60.08 for CPT code 33864, 60.88 for CPT code 33871, and the RUC-recommended work RVU of 17.75 for CPT code 33866 as proposed. We are also finalizing the direct PE inputs as proposed.

(13) Iliac Branched Endograft Placement (CPT Codes 34717 and 34718)

For CY 2018, the CPT Editorial Panel created a family of 20 new and revised codes that redefined coding for endovascular repair of the aorta and iliac arteries. The iliac branched endograft technology has become more mainstream over time, and two new CPT codes were created to capture the work of iliac artery endovascular repair with an iliac branched endograft. These two new codes were surveyed and reviewed for the January 2019 RUC meeting.

We proposed the RUC-recommended work RVU of 9.00 for CPT code 34717 (*Endovascular repair of iliac artery at the time of aorto-iliac artery endograft placement by deployment of an iliac branched endograft including pre-procedure sizing and device selection, all ipsilateral selective iliac artery catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally in the internal iliac, external iliac, and common femoral artery(ies), and treatment zone angioplasty/stenting, when performed, for rupture or other than rupture (e.g., for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation, penetrating ulcer, traumatic disruption), unilateral*) and the RUC-recommended work RVU of 24.00 for CPT code 34718 (*Endovascular repair of iliac artery, not associated with placement of an aorto-iliac artery endograft at the same session, by deployment of an iliac branched endograft, including pre-procedure sizing and device selection, all ipsilateral selective iliac artery catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally in the internal iliac, external iliac, and common*

femoral artery(ies), and treatment zone angioplasty/stenting, when performed, for other than rupture (e.g., for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation, penetrating ulcer), unilateral).

We proposed the RUC-recommended direct PE inputs for all codes in the family.

We received public comments on the proposed valuation of the codes in the Iliac Branched Endograft Placement family. The following is a summary of the comments we received and our responses.

Comment: A commenter stated that they supported the proposal of the RUC-recommended work RVU for both codes in the family.

Response: We appreciate the support for our proposals from the commenter.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the Iliac Branched Endograft Placement family as proposed.

(14) Exploration of Artery (CPT Codes 35701, 35703, and 35703)

CPT code 35701 (*Exploration not followed by surgical repair, artery; neck (e.g., carotid, subclavian)*) was identified via a screen for services with a negative IWPOT and Medicare utilization over 10,000 for all services or over 1,000 for Harvard valued and CMS/Other source codes. In September 2018, the CPT Editorial Panel revised one code, added two new codes, and deleted three existing codes in the family to report major artery exploration procedures and to condense the code set due to low frequency.

We proposed the RUC-recommended work RVU for all three codes in the family. We proposed a work RVU of 7.50 for CPT code 35701, a work RVU of 7.12 for CPT code 35702 (*Exploration not followed by surgical repair, artery; upper extremity (e.g., axillary, brachial, radial, ulnar)*), and a work RVU of 7.50 for CPT code 35703 (*Exploration not followed by surgical repair, artery; lower extremity (e.g., common femoral, deep femoral, superficial femoral, popliteal, tibial, peroneal)*).

For the direct PE inputs, we proposed to refine the clinical labor, supplies, and equipment to match the number of office visits contained in the global periods of the codes under review. We proposed to refine the clinical labor time for the "Post-operative visits (total time)" (CA039) activity from 36 minutes to 27 minutes for CPT codes 35701 and 35702, and from 63 minutes to 27 minutes for CPT code 35703. Each of these CPT codes contains a single postoperative level 2 office visit (CPT

code 99212) in its global period, and 27 minutes of clinical labor is the time associated with this office visit. We proposed to refine the equipment time for the exam table (EF023) to the same time of 27 minutes for each code to match the clinical labor time. Finally, we are also proposing to refine the quantity of the minimum multi-specialty visit pack (SA048) from 2 to 1 for CPT code 35703 to match the single postoperative visit in the code's global period. We believe that the additional direct PE inputs in the recommended materials were an accidental oversight due to revisions that took place at the RUC meeting following the approval of the PE inputs for these codes.

We received public comments on the proposed valuation of the codes in the Exploration of Artery family. The following is a summary of the comments we received and our responses.

Comment: A commenter stated that they supported the proposed work RVUs and thanked CMS for correcting the PE to reflect the number of office visits contained in the global period.

Response: We appreciate the support for our proposals from the commenter.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the Exploration of Artery family as proposed.

(15) Intravascular Ultrasound (CPT Codes 37252 and 37253)

In the CY 2015 PFS proposed rule, a stakeholder requested that CMS establish non-facility PE RVUs for CPT codes 37250 and 37251. CMS sought comment regarding the setting and valuation of these services. The CPT Editorial Panel deleted CPT codes 37250 (*Ultrasound evaluation of blood vessel during diagnosis or treatment*) and 37251 (*Ultrasound evaluation of blood vessel during diagnosis or treatment*) and created new bundled codes 37252 (*Intravascular ultrasound (noncoronary vessel) during diagnostic evaluation and/or therapeutic intervention, including radiological supervision and interpretation; initial noncoronary vessel*) and 37253 (*Intravascular ultrasound (noncoronary vessel) during diagnostic evaluation and/or therapeutic intervention, including radiological supervision and interpretation; each additional noncoronary vessel*) to describe intravascular ultrasound (IVUS). CMS finalized the RUC recommended work RVUs for intravascular ultrasound.

When CPT codes 37252 and 37253 were reviewed at the January 2015 RUC meeting, they were assumed to be work neutral compared to predecessor codes

CPT codes 37250 and 37251, meaning they would not result in an overall increase in work spending, and that they would result in an overall savings of work RVUs that would be redistributed to the Medicare conversion factor. Services are considered work neutral if, despite changes in coding, the overall amount of work RVUs for a set of services is held constant from one year to the next.

The RUC determined that, between CY 2015 and CY 2016, the overall work spending for these services went up by 44 percent as compared to the predecessor codes, thus disrupting the projected work neutrality. Observed utilization also doubled. In April 2018, the RUC reviewed this code family and found that the utilization of these services was underestimated, considering that the newer bundled codes included radiological supervision and interpretation.

Consequently, the RUC recommended that these services be surveyed for October 2018. The RUC indicated that the specialty societies should research why there was such an increase in the utilization. Accordingly, the specialty society surveyed these add-on codes, and the survey results indicated the intraservice and total work times, along with the work RVU should remain the same despite the RUC's underestimation of utilization for these codes.

We disagreed with the RUC-recommended work RVU of 1.80 for CPT code 37252 and proposed a work RVU of 1.55 based on a crosswalk to CPT code 19084. CPT code 19084 is a recently reviewed code with 20 minutes of intraservice time and 25 minutes of total time. In reviewing CPT code 37252, we note, as mentioned above, that in CY 2015 the specialty society expected that bundling this service would achieve work neutrality, meaning that new coding would not result in an overall increase in work spending. However, since 2015, observed utilization for CPT code 37252 has greatly exceeded estimated utilization. Therefore, we proposed for CY 2020 work RVUs based on crosswalk codes that would have resulted in restored work neutrality for the intravascular ultrasound code family.

For CPT code 37253, we disagreed with the RUC-recommended work RVU of 1.44 and we proposed a work RVU of 1.19. Although we disagreed with the RUC-recommended work RVU, we note the relative difference in work between CPT codes 37252 and 37253 is an interval of 0.36 RVUs. Therefore, we proposed a work RVU of 1.19 for CPT code 37253, based on the recommended interval of 0.36 fewer RVUs than our

proposed work RVU of 1.55 for CPT code 37252.

We proposed the RUC-recommended direct PE inputs for all codes in the family.

We received public comments on the proposed valuation of the codes in the Intravascular Ultrasound family. The following is a summary of the comments we received and our responses.

Comment: A few commenters disagreed with our proposed values for these codes and urged us to accept the RUC-recommended values. One commenter stated the increased utilization for these codes may be for a host of reasons, some of which include increased complexity of interventions being performed in the arterial, venous, and aortic spaces. This commenter stated that a large proportion of the utilization of this service is by a few physicians, and if we reduce the RVUs as proposed, many physicians and patients may be affected. The commenter stated that an attempt to enforce work neutrality may result in harm to a large group of patients while only a small group of physicians are responsible, and recommended that this issue should be addressed at a local level. The commenter stated that if CMS has continuing concerns about overutilization or outliers for CPT codes 37252 and 37253, the Agency can use LCDs and the RAC process. Another commenter disagreed with use of an incremental methodology to value CPT code 37253, suggesting that it inaccurately treats all components of the physician time as having identical intensity.

Response: We are persuaded that reducing work RVUs that would have resulted in work neutrality for these codes may not be appropriate, and that valuation in this instance should be determined irrespective of utilization. Comments indicate that the increase in utilization for these services may have occurred for a variety of reasons including those related to potential inappropriate billing by some practitioners. We would not ordinarily expect volume for a revised code family to change exponentially between the old and revised code sets, however we are persuaded by commenters that this is more appropriately addressed in this instance through an analysis of claims to determine potentially inappropriate billing by some practitioners. In response to public comment, we are finalizing the RUC-recommended work RVUs of 1.80 for CPT Code 37252 and 1.44 for CPT code 37253.

After consideration of the public comments, we not finalizing our proposed work RVUs, and we are

instead finalizing the RUC-recommended work RVUs for CPT Codes 37252 and 37253. We are also finalizing the direct PE inputs as proposed.

(16) Stab Phlebectomy of Varicose Veins (CPT Codes 37765 and 37766)

These services were identified in February 2008 via the High Volume Growth screen, for services with a total Medicare utilization of 1,000 or more that have increased by at least 100 percent from 2004 through 2006. The RUC subsequently recommended monitoring and reviewing changes in utilization over multiple years. In October 2017, the RUC recommended that this service be surveyed for April 2018. We proposed the RUC-recommended work RVUs of 4.80 for CPT code 37765 (*Stab phlebectomy of varicose veins, 1 extremity; 10–20 stab incisions*) and 6.00 for CPT code 37766 (*Stab phlebectomy of varicose veins, 1 extremity; more than 20 incisions*). We proposed the RUC-recommended direct PE inputs for all codes in the family.

We received public comments on the proposed valuation of the codes in the Stab Phlebectomy of Varicose Veins family. The following is a summary of the comments we received and our responses.

Comment: Commenters stated that they supported our proposal of the RUC-recommended work RVU and direct PE inputs for both codes in the family.

Response: We appreciate the support for our proposals from the commenters.

Comment: A few commenters stated that our proposals for these codes will result in unreasonable reductions in payment.

Response: We continue to believe that the RUC's recommended decreases in work RVUs are proportionate to the decreases in surveyed work times for these services.

Comment: A commenter stated that the RUC-recommended physician survey times are inaccurate, and the commenter requested that we consider data collected by the American Vein and Lymphatic Society as additional physician work time data.

Response: We welcome the submission of any additional data or information that would allow us to consider these codes for further review at a future time.

After consideration of the public comments, we are finalizing the RUC-recommended work RVUs as proposed. We are also finalizing the direct PE inputs as proposed.

(17) Biopsy of Mouth Lesion (CPT Code 40808)

CPT code 40808 (*Biopsy, vestibule of mouth*) was identified via a screen for services with a negative IWPUT and Medicare utilization over 10,000 for all services or over 1,000 for Harvard valued and CMS/Other source codes.

We disagree with the RUC's recommended work RVU of 1.05 with a crosswalk to CPT code 11440 (*Excision, other benign lesion including margins, except skin tag (unless listed elsewhere), face, ears, eyelids, nose, lips, mucous membrane; excised diameter 0.5 cm or less*), as we believe this increase in work RVU is not commensurate with the RUC-recommended 5-minute reduction in intraservice time and a 10-minute reduction in total time. While we understand that the RUC considers the current time values for this service to be invalid estimations, we do not see compelling evidence that would indicate that an increase in work RVU that would be concurrent with a reduction in physician time is appropriate. Therefore, we proposed to maintain the current work RVU of 1.01, and note that implementing the current work RVU with the RUC-recommended revised physician time values would correct the negative IWPUT anomaly.

For the direct PE inputs, we proposed to refine the clinical labor time for the "Prepare room, equipment and supplies" (CA013) activity to 3 minutes and to refine the clinical labor time for the "Confirm order, protocol exam" (CA014) activity to 0 minutes. As we detailed when discussing this issue in the CY 2019 PFS final rule (83 FR 59463 through 59464), CPT code 40808 does not include the old clinical labor task "Patient clinical information and questionnaire reviewed by technologist, order from physician confirmed and exam protocol by radiologist" on a prior version of the PE worksheet, nor does the code contain any clinical labor for the CA007 activity ("Review patient clinical extant information and questionnaire"). CPT code 40808 does not appear to be an instance where an old clinical labor task was split into two new clinical labor activities, and we continue to believe that in these cases the 3 total minutes of clinical staff time would be more accurately described by the CA013 "Prepare room, equipment and supplies" activity code. We also note that there is no effect on the total clinical labor direct costs in these situations, since the same 3 minutes of clinical labor time is still being furnished.

We are also proposing to refine the equipment time for the electrocautery-

hyfrecator (EQ110) to conform to our established policies for non-highly technical equipment.

We received public comments on the proposed valuation of the codes in the Biopsy of Mouth Lesion family. The following is a summary of the comments we received and our responses.

Comment: One commenter disagreed with our rationale, stating that it ignores that the RUC reviewed and accepted compelling evidence that the original valuation was based on flawed methodology when it was reviewed in 1995, resulting in a negative IWPUT. The value of the service was maintained without taking into consideration the times newly assigned to the service in 1995. That resulted in the physician time and work value having a distorted relationship. The commenter stated that, contrary to the assertion made in the proposed rule, this compelling evidence makes a strong case that the work was formerly misvalued. The commenter asserted that if a work value was assigned by CMS in 1995 without CMS appropriately being informed by physician time data, then the work value assigned prior to the RUC's 2018 analysis used an inappropriate methodology. The commenter also stated that the IWPUT derived from the RUC recommendation is only 0.0194, while the IWPUT of CMS' alternate proposal, 0.0153, would be less than twice the intensity assigned to pre-service scrub/dress/wait time and inappropriately low for the intra-service time of this service or for that matter, the clear majority of all services in the Medicare PFS.

Response: We are persuaded by the comments regarding the problematic nature of using the source physician time, as well as the derived intensity, to revalue this code, and agree with the commenter that the RUC-recommended work RVU of 1.05 for CPT code 40808 is appropriate.

Comment: Several commenters disagreed with the proposal to refine the clinical labor time for the "Confirm order, protocol exam" (CA014) activity to 0 minutes. Commenters stated that 1 minute was required to order the pathology and complete the request form, including patient history, location, differential diagnosis, and staff processing time. Another commenter stated that they supported the proposal to refine the clinical labor time for the "Prepare room, equipment and supplies" (CA013) activity to 3 minutes, but noted that an additional minute is required for the CA014 activity to order the specimen for pathology to review.

Response: We continue to disagree with the commenters that 1 minute

should be assigned for the CA014 clinical labor activity in CPT code 40808. As we stated in the proposed rule, CPT code 40808 does not include the old clinical labor task "Patient clinical information and questionnaire reviewed by technologist, order from physician confirmed and exam protocol by radiologist" on a prior version of the PE worksheet, nor does the code contain any clinical labor for the CA007 activity or appear to be an instance where an old clinical labor task was split into two new clinical labor activities. We continue to believe that in these cases the 3 total minutes of clinical staff time would be more accurately described by the CA013 activity code, and commenters did not supply any rationale as to why this would not be the case. We also note once again that there is no effect on the total clinical labor direct costs from these refinements, since the same 3 minutes of clinical labor time is still being furnished.

After consideration of the public comments, we are finalizing the RUC-recommended work RVU of 1.05 for CPT code 40808 rather than our proposed value of 1.01. We are also finalizing the direct PE inputs as proposed.

(18) Transanal Hemorrhoidal Dearterialization (CPT Codes 46945, 46946, and 46948)

We proposed the RUC-recommended work RVU for all three codes in the family. We proposed a work RVU of 3.69 for CPT code 46945 (*Hemorrhoidectomy, internal, by ligation other than rubber band; single hemorrhoid column/group, without imaging guidance*), a work RVU of 4.50 for CPT code 46946 (*2 or more hemorrhoid columns/groups, without imaging guidance*), and a work RVU of 5.57 for CPT code 46948 (*Hemorrhoidectomy, internal, by transanal hemorrhoidal dearterialization, 2 or more hemorrhoid columns/groups, including ultrasound guidance, with mucopexy when performed*).

We proposed the RUC-recommended direct PE inputs for all codes in the family.

We received public comments on the proposed valuation of the codes in the Transanal Hemorrhoidal Dearterialization family. The following is a summary of the comments we received and our responses.

Comment: A commenter stated that they supported the proposal of the RUC-recommended work RVU for both codes in the family.

Response: We appreciate the support for our proposals from the commenter.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the Transanal Hemorrhoidal Dearterialization family as proposed.

(19) Preperitoneal Pelvic Packing (CPT Codes 49013 and 49014)

In May 2018, the CPT Editorial Panel approved the addition of two codes for preperitoneal pelvic packing, removal and/or repacking for hemorrhage associated with pelvic trauma. These new codes were surveyed and reviewed for the October 2018 RUC meeting.

We disagree with the RUC-recommended work RVU of 8.35 for CPT code 49013 (*Preperitoneal pelvic packing for hemorrhage associated with pelvic trauma, including local exploration*) and proposed a work RVU of 7.55 based on a crosswalk to CPT code 52345 (*Cystourethroscopy with ureteroscopy; with treatment of ureteropelvic junction stricture (e.g., balloon dilation, laser, electrocautery, and incision)*). We are also proposing to reduce the immediate postservice work time from 60 minutes to 45 minutes, which results in a total work time of 140 minutes for this procedure. We believe that the survey respondents overstated the immediate postservice work time that would typically be required to perform CPT code 49013, which we investigated by comparing this new service against the existing 0-day global codes on the PFS. We found that among the roughly 1100 codes with 0-day global periods, only 21 codes had an immediate postservice work time of 60 minutes or longer. The 21 codes that fell into this category had significantly higher intraservice work times than CPT code 49013, with an average intraservice work time of 111 minutes as compared to the 45 minutes of intraservice work time in CPT code 49013. Generally speaking, it is extremely rare for a service to have more immediate postservice work time than intraservice work time, and in fact only 28 out of the roughly 1100 codes with 0-day global periods had more immediate postservice work time than intraservice work time. While we agree that each service on the PFS is its own unique entity, these comparisons to other 0-day global codes suggest that the survey respondents overestimated the amount of immediate postservice work time that would typically be associated with CPT code 49013.

As a result, we believe that it would be more accurate to reduce the immediate postservice work time to 45 minutes and to propose a work RVU of

7.55 based on a crosswalk to CPT code 52345. This crosswalk code shares an intraservice work time of 45 minutes and a similar total time of 135 minutes after taking into account the reduced immediate postservice work time that we proposed for CPT code 49013. We searched the RUC database for 0-day global procedures with 45 minutes of intraservice work time, and at the recommended work RVU of 8.35, CPT code 49013 would establish a new maximum value, higher than all of the 79 other codes that fall into this category. We recognize that CPT code 49013 describes a preperitoneal pelvic packing service associated with pelvic trauma, and that this is a difficult and intensive procedure that rightly has a higher work RVU than many of these other 0-day global codes. However, we believe that it better maintains relativity to propose a crosswalk to CPT code 52345 at a work RVU of 7.55, which would still assign this code the second-highest work RVU among all 0 day global codes with 45 minutes of intraservice work time, as opposed to proposing the survey median work RVU of 8.35 at a rate higher than anything in the current RUC database.

We disagree with the RUC-recommended work RVU of 6.73 for CPT code 49014 (*Re-exploration of pelvic wound with removal of preperitoneal pelvic packing including repacking, when performed*) and proposed a work RVU of 5.70 based on the 25th percentile survey value. We believe that the survey 25th percentile work RVU more accurately describes the work of re-exploring this type of pelvic wound, and by proposing the survey 25th percentile we are maintaining the general increment in RVUs between the two codes in the family (a difference of 1.62 RVUs as recommended by the RUC as compared to 1.85 RVUs as proposed here). We are supporting this valuation with a reference to CPT code 39401 (*Mediastinoscopy; includes biopsy(ies) of mediastinal mass (e.g., lymphoma), when performed*), a recently reviewed code from CY 2015 which shares the same intraservice time of 45 minutes, a slightly higher total time of 142 minutes and a lower work RVU of 5.44.

We proposed the RUC-recommended direct PE inputs for all codes in the family.

We received public comments on the proposed valuation of the codes in the Preperitoneal Pelvic Packing family. The following is a summary of the comments we received and our responses.

Comment: Many commenters disagreed with the CMS proposed work RVU of 7.55 for CPT code 49013 and

stated that CMS should instead finalize the RUC-recommended work RVU of 8.35. Commenters stated that the typical patient for CPT code 49013 is a critically injured emergent patient and that the procedure typically is performed as expeditiously as possible to avoid a hemorrhagic death of the patient. Commenters stated that CPT code 52345 is an elective outpatient operation, not an emergent procedure, and therefore, it was inarguable that the intensity of work for CPT code 49013 is considerably greater despite the two procedures sharing the same intraservice work time. Commenters disagreed with the CMS comparison of the postoperative time for code 49013 to other 0-day global procedures, stating that this took place without consideration of the type of work that is required for this code. Commenters stated that there are less than 800 0-day global codes that have been reviewed by the RUC, and that almost 240 of those procedures are endoscopy services performed electively under moderate sedation, while another 125 of those procedures include simple injections, biopsies, casting/strapping services, trimming nails, simple repair of wounds, and osteopathic and chiropractic services. Commenters stated that it was inappropriate and incorrect to equate code 49013 to these types of 0-day global codes for purposes of reviewing postoperative time.

Commenters also disagreed with the CMS-proposed immediate postservice work time of 45 minutes and stated that CMS should instead finalize the RUC-recommended work time of 60 minutes. Commenters stated that the immediate postservice work time of CPT code 49013 includes all postoperative care until midnight on the day of the procedure, a period where the patient will still be unstable and critical and their hemodynamic status will need to be monitored very closely. Commenters stated that due to the rare emergency nature of the procedure 60 minutes of postoperative time in the operating room, recovery unit, and intensive care unit on the day of this procedure would be typical. Commenters also pointed to the survey data for CPT code 49013, in which over 65 percent of all survey respondents indicated 50 minutes or more of postoperative time and of the 28 respondents with recent (12 month) experience, 60 percent indicated 60 minutes or more of postoperative work time. Commenters stated that there was no evidence to the contrary that these experienced providers overestimated the time they spend postoperatively on the day of the procedure.

Response: We appreciate the additional feedback from the commenters regarding the typical patients undergoing CPT code 49013 and the nature of the postoperative care that they will typically receive. Based on the additional information supplied by the commenters, we are not finalizing our refinements to the work RVU or postoperative work time for this code.

Comment: Many commenters disagreed with the CMS proposed work RVU of 5.70 for CPT code 49014 and stated that CMS should instead finalize the RUC-recommended work RVU of 6.73. Commenters stated that the typical patient undergoing CPT code 49014 will likely still be critically ill and unstable having survived significant pelvic trauma 24 to 48 hours prior to the procedure. Commenters disagreed with the CMS comparison to CPT code 39401, which describes a diagnostic biopsy procedure that is typically performed as an outpatient procedure on a stable patient. Commenters stated that the intensity of removing the preperitoneal pelvic pads one by one while ensuring the patient remains hemodynamically stable, as described by CPT code 49014, is much greater than taking mediastinal biopsies as described by CPT code 39401. One commenter provided a table that outlined several recently reviewed 0-day global codes with similar intraoperative time and intensity as code 49014, and stated that these codes supported the RUC-recommended work RVU of 6.73.

Response: We appreciate the additional feedback from the commenters regarding the typical patients undergoing CPT code 49014. Based on the additional information supplied by the commenters, we are not finalizing our refinement to the work RVU for this code.

After consideration of the public comments, we are not finalizing our proposed refinements to the work RVUs or the work times for the codes in the Preperitoneal Pelvic Packing family. We are instead finalizing the RUC-recommended work RVU of 8.35 for CPT code 49013 and the RUC-recommended work RVU of 6.73 for CPT code 49014. We are also finalizing the RUC-recommended immediate postservice work time of 60 minutes for CPT code 49013. We are finalizing the RUC-recommended direct PE inputs for both codes in the family as proposed.

(20) Cystourethroscopy Insertion Transprostatic Implant (CPT Codes 52441 and 52442)

In 2005, the AMA RUC began the process of flagging services that represent new technology or new services as they were presented to the AMA/Specialty Society RVS Update Committee. This service was reviewed at the October 2018 RAW meeting, and the RAW indicated that the utilization is increasing and questioned the time required to perform these services. These two codes were surveyed and reviewed for the January 2019 RUC meeting.

We disagree with the RUC-recommended work RVU of 4.50 (current value) for CPT code 52441 (*Cystourethroscopy, with insertion of permanent adjustable transprostatic implant; single implant*) and proposed a work RVU of 4.00. This proposed work RVU is based on a crosswalk from recently reviewed CPT code 58562 (*Hysteroscopy, surgical; with removal of impacted foreign body*), which has a work RVU of 4.00, and an identical 25 minutes of intraservice time as CPT code 52441.

We disagree with the RUC-recommended work RVU of 1.20 (current value) for CPT code 52442 (*Cystourethroscopy, with insertion of permanent adjustable transprostatic implant; each additional permanent adjustable transprostatic implant (List separately in addition to code for primary procedure)*) and proposed a work RVU of 1.01. This proposed work RVU is based on a crosswalk from CPT code 36218 (*Selective catheter placement, arterial system; additional second order, third order, and beyond, thoracic or brachiocephalic branch, within a vascular family (List in addition to code for initial second or third order vessel as appropriate)*), which has a work RVU of 1.01, and an identical 15 minutes of intraservice time as CPT code 52442.

The RUC survey showed a reduction in time, and the work should reflect these changes.

We proposed the RUC-recommended direct PE inputs for all codes in the family without refinement.

We received public comments on the proposed valuation of the codes in the Cystourethroscopy Insertion Transprostatic Implant family. The following is a summary of the comments we received and our responses.

Comment: Several commenters disagreed with the CMS proposed work RVU of 4.00 for CPT code 52441 and stated that CMS should instead finalize the RUC-recommended work RVU of

4.50. One commenter stated the RUC recommendation for code 52441 was understated, but would support the RUC recommendation at this time. Commenters stated that the CMS proposal completely disregards all factors that go into the work value apart from time and, if finalized, would create a rank order anomaly relative to other urological procedures. Commenters stated that although the intraservice time for CPT code 52441 has decreased from 30 minutes to 25 minutes, the physician work for the procedure is now more intense.

Response: We recognize that adjusting work RVUs for changes in time is not always a straightforward process and that the intensity associated with changes in time is not necessarily always linear, which is why we apply various methodologies to identify several potential work values for individual codes. However, we reiterate that we believe it would be irresponsible to ignore changes in time based on the best data available and that we are statutorily obligated to consider both time and intensity in establishing work RVUs for PFS services. We continue to believe that recently reviewed CPT code 58562 with an identical 25 minutes of intraservice time is a strong crosswalk and a work RVU of 4.00 is a more accurate valuation for code 52441.

Comment: A few commenters disagreed with our comparison of code 52441 to code 58562 because they are unrelated procedures, and also stated that removal of an intrauterine foreign body is not the same procedure as placement of a transprostatic implant and does not require as much skill and decision.

Response: We disagree with the commenters that CPT code 58562 is not an appropriate crosswalk code on the grounds that it is an unrelated procedure. We continue to believe that the nature of the PFS relative value system is such that all services are appropriately subject to comparisons to one another. Although codes that describe clinically similar services are sometimes stronger comparator codes, we do not agree that codes must share the same site of service, patient population, or utilization level to serve as an appropriate crosswalk.

Comment: Several commenters disagreed with the CMS proposed work RVU of 1.01 for CPT code 52442 and stated that CMS should instead finalize the RUC-recommended work RVU of 1.20. One commenter stated the RUC recommendation for code 52442 was understated and suggested the work RVU should be increase to 2.09 using a

crosswalk to code 36227 (*Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation (List separately in addition to code for primary procedure)*). Commenters stated that although the intraservice time for CPT code 52442 has decreased from 25 minutes to 15 minutes, the physician work for the procedure is now more intense. Commenters stated that the CMS proposal for code 52442 completely disregards all factors that go into the work value apart from time and, if finalized, would create a rank order anomaly relative to other urological procedures.

Response: We disagree that CPT code 36227 is a better comparator to code 52442. Code 36227 is significantly more intense than the reviewed code 52442 because it involves catheter insertion into the external carotid artery, and we do not believe that it would be an appropriate comparison code. We agree with the commenters that intensity has increased for code 52442. This is the reason why we crosswalked the work RVU of code 36218 to code 52442. Code 36218 has the same intraservice time of 15 minutes and a higher intensity than code 52442. According to the RUC database, the intensity of work per unit of time (IWP/UT) is greater for code 36218 than for code 52442. We continue to believe that CPT code 36218 with an identical 15 minutes of intraservice time is a strong crosswalk and a work RVU of 1.01 is a more accurate valuation for code 52442.

After consideration of the public comments, we are finalizing the work RVUs and the direct PE inputs for the codes in the Cystourethroscopy Insertion Transprostatic Implant family of codes (CPT codes 52441 and 52442) as proposed.

(21) Orchiopexy (CPT Code 54640)

The CPT Editorial Panel revised existing CPT code 54640 to describe an additional approach for orchiopexy (scrotal) and to clearly indicate that hernia repair is separately reportable. This code was surveyed and reviewed for the January 2019 RUC meeting.

We proposed to maintain the current work RVU of 7.73 as recommended by the RUC. We proposed the RUC-recommended direct PE inputs for CPT code 54640 without refinement.

We received public comments on the proposed valuation of CPT code 54640 for Orchiopexy. The following is a summary of the comments we received and our responses.

Comment: Commenters were supportive of our proposal of the RUC-recommended work RVUs.

Response: We thank the commenters for their support.

After consideration of the public comments, we are finalizing the RUC-recommended work RVUs and direct PE inputs for Orchiopexy (CPT code 54640).

(22) Radiofrequency Neurotomy Sacroiliac Joint (CPT Codes 64451, 64625)

In September 2018, the CPT Editorial Panel created two new codes to describe injection and radiofrequency ablation of the sacroiliac joint with image guidance for somatic nerve procedures. We proposed the RUC-recommended work RVU of 1.52 for CPT code 64451 (*Injection(s), anesthetic agent(s) and/or steroid; nerves innervating the sacroiliac joint, with image guidance (i.e., fluoroscopy or computed tomography)*) and the RUC-recommended work RVU of 3.39 for CPT code 64625 (*Radiofrequency ablation, nerves innervating the sacroiliac joint, with image guidance (i.e., fluoroscopy or computed tomography)*).

For the direct PE inputs, we proposed to refine the quantity of the “needle, 18–26g 1.5–3.5in, spinal” (SC028) supply from 3 to 1 for CPT code 64451. There are no spinal needles in use in the reference code associated with CPT code 64451, and there was no explanation in the recommended materials explaining why three such needles would be typical for this procedure. We agree that the service being performed in CPT code 64451 would require a spinal needle, but we do not believe that the use of three such needles would be typical.

We proposed to refine the quantity of the “cannula (radiofrequency denervation) (SMK–C10)” (SD011) supply from 4 to 2 for CPT code 64625. We do not believe that the use of 4 of these cannula would be typical for the procedure, as the reference code currently used for destruction by neurolytic agent contains only a single cannula. We believe that the nerves would typically be ablated one at a time using this cannula, as opposed to ablating four of them simultaneously as suggested in the recommended direct PE inputs. We also searched in the RUC database for other CPT codes that made use of the SD011 supply, and out of the seven codes that currently use this item, none of them include more than 2 cannula. As a result, we proposed to refine the supply quantity to 2 cannula to match the highest amount contained in an existing code on the PFS. We are

also refining the equipment time for the “radiofrequency kit for destruction by neurolytic agent” (EQ354) equipment from 164 minutes to 82 minutes. The RUC’s equipment time recommendation was predicated on the use of 4 of the SD011 supplies for 41 minutes apiece, and we are refining the equipment time to reflect our supply refinement to 2 cannula. It was unclear in the recommended materials as to whether the radiofrequency kit equipment was in use simultaneously or sequentially along with the cannula supplies, and therefore, we are soliciting comments on the typical use of this equipment.

Finally, we proposed to refine the equipment time for the technologist PACS workstation (ED050) equipment to match our standard equipment time formulas, which results in an increase of 5 minutes of equipment time for both codes.

We received public comments on the proposed valuation of the codes in the Radiofrequency Neurotomy Sacroiliac Joint family. The following is a summary of the comments we received and our responses.

Comment: Several commenters disagreed with the CMS proposal to refine the quantity of the “needle, 18–26g 1.5–3.5in, spinal” (SC028) supply from 3 to 1 for CPT code 64451. Commenters stated that this code describes four separate injections of three sacral levels, and that four separate needles are required to inject the dorsal rami of L5 and the lateral branches of S1, S2 and S3. Commenters clarified that although the original RUC recommendation indicated that only 3 needles are needed for CPT code 64451, this was an error and the recommendation should in fact be 4 needles. Commenters stated that standard practice is to place the four needles, then simultaneously inject, and that if one needle were to be used there would be additional time required to account for the sequential fashion of the injections.

Response: We appreciate the additional information provided by the commenters regarding the SC028 spinal needle supply, especially the clarification that the use of four needles would be typical for the procedure. This was particularly helpful in resolving the discrepancy between the original recommendation of three needles and the four injections taking place. Although we continue to have reservations as to whether four simultaneous injections would be typical for this procedure, we are finalizing a supply quantity of 4 spinal needles for CPT code 64451 as recommended by the commenters.

Comment: Several commenters disagreed with the CMS proposal to refine the quantity of the “cannula (radiofrequency denervation) (SMK–C10)” (SD011) supply from 4 to 2 for CPT code 64625. Commenters stated that, in a similar fashion to CPT code 64451, the radiofrequency ablation of the nerves innervating the sacroiliac joint in CPT code 64625 requires four cannulas for simultaneous ablation of the four nerves. Commenters stated that these cannula are placed and then guided simultaneously to allow for fewer fluoroscopic images and a safer total radiation dose for the patient and staff. Commenters also noted that the comparison codes referenced in the proposed rule involved an ablation of a single nerve, and that while this was an excellent base comparison, CPT code 64625 reflects four times that work. Commenters requested that CMS finalize the RUC-recommended supply quantity of 4 cannulas.

Response: We appreciate the additional information provided by the commenters regarding the SD011 cannula supply, especially the reminder that the other comparison codes containing a cannula supply involved the ablation of a single nerve instead of four nerves. As we stated with regard to the spinal needle supply for CPT code 64451, we continue to have reservations as to whether four simultaneous ablations would be typical for this procedure; however, we are finalizing a supply quantity of 4 cannula for CPT code 64625 as recommended by the commenters.

Comment: Several commenters disagreed with the CMS proposal to refine the equipment time for the “radiofrequency kit for destruction by neurolytic agent” (EQ354) equipment from 164 minutes to 82 minutes. Commenters stated that four kits are used for 41 minutes each totaling 164 minutes, as the 41 minutes (times 4) occurs simultaneously. Commenters stated again that four cannulas and four kits are needed for the simultaneous ablation of four nerves.

Response: Since we did not finalize our proposal to refine the quantity of the SD011 cannula supply from 4 to 2 for CPT code 64625, we are also not finalizing our refinement to the EQ354 equipment time. We will instead finalize the RUC-recommended equipment time of 164 minutes for the radiofrequency kit.

Comment: Several commenters stated that the proposed reduction in RVUs for knee genicular nerve ablation and sacroiliac joint ablation will effectively reduce access for Medicare beneficiaries to reasonable and sensible treatments

for chronic knee and low back pain respectively. The commenters detailed the clinical benefits of these procedures and requested that the proposed reduction in RVUs for knee and sacroiliac joint ablation not be enacted, as the commenters stated that doing so would jeopardize their ability to responsibly treat a large number of patients.

Response: We appreciate the feedback from the commenters detailing their experience with these procedures and their clinical importance to Medicare beneficiaries. We agree that it is extremely important to ensure reasonable and fair payment for each service in order to maintain access to care. In the particular case of the codes in the Radiofrequency Neurotomy Sacroiliac Joint family, we agreed with the RUC recommendations for work valuation and proposed the recommended work RVUs without refinement. We believe that this valuation will ensure that providers are properly compensated for these services.

After consideration of the public comments, we are finalizing the work RVUs for the codes in the Radiofrequency Neurotomy Sacroiliac Joint family as proposed. We are finalizing the RUC-recommended direct PE inputs for both codes in the family, with the exception of a refinement from 3 to 4 spinal needles (SC028) for CPT code 64451 and the proposed equipment time refinements for the technologist PACS workstation (ED050) equipment to match our standard equipment time formulas.

(23) Lumbar Puncture (CPT Codes 62270, 62328, 62272, and 62329)

In October 2017, these services were identified as being performed by a different specialty than the specialty that originally surveyed this service. In January 2018, the RUC recommended that these services be referred to CPT to bundle image guidance. At the September 2018 CPT Editorial Panel meeting, the Panel created two new codes to bundle diagnostic and therapeutic lumbar puncture with fluoroscopic or CT image guidance and revised the existing diagnostic and therapeutic lumbar puncture codes so they would only be reported without fluoroscopic or CT guidance.

For CPT code 62270 (*Spinal puncture, lumbar, diagnostic*), we disagree with the RUC-recommended work RVU of 1.44 and we proposed a work RVU of 1.22 based on a crosswalk to CPT code 40490 (*Biopsy of lip*). CPT code 40490 has the same intraservice time of 15 minutes and 2 additional minutes of

total time. In reviewing CPT code 62270, we noted that the recommended intraservice time is decreasing from 20 minutes to 15 minutes (25 percent reduction), and the recommended total time is decreasing from 40 minutes to 32 minutes (20 percent reduction); however, the RUC-recommended work RVU is increasing from 1.37 to 1.44, which is an increase of just over 5 percent. Although we do not imply that the decrease in time as reflected in survey values must equate to a one-to-one or linear decrease in the valuation of work RVUs, we believe that since the two components of work are time and intensity, significant decreases in time should be appropriately reflected in decreases to work RVUs. In the case of CPT code 62270, we believed that it was more accurate to propose a work RVU of 1.22 based on a crosswalk to CPT code 40490 to account for these decreases in the surveyed work time.

For CPT code 62328 (*Spinal puncture, lumbar, diagnostic; with fluoroscopic or CT guidance*), we disagree with the RUC-recommended work RVU of 1.95 and we proposed a work RVU of 1.73. Although we disagree with the RUC-recommended work RVU, we note that the relative difference in work between CPT codes 62270 and 62328 is equivalent to an interval of 0.51 RVUs. Therefore, we proposed a work RVU of 1.73 for CPT code 62328, based on the recommended interval of 0.51 additional RVUs above our proposed work RVU of 1.22 for CPT code 62270.

For CPT code 62272 (*Spinal puncture, therapeutic, for drainage of cerebrospinal fluid (by needle or catheter)*), we disagree with the RUC-recommended work RVU of 1.80 and we proposed a work RVU of 1.58. Although we disagree with the RUC-recommended work RVU, we note that the relative difference in work between CPT codes 62270 and 62328 is equivalent to the RUC-recommended interval of 0.36 RVUs. Therefore, we proposed a work RVU of 1.58 for CPT code 62272, based on the recommended interval of 0.36 additional RVUs above our proposed work RVU of 1.22 for CPT code 62270.

For CPT code 62329 (*Spinal puncture, therapeutic, for drainage of cerebrospinal fluid (by needle or catheter); with fluoroscopic or CT guidance*), we disagree with the RUC-recommended work RVU of 2.25 and we proposed a work RVU of 2.03. Although we disagree with the RUC-recommended work RVU, we note that the relative difference in work between CPT codes 62270 and 62329 is equivalent to the recommended interval of 0.81 RVUs. Therefore, we proposed a

work RVU of 2.03 for CPT code 62329, based on the recommended interval of 0.81 additional RVUs above our proposed work RVU of 1.22 for CPT code 62270.

We proposed the RUC-recommended direct PE inputs for all four codes in the family without refinement.

We received public comments on the proposed valuation of the codes in the Lumbar Puncture family. The following is a summary of the comments we received and our responses.

Comment: Several commenters disagreed with the CMS-proposed work RVU of 1.22 for CPT code 62270 and stated that CMS should instead finalize the RUC-recommended work RVU of 1.44. Commenters stated that the proposed crosswalk to CPT code 40490 was inappropriate and was chosen based only on a time comparison without consideration to the intensity of the work. Commenters stated that CPT code 62270 had a very different and more intensive patient population than the proposed crosswalk to CPT code 40490, with the crosswalk code typically performed in a physician office as an elective procedure while code CPT code 62270 is typically performed on seriously ill patients in the emergency room or inpatient hospital setting. Commenters stated that CPT code 62270 is a more intense and complex procedure because it involves insertion of a needle to at least a depth of 6–7 cm in the average sized patient while navigating around spine anatomy such as subcutaneous soft tissues, paraspinal muscles, spinous process, interspinous ligament, transverse process, epidural space and dura to access the cerebrospinal space. Commenters also stated that these two procedures were not clinically similar, as CPT code 40490 is a superficial biopsy of a visible lesion whereas CPT code 62270 requires the physician to guide a needle from the skin, through the soft tissues, between the posterior elements of the lumbar spine, and into the thecal sac within the spinal canal in a patient that is presenting with neurologic symptoms necessitating an emergent procedure.

Response: We disagree with the commenters that CPT code 40490 was an inappropriate choice to use as a crosswalk for work valuation, and we did not choose this code based only on a time comparison without respect to intensity. We recognize that it would not be appropriate to develop work RVUs solely based on time given that intensity is also an element of work. We clarify again that we do not treat all components of physician time as having identical intensity. Were we to disregard

intensity altogether, the work RVUs for all services would be developed based solely on time values and that is definitively not the case, as indicated by the many services that share the same time values but have different work RVUs. For more details on our methodology for developing work RVUs, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section II.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80272 through 80277).

In more general terms, we continue to believe that the nature of the PFS relative value system is such that all services are appropriately subject to comparisons to one another. Although codes that describe clinically similar services are sometimes stronger comparator codes, we do not agree that codes must share the same site of service, patient population, or utilization level to serve as an appropriate crosswalk. We also note that the RUC-recommended crosswalk code used to determine the recommended work RVU of 1.44, CPT code 12004, is itself not clinically similar to CPT code 62270. While both procedures include an initial injection, they are otherwise clinically distinct from one another, with CPT code 12004 describing repair of superficial wounds while CPT code 62270 describes a spinal puncture for the purpose of obtaining cerebrospinal fluid samples. We do not understand the critique of CPT code 40490 as a clinically dissimilar code on the part of the commenters when the recommended work RVU of 1.44 is also based on a clinically dissimilar code.

For the specific case of CPT code 40490, while it is true that this is not an emergent procedure, the service nonetheless requires tissue excision and carries a substantial risk of serious bleeding from the patient. To the extent that commenters stated that CPT code 62270 is a more intense procedure than CPT code 40490, we agree with the commenters, which is why we proposed a higher intensity for CPT code 62270 in the proposed rule. We also note that CPT code 40490 was not the only crosswalk code that we could have chosen for work valuation. We also considered CPT code 12013 (*Simple repair of superficial wounds of face, ears, eyelids, nose, lips and/or mucous membranes; 2.6 cm to 5.0 cm*), an MPC code with the same 15 minutes of intraservice time, 27 minutes of total time, and the same work RVU of 1.22. If the commenters have reason to believe that wound repair procedures such as CPT code 12004 are more

appropriate choices as crosswalks on clinical grounds, we emphasize that we also could have chosen CPT code 12013 (another wound repair procedure) for our crosswalk and still derived the same work RVU of 1.22.

Comment: Several commenters disagreed with the CMS-proposed work RVUs for CPT codes 62328, 62272, and 62329. Commenters stated that CMS should instead finalize the RUC-recommended work RVUs for these procedures. Commenters stated that the incremental methodology used in valuing these services was flawed; commenters did not agree that it was appropriate to reduce the work RVU for CPT code 62270 from the value proposed by the RUC, while also recalibrating the work RVUs for CPT codes 62328, 62272, and 62329 relative to the RUC's recommended difference in work between these code and CPT code 62270. Commenters stated that patients for CPT code 62328 have typically failed a bedside lumbar puncture or have prior history of spine surgery that requires imaging to facilitate access into the cerebrospinal fluid space, and therefore, calculating a step-up in value from CPT code 62270 does not accurately capture the work differences. Commenters stated that it is imperative to employ RUC survey data to value these codes, and that using an incremental approach in lieu of survey data, strong crosswalks, and input from the practitioners providing these services was unjustified.

Response: We believe the use of an incremental difference between codes is a valid methodology for setting values, especially in valuing services within a family of revised codes where it is important to maintain appropriate intra-family relativity. Historically, we have frequently utilized an incremental methodology in which we value a code based upon its incremental difference between another code or another family of codes. We note that the RUC has also used the same incremental methodology on occasion when it was unable to produce valid survey data for a service. We have no evidence to suggest that the consideration of an incremental difference between codes for the work component would be an inaccurate methodology to use for identifying the work resources in time and intensity involved in furnishing the service. For more details on our methodology for developing work RVUs, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section II.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80272 through 80277).

Comment: Several commenters stated the crosswalk or methodology used in the original valuation of CPT code 62272 is unknown and not resource-based, and therefore, it was invalid for CMS to compare the current time and work to the surveyed time and work. Commenters stated that referencing physician times and derived intensities created almost 30 years ago under the Harvard study as a method to critique RUC recommendations was not appropriate.

Response: We believe that it is crucial that the code valuation process take place with the understanding that the existing work times, used in the PFS ratesetting processes, are accurate. We recognize that adjusting work RVUs for changes in time is not always a straightforward process and that the intensity associated with changes in time is not necessarily always linear, which is why we apply various methodologies to identify several potential work values for individual codes. However, we reiterate that we believe it would be irresponsible to ignore changes in time based on the best data available, and that we are statutorily-obligated to consider both time and intensity in establishing work RVUs for PFS services. For additional information regarding the use of old work time values that were established many years ago and have not since been reviewed in our methodology, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section II.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80273 through 80274). We also note that for the specific case of CPT code 62272, our proposed work RVU of 1.58 was based on the use of an incremental methodology and was unrelated to the existing work time values.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the Lumbar Puncture family as proposed.

(24) Electronic Analysis of Implanted Pump (CPT Codes 62367, 62368, 62369, and 62370)

CPT code 62368 (*Electronic analysis of programmable, implanted pump for intrathecal or epidural drug infusion (includes evaluation of reservoir status, alarm status, drug prescription status); with reprogramming*) was identified by the RUC on a list of services which were originally surveyed by one specialty but are now typically performed by a different specialty. It was reviewed along with three other codes in the

family for PE only at the April 2018 RUC meeting. The RUC did not recommend work RVUs for these codes and we did not propose to change the current work RVUs.

For the direct PE inputs, we proposed to remove the minimum multi-specialty visit pack (SA048) from CPT code 62370 as a duplicative supply due to the fact that this code is typically billed with an E/M or other evaluation service.

We received public comments on the proposed valuation of the codes in the Electronic Analysis of Implanted Pump family. The following is a summary of the comments we received and our responses.

Comment: A few commenters supported the proposal to remove the minimum multi-specialty visit pack (SA048) from CPT code 62370 as a duplicative supply.

Response: We appreciate the support for our proposal from the commenters.

Comment: Several commenters disagreed with the proposed reduction in the nonfacility PE RVUs for the Electronic Analysis of Implanted Pump family of codes. The commenters detailed the use of implantable infusion pumps for the treatment of spasticity and chronic intractable pain and stated that they had concerns that the proposed physician payment reductions could threaten access to this important alternative therapy. The commenters stated that CMS provided commentary in the proposed rule about removing the minimum multi-specialty visit pack (SA048) from CPT code 62370 but there was no rationale given for a reduction of this magnitude applying across the entire family of codes. The commenters stated that they did not believe that a reduction in clinical labor time for these services was warranted, and restated that reducing the clinical labor time and cutting payment to physician offices for these codes, without a basis for doing so, was inappropriate.

Response: We clarify for the commenters that we proposed to remove the minimum multi-specialty visit pack (SA048) only from CPT code 62370, as a duplicative supply due to the fact that this code is typically billed with an E/M or other evaluation service. We did not propose to remove the SA048 visit pack from CPT code 62369 as this code is not typically billed with an E/M service. Aside from this singular refinement, we proposed the RUC-recommended direct PE inputs without refinement for the four codes in the family. We agree with the RUC that the typical clinical labor time required to perform these services has decreased significantly since they were last reviewed in 2011, particularly in light of

the fact that three of the four codes are typically billed with a same day E/M service.

Comment: A commenter stated that the RUC and CMS applied significant reductions to clinical labor inputs for CPT codes 62367 and 62368 because these services are billed more than 50 percent of the time with E/M office visit services. The commenter stated that while this may be the case, the underlying rationale—that clinical staff times are redundant—does not apply to these services. The commenter stated that neuromodulation physician offices provide these services to patients every day, and the time spent by clinical staff is not duplicative and is not captured by any accompanying E/M codes.

Response: In cases where a service is typically furnished to a beneficiary on the same day as an E/M service, we believe that there is overlap between the two services in some of the activities furnished during the preservice evaluation and postservice time. Our longstanding adjustments have reflected a broad assumption that at least one-third of the work time in both the preservice evaluation and postservice period is duplicative of work furnished during the E/M visit, and we believe that the clinical labor tasks are similarly duplicative. For example, we do not believe that clinical labor tasks such as “Greet patient, provide gowning, ensure appropriate medical records are available” (CA009) and “Prepare room, equipment and supplies” (CA013) would typically be performed in CPT code 62367 given that clinical labor time is already allocated for these identical tasks in the E/M codes. We also note that the commenter did not provide a rationale as to why this clinical labor time would not be duplicative. We continue to agree with the RUC-recommended clinical labor times that we proposed for the four codes in this family.

Comment: A commenter stated that the clinical labor time assigned to CPT codes 62369 and 62370 for clinical staff time during the procedure (the intraservice time) should not be set as the same time as the time assigned for physician intraservice work. The commenter stated that the clinical staff spends significant amounts of time before and after the physician provides his/her services, including tracking patient refill dates, reviewing charts, writing prescriptions, and transmitting them to a pharmacy. The commenter stated that when medications are received, these need to be recorded and double-locked per Drug Enforcement Agency (DEA) regulations, and then when taken out and dispensed the staff

must inform and assist the patient in collecting their signatures. The commenter stated that this clinical labor occurs for every patient encounter and should be recognized in the RVUs assigned to these services.

Response: We agree with the commenter that these are important tasks that must be carried out for each patient and they should be recognized in the valuation of these services. However, we note for the commenter that most of these clinical labor tasks are already included in the typically billed same day E/M code for CPT code 62370, which has clinical labor time allocated for these very same activities, such as checking tab test results, reviewing document history, and coordinating home care. In the case of CPT code 62369, which is not typically billed with a same day E/M code, clinical labor for performing these tasks has been retained in the proposed direct PE inputs.

After consideration of the public comments, we are finalizing the direct PE inputs for the codes in the Electronic Analysis of Implanted Pump family as proposed. We did not propose and we are not finalizing any changes to the current work RVUs.

(25) Somatic Nerve Injection (CPT Codes 64400, 64408, 64415, 64416, 64417, 64420, 64421, 64425, 64430, 64435, 64445, 64446, 64447, 64448, 64449, and 64450)

In May 2018, the CPT Editorial Panel approved the revision of descriptors and guidelines for the codes in this family and the deletion of three CPT codes to clarify reporting (that is, separate reporting of imaging guidance, number of units and a change from a 0-day global to ZZZ for one of the CPT codes in this family). This family of services describe the injection of an anesthetic agent(s) and/or steroid into a nerve plexus, nerve, or branch; reported once per nerve plexus, nerve, or branch as described in the descriptor regardless of the number of injections performed along the nerve plexus, nerve, or branch described by the code.

CPT codes 64400 (*Injection(s), anesthetic agent(s); trigeminal nerve, each branch (i.e., ophthalmic, maxillary, mandibular)*), 64408 (*Injection(s), anesthetic agent(s), and/or steroid; vagus nerve*), 64415 (*Injection(s), anesthetic agent(s) and/or steroid; brachial plexus*), 64416 (*Injection(s), anesthetic agent(s) and/or steroid; brachial plexus, continuous infusion by catheter (including catheter placement)*), 64417 (*Injection(s), anesthetic agent(s) and/or steroid; axillary nerve*), 64420 (*Injection(s),*

anesthetic agent(s) and/or steroid; intercostal nerve, single level), 64421 (*Injection(s), anesthetic agent(s) and/or steroid; intercostal nerves, each additional level (List separately in addition to code for primary procedure)*), 64425 (*Injection(s), anesthetic agent(s) and/or steroid; ilioinguinal, iliohypogastric nerves*), 64430 (*Injection(s), anesthetic agent(s) and/or steroid; pudendal nerve*), 64435 (*Injection(s), anesthetic agent(s) and/or steroid; paracervical (uterine) nerve*), 64445 (*Injection(s), anesthetic agent(s) and/or steroid; sciatic nerve*), 64446 (*Injection(s), anesthetic agent(s) and/or steroid; sciatic nerve, continuous infusion by catheter (including catheter placement)*), 64447 (*Injection(s), anesthetic agent(s); femoral nerve*), 64448 (*Injection(s), anesthetic agent(s) and/or steroid; femoral nerve, continuous infusion by catheter (including catheter placement)*), 64449 (*Injection(s), anesthetic agent(s) and/or steroid; lumbar plexus, posterior approach, continuous infusion by catheter (including catheter placement)*), and 64450 (*Injection(s), anesthetic agent(s); other peripheral nerve or branch*) were reviewed for work and PE at the October 2018 RUC meeting. The PE for CPT code 64450 was re-reviewed during the RUC January 2019 meeting.

During the October 2018 RUC presentation for this family of services, the specialty societies stated that CPT codes 64415, 64416, 64417, 64446, 64447, and 64448 were reported with CPT code 76942 (*Ultrasonic guidance for needle placement (e.g., biopsy, aspiration, injection, localization device), imaging supervision and interpretation*) more than 50 percent of the time. Specifically, 76 percent with CPT code 64415, 85 percent with CPT code 64416, 68 percent with CPT code 64417, 77 percent with CPT code 64446, 77 percent with CPT code 64447, and 79 percent with CPT code 64448. It was also noted in the RUC recommendations that this overlap was accounted for in the RUC recommendations submitted for these services. Furthermore, the RUC recommendations stated that the RUC referred CPT codes 64415, 64416, 64417, 64446, 64447 and 64448 to be bundled with ultrasound guidance, CPT code 76942 to the CPT Editorial Panel for CPT 2021.

In reviewing this family of services, our proposed work and PE values for CPT codes 64415, 64416, 64417, 64446, 64447 and 64448 did not consider the overlap of imaging, as noted in the RUC recommendations. We noted that the RUC recommendations did not include values to support the valuation for the

bundling of imaging in their work or PE recommendations and that the CPT code descriptors do not state that imaging is included.

For CY 2020, we proposed the RUC-recommended work RVUs for CPT codes 64417 (work RVU of 1.27), 64435 (work RVU of 0.75), 64447 (work RVU of 1.10), and 64450 (work RVU of 0.75), the RUC reaffirmed work RVU of 0.94 for CPT code 64405 (*Injection, anesthetic agent; greater occipital nerve*), which is the current work RVU finalized in the CY 2019 PFS final rule (83 FR 59542), and the RUC reaffirmed work RVU of 1.10 for CPT code 64418 (*Injection, anesthetic agent; suprascapular nerve*), which is the current work RVU value finalized in the CY 2018 PFS final rule (82 FR 53054). Although we proposed the RUC-reaffirmed work RVUs for these two codes, as submitted in the RUC recommendations, we noted that comparable codes in this family of services have lower work RVUs. Thus, these two codes may have become misvalued since their last valuation, as they were not resurveyed under this code family during the October 2018 RUC meeting.

In continuing our review of this code family, we disagreed with the RUC-recommended work RVU of 1.00 for CPT code 64400 and proposed a work RVU of 0.75, to maintain rank order in this code family. Our proposed work RVU is based on a crosswalk to another code in this family, CPT code 64450, which has an identical work RVU of 0.75 and near identical intraservice and total time values to CPT code 64400.

We noted that the RUC-recommended intraservice time decreased from 37 to 6 minutes (84 percent reduction) and the RUC-recommended total time decreased from 69 to 20 minutes (71 percent reduction) for CPT code 64400. However, the RUC-recommended work RVU only decreased by 0.11, a 10 percent reduction. We did not believe the RUC-recommended work RVU appropriately accounts for the substantial reductions in the surveyed work times for the procedure. Although we did not imply that the decrease in time as reflected in survey values must always equate to a one-to-one or linear decrease in the valuation of work RVUs, we believe that since the two components of work and time are intensity, absent an obvious or explicitly stated rationale for why the relative intensity of a given procedure has increased, significant decreases in time should be reflected in decreases to work RVUs. In the case of CPT code 64400, we believe that it would be more accurate to propose a work RVU of 0.75

based on a crosswalk to CPT code 64450, which has an identical work RVU of 0.75 and near identical intraservice and total times to CPT code 64400. We further noted that our proposed work RVU maintains rank order in this code family among comparable codes.

For CPT code 64408, we disagreed with the RUC-recommended work RVU of 0.90 and proposed a work RVU of 0.75, to maintain rank order in this code family. Our proposed work RVU is based on a crosswalk to another code in this family, CPT code 64450, which has an identical work RVU of 0.75, and near identical intraservice and total time values to CPT code 64408.

We noted that the RUC-recommended intraservice time decreased from 16 to 5 minutes (69 percent reduction) and RUC-recommended total time decreased from 36 to 20 minutes (44 percent reduction) for CPT code 64408.

Although the RUC-recommended work RVU decreased by 0.51, a 36 percent reduction, we do not believe the RUC-recommended work RVU appropriately accounted for the substantial reductions in the surveyed work times for the procedure. Although we did not imply that the decrease in time as reflected in survey values must always equate to a one-to-one or linear decrease in the valuation of work RVUs, we believe that since the two components of work and time are intensity, absent an obvious or explicitly stated rationale for why the relative intensity of a given procedure has increased, significant decreases in time should be reflected in decreases to work RVUs. In the case of CPT code 64408, we believe that it would be more accurate to propose a work RVU of 0.75, based on a crosswalk CPT code 64450, to account for these decrease in the surveyed work times. We further noted that our proposed work RVU maintains rank order in this code family among comparable codes.

For CPT code 64415, we disagreed with the RUC-recommended work RVU of 1.42 and proposed a work RVU of 1.35, based on our total time ratio methodology and further supported by a reference to CPT code 49450 (*Replacement of gastrostomy or cecostomy (or other colonic) tube, percutaneous, under fluoroscopic guidance including contrast injections(s), image documentation and report*), which has a work RVU of 1.36 and similar intraservice and total time values to CPT code 64415.

We noted that the RUC-recommended intraservice time decreased from 15 to 12 minutes (20 percent reduction) and RUC-recommended total time decreased from 44 to 40 minutes (9 percent

reduction). However, the RUC-recommended work RVU only decreased by 0.06, which is a 4 percent reduction. We did not believe the RUC-recommended work RVU appropriately accounted for the substantial reductions in the surveyed work times for the procedure. Although we did not imply that the decrease in time as reflected in survey values must always equate to a one-to-one or linear decrease in the valuation of work RVUs, we believe that since the two components of work and time are intensity, absent an obvious or explicitly stated rationale for why the relative intensity of a given procedure has increased, significant decreases in time should be reflected in decreases to work RVUs. In the case of CPT code 64415, we believed that it would be more accurate to propose a work RVU of 1.35, based on our time ratio methodology and a reference to CPT code 49450, to account for these decrease in the surveyed work times.

For CPT code 64416, we disagreed with the RUC-recommended work RVU of 1.81 and proposed a work RVU of 1.48, based on our total time ratio methodology and further supported by a bracket of CPT code 62270 (*Spinal puncture, lumbar, diagnostic*), which has a work RVU of 1.37, identical intraservice, and similar total time to CPT code 64416 and CPT code 91035 (*Esophagus, gastroesophageal reflux test; with mucosal attached telemetry pH electrode placement, recording, analysis and interpretation*), which has a work RVU of 1.59, identical intraservice, and near identical total time values to CPT code 64416.

We noted that while the RUC-recommended intraservice time remained unchanged, the RUC-recommended total time decreased from 60 to 49 minutes (18 percent reduction). However, the RUC recommended maintaining the current work RVU of 1.81. We do not believe the RUC-recommended work RVU appropriately accounted for the substantial reductions in the surveyed total time for the procedure. Although we did not imply that the decrease in time as reflected in survey values must always equate to a one-to-one or linear decrease in the valuation of work RVUs, we believed that since the two components of work and time are intensity, absent an obvious or explicitly stated rationale for why the relative intensity of a given procedure has increased, significant decreases in time should be reflected in decreases to work RVUs. In the case of CPT code 64416, we believed that it would be more accurate to propose a work RVU of 1.48, based on our time ratios methodology and supported by a

bracket to CPT code 62270 and CPT code 91035, to account for these decreases in the surveyed work times.

For CPT code 64420, we disagreed with the RUC-recommended work RVU of 1.18 and proposed a work RVU of 1.08, based on our time ratio methodology and further supported by a reference to CPT code 12011 (*Simple repair of superficial wounds of face, ears, eyelids, nose, lips and/or mucous membranes; 2.5 cm or less*), which has a work RVU of 1.07 and similar intraservice and total time values to CPT code 64420.

We noted that the RUC-recommended intraservice time decreased from 17 to 10 minutes (41 percent reduction) and the RUC-recommended total time decreased from 37 to 34 minutes (8 percent reduction). However, the RUC recommended to maintaining the current work RVU of 1.18. We do not believe the RUC-recommended work RVU appropriately accounted for the substantial reductions in the surveyed work times for the procedure. Although we did not imply that the decrease in time as reflected in survey values must always equate to a one-to-one or linear decrease in the valuation of work RVUs, we believe that since the two components of work and time are intensity, absent an obvious or explicitly stated rationale for why the relative intensity of a given procedure has increased, significant decreases in time should be reflected in decreases to work RVUs. In the case of CPT code 64420, we believed that it would be more accurate to propose a work RVU of 1.08 based on our times ratio methodology and a crosswalk to CPT code 12011, to account for these decreases in the surveyed work times.

For CPT code 64421, we disagreed with the RUC-recommended work RVU of 0.60 and proposed a work RVU of 0.50, based on our intraservice time ratio methodology and to maintain rank order among comparable codes in the family. Our proposed work RVU is further supported by a crosswalk to CPT code 15276 (*Application of skin substitute graft to face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits, total wound surface area up to 100 sq cm; each additional 25 sq cm wound surface area, or part thereof (List separately in addition to code for primary procedure)*), which has a work RVU of 0.50 and identical intraservice and total times to CPT code 64421.

We noted that our time ratio methodology suggests the code is better valued at 0.50. Furthermore, we note the RUC-recommended work RVU of 0.60 creates a rank order anomaly in the code

family. In the case of CPT code 64421, we believed that it would be more accurate to propose a work RVU of 0.50, based on our time ratio methodology and a crosswalk to CPT code 15276, to maintain rank order among comparable codes in the family.

For CPT code 64425, we disagreed with the RUC-recommended work RVU of 1.19 and proposed a work RVU of 1.00, to maintain rank order among comparable codes in the family, based on a bracket of CPT code 12001 (*Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.5 cm or less*) which has a work RVU of 0.84 and near identical intraservice and total time values to CPT code 64425 and CPT code 30901 (*Control nasal hemorrhage, anterior, simple (limited cautery and/or packing) any method*), which has a work RVU of 1.10 and near identical intraservice and total times to CPT code 64425. CPT code 64425 has 11 minutes of intraservice time and 25 minutes of total time.

We noted that the RUC-recommended work RVU of 1.19 creates a rank order anomaly in the code family. In the case of CPT code 64425, we believed that it would be more accurate to propose a work RVU of 1.00, based on a bracket of CPT codes 12001 and 30901 to maintain rank order among comparable codes in the family.

For CPT code 64430, we disagreed with the RUC-recommended work RVU of 1.15 and proposed a work RVU of 1.00, to maintain rank order among comparable codes in the family, based on a bracket of CPT code 45330 (*Sigmoidoscopy, flexible; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)*), which has a work RVU of 0.84 and near identical intraservice and total time values to CPT code 64430 and CPT code 31576 (*Laryngoscopy, flexible; with biopsy(ies)*), which has a work RVU of 1.89 and near identical intraservice and total time values to CPT code 64430.

We noted that the RUC-recommended intraservice time decreased from 17 to 10 minutes (41 percent reduction) and the RUC-recommended total time increased from 39 to 43 minutes (10 percent increase). While the RUC-recommended work RVU is decreasing by 0.31, a 21 percent reduction, we do not believe the RUC-recommended work RVU appropriately accounted for the substantial reductions in the surveyed intraservice work time for the procedure. Although we did not imply that the decrease in time as reflected in survey values must always equate to a one-to-one or linear decrease in the

valuation of work RVUs, we believe that since the two components of work and time are intensity, absent an obvious or explicitly stated rationale for why the relative intensity of a given procedure has increased, significant decreases in time should be reflected in decreases to work RVUs. In the case of CPT code 64430, we believed that it would be more accurate to propose a work RVU of 1.00, based on a bracket of CPT codes 45300 and 31576 to account for these decreases in surveyed work times and to maintain rank order among comparable codes in this family.

For CPT code 64445, we disagreed with the RUC-recommended work RVU of 1.18 and proposed a work RVU of 1.00, based on our time ratio methodology and to maintain rank order among comparable codes in the family. Our proposed work RVU is based on a bracket of CPT code 12001 (*Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.5 cm or less*), which has a work RVU of 0.84 and near identical intraservice and total times to CPT code 64445 and CPT code 30901 (*Control nasal hemorrhage, anterior, simple (limited cautery and/or packing) any method*), which has a work RVU of 1.10 and near identical intraservice and total time values to CPT code 64445.

We noted that the RUC-recommended intraservice time decreased from 15 to 10 minutes (33 percent reduction) and the RUC-recommended total time decreased from 48 to 24 minutes (50 percent reduction). While the RUC-recommended work RVU is decreasing by 0.30, a 21 percent reduction, we do not believe the RUC-recommended work RVU appropriately accounted for the substantial reductions in the surveyed intraservice work time for the procedure. Although we did not imply that the decrease in time as reflected in survey values must always equate to a one-to-one or linear decrease in the valuation of work RVUs, we believe that since the two components of work and time are intensity, absent an obvious or explicitly stated rationale for why the relative intensity of a given procedure has increased, significant decreases in time should be reflected in decreases to work RVUs. In the case of CPT code 64445, we believed that it would be more accurate to propose a work RVU of 1.00, based on a bracket of CPT codes 12001 and 30901 to account for these decreases in surveyed work times and to maintain rank order among comparable codes in the family.

For CPT code 64446, we disagreed with the RUC-recommended work RVU of 1.54 and proposed a work RVU of

1.36 based on our intraservice time ratios methodology and further supported by a reference to CPT code 51710 (*Change of cystostomy tube; complicated*), which has a near identical work RVU of 1.35 and near identical intraservice and total time values to CPT code 64446.

We noted that RUC-recommended intraservice time decreased from 20 to 15 minutes (25 percent reduction) and the RUC-recommended total time decreased from 64 to 40 minutes (38 percent reduction). While the RUC-recommended work RVU is decreasing by 0.27, a 15 percent reduction, we do not believe the RUC-recommended work RVU appropriately accounted for the substantial reductions in the surveyed intraservice work time for the procedure. Although we did not imply that the decrease in time as reflected in survey values must always equate to a one-to-one or linear decrease in the valuation of work RVUs, we believe that since the two components of work and time are intensity, absent an obvious or explicitly stated rationale for why the relative intensity of a given procedure has increased, significant decreases in time should be reflected in decreases to work RVUs. In the case of CPT code 64446, we believed that it would be more accurate to propose a work RVU of 1.36, based on our time ratios methodology and a reference to CPT code 51710 to account for these decreases in surveyed times and to maintain rank order among comparable codes in the family.

For CPT code 64448, we disagreed with the RUC-recommended work RVU of 1.55 and proposed a work RVU of 1.41, based on our intraservice time ratio methodology and a reference to CPT code 27096 (*Injection procedure for sacroiliac joint, anesthetic/steroid, with image guidance (fluoroscopy or CT) including arthrography when performed*), which has a work RVU of 1.48 and near identical intraservice time and identical total time values to CPT code 64448.

We noted that RUC-recommended intraservice time decreased from 15 to 13 minutes (13 percent reduction) and the RUC-recommended total time decreased from 55 to 38 minutes (62 percent reduction). While the RUC-recommended work RVU is only decreasing by 0.08, which is only a 5 percent reduction. We do not believe the RUC-recommended work RVU appropriately accounted for the substantial reductions in the surveyed intraservice work time for the procedure. Although we did not imply that the decrease in time as reflected in survey values must always equate to a

one-to-one or linear decrease in the valuation of work RVUs, we believe that since the two components of work and time are intensity, absent an obvious or explicitly stated rationale for why the relative intensity of a given procedure has increased, significant decreases in time should be reflected in decreases to work RVUs. In the case of CPT code 64448, we believed that it would be more accurate to propose a work RVU of 1.41, based on our time ratios methodology and a crosswalk to CPT code 27096 to account for these decreases in surveyed times and to maintain rank order among comparable codes in the family.

For CPT code 64449, we disagreed with the RUC-recommended work RVU of 1.55 and proposed a work RVU of 1.27, based on our intraservice time ratio methodology and a reference to CPT code 11755 (*Biopsy of nail unit (e.g., plate, bed, matrix, hyponychium, proximal and lateral nail folds) (separate procedure)*), which has a work RVU of 1.25 and near identical intraservice and total times to CPT code 64449.

We noted that RUC-recommended intraservice time decreased from 20 to 14 minutes (30 percent reduction) and the RUC-recommended total time decreased from 60 to 38 minutes (37 percent reduction). While the RUC-recommended work RVU is decreasing by 0.26, a 14 percent reduction, we do not believe the RUC-recommended work RVU appropriately accounted for the substantial reductions in the surveyed intraservice work time for the procedure. Although we did not imply that the decrease in time as reflected in survey values must always equate to a one-to-one or linear decrease in the valuation of work RVUs, we believe that since the two components of work and time are intensity, absent an obvious or explicitly stated rationale for why the relative intensity of a given procedure has increased, significant decreases in time should be reflected in decreases to work RVUs. In the case of CPT code 64449, we believe that it would be more accurate to propose a work RVU of 1.27, based on our time ratios methodology and a reference to CPT code 11755 to account for these decreases in surveyed times and to maintain rank order among comparable codes in the family.

For the direct PE inputs, we proposed to remove the clinical labor time for the “Confirm availability of prior images/studies” (CA006) activity for CPT code 64450. This code does not currently include this clinical labor time, and unlike the new code, CPT code 64XX1, in the Genicular Injection and RFA code family, in which the PE for CPT code

64450 was resurveyed at the January 2019 RUC for PE, CPT code 64450 does not include imaging guidance in its code descriptor. When CPT code 64450 is performed with imaging guidance, it would be billed together with a separate imaging code that already includes clinical labor time for confirming the availability of prior images. As a result, it would be duplicative to include this clinical labor time in CPT code 64450. We are also proposing to refine the clinical labor time for the “*Assist physician or other qualified healthcare professional—directly related to physician work time (100 percent)*” (CA018) activity from 10 to 5 minutes for CPT code 64450, to match the intraservice work time and proposing to refine the equipment times in accordance with our standard equipment time formulas for CPT code 64450.

Additionally, we proposed to refine the clinical labor time for the “provide education/obtain consent” (CA011) from 3 minutes to 2 minutes, for CPT codes 64400, 64408, 64415, 64417, 64420, 64425, 64430, 64435, 64445, 64447 and 64450, to conform to the standard for this clinical labor task. We are also proposing to refine the equipment time in accordance with our standard equipment time formula for these codes. We note that there were no RUC-recommended direct PE inputs provided for CPT codes 64416, 64446, and 64448.

We received public comments on the proposed valuation of the codes in the Somatic Nerve Injection family. The following is a summary of the comments we received and our responses.

Comment: Several commenters stated that they supported our proposal of the RUC-recommended work RVUs for CPT codes 64417, 64435, 64447, and 64450 and the RUC-reaffirmed work RVUs for CPT codes 64405 and 64418.

Response: We appreciate the support for our proposals from commenters. As noted above, although we proposed the RUC-reaffirmed work RVUs for 64405 and 64418, as submitted in the RUC recommendations, we reiterate that comparable codes in this family of services have lower work RVUs. Thus, we are considering whether these two codes may have become misvalued since their last valuation, as they were not resurveyed under this code family during the October 2018 RUC meeting.

Comment: Several commenters disagreed with the proposed work RVUs for CPT codes 64415, 64416, 64446, 64448, 64449. Commenters stated that CMS should instead finalize the RUC-recommended work RVUs for these procedures. Commenters stated that

CMS based the proposed values for these services on what the commenters referred to as the “CMS time ratio methodology”; however, the agency did not elaborate on which time ratio specifically. Commenters speculated on the time ratio methodology they believed CMS applied to value the codes where the time ratio methodology used was not explicitly stated.

Several commenters disagreed with the use of time ratio methodologies for work valuation of these services. Commenters stated that this use of time ratios is not a valid methodology for valuation of physicians’ services. Commenters stated that treating all components of physician time (preservice, intraservice, postservice and post-operative visits) as having identical intensity is incorrect, and inconsistently applying time ratio methodologies to only certain services under review creates inherent payment disparities in a payment system which is based on relative valuation. Commenters suggested that, in many scenarios, CMS selects an arbitrary combination of inputs to apply rather than seeking a valid clinically relevant relationship that would preserve relativity. Commenters urged CMS to determine the work valuation for each code based not only on surveyed work times, but also the intensity and complexity of the service and relativity to other similar services, rather than basing the work value entirely on time.

Response: We have stated the specific time ratio methodology used to determine the proposed work RVU for each of the codes in this family where it was not explicitly stated in this final rule.

We disagree with the commenters and continue to believe that the use of time ratios is one of several appropriate methods for identifying potential work RVUs for PFS services, particularly when the alternative values recommended by the RUC and other commenters do not account for information provided by surveys which suggests that the amount of time involved in furnishing the service has changed significantly. We have responded to concerns about our methodology earlier in this section. For additional information regarding the use of old work time values that were established many years ago and have not since been reviewed in our methodology, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section II.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80273 through 80274). Based on

the aforementioned crosswalks, brackets, or references for CPT codes 64415, 64416, 64446, 64448, 64449 codes, we continue to believe that the proposed values for these codes better maintain the relative intensity of the codes in the family, and better preserves relativity with the rest of the codes on the PFS.

Comment: Several commenters disagreed with the proposed work RVUs for CPT codes 64420 and 64421. Commenters stated that CMS should instead finalize the RUC-recommended work RVUs for these procedures. Commenters stated that CMS based the proposed values for these services on what the commenters referred to as the “CMS time ratio methodology”, however, the Agency did not elaborate on which time ratio specifically. Commenters speculated the time ratio methodology they believed CMS applied to value these codes.

Several commenters disagreed with the use of time ratio methodologies for work valuation of these services. Commenters stated that this use of time ratios is not a valid methodology for valuation of physician services. Commenters stated that treating all components of physician time (preservice, intraservice, postservice and post-operative visits) as having identical intensity is incorrect, and inconsistently applying it to only certain services under review creates inherent payment disparities in a payment system which is based on relative valuation. Commenters noted that in many scenarios, CMS selects an arbitrary combination of inputs to apply rather than seeking a valid clinically relevant relationship that would preserve relativity. Commenters urged CMS to determine the work valuation for the each code based not only on surveyed work times, but also the intensity and complexity of the service and relativity to other similar services, rather than basing the work value entirely on time.

Several commenters disagreed with our reference to older work time sources, and noted that their use led to the proposal of work RVUs based on flawed assumptions. Commenters stated that codes with “CMS/Other” or “Harvard” work time sources, used in the original valuation of certain older services, were not surveyed, and therefore, were not resource-based. Commenters stated that it was invalid to draw comparisons between the current work times and work RVUs of these services to the newly surveyed work time and work RVUs as recommended by the RUC.

Response: In this final rule we have stated the specific time ratio methodology used to determine the CMS proposed work RVU for each of the codes in this family where it was not explicitly stated.

We disagree with the commenters and continue to believe that the use of time ratios is one of several appropriate methods for identifying potential work RVUs for particular PFS services, particularly when the alternative values recommended by the RUC and other commenters do not account for information provided by surveys that suggests the amount of time involved in furnishing the service has changed significantly. We have responded to concerns about our methodology earlier in this section. For additional information regarding the use of old work time values that were established many years ago and have not since been reviewed in our methodology, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section II.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80273 through 80274).

We agree that it is important to use the recent data available regarding work times, and we note that when many years have passed between when time is measured, significant discrepancies can occur. However, we also believe that our operating assumption regarding the validity of the existing values as a point of comparison is critical to the integrity of the relative value system as currently constructed. We have responded to concerns about our methodology earlier in this section. For additional information regarding the use of old work time values that were established many years ago and have not since been reviewed in our methodology, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section II.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80273 through 80274). Based on the aforementioned crosswalks, brackets, or references for these codes, which continue to believe the proposed values better maintains the relative intensity of the codes in the family, and better preserves relativity with the rest of the codes on the PFS.

Comment: A commenter noted that CMS did not state the current times for CPT code 64425. Several commenters disagreed with the proposed work RVUs for CPT Codes 64400, 64408, 64425, and 64430). Commenters stated that CMS should instead finalize the RUC-recommended work RVUs for these procedures. Commenters disagreed with

our reference to the older work time sources, and suggested that the use of those sources led to the proposal of work RVUs based on flawed assumptions. Commenters stated that codes with “CMS/Other” or “Harvard” work time sources, used in the original valuation of certain older services, in this case, were not surveyed, and therefore, were not resource-based. Commenters noted that it was invalid to draw comparisons between the current work times and work RVUs of these services to the newly surveyed work time and work RVUs as recommended by the RUC for the services.

Response: We have included the times for CPT code 64425 in the discussion above on this code in this final rule, to note that this code has 11 minutes of intraservice time and 25 minutes of total time. We appreciate the commenters’ concerns regarding our reference to older work time sources and their use in the code valuation process for establishing work RVUs for these services. We agree that it is important to use the recent data available regarding work times, and we recognize that when many years have passed since time was last measured, significant discrepancies can occur. However, we also believe that our operating assumption regarding the validity of the existing values as a point of comparison is critical to the integrity of the relative value system as currently constructed. We have responded to concerns about our methodology earlier in this section. For additional information regarding the use of old work time values that were established many years ago and have not since been reviewed in our methodology, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section II.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80273 through 80274). Based on the aforementioned crosswalks, brackets, or references for these codes, which continue to believe the proposed values better maintains the relative intensity of the codes in the family, and better preserves relativity with the rest of the codes on the PFS.

Comment: Several commenters disagreed with the proposed work RVUs for CPT codes 64415, 64416, 64446, 64448, and 64449. Commenters stated that CMS should instead finalize the RUC-recommended work RVUs for these procedures.

Several commenters disagreed with the use of time ratio methodologies for work valuation of these services. Commenters stated that this use of time ratios is not a valid methodology for

valuation of physician services. Commenters stated that treating all components of physician time (preservice, intraservice, postservice and post-operative visits) as having identical intensity is incorrect, and inconsistently applying it to only certain services under review creates inherent payment disparities in a payment system which is based on relative valuation. Commenters suggested that in many scenarios, CMS selects an arbitrary combination of inputs to apply rather than seeking a valid clinically relevant relationship that would preserve relativity. Commenters urged CMS to determine the work valuation for each code based not only on surveyed work times, but also the intensity and complexity of the service and relativity to other similar services, rather than basing the work value entirely on time.

Response: We disagree with the commenters that the use of time ratios is not a valid valuation methodology, and continue to believe that the use of time ratios is one of several appropriate methods for identifying potential work RVUs for particular PFS services, particularly when the alternative values recommended by the RUC and other commenters do not account for information provided by surveys that suggests the amount of time involved in furnishing the service has changed significantly. We have responded to concerns about our methodology earlier in this section. For additional information regarding the use of old work time values that were established many years ago and have not since been reviewed in our methodology, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section II.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80273 through 80274). Based on the aforementioned crosswalks, brackets, or references for these codes, which continue to believe the proposed values better maintains the relative intensity of the codes in the family, and better preserves relativity with the rest of the codes on the PFS.

Comment: Several commenters disagreed with the proposed work RVU of 1.00 for CPT code 64445. Commenters stated that CMS should instead finalize the RUC-recommended work RVU of 1.10 for this procedure. A commenter stated that the CMS proposed value of 1.00 seemingly was selected using a method with no precedent.

Response: We disagree with the commenter's suggestion that the CMS-proposed value was selected using an

unprecedented method. As stated in the CY 2020 PFS proposed rule (84 FR 40582), the proposed work RVU was selected to maintain rank order among comparable codes in the family. The proposed work RVU was further supported by a bracket to CPT codes 12001 and 30901. In the CY 2011 PFS final rule with comment period (75 FR 73328 through 73329), we discussed a variety of methodologies and approaches used to develop work RVUs, including survey data, building blocks, crosswalks to key reference or similar codes, and magnitude estimation (see the CY 2011 PFS final rule with comment period (75 FR 73328 through 73329) for more information). For additional information on our methodology, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section II.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80273 through 80274). Based on the aforementioned brackets, which continue to believe the proposed value better maintains the relative intensity of the codes in the family, and better preserves relativity with the rest of the codes on the PFS.

Comment: A few commenters disagreed with the proposed direct PE refinements to refine the clinical labor time for the "provide education/obtain consent" (CA011) from 3 minutes to 2 minutes, for CPT codes 64400, 64408, 64415, 64417, 64420, 64425, 64430, 64435, 64445, 64447 and 64450, to conform to the standard for this clinical labor task. The also disagreed with the proposal to refine the equipment time in accordance with our standard equipment time formula for these codes. Commenters stated that the RUC does not have a standard time for this task. This time is required because of the potential complications associated with injections and the need to review aftercare instructions.

Response: We disagree with the commenters that 3 minutes would be typically needed for the clinical staff to provide education and obtain consent in these procedures. We have typically assigned 2 minutes for this clinical labor activity unless we had a specific rationale for a higher amount of clinical labor time, and we continue to believe that this standard amount of clinical labor time would be the most accurate value for CPT codes 64400, 64408, 64415, 64417, 64420, 64425, 64430, 64435, 64445, 64447 and 64450. Furthermore, we note that these codes have 2 minutes of "Review home care instructions, coordinate visits/prescriptions" (CA035).

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the Somatic Nerve Injection family as proposed.

(26) Genicular Injection and RFA (CPT Codes 64640, 64454, and 64624)

In May 2018, the CPT Editorial Panel approved the addition of two codes to report injection of anesthetic and destruction of genicular nerves by neurolytic agent. In October 2018, the RUC discussed issues surrounding the survey of this family of services and supported the specialty societies' request for CPT codes 64640 (*Destruction by neurolytic agent; other peripheral nerve or branch*), 64454 (*Injection(s), anesthetic agent(s) and/or steroid; genicular nerve branches including imaging guidance, when performed*), and 64624 (*Destruction by neurolytic agent genicular nerve branches including imaging guidance, when performed*) to be resurveyed and presented at the January 2019 RUC meeting, based on their concern that many survey respondents appeared to be confused about the number of nerve branch injections involved with these three codes. The RUC resurveyed these services at the January 2019 RUC meeting.

For CY 2020, we proposed the RUC-recommended work RVUs for two of the three codes in this family. We proposed the RUC-recommended work RVU of 1.98 (25th percentile survey value) for CPT code 64640 and the RUC-recommended work RVU of 1.52 (25th percentile survey value) for CPT code of 64454.

For CPT code 64624, we disagreed with the RUC-recommended work RVU of 2.62, which is higher than the 25th percentile survey value, a work RVU 2.50, and proposed a work RVU of 2.50 (25th percentile survey value) based on a reference to CPT code 11622 (*Excision, malignant lesion including margins, trunk, arms, or legs; excised diameter 1.1 to 2.0 cm*), which has a work RVU of 2.41 and near identical intraservice and total times to CPT code 64624.

In our review of CPT code 64624, we examined the intraservice time ratio for the new code, CPT code 64624, in relation to an existing code in this family of services, CPT code 64640. CPT code 64624 has a RUC-recommended work RVU of 2.62, 25 minutes of intraservice time, and 74 minutes of total time. CPT code 64640 has a RUC-recommended work RVU of 1.98, 20 minutes of intraservice time, and 64 minutes of total time. To derive our proposed work RVU of 2.50, we calculated the intraservice time ratio

between these two codes, which is a calculated value of 1.25, and applied this ratio times the RUC-recommended work RVU of 1.98 for CPT code 64650, which resulted in a calculated value of 2.48. This value is nearly identical to the January 2018 RUC 25th percentile survey value for CPT code 64624, a work RVU of 2.50. Our proposed work RVU of 2.50 is further supported by a reference to CPT code 11622.

For the direct PE inputs, we proposed to remove the clinical labor time for the “Confirm availability of prior images/studies” (CA006) activity for CPT code 64640. This code does not currently include this clinical labor time, and unlike the new code in the family (CPT code 64624), CPT code 64640 does not include imaging guidance in its code descriptor. When CPT code 64640 is performed with imaging guidance, it would be billed together with a separate imaging code that already includes clinical labor time for confirming the availability of prior images. As a result, it would be duplicative to include this clinical labor time in CPT code 64640. We proposed to refine the clinical labor time for the “Assist physician or other qualified healthcare professional—directly related to physician work time (100 percent)” (CA018) activity from 25 to 20 minutes for CPT code 64640, to match the intraservice work time. We are also proposed to refine the equipment times in accordance with our standard equipment time formulas for CPT code 64640.

We proposed the RUC-recommended direct PE inputs for CPT code 64454 without refinement.

For CPT code 64624, we proposed to refine the quantity of the “cannula (radiofrequency denervation) (SMK–C10)” (SD011) supply from 3 to 1. We did not believe that the use of 3 of this supply item would be typical for the procedure. We noted that the RUC recommendations for another code in this family, CPT code 64640 only contains 1 of this supply item. We believed that the nerves would typically be ablated one at a time using this cannula, as opposed to ablating three of them simultaneously as suggested in the recommended direct PE inputs. We also searched in the RUC database for other CPT codes that made use of the SD011 supply, and out of the seven codes that currently use this item, none of them include more than 2 cannula. As a result, we proposed to refine the supply quantity to 2 cannula to match the highest amount contained in an existing code on the PFS. We proposed to refine the equipment time for the “radiofrequency kit for destruction by neurolytic agent” (EQ354) equipment

from 141 minutes to 47 minutes. The equipment time recommendation was predicated on the use of 3 of the SD011 supplies for 47 minutes apiece, and we proposed to refine the equipment time to reflect our supply refinement to 1 cannula. It was unclear in the RUC recommendation materials as to whether the radiofrequency kit equipment was in use simultaneously or sequentially along with the cannula supplies, and therefore, we are soliciting comments on the typical use of this equipment.

We received public comments on the proposed valuation of the codes in the Genicular Injection and RFA family. The following is a summary of the comments we received and our responses.

Comment: A commenter stated that for both of the new codes, CPT codes 64454 and 64624, they were concerned that CMS proposed to reduce values recommended by the CPT Relative Value Scale Update Committee (RUC) based primarily upon a comparison to CPT code 64640.

Response: We note that we proposed a different work RVU for one of the two new codes in this family, not both, as noted by the commenter. We proposed a work RVU of 2.50 for CPT code 64454, based upon an intraservice time ratio between that code and CPT code 64640. We proposed the RUC-recommended work RVU of 1.52 for CPT code 64454.

Comment: A commenter stated that they supported our proposal of the RUC-recommended work RVUs for the CPT codes 64640 and 64454, two of the three codes in this family.

Response: We appreciate the support for our proposals from the commenter.

Comment: Several commenters disagreed with the CMS proposed work RVU of 2.50 for CPT code 64624 and stated that CMS should instead finalize the RUC-recommended work RVU of 2.62. A commenter stated that CPT code 64624 describes the destruction of three different nerve branches at three locations to provide analgesia for the respective knee and should not be crosswalked to CPT code 11642 (*Excision, malignant lesion including margins, face, ears, eyelids, nose, lips; excised diameter 1.1 to 2.0 cm*) which describes excision of a malignant lesion. This commenter further noted that the RUC direct crosswalk, CPT code 11642 requires the same time as CMS’ proposed crosswalk code 11622.

However, CPT code 11622 requires less physician work because it is an excision on the trunk, arms or legs, whereas CPT code 11642 is an excision on the face, ears, eyelids, nose, lips, which is a more delicate area in which precision is

required and it is more intense and complex to complete. CPT code 64624 likewise is more intense, complex and requires precision to avoid irreversible damage.

Response: We note that the commenter stated the RUC’s crosswalk in reference to what code CPT code 64424 should not be crosswalked to, perhaps the commenter meant to note the CMS reference code, CPT code 11622. We agree with the commenter that CPT code 64624 should not be crosswalked to CPT code 11622, which is why we proposed this code as a reference, and not a direct crosswalk. Furthermore, we disagree that RUC crosswalk, CPT code 11642, requires the same times as CMS’ proposed crosswalk, 11622.

We disagree with the commenters that there is a meaningful difference in intensity between CPT reference code, CPT code 11622 and RUC’s crosswalk CPT 11642. These two codes share the identical work times, the same intraservice time of 30 minutes and same total time, 68 minutes. We continue to believe that it was more accurate to propose a work RVU of 2.50 for CPT code 64624, based on the reference to CPT code 11622, further supported by the survey 25th percentile value, a work RVU of 2.50. We believe the proposed value better maintains the relative intensity of the two codes in the family, and better preserves relativity with the rest of the codes on the PFS.

Comment: Several commenters disagreed with the CMS proposal to refine the quantity of the “cannula (radiofrequency denervation) (SMK–C10)” (SD011) supply from 3 to 1 for CPT code 64624. Commenters stated that, as with the sacroiliac joint code, CPT code 64624 does require simultaneous ablation of the three genicular nerves. Commenters further noted that this is standard practice, and therefore, was the way the survey respondents would have completed the survey.

Response: We appreciate the additional information provided by the commenters regarding the SD011 cannula supply. We continue to have reservations as to whether three simultaneous ablations would be typical for this procedure; however, we are finalizing a supply quantity of 3 cannula (SD011) for CPT code 64624 as recommended by commenters.

Comment: Several commenters disagreed with the CMS proposal to refine the equipment time for the “radiofrequency kit for destruction by neurolytic agent” (EQ354) equipment from 141 minutes to 47 minutes. Commenters stated that three kits are

used for 47 minutes each totaling 141 minutes, as the 47 minutes (times 3) occurred simultaneously. Commenters stated again that three cannulas and three kits are needed for the simultaneous ablation of three nerves.

Response: Since we did not finalize our proposal to refine the quantity of the SD011 cannula supply from 3 to 1 for CPT code 64624, we are also not finalizing our refinement to the equipment time for EQ354. We will instead finalize the RUC-recommended equipment time of 141 minutes for the radiofrequency kit (EQ354).

After consideration of the public comments, we are finalizing the work RVUs for the codes in the Genicular Injection and RFA family as proposed. We are also finalizing the RUC-recommended direct PE inputs for the codes in this family, with the exception of finalizing a supply quantity of 3 of SD011 and 141 minutes for EQ354 for CPT code 64624, as recommended by commenters.

(27) Cyclophotocoagulation (CPT Codes 66711, 66982, 66983, 66984, 66987, and 66988)

In October 2017, CPT codes 66711 (*Ciliary body destruction; cyclophotocoagulation, endoscopic*) and 66984 (*Extracapsular cataract removal with insertion of intraocular lens prosthesis (1 stage procedure), manual or mechanical technique (e.g., irrigation and aspiration or phacoemulsification)*) were identified as codes reported together 75 percent of the time or more. The RUC reviewed action plans to determine whether a code bundle solution should be developed for these services. In January 2018, the RUC recommended to refer to CPT to bundle 66711 with 66984 for CPT 2020. In May 2018, the CPT Editorial Panel revised three codes and created two new codes, CPT codes 66987 (*Extracapsular cataract removal with insertion of intraocular lens prosthesis (1-stage procedure), manual or mechanical technique (e.g., irrigation and aspiration or phacoemulsification), complex, requiring devices or techniques not generally used in routine cataract surgery (e.g., iris expansion device, suture support for intraocular lens, or primary posterior capsulorrhexis) or performed on patients in the amblyogenic developmental stage; with endoscopic cyclophotocoagulation*) and 66988 (*Extracapsular cataract removal with insertion of intraocular lens prosthesis (1 stage procedure), manual or mechanical technique (e.g., irrigation and aspiration or phacoemulsification); with endoscopic cyclophotocoagulation*) to differentiate cataract procedures

performed with and without endoscopic cyclophotocoagulation.

The codes discussed above and CPT codes 66982 (*Extracapsular cataract removal with insertion of intraocular lens prosthesis (1-stage procedure), manual or mechanical technique (e.g., irrigation and aspiration or phacoemulsification), complex, requiring devices or techniques not generally used in routine cataract surgery (e.g., iris expansion device, suture support for intraocular lens, or primary posterior capsulorrhexis) or performed on patients in the amblyogenic developmental stage*) and 66983 (*Intracapsular cataract extraction with insertion of intraocular lens prosthesis (1 stage procedure)*) were reviewed at the January 2019 RUC meeting.

For CY 2020, we proposed the RUC-recommended work RVU of 10.25 for CPT code 66982, the RUC recommendation to contractor-price CPT code 66983, and the RUC-recommended work RVU of 7.35 for CPT code 66984. We disagreed with the RUC recommendations for CPT codes 66711, 66987, and 66988.

For CPT code 66711, we disagreed with the RUC-recommended work RVU of 6.36 and proposed a work RVU of 5.62, based on crosswalk to CPT code 28285 (*Correction, hammertoe (e.g., interphalangeal fusion, partial or total phalangectomy)*), which has an identical work RVU of 5.62, and similar intraservice and total times.

In our review of CPT code 66711, we noted that the recommended intraservice time is decreasing from 20 minutes to 10 minutes (33 percent reduction), and that the recommended total time is decreasing from 192 minutes to 191 minutes (0.5 percent reduction). While the RUC-recommended work RVU is decreasing from 7.93 to 6.36, which is a 20 percent reduction, we do not believe it appropriately accounts for the decreases in survey time. Time ratio methodology suggest that CPT code 66711 is better valued at a work RVU of 5.29, thus it is overvalued with consideration to the decreases in survey times. Although we did not imply that the decrease in time as reflected in survey values must equate to a one-to-one or linear decrease in the valuation of work RVUs, we believe that since the two components of work are time and intensity, significant decreases in time should be appropriately reflected in decreases to work RVUs. In the case of CPT code 66711, we believed that it would be more accurate to propose a work RVU of 5.62, based on our time ratio methodology and a crosswalk to CPT

code 28285 to account for these decreases in surveyed work times.

For CPT code 66987, the RUC recommended a work RVU of 13.15, we disagreed with the RUC-recommended work RVU and proposed contractor-pricing for this code. In reviewing this code, we noted that the RUC recommendation survey values did not support the RUC-recommended work RVU of 13.15 and furthermore, the RUC recommendations did not include a crosswalk to support the RUC-recommended work RVU. The RUC recommendations noted a lack of potential crosswalk codes due to the complete lack of similarly intense major surgical procedures comparable in the amount of skin-to-skin time, operating room time and amount of post-operative care. We note that the RUC-recommended work RVU of 13.15 is higher than similarly timed codes on the PFS. Given that lack of both survey data and a crosswalk to support the RUC-recommended work RVU for this new code, and that the RUC-recommended work RVU of 13.15 is higher than similarly timed codes on the PFS, we believed it is was appropriate to propose contractor-pricing for CPT code 66987. We also noted that the RUC recommended contractor-pricing for another code in this family, CPT code 66983, which we proposed to contractor-price for CY 2020.

For CPT code 66988, the RUC recommended a work RVU of 10.25, we disagreed with the RUC-recommended work RVU and proposed contractor-pricing for this code. In reviewing this code, we noted that the RUC recommendation survey values do not support the RUC-recommended work RVU of 10.25. Furthermore, we were concerned with the RUC recommended crosswalk, CPT code 67110 (*Repair of retinal detachment; by injection of air or other gas (e.g., pneumatic retinopexy)*), which is the same crosswalk used to support the RUC-recommended work RVU of 10.25 for another code in this family, CPT code 66982. CPT code 67110 has 30 minutes of intraservice time and 196 minutes of total time. Although CPT code 67110 has the identical intraservice time to CPT codes 66982 and 66988, we note that CPT code 67110 has 196 minutes of total time, which is 21 minutes less than the 175 minutes of total time of CPT code 66982, and 6 minutes less than the 202 minutes of total time of CPT Code 66988. However, the RUC is recommending the same work RVU of 10.25 for CPT codes 66982 and 66988, supported by the same crosswalk to CPT code 67110.

Given that lack of survey data and our concern for the RUC-recommended crosswalk to support the RUC-recommended work RVU of 10.25 for CPT code 66988, we believed it was appropriate to propose contractor-pricing for CPT code 66988. We also noted that the RUC recommended contractor-pricing for another code in this family, CPT code 66983, which we are prosed for CY 2020.

We proposed to remove all the direct PE inputs for CPT codes 66987 and 66988, given our proposal to contractor-price these codes. We proposed the RUC-recommended direct PE inputs for the other codes in this family.

We received public comments on the proposed valuation of the codes in the Cyclophotocoagulation family. The following is a summary of the comments we received and our responses.

Comment: A commenter noted that for CPT code 66711, the intra-service time is decreasing from 30 minutes to 20 minutes, not 20 minutes to 10 minutes, as stated by CMS in the proposed rule.

Response: We apologize for the typo and in this final rule corrected the intraservice time value for CPT code 66711 in the discussion above on this code, to reflect a decrease in intraservice time from 30 minutes to 20 minutes.

Comment: Several commenters stated support for our proposal of the RUC-recommended work RVU for CPT code 66982, the RUC recommendation to contractor-price CPT code 66983, and the RUC-recommended work RVU for CPT code 66984.

Comment: Several commenters stated support for our proposal of the RUC-recommended work RVU for CPT code 66982, the RUC recommendation to contractor-price CPT code 66983, and the RUC-recommended work RVU for CPT code 66984.

Response: We appreciate the support for our proposals from the commenters.

Comment: Several commenters disagreed with the use of time ratio methodologies for work valuation for CPT code 66711. Commenters stated that this use of time ratios is not a valid methodology for valuation of physician services. Commenters stated that treating all components of physician time (preservice, intraservice, postservice and post-operative visits) as having identical intensity is incorrect, and inconsistently applying it to only certain services under review creates inherent payment disparities in a payment system which is based on relative valuation. Commenters stated that in many scenarios, CMS selects an arbitrary combination of inputs to apply rather than seeking a valid clinically relevant relationship that would

preserve relativity. Commenters urged CMS to determine the work valuation for the each code based not only on surveyed work times, but also the intensity and complexity of the service and relativity to other similar services, rather than basing the work value entirely on time.

Response: We appreciate the commenters' concerns regarding CMS' use of time ratio methodologies in the code valuation process for establishing work RVUs. We have responded to concerns about our methodology earlier in this section of this final rule. For additional information regarding the use of use of time ratios in our methodology, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section II.N.2), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80273 through 80274).

Comment: Several commenters disagreed with the CMS proposed work RVU of 5.62 for CPT code 66711 and stated that CMS should instead finalize the RUC-recommended work RVU of 6.36. Commenters stated that although CPT code 66711 has a similar total time value to the CMS crosswalk CPT code 28285, CPT code 66711 requires more physician work and is much more intense, and complex working in the eye than on a toe. Correction of hammertoe as described by CPT code 28285, is a low-risk procedure on a small appendage, while CPT 66711, endoscopic ciliary photocoagulation (ECP) is a high-risk procedure on a diseased eye with risk of loss of vision.

It was noted in the RUC's comment letter that they expressed difficulty in finding a valid crosswalk to recommend the appropriate work RVU for CPT code 66711. The RUC further noted that they conducted a thorough search of all other potential crosswalk codes and ran into a lack of potential crosswalk codes due to the lack of similarly intense major surgical procedures with a comparable amount of skin-to-skin time, OR time and amount of post-operative care. They noted that the most appropriate crosswalk for CPT 66711 is CPT code 67210 Destruction of localized lesion of retina (e.g., macular edema, tumors), 1 or more sessions; photocoagulation (work RVU = 6.36 and 15 minutes intraservice time). CPT code 66711 is more intense and complex to perform than 67210 on all measures examined (mental effort/judgment, technical skill/physical effort and psychological stress); both codes use laser ablation of tissue making it the most clinically relatable service for comparison.

Response: We disagree with the commenters that there is a meaningful

difference in intensity between CPT code 66711 and the CMS crosswalk CPT code 28285. These two codes share an identical intraservice time of 30 minutes and differ by only 2 minutes of total time, 192 minutes for CPT code 66711, compared to 190 minutes for CPT code 28285. Given the minimal difference in intensity between these two codes, it would be difficult for two procedures to match more closely on intensity (which is itself a derived number not measured directly) without sharing the same work times. Like CPT code 66711, the CMS crosswalk, CPT code 28285, is a significant 090-day global procedure that requires 30 minutes of intraservice work time. We continue to believe that it is more accurate to propose a work RVU of 5.62 for CPT code 66711, based on the aforementioned crosswalk to CPT code 28285, which we believe better preserves relativity with the rest of the codes on the PFS. Furthermore, the CMS crosswalk code (CPT code 28285) was found after a thorough search of valid crosswalks to recommend the appropriate work RVU for CPT code 66711, which we reiterate is significant 090-day global procedure that requires 30 minutes of intraservice work time, the same as CPT code 66711.

Comment: Several commenters disagreed with the CMS proposal to contractor-price CPT code 66987 and stated that CMS should instead finalize the RUC-recommended work RVU of 13.15. Several commenters stated that contractor-pricing would be burdensome. One commenter noted that contractor-pricing would be burdensome because CPT code 66987 and CPT code 66987 (CMS proposed contractor-pricing) would be reported over 7,000 times per year.

Response: We thank commenters for their feedback. We note that the RUC-recommended contractor-pricing for another code in this family, CPT code 66983, and did not make a general or specific reference to burden related to contractor-pricing. Furthermore, we note that when services are furnished to a Medicare beneficiary, the provider files the Medicare claim with the contractor that has jurisdiction over the claims furnished by the provider. We are not persuaded by commenter's assertion that contractor-pricing for CPT code 66987 would lead to an increase in burden.

Comment: The RUC's comment letter noted that they had challenges of surveying these intense 090-day global services with short intra-service time due a lack of similar reference services. One commenter stated that CMS recommend contractor-pricing for CPT code 66987, despite survey data that

supports the RUC-recommended value for this code.

Response: As stated in the proposed rule, the RUC-recommended work RVU of 13.50, lacked support from survey data and a crosswalk to support the value. Furthermore, the RUC-recommended a work RVU of 13.50, but the survey 25 percentile value was 13.50, and the RUC-recommended work RVU is higher than similarly timed codes on the PFS. Therefore, we believe it is more appropriate to contractor-price this code until more data can be collected, for consideration in future rulemaking.

Comment: Several commenters disagreed with the CMS proposal to contractor-price CPT code 66988 and stated that CMS should instead finalize the RUC-recommended work RVU of 10.25. Several commenters stated that contractor-pricing would be burdensome. One commenter noted that contractor-pricing would be burdensome because CPT code 66988 and CPT code 66987 (CMS proposed contractor-pricing) would be reported over 7,000 times per year.

Response: We thank commenters for their feedback. We note that the RUC-recommended carrier-pricing for another code in this family, CPT code 66983, and did not make general or specific reference to burden related to contractor-pricing. Furthermore, we note that when services are furnished to a Medicare beneficiary, the provider files the Medicare claim with the contractor that has jurisdiction over the claims furnished by the provider. We are not persuaded by the commenter's discussion that contractor-pricing for CPT code 66988 would lead to an increase in burden.

Comment: One commenter stated that CMS recommended contractor-pricing for CPT code 66988, despite survey data that supports the RUC-recommended value for this code.

Response: As stated in the proposed rule, the RUC-recommended work RVU of 10.25, lacked support from survey data and a crosswalk to support the value. Furthermore, the RUC-recommended a work RVU of 10.25 but the survey 25 percentile value was 11.08. Furthermore, CMS noted concerns with the RUC's crosswalk (CPT code 67710) to support their work RVU for this code. To reiterate, although CPT code 67110 has the identical intraservice time to CPT codes 66982 and 66988, we note that CPT code 67110 has 196 minutes of total time, which is 21 minutes less than the 175 minutes of total time of CPT code 66982, and 6 minutes less than the 202 minutes of total time of CPT Code

66988. However, the RUC is recommended the same work RVU of 10.25 for CPT codes 66982 and 66988, supported by the same crosswalk to CPT code 67110, which we found concerning. Therefore, we believe it is more appropriate to contractor-price this code until more data can be collected, for consideration in future rulemaking.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the Cyclophotocoagulation family as proposed.

(28) X-Ray Exam—Sinuses (CPT Codes 70210 and 70220)

CPT code 70210 (*Radiologic examination, sinuses, paranasal, less than 3 views*) and CPT code 70220 (*Radiologic examination, sinuses, paranasal, complete, minimum of 3 views*) were identified as potentially misvalued through a screen for Medicare services with utilization of 30,000 or more annually. These two codes were first reviewed by the RUC in April 2018, but were subsequently surveyed by the specialty societies and reviewed again by the RUC in January 2019.

For CPT code 70210, we disagreed with the RUC-recommended work RVU of 0.20, and proposed to maintain the current work RVU of 0.17 supported by a bracket of CPT code 73501 (*Radiologic examination, hip, unilateral, with pelvis when performed; 1 view*), which has a work RVU of 0.18, and CPT code 73560 (*Radiologic examination, knee; 1 or 2 views*), which has a work RVU of 0.16.

The RUC's recommendation is consistent with 25th percentile of survey results and is based on a comparison of the survey code with the two key reference services. The first key reference service, CPT code 71046 (*Radiologic examination, chest; 2 views*), has a work RVU of 0.22, 4 minutes of intraservice time, and 6 minutes of total time. The RUC noted that the survey code has 1 minute less intraservice and total time compared with the first key reference service (CPT code 71046), which accounts for the slightly lower work RVU for the survey code. The RUC also compared CPT code 70210 to CPT code 70355

(*Orthopantomogram (e.g., panoramic X-ray)*), with a work RVU of 0.20, 5 minutes of intraservice time, and 6 minutes of total time. Although the intraservice and total times are lower for CPT code 70210 than for CPT code 70355, the work is slightly more intense for the survey code, according to the RUC, justifying an identical work RVU of 0.20 for CPT code 70210. We

disagreed with the RUC's recommendation to increase the work RVU for CPT code 70210 from the current value (0.17) to 0.20 for two main reasons. First, the total time (5 minutes) for this code has not changed from the current total time and without a corresponding explanation for an increase in valuation despite maintaining the same total time, we were not convinced that the work RVU for this code should increase. In addition, we noted that based on a general comparison of CPT codes with identical intraservice time and total time (approximately 23 comparison codes, excluding those currently under review), a work RVU of 0.20 would establish a new upper threshold among this cohort. Therefore, we proposed to maintain the work RVU of 0.17 for CPT code 70210.

For CPT code 70220, we proposed the RUC-recommended work RVU of 0.22.

We proposed the RUC-recommended direct PE inputs for all codes in the family.

We received public comments on the proposed valuation of the codes in the X-Ray Exam—Sinuses family. The following is a summary of the comments we received and our responses.

Comment: Several commenters stated that they supported our proposal for the direct PE inputs for the codes in this family and our proposal for the RUC-recommended work RVU for CPT code 70220.

Response: We appreciate the support for our proposals from the commenters.

Comment: Several commenters disagreed with the proposed work RVUs for CPT code 70210. Commenters stated that CMS should instead finalize the RUC-recommended work RVUs for this procedure. A commenter stated that the best "corresponding explanation for an increase in valuation despite maintaining the same total time" is that the current time and value have no validity for comparison since they are CMS/Other, and were assigned using an unknown methodology. In addition, although total times happen to match, CMS/Other times did not break out pre-service, intra-service, and post-service times which have different intensities. Therefore, the value recommendation is based on the survey, which is supported by the survey times, the comparison with other axial x-ray codes, and the survey times.

Response: We appreciate the commenters' concerns regarding CMS' interpretation of older work time sources and their use in the code valuation process for establishing work RVUs for these services. We agree that it is important to use the recent data

available regarding work times, and we note that when many years have passed between when time is measured, significant discrepancies can occur. However, we also believe that our operating assumption regarding the validity of the existing values as a point of comparison is critical to the integrity of the relative value system as currently constructed. We have responded to concerns about our methodology earlier in this section. For additional information regarding the use of old work time values that were established many years ago and have not since been reviewed in our methodology, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section I.N. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80273 through 80274). Based on the aforementioned crosswalks, brackets, or references for these codes, which continue to believe the proposed values better maintains the relative intensity of the codes in the family, and better preserves relativity with the rest of the codes on the PFS.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the X-Ray Exam—Sinuses as proposed.

(29) X-Ray Exam—Skull (CPT Codes 70250 and 70260)

CPT code 70250 (*Radiologic examination, skull, less than 4 views*) was identified as potentially misvalued through a screen of Medicare services with utilization of 30,000 or more annually. CPT code 70260 (*Radiologic examination, skull; complete, minimum of 4 views*) was included as part of the same family. These two codes were first reviewed by the RUC in April 2018, but were subsequently surveyed by the specialty societies and reviewed by the RUC again in January 2019.

For CPT code 70250 we disagreed with the RUC-recommended work RVU of 0.20 and proposed a work RVU of 0.18 supported by crosswalk to CPT code 73501 (*Radiologic examination, hip, unilateral, with pelvis when performed; 1 view*), which has a work RVU of 0.18, 3 minutes of intraservice time, and 5 minutes of total time.

The RUC-recommended work RVU is bracketed by the top key reference service, CPT code 71046 (*Radiologic examination, chest; 2 views*) with 4 minutes of intraservice time, 6 minutes total time, and a work RVU of 0.22; and key reference service, CPT code 73562 (*Radiologic examination, knee; 3 views*), with intraservice time of 4 minutes, total time of 6 minutes, and a work RVU

of 0.18. The RUC noted that while the survey code has less time than CPT code 71046, the work is slightly more intense due to anatomical and contextual complexity. The survey code is also more intense compared with the second key reference service, CPT code 73562, according to the RUC, because of the higher level of technical skill involved in an X-ray of the skull (axial skeleton) compared with an X-ray of the knee (appendicular skeleton). The RUC further indicated that a comparison between the survey code and CPT codes with a work RVU of 0.18 would not be appropriate given the higher level of complexity associated with an X-ray of the skull than with other CPT codes that have similar times. We disagreed with the RUC-recommended work RVU of 0.20 for CPT code 70250. We note that the total time for furnishing the service has decreased by 2 minutes while the description of the work involved in furnishing the service has not changed. This suggests that a value closer to the total time ratio (TTR) calculation (work RVU of 0.17) would be more appropriate. In addition, a search of CPT codes with 3 minutes of intraservice time and 5 minutes of total time indicates that the maximum work RVU for codes with these times is 0.18, meaning that a work RVU of 0.20 would establish a new relative high work RVU for codes with these times. Therefore, we proposed a work RVU of 0.18 for CPT code 70250.

We disagreed with the RUC recommended a work RVU of 0.29 for CPT code 70260 and proposed a work RVU of 0.28 based on an increment between this code and CPT code 70250. Moreover, since we proposed a lower work RVU for the base code for this family (work RVU of 0.18 for CPT code 70250), we believe a lower work RVU for CPT code 70260 is warranted. To identify an alternative value, we calculated the increment between the current work RVU for CPT code 72050 (work RVU of 0.24) and the current work RVU for CPT code 72060 (work RVU of 0.34) and applied it to the CMS proposed work RVU for CPT code 70250 (0.18 + 0.10) to calculate a proposed work RVU of 0.28.

The survey times for furnishing the service are 4 minutes of intraservice time and 7 minutes total time, compared with the current intraservice time and total time of 7 minutes. However, in developing their recommendation, the RUC reduced the total time for this code from 7 minutes to 6 minutes. Although the RUC's recommended work RVU reflects the 25th percentile of survey results, the survey 25th percentile is based on an additional minute of total

time compared with the RUC's total time for this CPT code.

We believe that applying this increment is a better reflection of the work time and intensity involved in furnishing CPT code 70260, and therefore, we proposed a work RVU of 0.28 for this service.

We proposed the RUC-recommended direct PE inputs for all codes in the family.

We received public comments on the proposed valuation of the codes in the X-Ray Exam—Skull family. The following is a summary of the comments we received and our responses.

Comment: Several commenters disagreed with the proposed work RVUs for CPT codes 70250 and 70260. Commenters stated that CMS should instead finalize the RUC-recommended work RVUs for these procedures. Commenters disagreed with our reference to older work time sources, and noted that their use led to the proposal of work RVUs based on flawed assumptions. Commenters stated that codes with “CMS/Other” or “Harvard” work time sources, used in the original valuation of certain older services, in this case, were not surveyed, and therefore, were not resource-based. Commenters noted that it was invalid to draw comparisons between the current work times and work RVUs of these services to the newly surveyed work time and work RVUs as recommended by the RUC for the services.

Response: We appreciate the commenters' concerns regarding CMS' interpretation of older work time sources and their use in the code valuation process for establishing work RVUs for these services. We agree that it is important to use the recent data available regarding work times, and we note that when many years have passed between when time is measured, significant discrepancies can occur. However, we also believe that our operating assumption regarding the validity of the existing values as a point of comparison is critical to the integrity of the relative value system as currently constructed. We have responded to concerns about our methodology earlier in this section. For additional information regarding the use of old work time values that were established many years ago and have not since been reviewed in our methodology, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section I.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80273 through 80274). Based on the aforementioned crosswalks, brackets, or references for

these codes, which continue to believe the proposed values better maintains the relative intensity of the codes in the family, and better preserves relativity with the rest of the codes on the PFS.

Comment: Several commenters disagreed with the CMS proposed work RVU for CPT 70260. Commenters stated that CMS should instead finalize the RUC-recommended work RVU for this procedure. Commenters stated that the incremental methodology used in valuing these services was flawed; commenters did not agree that it was appropriate to reduce the work RVU for CPT code 72202 from the value proposed by the RUC, while also recalibrating the work relative to the RUC's recommended difference in work between this code and CPT code 72200. Commenters noted that it is imperative to employ RUC survey data to value these codes, and that using an incremental approach in lieu of survey data, strong crosswalks, and input from the practitioners providing these services was unjustified.

Response: We believe the use of an incremental difference between codes is a valid methodology for setting values, especially in valuing services within a family of revised codes where it is important to maintain appropriate intra-family relativity. Historically, we have frequently utilized an incremental methodology in which we value a code based upon its incremental difference between another code or another family of codes. We note that the RUC has also used the same incremental methodology on occasion when it was unable to produce valid survey data for a service. We have no evidence to suggest that the use of an incremental difference between codes conflicts with the statute's definition of the work component as the resources in time and intensity required in furnishing the service. For more details on our methodology for developing work RVUs, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section II.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80272 through 80277).

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the X-Ray Exam—Skull family as proposed.

(30) X-Ray Exam—Neck (CPT Code 70360)

CPT code 70360 (*Radiologic examination; neck, soft tissue*) was identified as potentially misvalued through a screen of CPT codes with

annual Medicare utilization of 30,000 or more. CPT code 70360 was first reviewed by the RUC in April 2018 but was subsequently surveyed by the specialty societies and reviewed by the RUC again in January 2019.

For CPT code 70360 we disagreed with the RUC recommended work RVU of 0.20 and recommended a work RVU of 0.18, supported by a crosswalk to CPT code 73552 (*Radiologic examination, femur; minimum 2 views*), which has similar time values and work RVU of 0.18. To support their recommendation, the RUC cited the survey key reference service, CPT code 71046 (*Radiologic examination, chest; 2 views*), with a work RVU of 0.22, 4 minutes of intraservice time, and 6 minutes of total time. They noted that the key reference code has 1 minute higher intraservice and total time, accounting for the slightly higher work RVU compared with the survey code, CPT code 70360. The RUC also cited the second highest key reference service, CPT code 73562 (*Radiologic examination, knee; 3 views*) with a work RVU of 0.18, intraservice time of 4 minutes, and total time of 6 minutes. They noted that, while the survey code has lower intraservice time (3 minutes) and total time (5 minutes) compared with CPT code 73562, the survey code is more complex than the key reference service, thereby supporting a higher work RVU for the survey code (CPT code 70360) of 0.20. We do not agree with the RUC that the work RVU for CPT code 70360 should increase from 0.17 to 0.20. The total time for the CPT code, as recommended by the RUC (5 minutes), is unchanged from the existing total time. Without a corresponding discussion of why the current work RVU is insufficient, disagreed that there should be an increase in the work RVU. Furthermore, although the RUC's recommendation is consistent with the 25th percentile of survey results for the work RVU, the total time from the survey results was 6 minutes, not the RUC-recommended time of 5 minutes. We looked at CPT codes with similar (incorrectly stated as identical in the CY 2020 PFS proposed rule) times to the survey code for a crosswalk, we identified CPT code 73552 (*Radiologic examination, femur; minimum 2 views*), which has a work RVU of 0.18. We believe this is a more appropriate valuation for CPT code 70360 and proposed a work RVU for this CPT code of 0.18.

We proposed the RUC-recommended direct PE inputs for CPT code 70360.

We received public comments on the proposed valuation of the codes in the X-Ray Exam—Neck family. The

following is a summary of the comments we received and our responses.

Comment: A commenter noted that CMS' statement that they "looked at CPT codes with identical times to the survey code for a crosswalk" and identified 73552. However, the times for the two codes are not, in fact, identical. The intra-service time differs by a full minute which is a key component of a valid crosswalk.

Response: We thank the commenter for bringing this to our attention. We apologize for the confusion and corrected this typo in this final rule to reflect that the times are similar.

Comment: Several commenters disagreed with the proposed work RVUs for CPT code 70360. Commenters stated that CMS should instead finalize the RUC-recommended work RVUs for this procedure. Commenters disagreed with our reference to older work time sources, and noted that their use led to the proposal of work RVUs based on flawed assumptions. Commenters stated that codes with "CMS/Other" or "Harvard" work time sources, used in the original valuation of certain older services, in this case, were not surveyed, and therefore, were not resource-based. Commenters noted that it was invalid to draw comparisons between the current work times and work RVUs of these services to the newly surveyed work time and work RVUs as recommended by the RUC for the services.

Response: We appreciate the commenters' concerns regarding CMS' interpretation of older work time sources and their use in the code valuation process for establishing work RVUs for these services. We agree that it is important to use the recent data available regarding work times, and we note that when many years have passed between when time is measured, significant discrepancies can occur. However, we also believe that our operating assumption regarding the validity of the existing values as a point of comparison is critical to the integrity of the relative value system as currently constructed. We have responded to concerns about our methodology earlier in this section. For additional information regarding the use of old work time values that were established many years ago and have not since been reviewed in our methodology, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section II.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80273 through 80274). Based on the aforementioned crosswalks, brackets, or references for these codes, which continue to believe

the proposed values better maintains the relative intensity of the codes in the family, and better preserves relativity with the rest of the codes on the PFS

After consideration of the public comments, we are finalizing the work RVU and direct PE inputs for the code in the X-Ray Exam—Neck family as proposed.

(31) X-Ray Exam—Spine (CPT Codes 72020, 72040, 72050, 72052, 72070, 72072, 72074, 72080, 72100, 72110, 72114, and 72120)

CPT codes 72020 (*Radiologic examination spine, single view, specify level*) and 72072 (*Radiologic examination, spine; thoracic, 3 views*) were identified through a screen of CMS/Other Source codes with Medicare utilization greater than 100,000 services annually. The code family was expanded to include 10 additional CPT codes to be reviewed together as a group: CPT code 72040 (*Radiologic examination, spine, cervical; 2 or 3 views*), CPT code 72050 (*Radiologic examination, spine, cervical; 4 or 5 views*), CPT code 72052 (*Radiologic examination, spine cervical; 6 or more views*), CPT code 72070 (*Radiologic examination spine; thoracic, 2 views*), CPT code 72074 (*Radiologic examination, spine; thoracic, minimum of 4 views*), CPT code 72080 (*Radiologic examination, spine; thoracolumbar junction, minimum of 2 views*), CPT code 72100 (*Radiologic examination, spine, lumbosacral; 2 or 3 views*), CPT code 72110 (*Radiologic examination, spine, lumbosacral; minimum of 4 views*), CPT code 72114 (*Radiologic examination, spine, lumbosacral; complete, including bending views, minimum of 6 views*), and CPT code 72120 (*Radiologic examination, spine, lumbosacral; bending views only, 2 or 3 views*). This family of CPT codes was originally valued by the specialty societies using a crosswalk methodology approved by the RUC Research Subcommittee. However, after we expressed concern about the use of this approach for valuing work and PE, the specialty society agreed to survey these codes and the RUC reviewed them again in January 2019.

For the majority of CPT codes in this family, the RUC recommended a work RVU that is slightly different (higher or lower) than the current work RVU. Three CPT codes in this family are maintaining the current work RVU. We proposed the RUC-recommended work RVU for all 12 CPT codes in this family as follows: A work RVU of 0.16 for CPT code 72020, a work RVU of 0.22 for CPT code 72040, a work RVU of 0.27 for CPT code 72050, a work RVU of 0.30 for CPT

code 72052, a work RVU of 0.20 for CPT code 72070, a work RVU of 0.23 for CPT code 72072, a work RVU of 0.25 for CPT code 72074, a work RVU of 0.21 for CPT code 72080, a work RVU of 0.22 for CPT code 72100, a work RVU of 0.26 for CPT code 72110, a work RVU of 0.30 for CPT code 72114, and a work RVU of 0.22 for CPT code 72120.

We proposed the RUC-recommended direct PE inputs for all codes in the family.

We received public comments on the proposed valuation of the codes in the X-Ray Exam—Spine family. The following is a summary of the comments we received and our responses.

Comment: A commenter was supportive of our proposals for the work RVUs and direct PE inputs for the codes in this family.

Response: We appreciate the support for our proposals from the commenter.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the X-Ray Exam—Spine family as proposed.

(32) CT-Orbit-Ear-Fossa (CPT Codes 70480, 70481, and 70482)

In October 2017, the RAW requested that AMA staff develop a list of CMS/Other codes with Medicare utilization of 30,000 or more. CPT code 70480 (*Computed tomography (CT), orbit, sella, or posterior fossa or outer, middle, or inner ear; without contrast material*) was identified. In addition, the code family was expanded to include two related CT codes, CPT code 70481 (*Computed tomography, orbit, sella, or posterior fossa or outer, middle, or inner ear; with contrast material*) and CPT code 70482 (*Computed tomography, orbit, sella, or posterior fossa or outer, middle, or inner ear; without contrast material followed by contrast material(s) and further sections*). In 2018, the RUC recommended this code family be surveyed.

For CPT code 70840, we disagreed with the RUC-recommended work RVU of 1.28 and proposed instead a work RVU of 1.13. We proposed a lower work RVU because 1.13 represents the commensurate 12 percent decrease in work time reflected in survey values. We referenced the work RVUs of CPT codes 72128 (*Computed tomography, chest, spine; without dye*) and 71250 (*Computed tomography, thorax without dye*) both of which have the same intraservice time (that is, 15 minutes) as CPT code 70840 but longer total times (that is, 25 minutes versus 22 minutes). We believe that CPT code 72128 with a work RVU of 1.0 and CPT code 71250 with a work RVU of 1.16 more

accurately reflect the relative work values of CPT code 70840.

We also disagreed with the RUC-recommended work RVU of 1.13 for CPT code 70481. Instead, we proposed a work RVU of 1.06 for CPT code 70481. As with CPT code 70840, we proposed a lower work RVU for CPT code 70481 because a work RVU of 1.06 is commensurate with the 23 percent decrease in surveyed total time from 26 to 20 minutes. We believe CPT code 76641 (*Ultrasound, breast, unilateral*) with a work RVU of 0.73 and CPT code 70460 (*Computed Tomography, head or brain, without contrast*) with a work RVU of 1.13 serve as appropriate references for our proposed work RVU for CPT code 70841. Although CPT codes 76641 and 70460 have longer total times at 22 minutes and lower intraservice times at 12 minutes, we believe they better reflect the relative work value of CPT code 70481 with a proposed work RVU of 1.06, total time of 20 minutes, and intraservice time of 13 minutes.

For the third code in the family, CPT code 70482, we proposed the RUC-recommended work RVU of 1.27.

We proposed the RUC-recommended direct PE inputs for all codes in the family.

We received public comments on the proposed valuation of the codes in the CT-Orbit-Ear-Fossa family. The following is a summary of the comments we received and our responses.

Comment: Commenters expressed support for our proposal to accept the RUC-recommended work RVU for CPT code 70482. However, they disagreed with our proposal to lower the work RVUs commensurate with decreases in time for CPT codes 70480 and 70481. Commenters uniformly requested that we reconsider the work RVUs because the work associated with the CPT code 70482 is more anatomically complex than the code we proposed as reference. Additionally, commenters indicated that this particular family of CT codes does not reflect the typical step-up in time and work as is the case for most radiology code families. Commenters noted too that the RUC-recommended values fell at the survey 25th percentile or below as is typical of work valuations.

Response: We thank the commenters for their insights into the services associated with CPT codes 70480, 70481, and 70482. We were persuaded by their comments and will finalize the three codes with the RUC-recommended work RVUs.

Comment: Commenters disagreed with the proposal of the RUC-recommended direct PE inputs for CPT

codes 70480–70482, which would lower CT equipment time by approximately one-third. The commenters stated that based on their experience in actual imaging center practice CT equipment time should be based on the actual, total CT technologist time, rather than the RUC-recommended PE inputs that are not supported by standard operating procedures. Commenters stated that that once the patient is greeted and gowned, he/she will be escorted into the CT room where the technologist will perform the other procedure-related activities such as confirming the exam to be performed against the order, determining the correct exam protocol, etc.

Response: We disagree with the commenters that the RUC-recommended and CMS proposed CT equipment times for the codes in this family are inaccurate. We continue to believe that certain highly technical pieces of equipment and equipment rooms are less likely to be used during all of the preservice or postservice tasks performed by clinical labor staff on the day of the procedure and are typically available for other patients even when one member of clinical staff may be occupied with a preservice or postservice task related to the procedure. For a more detailed description of this topic, we refer readers to the CY 2015 PFS final rule with comment period (79 FR 67639 through 67640).

After consideration of the public comments, we are finalizing the RUC-recommended values for all three codes in the CT-Orbit-Ear-Fossa family: CPT codes 70480 with work RVU 1.28, 70481 with work RVU 1.13, and 70482 with work RVU 1.27. We also are finalizing the RUC-recommended direct PE inputs for all three codes.

(33) CT Spine (CPT Codes 72125, 72126, 72127, 72128, 72129, 72130, 72131, 72132, and 72133)

CPT code 72132 (*Computed tomography, lumbar spine; with contrast material*) was identified as potentially misvalued on a screen of CMS/Other codes with Medicare utilization of 30,000 or more. Eight other spine CT codes were identified as part of the family, and they were surveyed and reviewed together at the April 2018 RUC meeting.

We proposed the RUC-recommended work RVU for eight of the nine codes in the family. We proposed a work RVU of 1.22 for CPT code 72126 (*Computed tomography, cervical spine; with contrast material*), a work RVU of 1.27 for CPT code 72127 (*Computed tomography, cervical spine; without*

contrast material, followed by contrast material(s) and further sections), a work RVU of 1.00 for CPT code 72128 (*Computed tomography, thoracic spine; without contrast material*), a work RVU of 1.22 for CPT code 72129 (*Computed tomography, thoracic spine; with contrast material*), a work RVU of 1.27 for CPT code 72130 (*Computed tomography, thoracic spine; without contrast material, followed by contrast material(s) and further sections*), a work RVU of 1.00 for CPT code 72131 (*Computed tomography, lumbar spine; without contrast material*), a work RVU of 1.22 for CPT code 72132 (*Computed tomography, lumbar spine; with contrast material*), and a work RVU of 1.27 for CPT code 72133 (*Computed tomography, lumbar spine; without contrast material, followed by contrast material(s) and further sections*).

We disagree with the RUC-recommended work RVU of 1.07 for CPT code 72125 (*Computed tomography, cervical spine; without contrast material*) and we proposed a work RVU of 1.00 to match the other without contrast codes in the family. The cervical spine CT procedure described by CPT code 72125 shares the identical surveyed work time as the thoracic spine CT procedure described by CPT code 72128 and the lumbar spine CT procedure described by CPT code 72131, and we believe that this indicates that these three CPT codes should share the same work RVU of 1.00. Our proposed work RVU would also match the pattern established by the rest of the codes in this family, in which the contrast procedures (CPT codes 72126, 72129, and 72132) share a proposed work RVU of 1.22 and the without/with contrast procedures (CPT codes 72127, 72130, and 72133) share a proposed work RVU of 1.27.

We recognize that the RUC has stated that they believe CPT code 72125 to be a more complex study than CPT codes 72128 and 72131 because the cervical spine is subject to an increased number of injuries and there are a larger number of articulations to evaluate. This was the basis for their recommendation that this code should be valued slightly higher than the other without contrast codes. However, if CPT code 72125 has a more difficult patient population and requires a larger number of articulations to evaluate as compared to CPT codes 72128 and 72131, we do not understand why this was not reflected in the surveyed work times, which were identical for the three procedures. We believe that if the intensity of the procedure were higher due to these additional difficulties, it would be reflected in a longer surveyed work

time. In addition, the survey respondents selected a higher work RVU for CPT code 72131 than CPT code 72125 at both the survey 25th percentile (1.20 to 1.18) and survey median values (1.39 to 1.28), which does not suggest that CPT code 72125 should be valued at a higher rate.

We also note that the surveyed intraservice work time for CPT code 72125 is decreasing from 15 minutes to 12 minutes, and we believe that this provides additional support for a slight reduction in the work RVU to match the other without contrast codes in the family. We recognize that adjusting work RVUs for changes in time is not always a straightforward process and that the intensity associated with changes in time is not necessarily always linear, which is why we apply various methodologies to identify several potential work values for individual codes. However, we reiterate that we believe it would be irresponsible to ignore changes in time based on the best data available and that we are statutorily obligated to consider both time and intensity in establishing work RVUs for PFS services. For additional information regarding the use of prior work time values in our methodology, we refer readers to our discussion of the subject in the CY 2017 PFS final rule (81 FR 80273 through 80274).

We proposed the RUC-recommended direct PE inputs for all codes in the family.

We received public comments on the proposed valuation of the codes in the CT Spine family. The following is a summary of the comments we received and our responses.

Comment: Several commenters disagreed with the CMS proposed work RVU of 1.00 for CPT code 72125 and stated that CMS should instead finalize the RUC-recommended work RVU of 1.07. Commenters stated that CPT code 72125 is a more complex service compared to CPT codes 72128 and 72131 because the cervical spine is subject to an increased number of injuries and there are a larger number of articulations to evaluate including the joints at the craniocervical junction, facet and uncovertebral joints.

Response: We disagree with the commenters that CPT code 72125 is a more complex service compared to CPT codes 72128 and 72131. We acknowledged that the RUC had provided this rationale in their recommendations for CPT code 72125, and we cited the data from the survey respondents that led us to believe that this was not the case. We did not receive a response from the commenters

addressing our use of the survey data, and therefore, we continue to believe that CPT code 72125 should not be valued higher than CPT codes 72128 and 72131.

Comment: Several commenters referenced how the codes in this family had been valued during previous reviews, stating that CMS had previously refined the work RVU of CPT codes 72128 and 72131 to 1.00 while finalizing the RUC-recommended work RVU of 1.07 for CPT code 72125. Commenters stated that because CMS reduced the work RVU for these codes but kept the RUC-recommended work RVUs, there was incongruence between their work times in the RUC database and the existing work RVUs. Commenters also stated that CPT codes with the same or similar times can, and should, have varying RVUs; even though the times for these codes are the same, commenters stressed that the intensity of work for CPT code 72125 is higher than CPT codes 72128 or 72131 due to more anatomical complexity in the cervical spine and the risk of injury to the patient.

Response: We appreciate the additional information provided by the commenters regarding the previous review of these codes in an earlier rule cycle. However, since all nine codes in the family were re-surveyed and produced new survey data, we believe that it is more appropriate to base their valuation on the current survey results, as opposed to the historical survey results. We continue to believe that if the intensity of CPT code 72125 were higher than CPT codes 72128 or 72131 due to the additional difficulties mentioned by the commenters, it would be reflected in a longer surveyed work time. We also note again that the survey respondents selected a higher work RVU for CPT code 72131 than CPT code 72125 at both the survey 25th percentile (1.20 to 1.18) and survey median values (1.39 to 1.28), which does not suggest that CPT code 72125 should be valued at a higher rate. We did not receive any comments explaining why the survey respondents valued CPT code 72125 lower than CPT code 72131 yet it should be valued at a higher rate.

In more general terms, we agree with the commenters that CPT codes with the same or similar times can, and should, have varying RVUs. We recognize that it would not be appropriate to develop work RVUs solely based on time given that intensity is also an element of work. We clarify again that we do not treat all components of physician time as having identical intensity. Were we to disregard intensity altogether, the work RVUs for all services would be developed based

solely on time values and that is definitively not the case, as indicated by the many services that share the same time values but have different work RVUs. For more details on our methodology for developing work RVUs, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section II.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80272 through 80277). In the specific case of CPT code 72125, we believe that it should share the same work RVU of 1.00 with CPT codes 72128 and 72131 not solely because these three codes share the same work times, but also because it matches the pattern established by the rest of the codes in this family, in which the contrast procedures (CPT codes 72126, 72129, and 72132) share a proposed work RVU of 1.22 and the without/with contrast procedures (CPT codes 72127, 72130, and 72133) share a proposed work RVU of 1.27.

Comment: Several commenters disagreed with the proposal of the RUC-recommended direct PE inputs for CPT codes 72125–72133, which would lower CT equipment time by approximately one-third. The commenters stated that, based on their experience in actual imaging center practice, CT equipment time should be based on the actual, total CT technologist time, rather than the RUC-recommended PE inputs that are not supported by standard operating procedures. Commenters stated that that once the patient is greeted and gowned, he/she will be escorted into the CT room where the technologist will perform the other procedure-related activities such as confirming the exam to be performed against the order, determining the correct exam protocol, etc.

Response: We disagree with the commenters that the RUC-recommended and CMS proposed CT equipment times for the codes in this family were inaccurate. We continue to believe that certain highly technical pieces of equipment and equipment rooms are less likely to be used during all of the preservice or postservice tasks performed by clinical labor staff on the day of the procedure and are typically available for other patients even when one member of clinical staff may be occupied with a preservice or postservice task related to the procedure. For a more detailed description of this topic, we refer readers to the CY 2015 PFS final rule with comment period (79 FR 67639 through 67640).

After consideration of the public comments, we are finalizing the work

RVUs and direct PE inputs for the codes in the CT Spine family as proposed.

(34) X-Ray Exam—Pelvis (CPT Codes 72170 and 72190)

CPT code 72190 (*Radiologic examination, pelvis; complete, minimum of 3 views*) was identified as potentially misvalued through a screen of CMS/Other codes with Medicare utilization of 30,000 or more annually. CPT code 72170 (*Radiologic examination, pelvis; 1 or 2 views*) was added as part of the family. The RUC originally reviewed these two codes after specialty societies employed a crosswalk methodology to value work and PE. However, after we expressed concern about the use of this approach, the specialty society agreed to survey the codes and the RUC reviewed them again at the meeting in January 2019.

The RUC recommended a work RVU of 0.17 for CPT code 72170, which maintains the current value. For CPT code 72190, the RUC recommended a work RVU of 0.25, which is slightly higher than the current value (work RVU of 0.21). We proposed the RUC-recommended work RVUs for these two codes in this family.

We proposed the RUC-recommended direct PE inputs for all codes in the family.

Comment: A commenter was supportive of our proposals for the work RVUs and direct PE inputs for the codes in this family.

Response: We appreciate the support for our proposals from the commenter. After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the X-Ray Exam—Pelvis family as proposed.

(35) X-Ray Exam—Sacrum (CPT Codes 72200, 72202, and 72220)

CPT code 72220 (*Radiologic examination, sacrum and coccyx, minimum of 2 views*) was identified on a screen of CMS/Other source codes with Medicare utilization greater than 100,000 annually. CPT codes 72200 (*Radiologic examination, sacroiliac joints; less than 3 views*) and 72202 (*Radiologic examination, sacroiliac joints; 3 or more views*) were also included for review as part of the same family of codes. These three codes were originally valued by the specialty societies using a crosswalk methodology approved by the RUC Research Subcommittee. However, after we expressed concern about the use of this approach for valuing work and PE, the specialty society agreed to survey these codes and the RUC reviewed them again in January 2019.

For CPT code 72200, we disagreed with the RUC recommended work RVU of 0.20, and proposed a work RVU of 0.17, which maintains the current value. We were concerned that the large variation in specialty societies' survey times is indicative of differences in patient population, practice workflow, or even possibly some ambiguity associated with the survey vignette. Furthermore, we did not agree that there is sufficient justification for an increase in work RVU for this service. To support their recommendation, the RUC compared the survey code to the key reference service, CPT code 73522 (*Radiologic examination, hips, bilateral, with pelvis when performed; 3–4 views*), with a work RVU of 0.29, 5 minutes of intraservice time and 7 minutes of total time. The intraservice and total times for the key reference service are 1 minute higher than the survey code (4 minutes intraservice time, 6 minutes total time for CPT code 72200) and the survey code is less intense, according to the RUC, thereby supporting a slightly lower work RVU of 0.20 for CPT code 72200. The RUC's second key reference service is CPT code 73562 (*Radiologic examination, knee; 3 views*), with 4 minutes of intraservice time, 6 minutes of total time, and a work RVU of 0.18. The RUC noted that this second key reference service is less intense to furnish than the survey code, which justifies a slightly lower work RVU despite identical intraservice time (4 minutes) and total time (6 minutes). The RUC further supported their recommendation with a bracket to CPT code 93042 (*Rhythm ECG, 1–3 leads; interpretation and report only*), which has a work RVU of 0.15, and CPT code 70355 (*Orthopantomogram (e.g., panoramic x-ray)*), which has a work RVU of 0.20 (which is identical to the RUC-recommended work RVU for CPT code 72200 but has one additional minute of intraservice time). Although the RUC-recommended work RVU of 0.20 is consistent with the work RVU estimated by the TTR and reflects the 25th percentile of survey results, we do not agree that there is sufficient justification for an increase in work RVU for this service. We also note that the 25th percentile of the survey results work RVU of 0.20 proposed by the RUC is based on the overall survey total time, which is 8 minutes, rather than the RUC-recommended 6 minutes. We found no corresponding explanation for the variability in survey times, leading us to question why there should be an increase in work RVU from the current value. Therefore, we proposed to

maintain the current work RVU of 0.17 for CPT code 72200.

For CPT code 72202, we disagreed with the RUC-recommended work RVU of 0.26, and proposed a work RVU of 0.23 based on our increment methodology. Our proposed value is supported by a bracket to CPT code 73521 (*Radiologic examination, hips, bilateral, with pelvis when performed; 2 views*), which has a work RVU of 0.22 and similar time values, and CPT code 74021 (*Radiologic examination, abdomen; 3 or more views*), which has a work RVU 0.27, and identical time values, to CPT code 72202. Although we disagreed with the RUC-recommended work RVU of 0.20 for CPT code 72200 (the prior code in this family), based on RUC survey results and the time resources involved in furnishing CPT codes 72200 and 72202, we agreed that the relative difference in work RVUs between CPT codes 72200 and 72202 is equivalent to the RUC-recommended incremental difference of 0.06 additional work RVUs. The RUC supported their recommendation with two key reference services. The first is CPT code 73522 (*Radiologic examination, hips, bilateral, with pelvis when performed; 3–4 views*) with 5 minutes intraservice time, 7 minutes total time, and a work RVU of 0.29. They noted that this code has an additional minute for intraservice and total time compared with the survey code, reflecting the additional views associated with evaluating bilateral hip joints. The RUC's second key reference service is CPT code 73562 (*Radiologic examination, knee; 3 views*) with 4 minutes intraservice time, 6 minutes total time, and a work RVU of 0.18. The RUC notes that the survey code has the same times but requires more intensity and includes an additional view compared with the reference service, which the RUC notes justifies a higher work RVU for the survey code.

We disagreed with the RUC's recommended work RVU for CPT code 72202. Given that there is no change in the total time required to furnish the service and there is no corresponding description of an increase in the intensity of the work relative to the existing value, we do not believe an increase in the work RVU for this service is warranted. Therefore, based on those concerns and our incremental methodology, supported by a bracket to CPT codes 73521 and 74021, we proposed a work RVU of 0.23 for CPT code 72202.

For CPT code 72220 we disagreed with the RUC-recommended work RVU 0.20 and proposed to maintain the current work RVU of 0.17. We note that

there is no change in the total time required to furnish the service. We also note that a work RUC-recommended RVU of 0.20 for CPT code 72220 would place it near the maximum work RVU for CPT codes with identical intraservice time (3 minutes) and total time (5 minutes). The RUC's key reference service from the survey results is CPT code 73522 (*Radiologic examination, hips, bilateral, with pelvis when performed, 2–4 views*), has a work RVU of 0.29, 5 minutes intraservice time, and 7 minutes total time. The RUC noted that their recommended work RVU for CPT code 72220 has a lower value than the top key reference code (CPT code 73522) because of the shorter time and lower intensity involved in furnishing the survey code. The RUC's second highest key reference service, CPT code 73562 (*Radiologic examination, knee; 3 views*) has a work RVU of 0.18 with 4 minutes of intraservice time and 6 minutes of total time. The RUC noted that this second key reference service has a lower work RVU than the survey code despite having a slightly higher intraservice time and total time because it involves an X-ray of just one knee.

We disagree with the RUC's recommended increase in the work RVU for CPT code 72220 from 0.17 to 0.20. We note that there is no change in the total time required to furnish the service and that the RUC-recommended work RVU would place it near the maximum work RVU for CPT codes with identical intraservice time (3 minutes) and total time (5 minutes). Therefore, based on those concerns we proposed to maintain the current work RVU of 0.17 for CPT code 72220.

We proposed the RUC-recommended direct PE inputs for all codes in the family.

We received public comments on the proposed valuation of the codes in the X-Ray Exam—Sacrum family. The following is a summary of the comments we received and our responses.

Comment: Several commenters stated that they supported the proposal of the RUC-recommended direct PE inputs for the code in the family.

Response: We appreciate the support for our proposal for the direct PE inputs from the commenters.

Comment: Several commenters disagreed with the proposed work RVUs for CPT codes 72200 and 72220.

Commenters stated that CMS should instead finalize the RUC-recommended work RVUs for these procedures.

Commenters disagreed with our reference to older work time sources, and noted that their use led to the proposal of work RVUs based on flawed

assumptions. Commenters stated that codes with “CMS/Other” or “Harvard” work time sources, used in the original valuation of certain older services, in this case, were not surveyed, and therefore, were not resource-based. Commenters noted that it was invalid to draw comparisons between the current work times and work RVUs of these services to the newly surveyed work time and work RVUs as recommended by the RUC for the services.

Response: We appreciate the commenters’ concerns regarding CMS’ interpretation of older work time sources and their use in the code valuation process for establishing work RVUs for these services. We agree that it is important to use the recent data available regarding work times, and we note that when many years have passed between when time is measured, significant discrepancies can occur. However, we also believe that our operating assumption regarding the validity of the existing values as a point of comparison is critical to the integrity of the relative value system as currently constructed. We have responded to concerns about our methodology earlier in this section. For additional information regarding the use of old work time values that were established many years ago and have not since been reviewed in our methodology, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section II.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80273 through 80274). Our proposal to maintain the current work RVUs for CPT codes 72200 (a work RVU of 0.17) and 72220 (a work RVU of 0.17) and a work RVU of 0.23 for CPT code 72202 is supported by the aforementioned bracket to CPT codes 73521 and 74021. We continue to believe the proposed values better maintains the relative intensity of the codes in the family, and better preserves relativity with the rest of the codes on the PFS.

Comment: A commenter stated that CMS’ note in the proposed rule regarding the reduction in time is misleading. A commenter disagreed with the CMS proposed work RVU for CPT code 72202. One commenter stated that CMS should instead finalize the RUC-recommended work RVU for this procedure, stating that the incremental methodology used in valuing these services was flawed; the commenter did not agree that it was appropriate to reduce the work RVU for CPT code 72202 from the value proposed by the RUC, while also recalibrating the work relative to the RUC’s recommended

difference in work between this code and CPT code 72200. A commenter noted that it is imperative to employ RUC survey data to value this service, and that using an incremental approach in lieu of survey data, strong crosswalks, and input from the practitioners providing these services was unjustified.

Response: We apologize for the confusion noted by commenters who stated that the reduction in time for CPT code 72200 was misleading. In this final rule we have clarified our note on the reductions in time in the discussion above on this code. We believe the use of an incremental difference between codes is a valid methodology for setting values, especially in valuing services within a family of revised codes where it is important to maintain appropriate intra-family relativity. Thus, we applied the use of an incremental difference between CPT codes 72202 and 72200 to develop the proposed work RVU for CPT code. Historically, we have frequently utilized an incremental methodology in which we value a code based upon its incremental difference between another code or another family of codes. We note that the RUC has also used the same incremental methodology on occasion when it was unable to produce valid survey data for a service. We have no evidence to suggest that the use of an incremental difference between codes conflicts with the statute’s definition of the work component as the resources in time and intensity required in furnishing the service. For more details on our methodology for developing work RVUs, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section II.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80272 through 80277).

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the X-Ray Exam—Sacrum family as proposed.

(36) X-Ray Exam—Clavicle-Shoulder (CPT Codes 73000, 73010, 73020, 73030, and 73050)

CPT code 73030 (*Radiologic examination, shoulder; complete, minimum of 2 views*) was identified as potentially misvalued through a screen of services with more than 100,000 utilization annually. CPT codes 73000 (*Radiologic examination; clavicle, complete*), 73010 (*Radiologic examination; scapula, complete*), 73020 (*Radiologic examination, shoulder; 1 view*), and 73050 (*Radiologic*

examination, acromioclavicular joints, bilateral, with or without weighted distraction) were included for review as part of the same family. We proposed the RUC-recommended work RVUs for all five codes in this family. We proposed a work RVU of 0.16 for CPT code 73000, a work RVU of 0.17 for CPT code 73010, a work RVU of 0.15 for CPT code 73020, a work RVU of 0.18 for CPT code 73030, and a work RVU of 0.18 for CPT code 73050.

We proposed the RUC-recommended direct PE inputs for all codes in the family.

Comment: A commenter was supportive of our proposals for the work RVUs and direct PE inputs for the codes in this family.

Response: We appreciate the support for our proposals from the commenter. After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the X-Ray Exam—Clavicle-Shoulder family as proposed.

(37) CT Lower Extremity (CPT Codes 73700, 73701, and 73702)

CPT code 73701 (*Computed tomography, lower extremity; with contrast material(s)*) was identified as potentially misvalued on a screen of CMS/Other codes with Medicare utilization of 30,000 or more. Two other lower extremity CT codes were identified as part of the family, and they were surveyed and reviewed together at the April 2018 RUC meeting.

We proposed the RUC-recommended work RVU for all three codes in this family. We proposed a work RVU of 1.00 for CPT code 73700 (*Computed tomography, lower extremity; without contrast material*), a work RVU of 1.16 for CPT code 73701 (*Computed tomography, lower extremity; with contrast material(s)*), and a work RVU of 1.22 for CPT code 73702 (*Computed tomography, lower extremity; without contrast material, followed by contrast material(s) and further sections*).

We proposed the RUC-recommended direct PE inputs for all codes in the family.

We received public comments on the proposed valuation of the codes in the CT Lower Extremity family. The following is a summary of the comments we received and our responses.

Comment: A commenter stated that they supported the proposal of the RUC-recommended work RVUs for the codes in the family.

Response: We appreciate the support for our proposals from the commenter.

Comment: Several commenters disagreed with the proposal of the RUC-recommended direct PE inputs for CPT

codes 73700–73702, which would lower CT equipment time by approximately one-third. The commenters stated that, based on their experience in actual imaging center practice, CT equipment time should be based on the actual, total CT technologist time, rather than the RUC-recommended PE inputs that are not supported by standard operating procedures. Commenters stated that that once the patient is greeted and gowned, he/she will be escorted into the CT room where the technologist will perform the other procedure-related activities such as confirming the exam to be performed against the order, determining the correct exam protocol, etc.

Response: We disagree with the commenters that the RUC-recommended and CMS proposed CT equipment times for the codes in this family are inaccurate. We continue to believe that certain highly technical pieces of equipment and equipment rooms are less likely to be used during all of the preservice or postservice tasks performed by clinical labor staff on the day of the procedure and are typically available for other patients even when one member of clinical staff may be occupied with a preservice or postservice task related to the procedure. For a more detailed description of this topic, we refer readers to the CY 2015 PFS final rule with comment period (79 FR 67639 through 67640).

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the CT Lower Extremity family as proposed.

(38) X-Ray Elbow-Forearm (CPT Codes 73070, 73080, and 73090)

CPT codes 73070 (*Radiologic examination, elbow; 2 views*) and 73090 (*Radiologic examination; forearm, 2 views*) were identified on a screen of CMS/Other source codes with Medicare utilization greater than 100,000 services annually. CPT code 73080 (*Radiologic examination, elbow; complete, minimum of 3 views*) was included for review as part of the same code family. All three CPT codes in this family were originally valued by the specialty societies using a crosswalk methodology approved by the RUC research committee. However, after we expressed concern about the use of this approach for valuing work and PE, the specialty society agreed to survey the codes and the RUC reviewed them again at the meeting in January 2019. We proposed the RUC-recommended work RVU for all three codes in this family. We proposed a work RVU of 0.16 for CPT

code 73070, a work RVU of 0.17 for CPT code 73080, and a work RVU of 0.16 for CPT code 73090.

We proposed the RUC-recommended direct PE inputs for all codes in the family.

Comment: A commenter was supportive of our proposals for the work RVUs and direct PE inputs for the codes in this family.

Response: We appreciate the support for our proposals from the commenter. After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the X-Ray Elbow-Forearm family as proposed.

(39) X-Ray Heel (CPT Code 73650)

CPT code 73650 (*Radiologic examination; calcaneous, minimum of 2 views*) was identified on a screen of CMS/Other source codes with Medicare utilization greater than 100,000 services annually. CPT code 73650 was originally valued by the specialty societies using a crosswalk methodology approved by the RUC Research Subcommittee. However, after we expressed concern about the use of this approach for valuing work and PE, the specialty society agreed to survey the code and the RUC reviewed it again in January 2019. For CPT code 73650, we proposed the RUC-recommended work RVU of 0.16.

We proposed the RUC-recommended direct PE inputs for CPT code 73650.

Comment: A commenter was supportive of our proposals for the work RVUs and direct PE inputs for the code in this family.

Response: We appreciate the support for our proposals from the commenter.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the code in the X-Ray Heel family as proposed.

(40) X-Ray Toe (CPT Code 73660)

CPT code 73660 (*Radiologic examination; toe(s), minimum of 2 views*) was identified on a screen of CMS/Other source codes with Medicare utilization greater than 100,000 services annually. CPT code 73660 was originally valued by the specialty societies using a crosswalk methodology approved by the RUC Research Subcommittee. However, after we expressed concern about the use of this approach for valuing work and PE, the specialty society agreed to survey the code and the RUC reviewed it again in January 2019. We proposed the RUC-recommended work RVU of 0.13 for CPT code 73660.

We proposed the RUC-recommended direct PE inputs for CPT code 73660.

Comment: A commenter was supportive of our proposals for the work RVUs and direct PE inputs for the code in this family.

Response: We appreciate the support for our proposals from the commenter.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the code in the X-Ray Toe family as proposed.

(41) Upper Gastrointestinal Tract Imaging (CPT Codes 74210, 74220, 74230, 74221, 74240, 74246, and 74248)

These services were identified through a list of list of CMS/Other codes with Medicare utilization of 30,000 or more. The CPT Editorial Panel subsequently revised this code set in order to conform to other families of radiologic examinations.

We proposed the RUC-recommended work RVUs of 0.59 for CPT code 74210 (*Radiologic examination, pharynx and/or cervical esophagus, including scout neck radiograph(s) and delayed image(s), when performed, contrast (e.g., barium) study*), 0.60 for CPT code 74220 (*Radiologic examination, esophagus, including scout chest radiograph(s) and delayed image(s), when performed; single-contrast (e.g., barium) study*), 0.70 for CPT code 74221 (*Radiologic examination, esophagus, including scout chest radiograph(s) and delayed image(s), when performed; double-contrast (e.g., high-density barium and effervescent agent) study*), 0.53 for CPT code 74230 (*Radiologic examination, swallowing function, with cineradiography/videoradiography, including scout neck radiograph(s) and delayed image(s), when performed, contrast (e.g., barium) study*), 0.80 for CPT code 74240 (*Radiologic examination, upper gastrointestinal tract, including scout abdominal radiograph(s) and delayed image(s), when performed; single-contrast (e.g., barium) study*) 0.90 for CPT code 74246 (*Radiologic examination, upper gastrointestinal tract, including scout abdominal radiograph(s) and delayed image(s), when performed; double-contrast (e.g., high-density barium and effervescent agent) study, including glucagon, when administered*), and 0.70 for CPT code 74248 (*Radiologic examination, upper gastrointestinal tract, including scout abdominal radiograph(s) and delayed image(s), when performed; with small intestine follow-through study, including multiple serial images (List separately in addition to code for primary procedure)*). We are also proposing the reaffirmed work RVU of 0.59 for CPT code 74210 (*Radiologic examination, pharynx and/or cervical esophagus,*

including scout neck radiograph(s) and delayed image(s), when performed, contrast (e.g., barium) study) and the reaffirmed work RVU of 0.53 for CPT code 74230 (*Radiologic examination, swallowing function, with cineradiography/videoradiography, including scout neck radiograph(s) and delayed image(s), when performed, contrast (e.g., barium) study*).

For the direct PE clinical labor input CA021 “Perform procedure/service—NOT directly related to physician work time,” we noted that no rationale was given for the RUC-recommended times for these codes, and we requested comment on the appropriateness of the RUC-recommended clinical labor times for this activity of 13 minutes, 13 minutes, 15 minutes, 15 minutes, 19 minutes, 22 minutes, and 15 minutes for CPT codes 74210, 74220, 74221, 74230, 74240, and 74246, respectively. In addition, for CPT code 74230, we proposed to refine the clinical labor times for the “Prepare room, equipment and supplies” (CA013) and “Prepare, set-up and start IV, initial positioning and monitoring of patient” (CA016) activity codes to the standard values of 2 minutes each, as well as to refine the equipment times to reflect these changes in clinical labor.

We received public comments on the proposed valuation of the codes in the Upper Gastrointestinal Tract Imaging family. The following is a summary of the comments we received and our responses.

Comment: A commenter supported our proposal to use the RUC-recommended work RVUs for these codes.

Response: We appreciate the support for our proposals from the commenter.

Comment: A commenter stated that, contrary to our statement that no rationale was provided for the times recommended for the “perform procedure/service—NOT directly related to physician work time” (CA021) clinical labor activity, the RUC had included detailed information on the RUC-recommended clinical labor in the PE SOR, and the commenter reiterated the rationale.

Response: We thank the commenter for the clarification.

Comment: A commenter disagreed with our refinements to the RUC-recommended minutes for the “Prepare, set-up and start IV, initial positioning and monitoring of patient” (CA016) activity. This commenter stated patients require extra time for positioning because by CMS’ own policy rules these patients need two diagnoses to qualify for the exam, the most common being prior cerebral infarct and pneumonia.

The patients are elderly, debilitated, and have multiple comorbidities. They are being positioned upright between a table and fluoroscopy tube with minimal allowance for deviation because the field of view (their oropharynx and larynx) are a small target.

A commenter disagreed with our proposed refinement to the number of minutes allocated to the “Prepare room, equipment and supplies” (CA013) activity, stating that this exam’s requirements exceed a normal radiographic exam. The commenter stated that multiple consistencies of barium must be prepared, including thin liquid, nectar thick liquid, honey-thick liquid, purees, mixed solids, and solids and that the varying barium consistencies are delivered by teaspoon, straw, and cup. The commenter stated that all of these items must be prepared prior to beginning the exam.

Response: We appreciate the additional information provided by commenters regarding these clinical labor activities. Based on the information provided by the commenters, we are not finalizing our proposed refinements to the CA013 and CA016 clinical labor activities, and we are instead finalizing the RUC-recommended times.

After consideration of the public comments, we are finalizing as proposed the RUC-recommended work RVUs, as well as the RUC-recommended direct PE inputs.

(42) Lower Gastrointestinal Tract Imaging (CPT Codes 74250, 74251, 74270, and 74280)

These services were identified through a list of list of CMS/Other codes with Medicare utilization of 30,000 or more. We proposed the RUC-recommended work RVUs of 0.81 for CPT code 74250 (*Radiologic examination, small intestine, including multiple serial images and scout abdominal radiograph(s), when performed; single-contrast (e.g., barium) study*), 1.17 for CPT code 74251 (*Radiologic examination, small intestine, including multiple serial images and scout abdominal radiograph(s), when performed; double-contrast (e.g., high-density barium and air via enteroclysis tube) study, including glucagon, when administered*), 1.04 for 74270 (*Radiologic examination, colon, including scout abdominal radiograph(s) and delayed image(s), when performed; single-contrast (e.g., barium) study*), and 1.26 for CPT code 74280 (*Radiologic examination, colon, including scout abdominal*

radiograph(s) and delayed image(s), when performed; double-contrast (e.g., high density barium and air) study, including glucagon, when administered).

For the direct PE clinical labor input CA021 “Perform procedure/service—NOT directly related to physician work time,” we noted that no rationale was given for the recommended times for these codes, and we requested comment on the appropriateness of the RUC-recommended clinical labor times for this activity of 19 minutes, 30 minutes, 25 minutes, and 36 minutes for CPT codes 74250, 74251, 74270, and 74280, respectively. In addition, we proposed to refine the equipment time for the room, radiographic-fluoroscopic (EL014) for CPT code 74250 to conform to our established standard for highly technical equipment and to match the rest of the codes in the family.

We received public comments on the proposed valuation of the codes in the Lower Gastrointestinal Tract Imaging family. The following is a summary of the comments we received and our responses.

Comment: A commenter supported our proposal to use the RUC-recommended work RVUs for these codes.

Response: We appreciate the support for our proposals from the commenter.

Comment: A commenter stated that, contrary to our statement that no rationale was provided for the times recommended for the “perform procedure/service—NOT directly related to physician work time” (CA021) clinical labor activity, the RUC had included detailed information on the RUC-recommended clinical labor in the PE SOR, and the commenter reiterated the rationale.

Response: We thank the commenter for the clarification. We are finalizing the RUC-recommended times as proposed for this clinical labor activity.

After consideration of the public comments, we are finalizing as proposed the RUC-recommended work RVUs, as well as our proposed direct PE refinements.

(43) Urography (CPT Code 74425)

The service described by CPT code 74425 (*Urography, antegrade (pyelostogram, nephrostogram, loopogram), radiological supervision and interpretation*) was combined with services describing genitourinary catheter procedures by the CPT Editorial Panel in CY 2016, resulting in CPT codes 50431 (*Injection procedure for antegrade nephrostogram and/or ureterogram, complete diagnostic procedure including imaging guidance*

(e.g., ultrasound and fluoroscopy) and all associated radiological supervision and interpretation; existing access) and 50432 (Placement of nephrostomy catheter, percutaneous, including diagnostic nephrostogram and/or ureterogram when performed, imaging guidance (e.g., ultrasound and/or fluoroscopy) and all associated radiological supervision and interpretation). CPT code 74425 was not deleted at the time, but the RUC agreed with the specialty societies that 2 years of Medicare claims data should be available for analysis before the code was resurveyed for valuation to allow for any changes in the characteristics and process involved in furnishing the service separately from the genitourinary catheter procedures. The specialty society surveyed CPT code 74425 and reviewed the results with the RUC in October 2018.

The results of the specialty society surveys indicated a large increase in the amount of time required to furnish the service and, correspondingly, to the work RVU. The total time for CPT code 74425 based on the survey results was 34 minutes, an increase of 25 minutes over the current total time of 9 minutes. In reviewing the survey results, the RUC revised the total time for this CPT code to 24 minutes, with a recommended work RVU of 0.51. The reason for the large increase in time, according to the RUC, is a change in the typical patient profile in which the typical patient is one with an ileal conduit through which nephrostomy tubes have been placed for post-operative obstruction. Based on the described change in patient population and increased time required to furnish the service, we proposed the RUC-recommended work RVU of 0.51 for CPT code 74425.

We proposed the RUC-recommended direct PE inputs for CPT code 74425.

We received public comments on the proposed valuation of the codes in the Urography family. The following is a summary of the comments we received and our responses.

Comment: Several commenters stated that they supported our proposals for the work RVUs and direct PE inputs for the code in this family.

Response: We appreciate the support for our proposals from the commenters.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the code in the Urography family as proposed.

(44) Abdominal Aortography (CPT Codes 75625 and 75630)

In October 2017, the RAW requested that AMA staff compile a list of CMS/ Other codes with Medicare utilization of

30,000 or more. In January 2018, the RUC recommended to survey these services for the October 2018 RUC meeting. Subsequently, the specialty society surveyed these codes.

We disagree with the RUC-recommended work RVU of 1.75 for CPT code 75625 (*Aortography, abdominal, by serialography, radiological supervision and interpretation*). In reviewing CPT code 75625, we note that the key reference service, CPT Code 75710 (*Angiography, extremity, unilateral, radiological supervision and interpretation*), has 10 additional minutes of intraservice time, 10 additional minutes of total time and the same work RVU, which would indicate the RUC-recommended work RVU of 1.75 appears to be overvalued. When we compared the intraservice time ratio between the RUC-recommended time of 30 minutes and the reference code intraservice time of 40 minutes we found a ratio of 25 percent. 25 percent of the reference code work RVU of 1.75 equals a work RVU of 1.31. When we compared the total service time ratio between the RUC-recommended time of 60 minutes and the reference code total service time of 70 minutes we found a ratio of 14 percent. 14 percent of the reference code work RVU of 1.75 equals a work RVU of 1.51. Therefore, we believe an accurate value would lie between 1.31 and 1.52 RVUs. In looking for a comparative code, we have identified CPT code 38222. CPT Code 38222 is a recently reviewed CPT code with the identical intraservice and total times. As a result, we believe that it is more accurate to propose a work RVU of 1.44 based on a crosswalk to CPT code 38222.

In case of CPT code 75630 (*Aortography, abdominal plus bilateral iliofemoral lower extremity, catheter, by serialography, radiological supervision and interpretation*), we proposed the RUC-recommended value of 2.00 RVUs.

We proposed the RUC-recommended direct PE inputs for all codes in the family.

We received public comments on the proposed valuation of the codes in the Abdominal Aortography family. The following is a summary of the comments we received and our responses.

Comment: Commenters supported our proposal to value CPT code 75630 with the RUC-recommended work RVU.

Response: We appreciate the support for our proposals from the commenters.

Comment: A few commenters stated that our proposed value for CPT code 75625 is invalid, as it relies on a reference to the current value, and the crosswalk or methodology used in the

original valuation of this service is unknown and not resource-based; therefore, it is invalid to compare the current time and work to the surveyed time and work.

Response: We believe that it is crucial that the code valuation process take place with the understanding that the existing work times, used in the PFS ratesetting processes, are accurate. We recognize that adjusting work RVUs for changes in time is not always a straightforward process and that the intensity associated with changes in time is not necessarily always linear, which is why we apply various methodologies to identify several potential work values for individual codes. However, we reiterate that we believe it would be irresponsible to ignore changes in time based on the best data available and that we are statutorily obligated to consider both time and intensity in establishing work RVUs for PFS services. For additional information regarding the use of old work time values that were established many years ago and have not since been reviewed in our methodology, we refer readers to our discussion of the subject in the CY 2017 PFS final rule (81 FR 80273 through 80274).

Comment: A commenter stated that CPT code 38222 provides a poor crosswalk to support our proposed value for CPT code 75625 because it is performed by physicians from a different specialty, it does not involve imaging and exposure to radiation, it does not require intra-arterial access or monitoring of hemodynamic parameters, and it is a much lower risk procedure.

Response: Our determination that the RUC's recommended value somewhat overstates the inherent work is based in part on an analysis of all codes of similar physician time values; we believe the survey data validates an increase in work, but this analysis of all codes of similar times indicates that the increase should not be of the magnitude recommended by the RUC. We note that the nature of the PFS relative value system is such that all services are appropriately subject to comparisons to one another, and that codes do not need to share the same specialty. Although codes that describe clinically similar services are sometimes stronger comparator codes, we do not agree that codes must share the same site of service, patient population, or utilization level to serve as an appropriate crosswalk. After consideration of the public comments, we are finalizing our proposed work RVUs and direct PE inputs for these codes.

(45) Angiography (CPT Codes 75726 and 75774)

We proposed the RUC-recommend work RVU for both codes in this family. We proposed a work RVU of 2.05 for CPT code 75726 (*Angiography, visceral, selective or supraseductive (with or without flush aortogram), radiological supervision and interpretation*), a work RVU of 1.01 for CPT code 75774 (*Angiography, selective, each additional vessel studied after basic examination, radiological supervision and interpretation (List separately in addition to code for primary procedure)*).

We proposed the RUC-recommended direct PE inputs for all codes in the family.

We received public comments on the proposed valuation of the codes in the Angiography family. The following is a summary of the comments we received and our responses.

Comment: A commenter stated that they supported the proposal of the RUC-recommended work RVUs for the codes in the family.

Response: We appreciate the support for our proposals from the commenter.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the Angiography family as proposed.

(46) X-Ray Exam Specimen (CPT Code 76098)

CPT code 76098 (*Radiological examination, surgical specimen*) was reviewed by the RUC based on a request from the American College of Radiology (ACR) to determine whether CPT code 76098 was undervalued because of the assumption that the service is typically furnished concurrently with a placement of localization device service (CPT codes 19281 (*Placement of breast localization device(s) (e.g., clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; first lesion, including mammographic guidance*), 19282 (*Placement of breast localization device(s) (e.g., clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; each additional lesion, including mammographic guidance (List separately in addition to code for primary procedure)*), 19283 (*Placement of breast localization device(s) (e.g., clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; first lesion, including stereotactic guidance*), 19284 (*Placement of breast localization device(s) (e.g., clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; each additional lesion, including stereotactic guidance (List separately in addition to code for primary procedure)*) 19285 (*Placement*

of breast localization device(s) (e.g., clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; first lesion, including ultrasound guidance), 19286 (*Placement of breast localization device(s) (e.g., clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; each additional lesion, including ultrasound guidance (List separately in addition to code for primary procedure)*), 19287 (*Placement of breast localization device(s) (e.g., clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; first lesion, including magnetic resonance guidance*), and 19288 (*Placement of breast localization device(s) (e.g., clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; each additional lesion, including magnetic resonance guidance (List separately in addition to code for primary procedure)*)) each representing a different imaging modality). In a letter to the RUC, ACR expressed concern about the appropriateness of a codes valuation process in which physician time and intensity for a code are reduced to account for overlap with codes that are furnished to a patient on the same day. During the April 2018 RUC meeting, the specialty societies requested a work RVU of 0.40 for CPT code 76098, with intraservice time of 5 minutes and total time of 15 minutes. Currently, this service has a work RVU of 0.16, with 5 minutes of total time and no available intraservice time. In April 2018, the RUC and the specialty society agreed that additional analysis of the data was warranted in consideration of the relatively large change in survey time and work RVU for this service. The RUC agreed to review CPT code 76098 again in October 2018.

The RUC recommended a work RVU of 0.31 for CPT code 76098, based on the October 2018 meeting, which represents an increase over the current value (0.16), but a decrease relative to the specialty society's original request of 0.40. The intraservice time for this CPT code is 5 minutes, and the total time is 11 minutes. Based on the parameters we typically use to review and evaluate RUC recommendations, which rely heavily on survey data, we agree that a work RVU of 0.31 for a CPT code with 5 minutes intraservice and 11 minutes total time is consistent with other CPT codes with similar times and levels of intensity. We proposed the RUC-recommended work RVU of 0.31 for CPT code 76098.

We share the ACR's interest in establishing or clarifying parameters that indicate when CPT codes that are furnished concurrently by the same provider should be valued to account

for the overlap in physician work time and intensity, and even PE. We are broadly interested in stakeholder feedback and suggestions about what those parameters might be and whether or how they should affect code valuation.

We proposed the RUC-recommended direct PE inputs for CPT code 76098.

We received public comments on the proposed valuation of the codes in the X-Ray Exam Specimen family. The following is a summary of the comments we received and our responses.

Comment: A commenter stated appreciation that CMS proposed the RUC-recommended value for CPT code 76098, but wanted to clarify some of the statements in the proposed rule regarding how the code came up for review and their concerns regarding the billed together data. They noted that CPT code 76098 was reviewed by the RUC in April 2018 as part of the CMS/ Other utilization >30,000 screen. At that time, RUC members questioned whether 76098 is typically performed with another code on the same patient, same date of service, and by the same provider. Billed together data showed that no single other code was typically performed with CPT code 76098, but if multiple codes (in this case all CPT codes representing placement of needle localization device by any imaging modality) were combined, then the billed together threshold was met. A commenter expressed concern about whether or not it is appropriate to combine multiple similar codes when determining billed together status. The ACR noted that adding individual billed together rates will result in double counting when three or more of those codes are billed together, rendering the data inaccurate unless this overlap is accounted for. Additionally, the ACR expressed concern that this method of determining billed together status reflects a change in RUC procedure and should be validated through the Research Subcommittee before establishing precedent. As further noted by the commenter, since this was a complex, multi-code issue, the RUC decided to revisit this issue at the October 2018 RUC meeting where AMA staff could present their research on this matter. In October 2018, the RUC agreed that CPT code 76098 is typically performed with one type of needle localization on the same day (any of CPT codes 19281–19288), and 4 minutes of pre-service time was removed from the survey time to account for overlap in work.

Response: We appreciate the support for our proposals from the commenter, and the additional information to clarify

how CPT code 76098 came up for review and noting their concerns regarding the billed together data.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the code in the X-Ray Exam Specimen family as proposed.

(47) 3D Rendering (CPT Code 76376)

CPT code 76376 (*3D rendering with interpretation and reporting of computed tomography, magnetic resonance imaging, ultrasound, or other tomographic modality with image postprocessing under concurrent supervision; not requiring image postprocessing on an independent workstation*) was identified as potentially misvalued on a screen of codes with a negative intraservice work per unit of time (IWPUT), with 2016 estimated Medicare utilization over 10,000 for RUC reviewed codes and over 1,000 for Harvard valued and CMS/Other source codes. It was surveyed and reviewed at the April 2018 RUC meeting.

We proposed the RUC-recommended work RVU of 0.20 for CPT code 76376. We are also proposing the RUC-recommended direct PE inputs for CPT code 76376.

We received public comments on the proposed valuation of the codes in the 3D Rendering family. The following is a summary of the comments we received and our responses.

Comment: A commenter stated that they supported the proposal of the RUC-recommended work RVU for CPT code 76376.

Response: We appreciate the support for our proposal from the commenter.

After consideration of the public comments, we are finalizing the work RVU and direct PE inputs for CPT code 76376 as proposed.

(48) Ultrasound Exam—Chest (CPT Code 76604)

CPT code 76604 (*Ultrasound, chest (includes mediastinum), real time with image documentation*) was identified as potentially misvalued on a screen of CMS/Other codes with Medicare utilization of 30,000 or more. It was surveyed and reviewed for the April 2018 RUC meeting.

We proposed the RUC-recommended work RVU of 0.59 for CPT code 76604. We are also proposing the RUC-recommended direct PE inputs for CPT code 76604.

We received public comments on the proposed valuation of the codes in the Ultrasound Exam—Chest family. The following is a summary of the comments we received and our responses.

Comment: A commenter stated that they supported the proposal of the RUC-recommended work RVU for CPT code 76604.

Response: We appreciate the support for our proposal from the commenter.

Comment: Several commenters disagreed with the RUC-recommended and CMS proposed replacement of the general ultrasound room (EL015) with a portable ultrasound unit (EQ250) for CPT code 76604. The commenters stated that their members reported using console-based ultrasound systems, which reflect a higher cost than portable ultrasound units, and stated that the direct PE inputs for CPT code 76604 should accurately reflect the cost of equipment being used by radiologic practices and freestanding imaging centers. Commenters stated that they only use console-based ultrasound systems because of their greater processing power, advanced features, better image quality, and suitability for a wider range of clinical scenarios including obstetrics, breast, vascular, abdominal, and chest.

Response: While we agree with the commenters that the direct PE inputs for CPT code 76604 should accurately reflect equipment usage, we disagree that the use of the ultrasound room would be typical for this procedure. We agree with the RUC recommendations that the practice patterns for CPT code 76604 have changed over time, and that it is no longer typical for patients to require the use of a full ultrasound room for this examination given the widespread availability of highly quality portable ultrasound equipment. We believe that the typical patient would be treated using these portal ultrasounds for their chest examination.

After consideration of the public comments, we are finalizing the work RVU and direct PE inputs for CPT code 76604 as proposed.

(49) X-Ray Exam—Bone (CPT Codes 77073, 77074, 77075, 77076, and 77077)

CPT codes 77073 (*Bone length studies (orthoroentgenogram, scanogram)*), 77075 (*Radiologic examination, osseous survey; complete (axial and appendicular skeleton)*), and 77077 (*Joint survey, single view, 2 or more joints*) were identified as potentially misvalued on a screen of CMS/Other codes with Medicare utilization of 30,000 or more. CPT codes 77074 (*Radiologic examination, osseous survey; limited (e.g., for metastases)*) and 77076 (*Radiologic examination, osseous survey, infant*) were reviewed as part of the same family.

We proposed the RUC-recommended work RVU for all five CPT codes in this

family. We proposed a work RVU of 0.26 for CPT code 77073, a work RVU of 0.44 for CPT code 77074, a work RVU of 0.55 for CPT code 77075, a work RVU of 0.70 for CPT code 77076, and a work RVU of 0.33 for CPT code 77077.

We proposed the RUC-recommended direct PE inputs for all codes in the family.

Comment: A commenter was supportive of our proposals for the work RVUs and direct PE inputs for the codes in this family.

Response: We appreciate the support for our proposals from the commenter.

After consideration of the public comments, we are finalizing the work RVUs and direct PE for the codes in the X-Ray Exam—Bone family as proposed.

(50) SPECT—CT Procedures (CPT Codes 78800, 78801, 78802, 78803, 78804, 78830, 78831, 78832, and 78835)

The CPT Editorial Panel revised five codes, created four new codes and deleted nine codes to better differentiate between planar radiopharmaceutical localization procedures and SPECT, SPECT—CT and multiple area or multiple day radiopharmaceutical localization/distribution procedures.

For CPT code 78800 (*Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s), (includes vascular flow and blood pool imaging when performed); planar limited single area (e.g., head, neck, chest pelvis), single day of imaging*), we disagree with the RUC recommendation to assign a work RVU of 0.70 based on the survey 25th percentile to this code, because we believe that it is inconsistent with the RUC-recommended reduction in physician time. We proposed a work RVU of 0.64 based on the following total time ratio: The RUC-recommended 27 minutes divided by the current 28 minutes multiplied by the current work RVU of 0.66, which results in a work RVU of 0.64. We note that this value is bracketed by the work RVUs of CPT code 93287 (*Peri-procedural device evaluation (in person) and programming of device system parameters before or after a surgery, procedure, or test with analysis, review and report by a physician or other qualified health care professional; single, dual, or multiple lead implantable defibrillator system*), with a work RVU of 0.45, and CPT code 94617 (*Exercise test for bronchospasm, including pre- and post-spirometry, electrocardiographic recording(s), and pulse oximetry*), with a work RVU of 0.70. Both of these supporting crosswalks have intraservice time values

of 10 minutes, and they have similar total time values.

For CPT code 78801

(Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s), (includes vascular flow and blood pool imaging when performed); planar, 2 or more areas (e.g., abdomen and pelvis, head and chest), 1 or more days of imaging or single area imaging over 2 or more days), we disagree with the RUC recommendation to maintain the current work RVU of 0.79 despite a 22-minute reduction in intraservice time. We believe a reduction from the current value is warranted given the recommended reduction in physician time, and also to be consistent with other services of similar time values. We proposed a work RVU of 0.73 based on the RUC-recommended incremental relationship between this code and CPT code 78800 (a difference of 0.09 RVU), which we apply to our proposed value for the latter code. As support for our proposed work RVU of 0.73, we note that it falls between the work RVUs of CPT code 94617 (*Exercise test for bronchospasm, including pre- and post-spirometry, electrocardiographic recording(s), and pulse oximetry*) with a work RVU of 0.70, and CPT code 93280 (*Programming device evaluation (in person) with iterative adjustment of the implantable device to test the function of the device and select optimal permanent programmed values with analysis, review and report by a physician or other qualified health care professional; dual lead pacemaker system*) with a work RVU of 0.77.

For CPT code 78802

(Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s), (includes vascular flow and blood pool imaging when performed); planar, whole body, single day of imaging), we disagree with the RUC recommendation to maintain the current work RVU of 0.86, as we believe that it is inconsistent with a reduction in time values, and because we do not agree that a work RVU that is among the highest of other services of similar intraservice time values is appropriate. We proposed a work RVU of 0.80 based on the RUC-recommended incremental relationship between this code and CPT code 78800 (a difference of 0.16 RVU), which we apply to our proposed value for the latter code. As support for our proposed work RVU of 0.80, we note that it falls between the work RVUs of CPT code 92520 (*Laryngeal function studies (i.e., aerodynamic testing and acoustic testing)*) with a work RVU of 0.75, and CPT code 93282 (*Programming device*

evaluation (in person) with iterative adjustment of the implantable device to test the function of the device and select optimal permanent programmed values with analysis, review and report by a physician or other qualified health care professional; single lead transvenous implantable defibrillator system) with a work RVU of 0.85.

For CPT code 78804

(Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s), (includes vascular flow and blood pool imaging when performed); planar, whole body, requiring 2 or more days of imaging), we disagree with the RUC recommendation to maintain the current work RVU of 1.07, as we believe that it is inconsistent with a reduction in time values, and because this work RVU appears to be valued highly relative to other services of similar time values. We proposed a work RVU of 1.01 based on the RUC-recommended incremental relationship between this code and CPT code 78800 (a difference of 0.37 RVU), which we apply to our proposed value for the latter code. As support for our proposed work RVU of 1.01, we reference CPT code 91111 (*Gastrointestinal tract imaging, intraluminal (e.g., capsule endoscopy), esophagus with interpretation and report*), which has a work RVU of 1.00 and similar physician time values.

For CPT code 78803

(Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s), (includes vascular flow and blood pool imaging when performed); tomographic (SPECT), single area (e.g., head, neck, chest pelvis), single day of imaging), we disagree with the RUC recommendation to increase the work RVU to 1.20 based on the survey 25th percentile to this code, because we believe that it is inconsistent with the RUC-recommended reduction in physician time. We proposed to maintain the current work RVU of 1.09. We support this value with a reference to CPT code 78266 (*Gastric emptying imaging study (e.g., solid, liquid, or both); with small bowel and colon transit, multiple days*), which has a work RVU of 1.08, and similar time values.

For CPT code 78830

(Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s), (includes vascular flow and blood pool imaging when performed); tomographic (SPECT) with concurrently acquired computed tomography (CT) transmission scan for anatomical review, localization and determination/

detection of pathology, single area (e.g., head, neck, chest or pelvis), single day of imaging), we disagree with the RUC recommendation to assign a work RVU of 1.60 based on the survey 25th percentile to this code, as this would value this code more highly than services of similar time values. To maintain relativity among services in this family, we proposed a work RVU of 1.49 for CPT code 78830 based on the RUC-recommended incremental relationship between CPT code 78830 and CPT code 78803 (a difference of 0.40 RVU), which we apply to our proposed value for the latter code. As support for our proposed work RVU of 1.49, we note that it is bracketed by the work RVUs of CPT codes 72195 (*Magnetic resonance (e.g., proton) imaging, pelvis; without contrast material(s)*) with a work RVU of 1.46, and 95861 (*Needle electromyography; 2 extremities with or without related paraspinal areas*) with a work RVU of 1.54. The physician time values of these services bracket those recommended for CPT code 778X0.

For CPT code 78831

(Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s), (includes vascular flow and blood pool imaging when performed); tomographic (SPECT), minimum 2 areas (e.g., pelvis and knees, abdomen and pelvis), single day of imaging, or single area of imaging over 2 or more days), we disagree with the RUC recommendation to assign a work RVU of 1.93 based on the survey 50th percentile to this code, as this would value this code more highly than services of similar time values. To maintain relativity among services in this family, we proposed a work RVU of 1.82 based on the RUC-recommended incremental relationship between this code and CPT code 78803 (a difference of 0.73 RVU), which we apply to our proposed value for the latter code. As support for our proposed work RVU of 1.82, we note that it is bracketed by the work RVUs of the CPT codes which are members of the same code families referenced for the previous CPT code, 78830: CPT codes 72191 (*Computed tomographic angiography, pelvis, with contrast material(s), including noncontrast images, if performed, and image postprocessing*) with a work RVU of 1.81, and 95863 (*Needle electromyography; 3 extremities with or without related paraspinal areas*) with a work RVU of 1.87. The physician time values of these services bracket those recommended for CPT code 778X1.

For CPT code 78832

(Radiopharmaceutical localization of

tumor, inflammatory process or distribution of radiopharmaceutical agent(s), (includes vascular flow and blood pool imaging when performed); tomographic (SPECT) with concurrently acquired computed tomography (CT) transmission scan for anatomical review, localization and determination/detection of pathology, minimum 2 areas (e.g., pelvis and knees, abdomen and pelvis), single day of imaging, or single area of imaging over 2 or more days imaging), we disagree with the RUC recommendation to assign a work RVU of 2.23 based on the survey 50th percentile to this code, as this would value this code more highly than services of similar time values. To maintain relativity among services in this family, we proposed a work RVU of 2.12 based on the RUC-recommended incremental relationship between this code and CPT code 78803 (a difference of 1.03 RVU), which we apply to our proposed value for the latter code. As support for our proposed work RVU of 2.12, we reference CPT code 70554 (Magnetic resonance imaging, brain, functional MRI; including test selection and administration of repetitive body part movement and/or visual stimulation, not requiring physician or psychologist administration), which has a work RVU of 2.11 and physician intraservice and total time values that are identical to those recommended for this service.

For CPT code 78835 (Radiopharmaceutical quantification measurement(s) single area), we disagree with the RUC recommendation to assign a work RVU of 0.51 based on the survey 25th percentile to this code, because we want to maintain relativity and proportionality among codes of this family. We based our values for the other codes in this family on their relative relationship to either CPT code 78800 or 78832, depending on the type of service described by the code. For CPT code 78830, which describes a single day of imaging and is thus analogous to CPT code 78835 in terms of units of service, our analysis indicates a reduction from the RUC value of approximately 7 percent is appropriate. Therefore, we apply a similar reduction of 7 percent to the RUC-recommended work RVU of 0.51 to arrive at an RVU of 0.47. We support this value by noting that it is bracketed by add-on CPT codes 77001 (Fluoroscopic guidance for central venous access device placement, replacement (catheter only or complete), or removal (includes fluoroscopic guidance for vascular access and catheter manipulation, any necessary

contrast injections through access site or catheter with related venography radiologic supervision and interpretation, and radiographic documentation of final catheter position) (List separately in addition to code for primary procedure)) with a work RVU of 0.38, and 77002 (Fluoroscopic guidance for needle placement (e.g., biopsy, aspiration, injection, localization device) (List separately in addition to code for primary procedure)), with a work RVU of 0.54. Both of these reference CPT codes have intraservice time values that are similar to, and total time values that are identical to, those recommended for CPT code 78835.

For the direct PE inputs, we are refining the number of minutes of clinical labor allocated to the activity “Prepare, set-up and start IV, initial positioning and monitoring of patient” to the 2-minute standard for CPT codes 78800, 78801, 78802, 78804, 78803, 78830, 78831, and 78832, as no rationale was provided for these codes to have times above the standard for this activity. We are also refining the equipment time formulas to reflect this clinical labor refinement for these codes. For CPT codes 78800, 78801, 78802, 78804, 78803, 78830, 78831, and 78832, we proposed to refine the equipment times to match our standard equipment time formula for the professional PACS workstation. For the supply item SM022 “sanitizing cloth-wipe (surface, instruments, equipment),” we proposed to refine these supplies to quantities of 5 each for CPT codes 78801, 78804, and 78832 to conform with other codes in the family.

We received public comments on the proposed valuation of the codes in the SPECT–CT Procedures family. The following is a summary of the comments we received and our responses.

Comment: A commenter disagreed with our proposal which revalues these codes based on a total time ratio to value CPT code 78800 and increments between CPT code 78800 and CPT codes 78801, 78802, and 78804, and maintains the current value for CPT code 78803 and uses increments between the latter code and CPT codes 78830, 78831, and 78832. According to this commenter, our proposal is inappropriate, as it relies on an invalid total time ratio methodology to value CPT code 78800, and this time ratio methodology contradicts our stated position that we do not consider decrease in time as reflected in survey values equates to a one-to-one or linear decrease in the valuation of work RVUs.

Response: We disagree with the commenters and continue to believe

that the use of time ratios is one of several appropriate methods for identifying potential work RVUs for particular PFS services, particularly when the alternative values recommended by the RUC and other commenters do not account for information provided by surveys that suggests the amount of time involved in furnishing the service has changed significantly. For more details on our methodology for developing work RVUs, we refer readers to our discussion of the subject in Section 2, Methodology for Establishing Work RVUs (section II.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80272 through 80277).

Comment: One commenter stated that the methodology used in the original valuation of CPT codes 78800, 78801, and 78803 is unknown and not resource-based; therefore, it is invalid to compare the current time and work to the surveyed time and work. This code’s source of time is Harvard, implying that the time was merely extrapolated and not measured directly. The commenter noted that CMS’ continued practice of referencing physician times and derived intensities created almost 30 years ago under the Harvard study as a method to critique RUC recommendations is not appropriate. The commenter also stated that the Harvard study employed much less rigor when determining physician time relative to the modern RUC/CMS process.

Response: We believe that it is crucial that the code valuation process take place with the understanding that the existing work times, used in the PFS ratesetting processes, are accurate. We recognize that adjusting work RVUs for changes in time is not always a straightforward process and that the intensity associated with changes in time is not necessarily always linear, which is why we apply various methodologies to identify several potential work values for individual codes. However, we reiterate that we believe it would be irresponsible to ignore changes in time based on the best data available and that we are statutorily obligated to consider both time and intensity in establishing work RVUs for PFS services. For additional information regarding the use of old work time values that were established many years ago and have not since been reviewed in our methodology, we refer readers to our discussion of the subject in the CY 2017 PFS final rule (81 FR 80273 through 80274).

Comment: For CPT Code 78835, a commenter stated that our application of a percentage reduction to a RUC recommendation is inappropriate and

not resourced based. The work of add-on code 78835 is a separate tangential service where the physician interprets and reviews a processed quantitated dataset and quality control information. Although 78835 is an add-on code for SPECT-CT, the commenter stated that the work of the add-on code differs markedly from the work of supervising and interpreting the SPECT-CT images themselves. The physicians not only reviews and interprets the dataset, but also commonly will redraw and reprocess to ensure reproducibility as they compare to prior images or datasets. The commenter stated that decisions are often discussed with referring physicians for improvement or decline of patients' area of interest status, and therefore, this is a very intense service as patient management will rely heavily on the quantitative comparisons.

Response: We continue to believe that applying a percentage reduction to the RUC-recommended value in this instance is an appropriate method of maintaining relativity among these services. Our proposed valuation for this service is consistent with other add-on codes of similar time, and maintains relative value with the other codes in the code family. In addition, we note that the intensity measure which results from our proposed value is essentially identical to that derived from the RUC-recommended value; the difference is only 0.002 of IWPUT. For these reasons, we believe that our proposed work RVU adequately captures the inherent intensity, and we note that the intensity value that results from our work RVU is virtually identical to that which results from the RUC value.

Comment: Commenters disagreed with our refinement to the clinical labor minutes allocated for the CA016 activity, and stated that the additional minute(s) above the standard PE 2 minutes is to account for the additional handling of the radiotracers or setting up the patient in the camera.

Response: We appreciate the additional information provided by the commenter, and in response to public comment, we are not finalizing our proposed refinements to the minutes allocated to the CA016 activity, and we are instead finalizing the RUC-recommended time inputs for this activity for all of the codes in the family.

Comment: A commenter disagreed with our proposed refinements to the SM022 supply item, used to clean the nuclear medicine equipment room and the room to receive and measure the radiotracers. The commenter stated that, if the imaging is typically over 2 days, then 10 items are needed. Also, if there

are two radiotracers, then 10 not 5 of the wipes are needed because some of the wipes are used on camera and the area where the patient is given the injection(s) and others are used for the place where you receive and then go back to draw up the radiotracers.

Response: In response to public comment, we are not finalizing our proposed refinement, and instead are adopting the RUC-recommended quantities of the SM022 supply item.

Comment: One commenter sent invoices to update the price for the "gamma camera system, single-dual head SPECT CT" (ER097) equipment. The commenter stated that an average and typical negotiated price is \$750,000 for this piece of equipment and that the CMS price for ER097 was undervaluing these services. The commenter urged CMS to update this equipment input price so that the reviewed procedures would be assessed appropriately and remain relative in valuation to other planar, SPECT, PET or PET-CT nuclear medicine services.

Response: We appreciate the submission of additional invoices from the commenter for use in pricing the ER097 gamma camera system. We are finalizing an increase in the price of this equipment item from the proposed \$464,428.95 to \$703,443.37 based on the submission of five invoices. Because the invoices for the ER097 gamma camera system were submitted as part of a reevaluation or comprehensive review of a code family, this updated pricing will be fully implemented immediately for CY 2020 rather than being phased in over the 4-year supply and equipment pricing transition. (For additional details on this policy finalized in CY 2019, see 83 FR 59474 in the CY 2019 PFS final rule.)

After consideration of the public comments, we are finalizing our proposed work RVUs and direct PE refinements, with the exception of the CA016 clinical labor activity and SM022 supply item, for which we are finalizing the RUC-recommended labor times and quantities.

(51) Myocardial PET (CPT Codes 78459, 78429, 78491, 78430, 78492, 78431, 78432, 78433, and 78434)

CPT code 78492 (Myocardial imaging, positron emission tomography (PET), perfusion; multiple studies at rest and/or stress) was identified via the High Volume Growth screen with total Medicare utilization over 10,000 that increased by at least 100 percent from 2009 through 2014. The CPT Editorial Panel revised this code set to reflect newer technology aspects such as wall motion, ejection fraction, flow reserve,

and technology updates for hardware and software. The CPT Editorial Panel deleted a Category III code, added six Category I codes, and revised the three existing codes to separately identify component services included for myocardial imaging using positron emission tomography.

For CPT code 78491 (*Myocardial imaging, positron emission tomography, perfusion study (including ventricular wall motion(s), and/or ejection fractions(s), when performed); single study, at rest or stress (exercise or pharmacologic)*), we disagreed with the RUC-recommended work RVU of 1.56, which is the survey 25th percentile value, as we believed that the 30-minute reduction in intraservice time and 15-minute reduction in physician total time does not validate an increase in work RVU, and we believed that the significance of the reductions in recommended physician time values warranted a reduction in work RVU. We proposed a work RVU of 1.00 based on the following total time ratio: The recommended 30 minutes divided by the current 45 minutes multiplied by the current work RVU of 1.50, which results in a work RVU of 1.00. As further support for this value, we note that it falls between CPT code 78278 (*Acute gastrointestinal blood loss imaging*), with a work RVU of 0.99, and CPT code 10021 (*Fine needle aspiration biopsy, without imaging guidance; first lesion*), with a work RVU of 1.03.

For CPT code 78430 (*Myocardial imaging, positron emission tomography, perfusion study (including ventricular wall motion(s), and/or ejection fractions(s), when performed); single study, at rest or stress (exercise or pharmacologic), with concurrently acquired computed tomography transmission scan*), we disagreed with the RUC recommendation of 1.67 based on the survey 25th percentile, as we did not agree this service would be appropriately valued with an RVU that is among the highest of all services of similar times with this global period. We proposed a work RVU of 1.11 by applying the RUC-recommended increment between CPT code 78491 and this code, an increment of 0.11, to our proposed value of 1.00 for CPT code 78491, thus maintaining the RUC's recommended incremental relationship between these codes. As further support for this value, we noted that it falls between CPT codes 95977 (*Electronic analysis of implanted neurostimulator pulse generator/transmitter (e.g., contact group[s], interleaving, amplitude, pulse width, frequency [Hz], on/off cycling, burst, magnet mode, dose lockout, patient selectable parameters,*

responsive neurostimulation, detection algorithms, closed loop parameters, and passive parameters) by physician or other qualified health care professional; with complex cranial nerve neurostimulator pulse generator/transmitter programming by physician or other qualified health care professional), with a work RVU of 0.97, and CPT code 93284 (*Programming device evaluation (in person) with iterative adjustment of the implantable device to test the function of the device and select optimal permanent programmed values with analysis, review and report by a physician or other qualified health care professional; multiple lead transvenous implantable defibrillator system*), with a work RVU of 1.25; both of these codes have similar physician time values.

For CPT code 78459 (*Myocardial imaging, positron emission tomography (PET), metabolic evaluation study (including ventricular wall motion(s), and/or ejection fraction(s), when performed) single study*), we disagreed with the RUC recommendation to increase the work RVU to 1.61 based on the survey 25th percentile. We believed that the magnitude of the recommended reductions in physician time (a 50-minute reduction in intraservice time and a 32-minute reduction in total time) suggests that this value is overestimated; furthermore, we note that the RUC's recommendation is among the highest for all XXX-global period codes, or codes for which the global period concept does not apply, with similar time values. We proposed a work RVU of 1.05 by applying the RUC-recommended increment between this code and CPT code 78491, a difference of 0.05, which we applied to our proposed value for the latter code. We support our RVU of 1.05 by referencing two CPT codes: 10021 (*Fine needle aspiration biopsy, without imaging guidance; first lesion*), and 36440 (*Push transfusion, blood, 2 years or younger*), both of which have work RVUs of 1.03, as well as identical intraservice and similar total time values.

We disagreed with the RUC's recommended valuation of 1.76 for CPT code 78429 (*Myocardial imaging, positron emission tomography (PET), metabolic evaluation study (including ventricular wall motion(s), and/or ejection fraction(s), when performed) single study; with concurrently acquired computed tomography transmission scan*), which is based on the survey 25th percentile, because we believed a work RVU that is greater than those of all other services of similar intraservice time values is not appropriate. We proposed a work RVU of 1.20 for CPT

code 78429. We proposed to value CPT code 78429 with an incremental methodology, which preserves the RUC-recommended relationship among the codes in this family; the RUC recommends an increment of 0.20 between CPT code 78429 and CPT code 78491. We proposed to apply this increment to our proposed value of 1.00 for CPT code 78491 to arrive at our value of 1.20.

We disagreed with the RUC's recommendation of 1.80 for CPT code 78492 (*Myocardial imaging, positron emission tomography, perfusion study (including ventricular wall motion(s), and/or ejection fractions(s), when performed); multiple studies at rest and stress (exercise or pharmacologic)*) given the magnitude of the recommended reduction in physician time values (a 35-minute reduction in intraservice time and a 17-minute reduction in total time), and also given the fact that the RUC's recommended value would be the highest of all codes of this intraservice time and global period. We proposed a work RVU of 1.24 based on the RUC-recommended incremental difference between 78491 and 78492 of 0.24, which we add to our proposed value for 78491 for a work RVU of 1.24. As further support for this value, we referenced CPT code 95908 (*Nerve conduction studies; 3-4 studies*), with a work RVU of 1.25, similar physician time values.

We disagreed with the RUC's recommendation of 1.90 for CPT code 78431 (*Myocardial imaging, positron emission tomography, perfusion study (including ventricular wall motion(s), and/or ejection fractions(s), when performed); multiple studies at rest and stress (exercise or pharmacologic), with concurrently acquired computed tomography transmission scan*) which is based on a crosswalk to CPT code 64617 (*Chemodenervation of muscle(s); larynx, unilateral, percutaneous (e.g., for spasmodic dysphonia), includes guidance by needle electromyography, when performed*), because the fact that this work RVU is greater than those of all other services of similar intraservice time values suggested that it is an overestimate. Instead we proposed a work RVU of 1.34 for CPT code 78431, based on an incremental methodology. We apply the RUC-recommended increment between 78491 and CPT code 78431, a difference of 0.34, to our proposed value of 1.00 for CPT code 78491, for a value of 1.34. We supported this value by referencing CPT code 77261 (*Therapeutic radiology treatment planning; simple*), with a work RVU of 1.30, and CPT code 94003 (*Ventilation assist and management, initiation of*

pressure or volume preset ventilators for assisted or controlled breathing; hospital inpatient/observation, each subsequent day), with a work RVU of 1.37. These codes have similar physician time values.

We disagreed with the RUC's recommendation of 2.07 for CPT code 78432 (*Myocardial imaging, positron emission tomography, combined perfusion with metabolic evaluation study (including ventricular wall motion(s), and/or ejection fraction(s), when performed), dual radiotracer (e.g., myocardial viability)*), because we believed the fact that this work RVU is greater than those of all other services of similar intraservice time values suggests that it is an overestimate. We proposed a work RVU of 1.51 for CPT code 78432, based on an incremental methodology. We applied the RUC-recommended increment between 78491 and CPT code 78432, a difference of 0.51, to our proposed value of 1.00 for CPT code 78491, for a value of 1.51. We support this value by referencing CPT code 10005 (*Fine needle aspiration biopsy, including ultrasound guidance; first lesion*), with a work RVU of 1.46, and similar physician time values.

Similarly for CPT code 78433 (*Myocardial imaging, positron emission tomography, combined perfusion with metabolic evaluation study (including ventricular wall motion(s), and/or ejection fraction(s), when performed), dual radiotracer (e.g., myocardial viability); with concurrently acquired computed tomography transmission scan*), we disagreed with the RUC's recommendation of 2.26 based on a crosswalk to CPT code 71552 (*Magnetic resonance (e.g., proton) imaging, chest (e.g., for evaluation of hilar and mediastinal lymphadenopathy); without contrast material(s), followed by contrast material(s) and further sequences*), because we believed the fact that this work RVU is among the highest among services of similar intraservice time values suggests that it is an overestimate. We proposed a work RVU of 1.70 by applying the RUC-recommended increment between CPT code 78433 and CPT code 78491, which is a difference of 0.70, to our proposed value for CPT code 78491 for a value of 1.70. We supported this value by referencing CPT codes 95924 (*Testing of autonomic nervous system function; combined parasympathetic and sympathetic adrenergic function testing with at least 5 minutes of passive tilt*) and 74182 (*Magnetic resonance (e.g., proton) imaging, abdomen; with contrast material(s)*), both of which have work RVUs of 1.73.

For CPT code 78434 (*Absolute quantitation of myocardial blood flow (AQMBF), positron emission tomography, rest and pharmacologic stress (List separately in addition to code for primary procedure)*), we disagreed with the RUC recommendation to assign a work RVU of 0.63 to this code based on the survey 25th percentile, because we believed a comparison to other codes with a global period of ZZZ (add-on codes) suggests that this is somewhat overvalued, and because we want to maintain relativity and proportionality to other codes in this series. We based our values for the other codes in this family on their relative relationships to CPT code 78491; for that code our analysis indicates that a reduction from the RUC value of roughly $\frac{1}{3}$ is appropriate, based on a ratio of the decrease in total time to the current work RVU. Therefore, we apply a similar reduction of $\frac{1}{3}$ to the RUC-recommended work RVU of 0.63 to arrive at an RVU of approximately 0.42. Applying a reduction that is similar to the reduction we believe is warranted from the RUC value for CPT code 78491 to CPT code 78434 will maintain consistency in value among these services. We believed this work RVU is validated by noting that it is bracketed by CPT codes 15272 (*Application of skin substitute graft to trunk, arms, legs, total wound surface area up to 100 sq cm; each additional 25 sq cm wound surface area, or part thereof (List separately in addition to code for primary procedure)*), with a work RVU of 0.33, and 11105 (*Punch biopsy of skin (including simple closure, when performed); each separate/additional lesion (List separately in addition to code for primary procedure)*), with a work RVU of 0.45. A work RVU of 0.42 is thus consistent with ZZZ global period codes of similar physician times.

For the direct PE inputs, for several of the equipment items, we proposed to refine the equipment times to conform to our established policies for non-highly, as well as for highly technical equipment. (For the highly technical equipment standard, please see the discussion in the CY 2013 PFS final rule, 77 FR 69028.) In addition, we proposed to refine the equipment times to conform to our established policies for PACS Workstation. For the new equipment items ER110: "PET Refurbished Imaging Cardiac Configuration" and ER111: "PET/CT Imaging Camera Cardiac Configuration," we proposed to assume that a 90 percent equipment utilization rate is typical, as this would be consistent with our equipment utilization assumptions for

expensive diagnostic imaging equipment. For the supply item SM022 "sanitizing cloth-wipe (surface, instruments, equipment)," we proposed to refine these supplies to quantities of 5 each for CPT codes 78432 and 78433 to conform with other codes in the family. We proposed that we will not price the "Software and hardware package for Absolute Quantitation" as a new equipment item, due to the fact that the submitted invoices included a service contract and a combined software/hardware bundle with no breakdown on individual pricing. Based on our lack of specific pricing data, we believe that this software is more accurately characterized as an indirect PE input that is not individually allocable to a particular patient for a particular service.

We received public comments on the proposed valuation of the codes in the Myocardial PET family. The following is a summary of the comments we received and our responses.

Comment: A commenter noted that the values published in the text of the 2020 PFS proposed rule do not match those posted in Table 20: Proposed CY 2020 Work RVUs for New, Revised and Potentially Misvalued Codes and in Addendum B.

Response: We regret that we have posted inaccurate values in the proposed rule Addenda and in Table 20. Our proposed work RVUs are accurately reflected in the text of the proposed rule.

Comment: A few commenters disagreed with our proposed work RVUs for CPT codes 78459, 78429, 78491, 78430, 78492, 78431, 78432, and 78433, stating that our use of a time ratio to value CPT code 78491 is invalid, as it treats all components of physician time (pre-service, intra-service, post-service and post-operative visits) as having identical intensity. Similarly, the commenter stated that our use of increments to value CPT codes 78459, 78429, 78430, 78492, 78431, 78432, and 78433 is inappropriate as it treats all components of the physician time as having identical intensity. The commenter stated that our proposed values for these codes vastly underestimate the physician work required to perform these services.

These commenters stated that our proposed valuations for these codes take no account of the fact that the physician work involved with these services has changed, and that substantial changes in instrumentation, hardware and software have occurred since these codes were created.

Response: As discussed in the Methodology for Establishing Work

RVUs section of this rule (section II.N.2. of this final rule), we continue to believe that time ratios are one of several appropriate methodologies for valuing services. However, we are persuaded that examining the changes in physician time for these services alone may not adequately reflect increases in intensity due to changes in technology for these services. We are persuaded by the comments that suggest that these codes describe services that have changed substantially over time. After consideration of the public comment, and in the interest of payment stability and protecting patient access for these services, we are not finalizing the proposed work RVUs for these services and instead are adopting the RUC-recommended work RVUs for these services.

Comment: Many commenters stated that moving from contractor pricing to active pricing for the technical component (TC) of these services using inputs as proposed will result in drastic reductions in payment rates for these services. These commenters stated that our proposal will result in a roughly 80 percent reduction in payments for the TC, and that this reduction will effectively eliminate access to Myocardial PET. Commenters stated that the RUC recommended direct PE inputs understate technical costs. Commenters discussed the importance of this service as a non-invasive diagnostic tool which they stated is superior to conventional nuclear cardiology and reduces the need for coronary angiography and coronary interventions. Commenters offered detailed evidence on the efficacy of PET and its usefulness in reducing mortalities and morbidities; this evidence includes a study which demonstrates that in patients being evaluated for suspected coronary artery disease, Cardiac PET results in a 50 percent reduction in the use of coronary arteriography and CABG and a 30 percent reduction in direct patient management costs, while maintaining excellent patient outcomes and minimizing indirect costs. Commenters noted other studies demonstrate the effectiveness of PET as a diagnostic tool when compared to other modalities for diagnosis of myocardial ischemia.

Commenters representing Cardiologists expressed support for the RUC process, however, they noted that they are alarmed at the proposed 75–80 percent reduction in the TC payment and stated it is not consistent with the amounts necessary to continue to operate a Cardiac PET facility. Further, they argued that the inputs used to calculate payment were incomplete and

inaccurate, which combined to trigger an unsustainable proposal. These commenters requested that we work with physicians, industry, and cardiologist representatives to improve the accuracy of all inputs used to generate the proposed CY 2020 RVUs, and they requested that CMS maintain payment at current levels pending an appropriate revision.

Response: As stressed by many commenters, adopting active pricing for the TC of these codes will result in significant reductions in payment. We believe there is substantial work to be done to assure the new valuations for the TCs of these codes accurately reflect the technical inputs. In the interest of maintaining payment stability and protecting patient access to these important services, we are delaying the adoption of active pricing for these codes until such time as more accurate sets of inputs can be developed, and we are maintaining contractor pricing for the TC of these services. CMS will continue to review the inputs, and encourage the public to submit additional information on the most accurate resource-based payment for these services by our annual February 10th deadline for consideration in future rulemaking.

Comment: One commenter disagreed with our proposed refinements to the SM022 supply item, used to clean the nuclear medicine equipment room and the room to receive and measure the radiotracers. The commenter stated that, if the imaging is typically over 2 days, then 10 items are needed. Also, if there are two radiotracers, then 10 not 5 of the wipes are needed because some of the wipes are used on camera and the area where the patient is given the injection(s) and others are used for the place where you receive and then go back to draw up the radiotracers.

Response: In response to public comment, we are not finalizing the proposed refinement and instead are finalizing the RUC-recommended quantities of the SM022 supply item.

Comment: Several commenters submitted invoices to update the price for the “PET Refurbished Imaging Cardiac Configuration” (ER110) and the “PET/CT Imaging Camera Cardiac Configuration” (ER111) equipment items. The commenters urged CMS to update these equipment prices in response to the additional data included on the invoices.

Response: We appreciate the submission of additional invoices from the commenters for use in pricing the ER110 and ER111 equipment items. We are finalizing an increase in the price of the ER110 “PET Refurbished Imaging

Cardiac Configuration” equipment from the proposed \$425,000 to \$527,615.63 based on additional pricing data, from one submitted invoice to an average of ten invoices. We are finalizing an increase in the price of the ER111 “PET/CT Imaging Camera Cardiac Configuration” equipment from the proposed \$1,232,226.44 to \$1,364,960.59 based on additional pricing data, from an average of four submitted invoices to an average of eight invoices. We note that we also received an additional invoice for the ER111 equipment at a price of \$3,206,811.30; however, due to the fact that this invoice was nearly triple the price of the other eight invoices, we did not include it in the overall average as it appears to be an outlier that is not representative of typical pricing.

Comment: Several commenters disagreed with the CMS proposal to refrain from establishing a price for the “Software and hardware package for Absolute Quantitation” as a new equipment item. Commenters stated that it was unreasonable for CMS to propose that the software should be removed, as historically all nuclear medicine hardware must have software to run them or they do not work. Commenters stated that practitioners must have both the hardware and software to analyze myocardial blood flow and that separating the software and hardware would render this system inoperable. One commenter urged CMS to price the software and hardware package for absolute quantitation as recommended while other commenters submitted additional invoices and asked CMS to use them for pricing.

Response: We stated in the proposed rule that we would not price the “Software and hardware package for Absolute Quantitation” as a new equipment item due to the fact that the submitted invoices included a service contract and a combined software/hardware bundle with no breakdown on individual pricing. We appreciate the submission of additional invoices from the commenters with more specific pricing information for this equipment without the inclusion of a service contract, which we continue to believe is a form of indirect PE. Therefore, we are finalizing the creation of “Software and hardware package for Absolute Quantitation” as a new equipment item (ER113) at a price of \$44,652.33 based on the submission of six new invoices from the commenters.

Comment: One commenter stated that the pricing for the new PET Generator Infusion Cart (ER109) was incorrect. The commenter stated that the invoices used to establish the proposed price for the

ER109 equipment were instead for the purchase of the “generator” that comes loaded with the radioactive rubidium 82. The commenter explained that the infusion cart is the machine that houses the rubidium generator and draws the rubidium tracer doses, and that the generator is a separate equipment item. The commenter provided four invoices for the purchase of the infusion cart itself, as well as several invoices for the monthly rental fee of an infusion cart.

Response: We appreciate the additional information provided by the commenter with regards to the PET generator and infusion cart, including the invoices for the monthly rental fee of an infusion cart. Based on the information provided by the commenter, we are finalizing a change to the name of the ER109 equipment item, which were are changing from “PET Generator Infusion Cart” to “PET Infusion Cart” to more accurately reflect the equipment in question. We are finalizing the price of the ER109 infusion cart at \$74,225.47 based on the submission of four new invoices from the commenters. In light of the clarification provided by the commenters, we are also creating a new ER114 equipment item named “PET Generator (Rubidium)” to cover the cost of the generator. The price of the ER114 equipment remains unchanged from the proposed price of \$47,052.80, which had mistakenly been applied to the ER109 infusion cart in the proposed rule, and we will assign the same equipment time to the ER114 generator as proposed for the ER109 infusion cart in CPT codes 78430, 78431, 78432, 78433, 78434, 78491, and 78492. We note as well for future reference that although we appreciated the submission of the rental invoices, we are unable to use invoices for a monthly rental fee to determine the typical purchase price for equipment. We believe that invoices for a monthly rental fee would not be representative of the purchase price for equipment, in the same fashion that the rental fee for a car differs from its purchase price.

Comment: One commenter supplied additional invoices for costs associated with Myocardial PET procedures that the commenter believed should be considered in pricing. The commenter stated that it was typical for building infrastructure improvements like enhanced load-bearing supports, lead-lining in the walls, and separate cooling systems to be necessary to install and maintain a PET machine. The commenter stated that payment rates that failed to account for the startup and maintenance costs necessary to provide high-quality imaging services to sick

patients would further disadvantage practices that provide Myocardial PET.

Response: We disagree with the commenter that these additional invoices constitute forms of direct PE. The commenter submitted two invoices for a “Lead PET Cabinet” which would be used for storage purposes. Under our PE methodology as detailed in the CY 2010 final rule with comment period (74 FR 61743–61748), this is considered to be an administrative cost which falls under indirect PE, similar to the expenses associated with office rent, as it is not a cost directly associated with the furnishing of the procedure. The commenter also submitted three invoices for a “PET Service Contract”, which, as the name suggests, constitutes a service contract that we would also consider to be an administrative expense and a form of indirect PE. The details of this contract specify that it included “maintenance, testing, and quality control” for PET equipment; however, our equipment pricing formula already includes maintenance costs, and if we were to pay separately for this service contract, we would be paying duplicatively for this equipment. We agree with the commenter that there are significant costs associated with running a practice that furnishes services involving capital-intensive imaging equipment. However, under our PE methodology these costs are included under indirect PE in the form of administrative and office rent expenses, and it would be inaccurate and duplicative to include them as a separate direct PE cost.

Comment: Several commenters disagreed with the CMS proposal to assume that a 90 percent equipment utilization rate would be typical for the new “PET Refurbished Imaging Cardiac Configuration” (ER110) and “PET/CT Imaging Camera Cardiac Configuration” (ER111) equipment items. Commenters stated that they had collected data from the number of patients imaged with this equipment each day, which showed an overall average of 4.5 patients imaged per facility per day. Commenters stated that this work flow data equated to the equipment remaining in use for 5–6 hours each day, which was far lower than what a 90 percent utilization rate would suggest. Commenters noted that these PET services existed in 2010 when CMS made the decision to apply the 90 percent utilization rate only to CT and MRI services, and they were unaware of any changes in CMS policy or any statutory requirement to assume a 90 percent utilization rate for PET imaging. Commenters stated that experts that perform cardiac PET and PET–CT in the physician office and independent

diagnostic testing facility (IDTF) settings confirmed that a 50 percent utilization rate would be a more accurate utilization rate and urged CMS to adopt the default utilization rate of 50 percent.

Response: We appreciate the submission of additional information from the commenters, particularly the work flow study data that indicated that the PET equipment typically remains in use for 5–6 hours per day. Based on the information from the commenters, we are not finalizing our proposal to assume a 90 percent utilization rate for the ER110 and ER111 equipment items, and we will instead finalize the default 50 percent utilization rate assumption for both equipment items.

Comment: A commenter stated that they were concerned about a rapid transition from contractor pricing to relative values that are significantly lower than current rates. The commenter stated that CMS should use the most current paid (2018) contractor claims for CPT codes 78459, 78491 and 78492 to establish a weighted average technical rate for each code, and then use its authority to phase in changes in payment so as not to disrupt services. The commenter acknowledged that it could be argued as to whether or not the phase-in provision applied to CPT codes 78459, 78491 and 78492, but urged CMS to phase in these codes and limit them to no more than a 20 percent reduction for the technical or global in any one year so as to not jeopardize patient access to care.

Response: Section 1848(c)(7) of the Act, as added by section 220(e) of the PAMA, specifies that for services that are not new or revised codes, if the total RVUs for a service for a year would otherwise be decreased by an estimated 20 percent or more as compared to the total RVUs for the previous year, the applicable adjustments in work, PE, and MP RVUs shall be phased-in over a 2-year period. We proposed to exempt CPT codes 78459, 78491 and 78492 from the phase-in of significant RVU reductions required by section 1848(c)(7) of the Act due to the fact that they are moving from contractor-priced status to active pricing status; we believe that this constitutes a “revised” code for purposes of section 1848(c)(7) of the Act. We have also previously finalized a policy through rulemaking stating that significant coding revisions within a family of codes can change the relationships among codes to the extent that it changes the way that all services in the group are reported, even if some individual codes retain the same number or, in some cases, the same descriptor. Excluding codes from the phase-in when there are significant

revisions to the code family also helps to maintain the appropriate rank order among codes in the family, avoiding years for which RVU changes for some codes in a family are in transition while others were fully implemented. We believe that either the shift from contractor-priced status to active pricing status or inclusion as part of a code family undergoing major revisions constitutes a “revised” code for purposes of section 1848(c)(7) of the Act. For additional information regarding the phase-in of significant RVU reductions, we direct readers to the CY 2016 PFS final rule with comment period (80 FR 70927 through 70929).

After consideration of the public comments, we are not finalizing our proposed work RVUs, and are instead finalizing the RUC-recommended work RVUs. We are not finalizing our proposal to assign PE RVUs using direct PE inputs, and we are instead maintaining contractor pricing for the TC of these services.

(52) Cytopathology, Cervical-Vaginal (CPT Code 88141, HCPCS Codes G0124, G0141, and P3001)

CPT code 88141 (*Cytopathology, cervical or vaginal (any reporting system), requiring interpretation by physician*), HCPCS code G0124 (*Screening cytopathology, cervical or vaginal (any reporting system), collected in preservative fluid, automated thin layer preparation, requiring interpretation by physician*), HCPCS code G0141 (*Screening cytopathology smears, cervical or vaginal, performed by automated system, with manual rescreening, requiring interpretation by physician*), and HCPCS code P3001 (*Screening Papanicolaou smear, cervical or vaginal, up to three smears, requiring interpretation by physician*) were identified as potentially misvalued on a list of CMS or other source codes with Medicare utilization of 30,000 or more.

In the CY 2000 PFS final rule (64 FR 59408), we finalized a policy that it was more appropriate to evaluate the work, PE, and MP RVUs for HCPCS codes P3001, G0124, and G0141 identical or comparable to the values of CPT code 88141.

For CY 2020, the RUC recommended a work RVU of 0.42 for CPT code 88141 and HCPCS codes G0124, G0141, and P3001, based on the current value. We disagreed with the RUC-recommended work RVU and proposed a work RVU of 0.26 for all four codes in this family, based on our intraservice time ratio methodology and a crosswalk to CPT code 93313 (*Echocardiography, transesophageal, real-time with image*

documentation (2D) (with or without M-mode recording); placement of transesophageal probe only), which has an identical work RVU of 0.26, identical intraservice and total work times values to CPT code 88141 and HCPCS codes G0124, and G0141, and similar intraservice and total time values to HCPCS code P3001.

In reviewing this family of codes, we noted that the intraservice and total work times for CPT code 88141 and HCPCS codes G0124, and G0141 are decreasing from 16 minutes to 10 minutes (38 percent reduction) and the intraservice and total work times for HCPCS code P3001 are decreasing from 16 minutes to 12 minutes (25 percent reduction). However, the RUC recommended a work RVU of 0.42 for all four codes in this family, based on the maintaining the current work RVU. Although we did not imply that the decrease in time as reflected in survey values must equate to a one-to-one or linear decrease in the valuation of work RVUs, we believe that since the two components of work are time and intensity, significant decreases in time should be appropriately reflected in decreases to work RVUs. In the case of CPT code 88141 and HCPCS codes G0124, G0141, and P3001, we believed that it would be more accurate to propose a work RVU of 0.26, based on our intraservice time ratio methodology and a crosswalk to CPT code 93313 to account for these decreases in the surveyed work times.

For the direct PE inputs, we proposed to refine the clinical labor time for the "Perform regulatory mandated quality assurance activity" (CA033) activity from 7 minutes to 5 minutes for all four codes in the family. We believed that these quality assurance activities would not typically take 7 minutes to perform, given that similar federally mandated Mammography Quality Standards Act (MQSA) activities were recommended and finalized at a time of 4 minutes for CPT codes 77065–77067 in CY 2017 (81 FR 80314–80316), and other related regulatory compliance activities were recommended and finalized at a time of 5 minutes for CPT codes 78012–78014 in CY 2013 (77 FR 69037). To preserve relativity between services, we proposed a clinical labor time of 5 minutes for the codes in this family based on this prior allocation of clinical labor time.

We are also proposed to remove the 1-minute of clinical labor time for the "File specimen, supplies, and other materials" (PA008) activity from all four codes under the rationale that this task is a form of indirect PE. As we stated in the CY 2017 PFS final rule (81 FR 80324), we agree that filing specimens is

an important task, and we agree that these would take more than zero minutes to perform. However, we continue to believe that these activities are correctly categorized under indirect PE as administrative functions, and therefore, we do not recognize the filing of specimens as a direct PE input, and we do not consider this task as typically performed by clinical labor on a per-service basis.

We proposed to refine the equipment time for the compound microscope (EP024) equipment to 10 minutes for all four codes in the family to match the work time of the procedures. The recommended materials for this code family state that the compound microscope is utilized by the pathologist, and therefore, we believe that the 10-minute work time of the procedures would be the most accurate equipment time to propose.

We received public comments on the proposed valuation of the codes in the Cytopathology, Cervical-Vaginal family. The following is a summary of the comments we received and our responses.

Comment: A commenter disagreed with the proposed work RVUs for CPT Code 88141, and HCPCS codes G0124, G0141, and P3001. This commenter stated that it is clear that CMS misinterpreted the RUC's recommendations because lowering the work value of code P3001, using what the commenter referred to as the "CMS' 25 percent time ratio methodology," would equate to a work RVU of 0.32, not 0.26 as proposed. This commenter also urged CMS to discontinue its arbitrary use of invalid time components, invalid methodologies using time ratios, and other irrational uses of data to value physician services.

Response: We note that we correctly interpreted the RUC's recommendations, and correctly applied a time ratio methodology to develop the proposed work RVUs for the codes in this family. We also considered an existing policy set forth in the CY 2000 PFS final rule (64 FR 59408), for these services to develop our proposed values. The RUC recommended maintaining the existing work RVU for all four codes in this family, which is a work RVU of 0.42. In our review of the codes in this family, the intraservice time ratio for CPT code 88141, suggest CPT code 88141 is better valued at a work RVU of 0.26. We note, that in an existing policy related to these four codes, discussed in the CY 2000 PFS final rule (64 FR 59408), we finalized a policy that it was more appropriate to evaluate the work, PE, and MP RVUs for HCPCS codes P3001, G0124, and G0141 identical or

comparable to the values of CPT code 88141. Thus, we proposed an identical work RVU of 0.26 for all four codes in this family, such that the proposed work RVU for HCPCS codes P3001, G0124, and G0141 are valued identical to CPT code 88141. We note that the RUC recommended that we maintain the same work RVU for all four codes in this family, and did not recommend a different work RVU for HCPCS P3001.

We also clarify for the commenters that our review process is not arbitrary in nature. Our reviews of recommended work RVUs and time inputs generally include, but have not been limited to, a review of information provided by the RUC, the HCPAC, and other public commenters, medical literature, and comparative databases, as well as a comparison with other codes within the PFS, consultation with other physicians and health care professionals within CMS and the federal government, as well as Medicare claims data. We also assess the methodology and data used to develop the recommendations submitted to us by the RUC and other public commenters and the rationale for the recommendations. In the CY 2011 PFS final rule with comment period (75 FR 73328 through 73329), we discussed a variety of methodologies and approaches used to develop work RVUs, including survey data, building blocks, crosswalks to key reference or similar codes, and magnitude estimation (see the CY 2011 PFS final rule with comment period (75 FR 73328 through 73329) for more information). With regards to the invocation of clinically relevant relationships by the commenters, we emphasize that we continue to believe that the nature of the PFS relative value system is such that all services are appropriately subject to comparisons to one another. Although codes that describe clinically similar services are sometimes stronger comparator codes, we do not agree that codes must share the same site of service, patient population, or utilization level to serve as an appropriate crosswalk.

Comment: Several commenters disagreed with the proposed work RVUs for CPT Code 88141, and HCPCS codes G0124, G0141, and P3001. Commenters stated that CMS should instead finalize the RUC-recommended work RVUs for these procedures. Commenters disagreed with our reference to older work time sources, and noted that their use led to the proposal of work RVUs based on flawed assumptions. Commenters stated that codes with "CMS/Other" or "Harvard" work time sources, used in the original valuation of certain older services, were not

surveyed, and therefore, were not resource-based. Commenters noted that it was invalid to draw comparisons between the current work times and work RVUs of these services to the newly surveyed work time and work RVUs as recommended by the RUC for the services.

Response: We appreciate the commenters' concerns regarding CMS' interpretation of older work time sources and their use in the code valuation process for establishing work RVUs for these services. We agree that it is important to use the recent data available regarding work times, and we note that when many years have passed between when time is measured, significant discrepancies can occur. However, we also believe that our operating assumption regarding the validity of the existing values as a point of comparison is critical to the integrity of the relative value system as currently constructed. We have responded to concerns about our methodology earlier in this section. For additional information regarding the use of old work time values that were established many years ago and have not since been reviewed in our methodology, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section I.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80273 through 80274). Based on the aforementioned crosswalks, we continue to believe the proposed values better preserve relativity with the rest of the codes on the PFS.

Comment: Several commenters disagreed with the CMS proposal to refine the clinical labor time for the "Perform regulatory mandated quality assurance activity" (CA033) activity from 7 minutes to 5 minutes for all four codes in the family. Commenters stated that laboratories which process and interpret gynecologic cytology are extensively regulated, and the commenters listed a series of different exercises that must take place in slide reexamination. Commenters stated that cytotechnologists are required to record the number of slides examined, the type of preparation, and the amount of time spent in slide examination. Commenters also stated that pap tests are highly litigated and perhaps relatively poorly paid procedures, and that the need for extensive QA and QC procedures and risk of litigation is a serious disincentive for providing this service.

Response: We appreciate the additional information provided by the commenters regarding the types of quality assurance activities that take

place during these procedures. However, commenters did not address our rationale for proposing this refinement to the CA033 clinical labor activity, which was the previous finalization of 4 minutes for similar federally mandated MQSA activities in CPT codes 77065–77067 and 5 minutes for CPT codes 78012–78014. We did not receive information from the commenters regarding how the quality assurance activities taking place in the codes in this family would be different from the similar quality assurance activities finalized in previous rulemaking, or provide a rationale for why additional time would typically be required for the reviewed codes. We continue to believe that a clinical labor time of 5 minutes is the most accurate valuation for the CA033 clinical labor activity to preserve relativity between services based on this prior allocation of clinical labor time.

Comment: Several commenters disagreed with the CMS proposal to remove the 1-minute of clinical labor time for the "File specimen, supplies, and other materials" (PA008) activity from all four codes under the rationale that this task is a form of indirect PE. Commenters stated that these tasks must be performed for each individual patient case and that the results are manually entered in most facilities. Commenters stated that the laboratory technician carefully reviews, double checks the information, and enters the reporting results into the laboratory information system. Commenters stated that 1 minute for this task was very typical and appropriate for this service.

Response: As we stated in the CY 2017 PFS final rule (81 FR 80324) and again in the proposed rule, we agree that filing specimens is an important task, and we agree that it would take more than zero minutes to perform. However, we continue to believe that these activities are correctly categorized under indirect PE as administrative functions, and therefore, we do not recognize the filing of specimens as a direct PE input, and we do not consider this task as typically performed by clinical labor on a per-service basis.

Comment: Several commenters disagreed with the CMS proposal to refine the equipment time for the compound microscope (EP024) equipment to 10 minutes for all four codes in the family to match the work time of the procedures. Commenters stated that the microscope is utilized by the pathologist for the entire physician time, and, in addition, the cytotechnologist uses a different microscope for at least 4 minutes to assist in the performance of regulatory

mandated quality assurance activities. Commenters urged CMS to finalize the RUC-recommended PE recommendations for CPT codes 88141, G0124, G0141, and P3001.

Response: We appreciate the additional information provided by the commenters regarding the use of the compound microscope by the cytotechnologist in these procedures. Based on the information provided by the commenters, we are not finalizing our proposed refinement to the equipment time for the compound microscope (EP024) equipment. We are instead finalizing the RUC-recommended equipment time for all four codes in the family.

After consideration of the public comments we are finalizing the work RVUs for the codes in this family as proposed. We are also finalizing our direct PE refinements as proposed, with the exception of the compound microscope (EP024) equipment time as detailed above.

(53) Biofeedback Training (CPT Codes 90912 and 90913)

CPT code 90911 (*Biofeedback training, perineal muscles, anorectal or urethral sphincter, including EMG and/or manometry*) was identified as potentially misvalued on a RAW screen of codes with a negative IWPUR and Medicare utilization over 10,000 for all services or over 1,000 for Harvard valued and CMS or other source codes. In September 2018, the CPT Editorial Panel replaced this code with two new codes to describe biofeedback training initial 15 minutes of one-on-one patient contact and each additional 15 minutes of biofeedback training.

We proposed the RUC-recommended work RVU of 0.90 for CPT code 90912 (*Biofeedback training, perineal muscles, anorectal or urethral sphincter, including EMG and/or manometry when performed; initial 15 minutes of one-on-one patient contact*), as well as the RUC-recommended work RVU of 0.50 for CPT code 90913 (*Biofeedback training, perineal muscles, anorectal or urethral sphincter, including EMG and/or manometry when performed; each additional 15 minutes of one-on-one patient contact*). For the direct PE inputs, we proposed to refine the equipment time for the power table (EF031) equipment in CPT code 90912 to conform to our established policies for non-highly technical equipment.

We are also proposing to designate CPT codes 90912 and 90913 as "sometimes therapy" procedures which means that an appropriate therapy modifier is always required when this service is furnished by therapists. For

more information we direct readers to the Therapy Code List section of the CMS website at <https://www.cms.gov/Medicare/Billing/TherapyServices/AnnualTherapyUpdate.html>.

We received public comments on the proposed valuation of the codes in the Biofeedback Training family. The following is a summary of the comments we received and our responses.

Comment: A commenter stated that they supported the proposal of the RUC-recommended work RVU for both codes in the family. Another commenter agreed with the proposal to designate both procedures as “sometimes therapy”, as they are performed in a physician’s office and will not require the use of the modifier for physical therapy, occupational therapy, or speech-language pathology plan of care.

Response: We appreciate the support for our proposals from the commenter.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the Biofeedback Training family as proposed. We are also finalizing the proposal to designate CPT codes 90912 and 90913 as “sometimes therapy” procedures.

(54) Corneal Hysteresis Determination (CPT Code 92145)

In 2005, the AMA RUC began the process of flagging services that represent new technology or new services as they were presented to the AMA/Specialty Society RVS Update Committee. The AMA RUC reviewed this service at the October 2018 RAW meeting, and indicated that the utilization is continuing to increase for this service. This code was surveyed and reviewed for the January 2019 RUC meeting.

We proposed the work RVU of 0.10 as recommended by the RUC. We also proposed the RUC-recommended direct PE inputs for CPT code 92145 without refinement.

We received public comments on the proposed valuation of CPT code 92145 for Corneal Hysteresis Determination. The following is a summary of the comments we received and our responses.

Comment: Commenters were supportive of our proposal of the RUC-recommended work RVUs.

Response: We thank the commenters for their support.

After consideration of the public comments, we are finalizing the RUC-recommended work RVUs and direct PE inputs for Corneal Hysteresis Determination (CPT code 92145).

(55) Computerized Dynamic Posturography (CPT Codes 92548 and 92549)

CPT code 92548 (*Computerized dynamic posturography*) was identified via the negative IWP/UT screen. CPT revised one code and added another code to more accurately describe the current clinical work and equipment necessary to provide this service.

We do not agree with the RUC’s recommended work RVUs of 0.76 for CPT code 92548 (*Computerized dynamic posturography sensory organization test (CDP–SOT), 6 conditions (i.e., eyes open, eyes closed, visual sway, platform sway, eyes closed platform sway, platform and visual sway), including interpretation and report*), or 0.96 for CPT code 92549 (*Computerized dynamic posturography sensory organization test (CDP–SOT), 6 conditions (i.e., eyes open, eyes closed, visual sway, platform sway, eyes closed platform sway, platform and visual sway), including interpretation and report; with motor control test (MCT) and adaptation test (ADT)*). For CPT code 92548, we agree that an increase in work RVU is warranted; however, we believe the surveyed time values suggest an increase of a less significant magnitude than that recommended. We proposed a work RVU of 0.67 based on the intraservice time ratio: we divide the RUC-recommended intraservice time value of 20 by the current value of 15 and multiply the product by the current work RVU of 0.50 for a ratio of 0.67. As a supporting crosswalk, we note that our value is greater than the work RVU of 0.60 for CPT code 93316 (*Transesophageal echocardiography for congenital cardiac anomalies; placement of transesophageal probe only*), which has identical intraservice and total times.

We proposed to maintain relativity between these two codes by valuing CPT code 92549 by applying the RUC-recommended incremental difference between the two codes, a difference of 0.20, to our proposed value of 0.67 for CPT code 93316; therefore, we proposed a work RVU of 0.87 for CPT code 92549. As further support for this value, we note that it falls between the work RVUs of CPT codes 95972 (*Electronic analysis of implanted neurostimulator pulse generator/transmitter (e.g., contact group[s], interleaving, amplitude, pulse width, frequency [Hz], on/off cycling, burst, magnet mode, dose lockout, patient selectable parameters, responsive neurostimulation, detection algorithms, closed loop parameters, and passive parameters) by physician or other qualified health care professional;*

with complex spinal cord or peripheral nerve (e.g., sacral nerve) neurostimulator pulse generator/transmitter programming by physician or other qualified health care professional), with a work RVU of 0.80, and CPT code 38207 (*Transplant preparation of hematopoietic progenitor cells; cryopreservation and storage*), with a work RVU of 0.89.

We proposed the RUC-recommended direct PE inputs for these codes without refinement.

We received public comments on the proposed valuation of the codes in the Computerized Dynamic Posturography family. The following is a summary of the comments we received and our responses.

Comment: A commenter objected to our proposed work RVUs for these codes, stating that they relied inappropriately on a time ratio to value CPT code 92548, and that use of a time ratio represents a flawed methodology. Furthermore, the commenter stated that we incorrectly referred to our supporting reference CPT code 93316 as a “crosswalk,” as this code does not have a work RVU equivalent to what we are proposing for CPT code 92548.

Response: We regret that the values posted in Addendum B and in table 20 of the proposed rule do not match those in the text of proposed rule. We reiterate that we proposed work RVUs of 0.67 for CPT code 92548 and 0.87 for CPT code 92549 as discussed above, as well as in the text of the proposed rule (84 FR 40596). We agree that CPT code 93316 is more appropriately termed a reference code rather than a crosswalk. We continue to believe that the use of time ratios is one of several appropriate methods for identifying potential work RVUs for particular services, and we refer readers to the “Methodology for Establishing Work RVUs” (section II.N.2. of this final rule) for a fuller discussion.

Comment: A commenter stated that our valuation of CPT code 92549, which is based on the RUC-recommended incremental relationship between this code and CPT code 92548 is an invalid methodology.

Response: We continue to believe that an analysis that includes RUC-recommended incremental relationships between codes is an appropriate methodology for estimating accurate relative value among services. We believe that use of the increment, as well as reference to bracketing CPT codes 95972 and 38207, the latter of which has higher time values than CPT 92549, validates our proposed work RVU.

Comment: Several commenters requested that CMS phase in the proposed cuts for CPT codes 92548 and 92549 under the authority provided by the “Protecting Access to Medicare Act of 2014” (Pub. L. 113–93) which requires a 2-year phase-in of payment reductions that exceed 20 percent. The commenters stated that these codes define services that are not new, rather they were clarified by CPT as noted by the retention of the same CPT code. Commenters stated that the services are now more clearly defined, in the interest of program integrity, but the services themselves have not changed.

Response: Section 1848(c)(7) of the Act, as added by section 220(e) of the PAMA, specifies that for services that are not new or revised codes, if the total RVUs for a service for a year would otherwise be decreased by an estimated 20 percent or more as compared to the total RVUs for the previous year, the applicable adjustments in work, PE, and MP RVUs shall be phased-in over a 2-year period. CPT code 92549 is exempt from the phase-in of significant RVU reductions required by section 1848(c)(7) of the Act because it is a new code, and the statute explicitly states that the phase-in does not apply to new codes. We proposed to exempt CPT code 92548 from the phase-in due to the fact that it is part of the same family of codes that included new CPT code 92549. We have previously finalized this policy through rulemaking, stating that significant coding revisions within a family of codes can change the relationships among codes to the extent that it changes the way that all services in the group are reported, even if some individual codes retain the same number or, in some cases, the same descriptor. Excluding codes from the phase-in when there are significant revisions to the code family also helps to maintain the appropriate rank order among codes in the family, avoiding years for which RVU changes for some codes in a family are in transition while others were fully implemented. In addition, the code descriptor for CPT code 92548 was significantly changed by CPT as part of this review, which we believe meets the criteria of “revised” as detailed in the statute. For additional information regarding the phase-in of significant RVU reductions, we direct readers to the CY 2016 PFS final rule with comment period (80 FR 70927 through 70929).

After consideration of the public comments, we are finalizing our proposed work RVUs and the RUC-recommended direct PE inputs.

(56) Auditory Function Evaluation (CPT Codes 92626 and 92627)

CPT code 92626 (*Evaluation of auditory function for surgically implanted device(s), candidacy or post-operative status of a surgically implanted device(s); first hour*) appeared on the RAW 2016 high volume growth screen. In 2017, it was identified through a CMS request. CPT code 92627 (*Evaluation of auditory function for surgically implanted device(s), candidacy or post-operative status of a surgically implanted device(s); each additional 15 minutes*) the add-on code for CPT code for 92626, also was included in the CMS request to review audiology services.

For CY 2020, we proposed the HCPAC-recommended work RVU of 1.40 for CPT code 92626, which is identical to its current RVU. We also proposed the HCPAC-recommended work RVU of 0.33 for the add-on code, CPT code 92627. We proposed the RUC-recommended direct PE inputs for both codes.

We received several comments on the proposed valuations of the Auditory Function Evaluation codes. All commenters expressed support for our recommended RVU values for the 2020 final rule. After consideration of the public comments, we are finalizing the proposed work RVUs and direct PE inputs for CPT codes 92926 and 92927.

(57) Septostomy (CPT Codes 92992 and 92993)

CPT codes 92992 (*Atrial septectomy or septostomy; transvenous method, balloon (e.g., Rashkind type) (includes cardiac catheterization)*) and 92993 (*Atrial septectomy or septostomy; blade method (Park septostomy) (includes cardiac catheterization)*) were nominated as potentially misvalued services. These services are typically performed on children, a non-Medicare population, and are currently contractor-priced. These codes were surveyed and reviewed for the January 2019 RUC meeting.

We proposed to maintain contractor pricing for CPT codes 92992 and 92993, as recommended by the RUC. These codes will be referred to the CPT Editorial Panel for revision and potential deletion. We also proposed a change from 90-day to 0-day global period status for these two procedures, also as recommended by the RUC.

We received public comments on the proposed valuation of the codes in the Septostomy family. The following is a summary of the comments we received and our responses.

Comment: A commenter stated that they supported the proposals to

maintain contractor pricing for CPT codes 92992 and 92993 and to change from 90-day to 0-day global period status for these two procedures.

Response: We appreciate the support for our proposals from the commenter.

After consideration of the public comments, we are finalizing contractor pricing for CPT codes 92992 and 92993 as proposed, as well as a change from 90-day to 0-day global period status for these two procedures.

(58) Ophthalmoscopy (CPT Codes 92201 and 92202)

CPT code 92225 was identified as potentially misvalued on a screen of codes with a negative IWPUP, with 2016 estimated Medicare utilization over 10,000 for RUC reviewed codes and over 1,000 for Harvard valued and CMS/Other source codes. In February 2018, the CPT Editorial Panel deleted CPT codes 92225 and 92226 and created two new codes to specify what portion of the eye is examined for a service beyond the normal comprehensive eye exam.

We proposed the RUC-recommended work RVUs of 0.40 for CPT code 92201 (*Ophthalmoscopy, extended, with retinal drawing and scleral depression of peripheral retinal disease (e.g., for retinal tear, retinal detachment, retinal tumor) with interpretation and report, unilateral or bilateral*) and 0.26 for CPT code 92202 (*Ophthalmoscopy, extended, with drawing of optic nerve or macula (e.g., for glaucoma, macular pathology, tumor) with interpretation and report, unilateral or bilateral*).

We proposed the RUC-recommended direct PE inputs for this code family without refinement.

We received public comments on the proposed valuation of the codes in the Ophthalmoscopy family. The following is a summary of the comments we received and our responses.

Comment: A commenter supported our proposal to use the RUC-recommended work RVU for this code.

Response: We appreciate the support for our proposal from the commenters.

After consideration of the public comments, we are finalizing work RVUs as proposed. We are also finalizing the direct PE inputs as proposed.

(59) Remote Interrogation Device Evaluation (CPT Codes 93297, 93298, 93299, and HCPCS code G2066)

When the RUC previously reviewed the CPT code 93299 at the January 2017 RUC meeting, the specialty society submitted PE inputs for CPT code 93299 (*Interrogation device evaluation(s), (remote) up to 30 days; implantable cardiovascular physiologic monitor system or subcutaneous cardiac rhythm*

monitor system, remote data acquisitions(s), receipt of transmissions and technician review, technical support and distribution of results); the PE Subcommittee and RUC accepted the society recommendations. In the CY 2018 PFS final rule (82 FR 53064), we did not finalize our proposal to establish national pricing for CPT code 93299 and the code remained contractor-priced.

At the October 2018 RUC meeting, the RUC re-examined CPT code 93299. CPT codes 93297 (*Interrogation device evaluation(s), (remote) up to 30 days; implantable cardiovascular physiologic monitor system, including analysis of 1 or more recorded physiologic cardiovascular data elements from all internal and external sensors, analysis, review(s) and report(s) by a physician or other qualified health care professional*) and 93298 (*Interrogation device evaluation(s), remote up to 30 days; subcutaneous cardiac rhythm monitor system, including analysis or recorded heart rhythm data, analysis, review(s) and report(s) by a physician or other qualified health care professional*) were added to this family of services. These three codes were reviewed for PE only.

CPT codes 93297 and 93298 are work-only codes and CPT code 93299 is meant to serve as the catch-all for both 30-day remote monitoring services. The RUC is unclear why the code family was designed this way, noting it may have been a way to allow for the possibility that the technical work would be provided by vendors, but they noted that this is not how the service is currently provided. They stated that in the decade since these codes were created, it has become clear that implantable cardiovascular monitor (ICM) and implantable loop recorder (ILR) services are very different services and the PE cannot be appropriately captured for both services in a single technical code. They noted that CPT codes 93297–93299 will be placed on the new technology/new services list and be re-reviewed by the RUC in 3 years to ensure correct calculation and utilization assumptions. It was noted in the RUC recommendations that the specialty society intended to submit a coding proposal to the CPT Editorial Panel to delete CPT code 93299, as it will no longer be necessary to have a separate code for PE if CPT codes 93297 and 93298 are allocated direct PE in CY 2020.

In our review of these services, we noted that the RUC recommendations did not provide a detailed description of the clinical labor tasks being performed or detailed information on the typical use of the supply and equipment used when furnishing these services. These

details are important in order for us to review if the RUC-recommended PE inputs are appropriate to furnish these services. The RUC submitted PE inputs (which were not previously included) for the work-only CPT codes 93297 and 93298, but did not include details to substantiate these recommended PE inputs for any of the three codes in this family.

Additionally, we were concerned with the appropriateness of the RUC's reference code, CPT code 93296 (*Interrogation device evaluation(s) (remote), up to 90 days; single, dual, or multiple lead pacemaker system, leadless pacemaker system, or implantable defibrillator system, remote data acquisition(s), receipt of transmissions and technician review, technical support and distribution of results*). CPT code 93296 is for remote monitoring over a 90-day period, but was used as a reference to derive the RUC-recommended direct PE inputs for CPT codes 93297–93299, which are for remote monitoring over a 30-day period.

For the CY 2020 direct PE inputs, we proposed to remove the clinical labor time for “Perform procedure/service—not directly related to physician work time” (CA021); to remove the requested quantity for the supply “Paper, laser printing (each sheet)” (SK057); and to refine the equipment times in accordance with our standard equipment time formulas for CPT codes 93297 and 93298.

Although we did not propose to allocate direct PE inputs for CPT codes 93297 and 93298, we sought additional comment on the appropriateness of CPT code 93296 as the reference code, details on the clinical labor tasks, and more information on the typical use of the supply and equipment used to furnish these services. For example, it was unclear in the RUC recommendations how many patients are monitored concurrently. As an additional example, it was unclear in the RUC recommendations as to what tasks are involved when clinical staff engage with the patient throughout the month to perform education about the device and re-education protocols after the initial enrollment.

The CPT Editorial Panel is deleting CPT code 93299 for CY 2020. We note this differs from the RUC recommendations for this code from the October 2018 meeting, which stated that the specialty society intended to submit a coding proposal to the CPT Editorial Panel to delete CPT code 93299, as it would no longer be necessary to have a separate code for PE, if CPT codes 93297 and 93298 are allocated direct PE for CY 2020. Given that we proposed to not

allocate direct PE inputs for CPT code 93297 and 93298 for CY 2020 and CPT code 93299 is being deleted for CY 2020, we proposed to create a G-code to describe the services previously furnished under CPT code 93299. We proposed to create HCPCS code G2066 (*Interrogation device evaluation(s), (remote) up to 30 days; implantable cardiovascular physiologic monitor system, implantable loop recorder system, or subcutaneous cardiac rhythm monitor system, remote data acquisition(s), receipt of transmissions and technician review, technical support and distribution of results*), to describe the services previously furnished under CPT code 93299, effective for CY 2020.

We received public comments on the proposed valuation of the codes in the Remote Interrogation Device Evaluation family. The following is a summary of the comments we received and our responses.

Comment: One commenter stated strong support for CMS' proposal to not recommend the RUC recommended direct PE inputs for CPT codes 93297 and 93298, and to create a contractor-priced G-code to replace CPT code 93299, which has been eliminated by the AMA CPT. This commenter further noted that they understood the interest in creating nationally priced CPT codes that reflect the differences in expenses between ILR and ICM monitoring services, the agreed that the RUC recommendations, which were developed without input from IDTFs like theirs and are not substantiated and should not be implemented. They urged that any future reevaluation of this code family provide for input by all providers IDTFs that perform the service.

Response: We thank the commenter for their support of our proposal.

Comment: A commenter stated they agreed with our proposal and recommended that they all be finalized including a proposal to establish HCPCS code G2066 effective January 1, 2020. The commenter stated that as a threshold matter, that the descriptors for CPT codes 93297 and 93298 were not changed. They still describe only the professional component (PC) and do not describe the TC. Without a change in descriptor, adding PE inputs to these professional codes is very confusing, especially to IDTFs, such as theirs, who are not allowed to bill for professional services.

Response: We thank the commenter for their support of our proposal.

Comment: A commenter noted they were perplexed that CMS stated the RUC recommendations did not provide a detailed description of the clinical

labor tasks being performed or detailed information on the typical use of the supply and equipment used when furnishing these services.

Response: We thank the commenter for the additional information. We note that while the RUC's recommendations contained some of the same information provided in the commenter's letter, it did not contain the same level of granularity provided in the commenter's letter. As an example, in our review of the time data, we note that both documents (RUC recommendations and commenter's letter) stated that over the course of a month a technologist interacts with the patient 1.63 times a month to process device-generated notifications for 17 minutes. However, the commenter's letter provided more details and noted that *if* a device generates an alert it will be communicated to the manufacturer's servers. This would imply that 17 minutes for this task is not always warranted, specifically if no alerts are communicated to the manufacturer's servers. This was unclear to us because the RUC recommendations did not contain the level of details as the commenter's letter.

Comment: One commenter noted that CMS sought additional information on the appropriateness of CPT code 93296 as the reference code. The commenter noted that the current recommendation uses CPT code 93296 as a simple reference code and suggested that it is appropriate because it is a similar service insofar as it is a remote interrogation of an electrophysiology device with similarities in terms of information workflow, but the recommended inputs are based on new data that was not available when the codes were last valued and the recommended PE inputs are in no way a crosswalk to the inputs of CPT code 93296.

Response: We appreciate the feedback, but continue to question the appropriateness of this crosswalk because 93299 is a service for up to 30 days and CPT code 93296 is for up to 90 days of remote monitoring.

Comment: Several commenters did not support our proposals, stating that CMS should allocate the RUC-recommended direct PE inputs for CPT codes 93297 and 93298, and that the creation of HCPCS code G2066 is unnecessary since CPT code 93299 is being deleted by the CPT Editorial Panel for CY 2020.

Response: We disagree with the commenters that the creation of HCPCS code G2066 is unnecessary because, CPT code 93299 is being deleted for CY 2020. We reiterate that the RUC

recommendations noted CPT code 93299 would be deleted *if* CMS allocated direct PE inputs for CPT codes 93297 and 93298 and that the specialty society intended to submit an application to the CPT Editorial Panel to have CPT code 93299. Further, it was noted in RUC recommendations that the RUC recommended that CPT code 93299 be referred to CPT for deletion.

Thus, based on the information submitted to CMS, our understanding is that the intent to delete CPT code was predicated on CMS allocating direct PEs to CPT codes 93297 and 93298. There was no indication in the RUC recommendations that an application to delete CPT code 93299 had been submitted and that it would be deleted for CY 2020. Furthermore, CPT code 93299 was reviewed at the October 2018 RUC, and related recommendations provided to CMS. CMS did not propose to allocate direct PE for those codes, thus it was necessary to create a HCPCS code G2066) to describe the services previously furnished under CPT code 93299, effective for CY 2020.

After consideration of the public comments, we are finalizing our proposals for the codes in the Remote Interrogation Device Evaluation family.

(60) Duplex Scan Arterial Inflow-Venous Outflow (CPT Codes 93985 and 93986)

In September 2018, the CPT Editorial Panel recommended replacing one HCPCS code (G0365) with two new codes to describe the duplex scan of arterial inflow and venous outflow for preoperative vessel assessment prior to creation of hemodialysis access for complete bilateral and unilateral study. We proposed the RUC-recommended work RVU of 0.80 for CPT code 93985 (*Duplex scan of arterial inflow and venous outflow for preoperative vessel assessment prior to creation of hemodialysis access; complete bilateral study*), as well as the RUC-recommended work RVU of 0.50 for CPT code 93986 (*Duplex scan of arterial inflow and venous outflow for preoperative vessel assessment prior to creation of hemodialysis access; complete unilateral study*).

For the direct PE inputs, we proposed to refine the clinical labor time for the "Prepare room, equipment and supplies" (CA013) activity from 4 minutes to 2 minutes for both codes in the family. Two minutes is the standard time for this clinical labor activity, and 2 minutes is also the time assigned for this activity in the reference code, CPT code 93990 (*Duplex scan of hemodialysis access (including arterial inflow, body of access and venous*

outflow)). There was no rationale provided in the recommended materials indicating why this additional clinical labor time would be typical for the procedures, and therefore, we proposed to refine to the standard time of 2 minutes. We are also proposing to adjust the equipment times to conform to this change in the clinical labor time.

We received public comments on the proposed valuation of the codes in the Remote Interrogation Device Evaluation family. The following is a summary of the comments we received and our responses.

Comment: A commenter stated that they supported the proposal of the RUC-recommended work RVU for both codes in the family. Two commenters also stated that they supported the proposed direct PE refinements.

Response: We appreciate the support for our proposals from the commenters.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the Duplex Scan Arterial Inflow-Venous Outflow family as proposed.

(61) Myocardial Strain Imaging (CPT Code 93356)

The CPT Editorial Panel deleted one Category III code and created one new Category I add-on code CPT code 93356 to describe the work of myocardial strain imaging performed in supplement to transthoracic echocardiography services. We proposed the RUC-recommended work RVU of 0.24.

We proposed the RUC-recommended direct PE inputs for CPT code 93356. However, we note that no rationale was given for the RUC-recommended 12 minutes of clinical labor time for the activity CA021 "Perform procedure/service," and we requested comment on the appropriateness of this allocated time value.

We received public comments on the proposed valuation of the codes in the Myocardial Strain Imaging family. The following is a summary of the comments we received and our responses.

Comment: A commenter supported our proposal to use the RUC-recommended work RVU for this code.

Response: We appreciate the support for our proposal from the commenters.

Comment: A commenter stated that, contrary to our statement that no rationale was provided for the times recommended for the "perform procedure/service—NOT directly related to physician work time" (CA021) clinical labor activity, the RUC had included detailed information on the RUC-recommended clinical labor in the PE SOR, and the commenter reiterated the rationale.

Response: We thank the commenter for the clarification.

After consideration of the public comments, we are finalizing our proposals for this code.

(62) Lung Function Test (CPT Code 94200)

The RUC recommended this service for survey because it appeared on a list of CMS/Other codes with Medicare utilization of 30,000 or more. According to the RUC, this service is typically reported with an E/M service and another pulmonary function test, and the RUC-recommended times would appropriately account for any overlap with other services. The RUC stated that the intraservice time involves reading and interpreting the test to determine if a significant interval change has occurred and then generating a report, which supports the 5 minutes of physician work indicated in the survey. The RUC did not agree with the specialty society that communication of the report required an additional 2 minutes of physician time over the postservice time included in the other services reported on the same day. The RUC reduced the postservice time from 2 minutes to 1 minute because the service requires minimal time to enter the results into the medical record and communicate the results to the patient and the referring physician. Based in part on these reductions in physician time, the RUC recommended a reduction in work RVU from the current value with a crosswalk to CPT code 95905 (*Motor and/or sensory nerve conduction, using preconfigured electrode array(s), amplitude and latency/velocity study, each limb, includes F-wave study when performed, with interpretation and report*).

For CPT code 94200 (*Maximum breathing capacity, maximal voluntary ventilation*), we proposed the RUC-recommended work RVU of 0.05. A stakeholder stated that the RUC's recommended work RVU understates the costs inherent in performing this service, and that the survey 25th percentile value of 0.10 is more accurate for this service. While we proposed the RUC-recommended 0.05, we solicited public comment on this stakeholder-recommended potential alternative value.

We proposed the RUC-recommended direct PE inputs for CPT code 94200 without refinement.

We received public comments on the proposed valuation of the codes in the Lung Function Test family. The following is a summary of the comments we received and our responses.

Comment: A commenter questioned how the most recent stakeholder comment was obtained, since the RUC recommendations are not public until after the publication of the proposed rule. The commenter stated that the recent stakeholder comment could not have been received by CMS via the formal comment process, and questioned whether the comment was communicated via the passing of verbal comments between individuals at the RUC meeting or someone inappropriately gained confidential information.

Response: As noted for the Arthrodesis—Sacroiliac Joint code (CPT Code 27279), such communication between the agency and a stakeholder was not inappropriate. When considering potential valuation for services on the PFS, we may take into account information provided to us by stakeholders including specialty societies that may have participated in the RUC process but did not agree with what was submitted as part of the RUC's recommendations. For instance, in CY 2019 rulemaking, for the Psychological and Neuropsychological Testing family of codes, we noted that a stakeholder that represents the psychologist and neuropsychologist community stated that the RUC's recommendations for those services would have resulted in significant reductions in payment (FR 83 35770).

Comment: The RUC reiterated that it considered the survey 25th percentile, but ultimately decided that it would overvalue the work involved in performing this service given the survey intra-service time of 5 minutes, and they instead recommended a work RVU of 0.05.

Response: After consideration of the public comments, we are finalizing the RUC-recommended work RVU of 0.05 as proposed. We are finalizing the direct PE inputs for CPT code 94200 as proposed.

(63) Long-Term EEG Monitoring (CPT Codes 95700, 95705, 95706, 95707, 95708, 95709, 95710, 95711, 95712, 95713, 95714, 95715, 95716, 95717, 95718, 95719, 95720, 95721, 95722, 95723, 95724, 95725, and 95726)

In January 2017, the RUC identified CPT code 95951 via the high volume growth screen, which considers if the service has total Medicare utilization of 10,000 or more and if utilization has increased by at least 100 percent from 2009 through 2014. The RUC recommended that this service be referred to the CPT Editorial Panel for needed changes, including code deletions, revision of code descriptors,

and the addition of new codes to this family. In May 2018, the CPT Editorial Panel approved the revision of one code, deletion of five codes, and addition of 23 new codes for reporting long-term EEG professional and technical services. We are using the phrase “professional component” codes to refer to CPT codes 95717–95726 and “technical component” codes to refer to CPT codes 95700–95716.

We proposed the RUC-recommended work RVU for six of the professional component (PC) codes in this family. We proposed a work RVU of 3.86 for CPT code 95721 (*Electroencephalogram, continuous recording, physician or other qualified health care professional review of recorded events, complete study; greater than 36 hours, up to 60 hours of EEG recording, without video*), a work RVU of 4.70 for CPT code 95722 (*Electroencephalogram, continuous recording, physician or other qualified health care professional review of recorded events, complete study; greater than 36 hours, up to 60 hours of EEG recording, with video*), a work RVU of 4.75 for CPT code 95723 (*Electroencephalogram, continuous recording, physician or other qualified health care professional review of recorded events, complete study; greater than 60 hours, up to 84 hours of EEG recording, without video*), a work RVU of 6.00 for CPT code 95724 (*Electroencephalogram, continuous recording, physician or other qualified health care professional review of recorded events, complete study; greater than 60 hours, up to 84 hours of EEG recording, with video*), a work RVU of 5.40 for CPT code 95725 (*Electroencephalogram, continuous recording, physician or other qualified health care professional review of recorded events, complete study; greater than 84 hours of EEG recording, without video*) and a work RVU of 7.58 for CPT code 95726 (*Electroencephalogram, continuous recording, physician or other qualified health care professional review of recorded events, complete study; greater than 84 hours of EEG recording, with video*).

We also proposed adopting the RUC-recommended work RVU of 0.00 for the 13 technical component (TC) codes in the family: CPT code 95700 (*Electroencephalogram (EEG) continuous recording, with video when performed, set-up, patient education, and take down when performed, administered in-person by EEG technologist, minimum of 8 channels*), CPT code 95705 (*Electroencephalogram (EEG) without video, review of data, technical description by EEG technologist, 2–12 hours; unmonitored*),

CPT code 95706 (*Electroencephalogram (EEG) without video, review of data, technical description by EEG technologist, 2–12 hours; with intermittent monitoring and maintenance*), CPT code 95707 (*Electroencephalogram (EEG) without video, review of data, technical description by EEG technologist, 2–12 hours; with continuous, real-time monitoring and maintenance*), CPT code 95708 (*Electroencephalogram (EEG) without video, review of data, technical description by EEG technologist, each increment of 12–26 hours; unmonitored*), CPT code 95709 (*Electroencephalogram (EEG) without video, review of data, technical description by EEG technologist, each increment of 12–26 hours; with intermittent monitoring and maintenance*), CPT code 95710 (*Electroencephalogram (EEG) without video, review of data, technical description by EEG technologist, each increment of 12–26 hours; with continuous, real-time monitoring and maintenance*), CPT code 95711 (*Electroencephalogram with video (VEEG), review of data, technical description by EEG technologist, 2–12 hours; unmonitored*), CPT code 95712 (*Electroencephalogram with video (VEEG), review of data, technical description by EEG technologist, 2–12 hours; with intermittent monitoring and maintenance*), CPT code 95713 (*Electroencephalogram with video (VEEG), review of data, technical description by EEG technologist, 2–12 hours; with continuous, real-time monitoring and maintenance*), CPT code 95714 (*Electroencephalogram with video (VEEG), review of data, technical description by EEG technologist, each increment of 12–26 hours; unmonitored*), CPT code 95715 (*Electroencephalogram with video (VEEG), review of data, technical description by EEG technologist, each increment of 12–26 hours; with intermittent monitoring and maintenance*), and CPT code 95716 (*Electroencephalogram with video (VEEG), review of data, technical description by EEG technologist, each increment of 12–26 hours; with continuous, real-time monitoring and maintenance*).

We disagreed with the RUC-recommended work RVU of 2.00 for CPT code 95717 (*Electroencephalogram, continuous recording, physician or other qualified health care professional review of recorded events, 2–12 hours of EEG recording; without video*) and we proposed a work RVU of 1.85 based on a crosswalk to CPT code 93314

(*Echocardiography, transesophageal, real-time with image documentation (2D) (with or without M-mode recording); image acquisition, interpretation and report only*). CPT code 93314 is a recently-reviewed code with 2 additional minutes of intraservice time and 4 additional minutes of total time as compared to CPT code 95717. When considering the work RVU for CPT code 95717, we looked to the second reference code chosen by the survey participants, CPT code 95957 (*Digital analysis of electroencephalogram (EEG) (e.g., for epileptic spike analysis)*). This code has 2 additional minutes of intraservice time and 9 additional minutes of total time as compared to CPT code 95717, yet has a work RVU of 1.98, lower than the recommended work RVU of 2.00. These time values suggested that CPT code 95717 would be more accurately valued at a work RVU slightly below the 1.98 of CPT code 95957. We also looked at the intraservice time ratio between CPT code 95717 and some of its predecessor codes. The intraservice time ratio with CPT code 95953 (*Monitoring for localization of cerebral seizure focus by computerized portable 16 or more channel EEG, electroencephalographic (EEG) recording and interpretation, each 24 hours, unattended*) suggests a similar potential work RVU of 1.91 (28 minutes divided by 45 minutes times a work RVU of 3.08). Based on this information, we proposed a work RVU of 1.85 for CPT code 95717 based on the aforementioned crosswalk to CPT code 93314.

We disagreed with the RUC-recommended work RVU of 2.50 for CPT code 95718 (*Electroencephalogram, continuous recording, physician or other qualified health care professional review of recorded events, analysis of spike and seizure detection, interpretation, and report, 2–12 hours of EEG recording; with video (VEEG)*) and we proposed a work RVU of 2.35. Although we disagreed with the RUC-recommended work RVU, we concurred with the RUC that the relative difference in work between CPT codes 95717 and 95718 is equivalent to the recommended interval of 0.50 RVUs. Therefore, we proposed a work RVU of 2.35 for CPT code 95718, based on the recommended interval of 0.50 additional RVUs above our proposed work RVU of 1.85 for CPT code 95717. We supported this work RVU with a reference to CPT code 99310 (*Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires at least 2 of the 3 key components*), which shares the same

intraservice time of 35 minutes and the identical work RVU of 2.35. CPT code 99310 is a lower intensity procedure but has increased total work time as compared to CPT code 95718.

We disagreed with the RUC-recommended work RVU of 3.00 for CPT code 95719 (*Electroencephalogram, continuous recording, physician or other qualified health care professional review of recorded events, analysis of spike and seizure detection, each increment of greater than 12 hours, up to 26 hours of EEG recording, interpretation and report after each 24-hour period; without video*), and we proposed a work RVU of 2.60 based on a crosswalk to CPT code 99219 (*Initial observation care, per day, for the evaluation and management of a patient, which requires 3 key components*). CPT code 99219 shares the same intraservice time of 40 minutes and has a slightly higher total time as compared to CPT code 95719. We also noted that the observation care described by CPT code 99219 shares some clinical similarities to the long term EEG monitoring described by CPT code 95719, although we noted, as always, that the nature of the PFS relative value system is such that all services are appropriately subject to comparisons to one another, and that codes do not need to share the same site of service, patient population, or utilization level to serve as an appropriate crosswalk.

In addition, we believed that the proposed crosswalk to CPT code 99219 at a work RVU of 2.60 more accurately captures the intensity of CPT code 95719. At the recommended work RVU of 3.00, the intensity of CPT code 95719 is anomalously high in comparison to the rest of the family, higher than any of the other PC codes. We did not have reason to believe that the 24-hour EEG monitoring done without video, as described in CPT code 95719, would be notably more intense than the other codes in the same family. Furthermore, the recommendations for this code family specifically state that the codes that describe video EEG monitoring are more intense than the codes that describe non-video EEG monitoring. However, at the recommended work RVU for CPT code 95719, this non-video form of EEG monitoring had the highest intensity in the family. At our proposed work RVU of 2.60, the intensity of CPT code 95719 is no longer anomalously high in comparison to the rest of the family, and also remains lower than the intensity of the 24 hour EEG monitoring with video procedure described by CPT code 95720.

We disagreed with the RUC-recommended work RVU of 3.86 for CPT code 95720 (*Electroencephalogram, continuous recording, physician or other qualified health care professional review of recorded events, analysis of spike and seizure detection, each increment of greater than 12 hours, up to 26 hours of EEG recording, interpretation and report after each 24-hour period; with video (VEEG)*), and we proposed a work RVU of 3.50 based on the survey 25th percentile value. The RUC-recommended work RVU of 3.86 was based on a crosswalk to CPT code 99223 (*Initial hospital care, per day, for the evaluation and management of a patient, which requires 3 key components*), a code that shares the same intraservice time of 55 minutes but has 15 additional minutes of total time as compared to CPT code 95720, at 90 minutes as compared to 75 minutes. We disagreed with the use of this crosswalk, as the 15 minutes of additional total time in CPT code 99223 resulted in a higher work valuation that overstates the work RVU of CPT code 95720. These 15 additional minutes of preservice and postservice work time in the recommended crosswalk code have a calculated work RVU of 0.34 under the building block methodology; subtracting out this work RVU of 0.34 from the crosswalk code's work RVU of 3.86 resulted in an estimated work RVU of 3.52, which is nearly identical to the survey 25th percentile work RVU of 3.50. Similarly, if we were to calculate a total time ratio between CPT code 95720 and the recommended crosswalk code 99223, it would produce a noticeably lower work RVU of 3.22 (75 minutes divided by 90 minutes times a work RVU of 3.86). Based on this rationale, we did not believe that it would serve the interests of relativity to propose a work RVU of 3.86 based on the recommended crosswalk.

Instead, we proposed a work RVU of 3.50 for CPT code 95720 based on the survey 25th percentile value. We noted that among the predecessor codes for this family, CPT code 95956 (*Monitoring for localization of cerebral seizure focus by cable or radio, 16 or more channel telemetry, electroencephalographic (EEG) recording and interpretation, each 24 hours, attended by a technologist or nurse*) had a higher intraservice time of 60 minutes and a higher total time of 105 minutes at a work RVU of 3.61. This prior valuation of CPT code 95956 does not support the RUC-recommended work RVU of 3.86 for CPT code 95720, but does support the proposed work RVU of 3.50 at the slightly lower newly surveyed work times. We also noted that

at the recommended work RVU of 3.86, the intensity of CPT code 95720 was anomalously high in comparison to the rest of the family, the second-highest intensity as compared to the other PC codes. We did not have reason to believe that the 24 hour EEG monitoring done with video as described in CPT code 95720 would be notably more intense than the other codes in the same family. At our proposed work RVU of 3.50, the intensity of CPT code 95720 is no longer anomalously high in comparison to the rest of the family, while still remaining slightly higher than the intensity of the 24 hour EEG monitoring performed without video procedure described by CPT code 95719.

For the direct PE inputs, we proposed to make a series of refinements to the clinical labor times of CPT code 95700. Many of the clinical labor times for this CPT code were derived using a survey process and were recommended to CMS at the survey median values. This was in contrast to the typical process that the RUC uses to make recommendations for direct PE inputs, where the inputs are usually based on either standard times or carried over from reference codes. We believe that when surveys are used to recommend direct PE inputs, we must apply a similar process of scrutiny to that used in assessing the work RVUs that are recommended based on a survey methodology. We have long expressed our concerns over the validity of the survey results used to produce work RVU recommendations, such as in the CY 2011 PFS final rule (75 FR 73328), and we have noted that over the past decade the AMA RUC has increasingly chosen to recommend the survey 25th percentile work RVU over the survey median value, potentially responding to the same concerns that we have identified.

As a result, we believe that when assessing the survey of direct PE inputs used to produce many of the recommendations for CPT code 95700, it would be more accurate to propose the survey 25th percentile direct PE inputs as opposed to the recommended survey median direct PE inputs. Therefore, we proposed to refine the clinical labor time for the "Provide education/obtain consent" (CA011) activity from 13 minutes to 7 minutes and to refine the clinical labor time for the "Review home care instructions, coordinate visits/prescriptions" (CA035) activity from 10 minutes to 7 minutes. In both of these cases, the recommended clinical labor times based on the survey median values are more than double the standard time for these activities. Although we agreed that additional

clinical labor time would be required to carry out these activities for CPT code 95700, we did not believe that the survey median times would be typical. We proposed the survey 25th percentile times of 7 minutes for each activity as we believe that this time would be more typical for obtaining consent and reviewing home care instructions.

We also proposed to refine the clinical labor time for the "Complete pre-procedure phone calls and prescription" (CA005) activity from 10 minutes to 3 minutes for CPT code 95700. This is another situation where we proposed the survey 25th percentile clinical labor time of 3 minutes instead of the survey median clinical labor time of 10 minutes. However, we also note that many of the tasks that fell under the CA005 activity code as described in the PE recommendations appear to constitute forms of indirect PE, such as collecting supplies for setup and loading equipment and supplies into vehicles. Collecting supplies and loading equipment are administrative tasks that are not individually allocable to a particular patient for a particular service, and therefore, constitute indirect PE under our methodology. Due to the fact that many of the tasks described under the CA005 activity code are forms of indirect PE, we believed that the RUC-recommended survey median clinical labor time of 10 minutes overstated the amount of direct clinical labor taking place. We believed that it was more accurate to propose the survey 25th percentile clinical labor time of 3 minutes for this activity code to reflect the non-administrative tasks performed by the clinical staff.

We also proposed to refine the quantity of the non-sterile gloves (SB022) supply from 3 to 2 for CPT code 95700. We note that the current reference code, CPT code 95953, uses 2 of these pairs of gloves and the survey also stated that 2 pairs of gloves were typical for the procedure. Although the recommended materials state that a pair of gloves is needed to set up the equipment, to take down the equipment, and a third is required for electrode changes, we did not agree that the use of a third pair of gloves would be typical given their usage in the reference code and in the responses from the survey.

We note that we did not propose to refine many of the other clinical labor times for CPT code 95700, which remain at the survey median clinical labor times. Due to the nature of the continuous recording EEG service taking place, we agree that the survey median clinical labor times of 12 minutes for the "Prepare room, equipment and supplies" (CA013) activity, 45 minutes

for the “Prepare, set-up and start IV, initial positioning and monitoring of patient” (CA016) activity, and 22 minutes for the “Clean room/equipment by clinical staff” (CA024) activity would be typical for this procedure. We reiterate that we assess the direct PE inputs for each procedure individually based on our methodology of what would be reasonable and medically necessary for the typical patient.

For CPT codes 95705–95716, we proposed to refine the clinical labor time for the “Coordinate post-procedure services” (CA038) activity from either 11 minutes to 5 minutes or from 22 minutes to 10 minutes as appropriate for the CPT code in question. The recommended materials for these procedures state that the tasks taking place constitute “Merge EEG and Video files (partially automated program), confirm transfer of data, delete from laptop/computer if necessary”. We believe that many of the tasks detailed here are administrative in nature, consisting of forms of data entry, and therefore, would be considered types of indirect PE. We note that when CPT code 95812 (*Electroencephalogram (EEG) extended monitoring; 41–60 minutes*) was recently reviewed for CY 2017, we finalized the recommended clinical labor time of 2 minutes for “Transfer data to reading station & archive data”, a task which we believe to be highly similar. Due to the longer duration of the procedures in CPT codes 95705–95716, we proposed clinical labor times of 5 minutes and 10 minutes for the CA038 activity for these CPT codes. We are also refining the equipment time for the Technologist PACS workstation (ED050) to match the clinical labor time proposed for the CA038 activity.

For the four continuous monitoring procedures, CPT codes 95707, 95710, 95713, and 95716, we proposed to refine the equipment time for the ambulatory EEG review station (EQ016) equipment. The recommended equipment time for the ambulatory EEG review station was equal to four times the “Perform procedure/service” (CA021) clinical labor time plus a small amount of extra prep time. We did not agree that it would be typical to assign this much equipment time, as it is our understanding that one ambulatory EEG review station can be hooked up to as many as four monitors at a time for continuous monitoring. Therefore, we did not believe that each monitor would require its own review station, and therefore, the equipment time should not be equal to four times the clinical labor of the “Perform procedure/service” (CA021) activity. As a result,

we proposed to refine the ambulatory EEG review station equipment time from 510 minutes to 150 minutes for CPT code 95707, from 1480 minutes to 400 minutes for CPT code 95710, from 514 minutes to 154 minutes for CPT code 95713, and from 1495 minutes to 415 minutes for CPT code 95716.

For the 10 professional component procedures, CPT codes 95717–95726, we again proposed to refine the equipment time for the ambulatory EEG review station (EQ016) equipment. We believe that the use of the ambulatory EEG review station is analogous in these procedures to the use of the professional PACS workstation (ED053) in other procedures, and we proposed to refine the equipment times for these 10 procedures to match our standard equipment time formula for the professional PACS workstation. Therefore, we proposed an equipment time for the ambulatory EEG review station equal to half the preservice work time (rounded up) plus the intraservice work time for CPT codes 95717 through 95726. We believed that this equipment time was more accurate than the recommended equipment time, which was equal to the total work time of the procedures, as the work descriptors for CPT codes 95717–95726 make no mention of the ambulatory EEG review station in the postservice work period.

Finally, we proposed to price the new “EEG, digital, prolonged testing system with remote video, for patient home use” (EQ394) equipment at \$26,410.95 based on an invoice submission. We did not use a second invoice submitted for the new equipment for pricing, as it contained a disaggregated list of equipment components and it was not clear if they represented the same equipment item as the first invoice.

We received public comments on the proposed valuation of the codes in the Long-Term EEG Monitoring family. The following is a summary of the comments we received and our responses. Due to the large number of comments we received for this code family, we will first summarize the comments related to general code valuation, followed by the comments related to specific work RVUs, and finally the comments related to direct PE inputs.

Comment: Many commenters expressed concern with the proposed values for the codes in the Long Term EEG Monitoring family. Commenters stated that the proposed values would jeopardize beneficiary access to these tests, which are vitally important to patients with epilepsy and other seizure disorders. Commenters listed some of the benefits resulting from advances in technology that now make it possible for

patients to receive long-term EEGs in their home, particularly for patients in rural and medically underserved communities. Commenters stated that if the proposed values were finalized, many Medicare beneficiaries will be forced to be admitted to a hospital to receive the same testing they could have received in their home, driving up costs to both the beneficiary and the federal government. These commenters requested that CMS withdraw the proposed reductions in values for in-home EEG tests and continue paying at rates established by regional Medicare Administrative Contractors (MACs) in their respective jurisdictions. Commenters stated that CMS has taken this approach in the past for services such as the Transcranial Magnetic Stimulation family (CPT codes 90867, 90868, 90869), which do not fit into the standard valuation methodology, and that continuing to use contractor pricing for a period of 3 to 4 years would allow health care providers and MACs to gain experience with the new codes.

Response: We appreciate the feedback from the commenters on the importance of maintaining access to these services. We agree with the commenters that it is critical for payment for services furnished to Medicare beneficiaries be accurately valued, and we share their desire to ensure that patients in rural and medically underserved communities will continue to receive care, especially in light of the rapidly growing utilization of EEG monitoring procedures. These services were flagged for review due to a high volume growth screen, which considers if the service has total Medicare utilization of 10,000 or more and if utilization has increased by at least 100 percent from 2009 through 2014. Based on the identification of these services in the high volume growth screen, the CPT Editorial Panel updated the coding by revising code descriptions, deleting codes, and adding new codes, with the goal of incorporating the current use of video in EEG tests, better differentiating inpatient and ambulatory monitoring services, and reflecting the rapid increase in utilization for these services.

We estimate that utilization for the new Long Term EEG Monitoring code set will exceed 500,000 services annually in CY 2020, and, generally speaking, we believe it is more accurate for the purposes of relativity to establish national pricing for services that will have high utilization as opposed to leaving them contractor-priced. However, we have carefully considered commenters’ concerns regarding the accuracy of the proposed inputs, especially in the context of the

accessibility and payment stability concerns also raised by the commenters, and we have decided that the proposed payment for the TC Long Term EEG Monitoring codes (CPT codes 95700–95716) should be withdrawn in favor of contactor-pricing for CY 2020 in order to allow additional time for stakeholder feedback. We are seeking additional information from stakeholders that will address the concerns about the resource inputs involved in furnishing these services in the context of the accessibility and need for payment stability raised by the commenters. We will further consider establishing national values for these codes through future rulemaking.

Comment: Several commenters stated that the PE methodology CMS used to establish values for TC services was inappropriate for these codes, and the recommendations from the RUC for PE inputs were so flawed as to be unusable. Commenters stated that the PE information submitted by the RUC to CMS was deeply flawed, as it was collected from physicians and EEG technologists who are employed by hospitals or physician offices and unfamiliar with home studies. Several commenters stated that the RUC recommendations did not include as PE inputs the significant fees for software, data usage, and cell phones which are necessary to establish and maintain the monitoring connections in the patient's home. Commenters also stated that the RUC-recommended work times were not reasonable for these procedures, as practitioners needed to go through video data and patient logs, as well as type up a detailed report and review patient history. Some commenters were critical of the RUC's survey methodology, stating that the work surveys were biased or flawed and suffered from a low response rate. Commenters stated that surveys are notoriously inaccurate and physicians rarely if ever use surveys to determine patients' care due to biases that result from a low response rate. These commenters were critical of the RUC's survey methodology in general and stated that the relatively small number of survey respondents were not representative of wider practice patterns.

Response: We appreciate the feedback from the commenters regarding the work RVUs, work times, and direct PE inputs recommended by the RUC. In the CY 2011 PFS final rule with comment period (75 FR 73328 through 73329), we discussed a variety of methodologies and approaches that we use to develop work RVUs, including survey data, building blocks, crosswalks to key reference or similar codes, and

magnitude estimation. We emphasize that we do not believe that the RUC is the exclusive source of information used in valuation of PFS services, and we are supportive of the submission of additional data that can aid in the process of determining the resources that are typically used to furnish these services. However, in the absence of alternative data to value new services, we believe that the recommendations from the RUC are a key source to use for valuation of work and direct PE, and therefore, these recommendations have an important role in our review process and in our responsibility to assign relative value units used to determine payment rates under the PFS. Because we did not receive data from the commenters to support alternate valuations from the RUC recommendations, not only do we believe it is appropriate to consider the RUC recommendations, we do not believe it would be appropriate to ignore the RUC recommendations for work RVUs and direct PE inputs for the Long Term EEG Monitoring family of codes. However, we urge interested stakeholders to consider submitting robust data regarding direct PE resource inputs and costs involved in furnishing these and other services for our consideration for future rulemaking.

Comment: Several commenters acknowledged that there has been an increase (greater than 100 percent) in EEG utilization from 2009–2014, and stated that it was critical for CMS to study why this increase has occurred. Commenters stated that utilization has increased for these services due to the effect of the Affordable Care Act on epilepsy care, the increased need for EEG monitoring in the ICU, the importance of long-term monitoring for accurate diagnoses for patients with seizures, and due to the presence of outlier cases. Commenters stated that millions of patients have obtained insurance over the last few years and many of the previously uninsured were poor and lower income, and therefore, the population of newly insured patients with psychiatric diagnoses has increased. Commenters stated that an abundance of data has emerged over the last 10 years demonstrating that more intensive continuous EEG monitoring in the ICU is needed to detect seizures that the prevalence of seizures that were previously undetected is very high in critically ill patients, and that patients with untreated seizures and non-convulsive status epilepticus have significantly poorer outcomes. Commenters stated that if physicians truly were able to more efficiently

interpret EEG, this increased efficiency would not be a reasonable justification for changing payment. Commenters stated that if a worker is more productive most businesses would encourage this, and the worker would not be punished for more efficient work.

Response: We appreciate the additional information supplied by the commenters regarding the potential causes behind increasing utilization of these services. We note that while observed increases in utilization contributed to review of these services under the misvalued code initiative, we establish RVUs based on the resources involved in furnishing services. We remind commenters that section 1848(c)(2)(C)(i) of the Act specifically defines the work component as the relative resources, incorporating time and intensity, required in furnishing the service. As such, if the work time for a service has decreased as a result of improvements in technology or practice patterns, those things should be reflected in the work valuation.

Comment: Several commenters stated that there were potential rank order anomalies in the proposed valuation of the codes in this family. Commenters stated that the TC of CPT code 95819 (*Electroencephalogram (EEG); including recording awake and asleep*), considered a routine EEG of 20–40 minutes recording, was valued higher than several of the new Long Term EEG Monitoring codes, including CPT codes 95711, 95712, 95714, 95708, and 95706. Commenters also stated that CPT code 95710, which does not include video, was valued higher than CPT code 95716, which does include video. Commenters questioned why the more resource intensive service with video would be valued less than the same service without video.

Response: We do not agree with the commenters that the identified codes represent rank order anomalies. CPT code 95819 has significantly more clinical labor time (154 minutes) than CPT codes 95711, 95712, 95714, 95708, and 95706. We remind readers that this is due to the fact that the new TC Long Term EEG Monitoring codes do not include direct PE inputs for setting up or taking down the monitoring equipment, which are separately reported under CPT code 95700. These direct PE inputs associated with setup and takedown are included in CPT code 95819, which, along with its greater assignment of clinical labor time, explains why it has a higher valuation than these procedures.

With regard to CPT codes 95710 and 95716, we agree that, generally speaking, the version of the procedure

that includes video would be valued higher than the version of the procedure that does not include video. We note that this is the pattern for all of the other video/non-video pairings in this code family, such as CPT codes 95705 and 95711, CPT codes 95706 and 95712, CPT codes 95707 and 95713, CPT codes 95708 and 95714, and CPT codes 95709 and 95715. We also note that the proposed direct costs for CPT code 95710 are lower than the proposed direct costs for CPT code 95716.

However, the total payment rate referred to by the commenter (that is, the total sum RVU for these codes) also includes the indirect PE portion of the payment and, under our ratesetting methodology, CPT code 95710 received a slightly higher indirect PE allocation as compared to CPT code 95716. This was due to the different utilization crosswalks that we proposed for the two codes, in which CPT code 95710 was crosswalked from services that would currently be reported using CPT code 95953 while CPT code 95716 was crosswalked from services that would currently be reported using CPT code 95951. Because CPT code 95953 has a slightly higher indirect PE allocation as compared to CPT code 95951, under the proposed new coding for CY 2020, CPT code 95710 would also have a slightly higher indirect PE allocation and receive slightly more indirect PE in comparison to CPT code 95716. We remind readers that indirect PE makes up a significant amount of the PE RVUs and, as such, the total payment for services; and procedures with greater direct PE costs do not always have a larger PE RVU. We also note that the proposed differential between these two new CPT codes was one half of one percent, which we do not believe to be a statistically significant amount, and that all of the TC codes in this family will be contractor-priced for CY 2020.

Comment: Several commenters stated that the phase-in of significant relative value unit reductions applies to codes that are not new or revised, which would exclude the long-term EEG monitoring codes. However, commenters still urged CMS to apply the phase-in to this family of codes due to the proposed payment reductions.

Response: Section 1848(c)(7) of the Act, as added by section 220(e) of the PAMA, specifies that for services that are not new or revised codes, if the total RVUs for a service for a year would otherwise be decreased by an estimated 20 percent or more as compared to the total RVUs for the previous year, the applicable adjustments in work, PE, and MP RVUs shall be phased-in over a 2-year period. We did not propose to

apply the phase-in of significant RVU reductions required by section 1848(c)(7) of the Act to the codes in the Long Term EEG Monitoring family due to the fact that they are all new codes created by the CPT Editorial Panel, which are statutorily excluded from the phase-in provision. For additional information regarding the phase-in of significant RVU reductions, we direct readers to the CY 2016 PFS final rule with comment period (80 FR 70927 through 70929).

Comment: Several commenters stated that the primary issues related to the undervaluation of the 2–12 hour EEG TC services (CPT codes 95705–95707 and 95711–95713) appeared to be a result of a misunderstanding of where and how these services are provided. Commenters stated that these codes were valued as if they typically will be performed in a physician's office setting, when in fact EEG TC services are typically performed in the home setting regardless of duration. Commenters stated that the proposed valuation was fatally flawed as a result, and stated that CMS should refrain from finalizing the proposed valuation and temporarily authorize contractor pricing pending revaluation that takes into consideration data to be provided from IDTFs.

Response: We disagree with the commenters that the 2–12 hour EEG TC codes would typically be performed in the home setting regardless of duration. The RUC reviewed and developed recommendations for these codes with the understanding that they were typically performed in the office setting. We emphasize that we do not believe that the RUC is the exclusive source of information used in valuation of PFS services, and we are supportive of the submission of additional data that can aid in the process of determining the resources that are typically used to furnish these services. However, in the absence of alternative data used to value new services, we believe that the recommendations from the RUC, generally speaking, are the most accurate source to use when it comes to determining the typical site of service for new codes. Because we did not receive data from the commenters to support their contention that the patient's home would be the typical setting for these codes, we do not believe that it would be appropriate to ignore the RUC recommendations regarding the related direct PE inputs. However, we urge interested stakeholders to consider submitting robust data regarding site of service for these and other services.

The following comments address the proposed work valuation of individual codes in the family.

Comment: Several commenters stated that the PC codes in the family (CPT codes 95717–95726) should be viewed as two distinct subsets when considering rank order for the family, as they represent two distinct patient populations. Commenters stated that when viewing the family of codes in this manner, the RUC-recommended work RVUs do not create a rank order anomaly for the family and recognize both the time and intensity of the services. Commenters stated that CPT codes 95717–95720 are typically facility-based services, provided to hospital inpatients and outpatients, in which the work is more complex and intense as the typical patients are undergoing pre-surgical evaluations and/or being withdrawn from anti-seizure medications to induce seizures. Commenters stated that CPT codes 95721–95726 will be provided to patients primarily tested in their homes, in which the practitioner does not access the data until the conclusion of the study. Commenters urged CMS to accept the RUC-recommended work RVUs for all of these PC codes.

Response: We disagree with the commenters that the PC codes in the family (CPT codes 95717–95726) should be viewed as two distinct subsets when considering rank order for the family. We believe that all ten of these new codes were created together by the CPT Editorial Panel, surveyed together by the specialty societies, and reviewed together by the RUC. We do not believe that it would serve the purpose of maintaining relativity to consider the first four codes separate from the last six codes, any more than it would be appropriate to consider only the video or only the non-video codes separate from their counterparts. We continue to believe that the nature of the PFS relative value system is such that all services are appropriately subject to comparisons to one another. Although codes that describe clinically similar services are sometimes stronger comparator codes, we do not agree that codes must share the same site of service, patient population, or utilization level to serve as an appropriate basis of comparison.

Comment: Many commenters disagreed with the CMS proposed work RVU of 1.85 for CPT code 95717 and stated that CMS should instead finalize the RUC-recommended work RVU of 2.00. Commenters stated that the CMS crosswalk code (CPT code 93314) was a poor reference point in general, as CMS finalized a work RVU for this crosswalk

code much lower than its RUC-recommended value of 2.80. Commenters also stated that the proposed work RVU of 1.85 would not maintain appropriate relativity to other services in this family, particularly CPT code 95813 (*Electroencephalogram (EEG) extended monitoring; 61–119 minutes*), for which CMS finalized the RUC-recommended work RVU of 1.63 in CY 2018. Commenters stated that the proposed value would inappropriately assign CPT code 95717 an intensity that is 10 percent lower than CPT code 95813.

Response: We appreciate the additional information provided by the commenters with respect to CPT code 95813. Based on the information provided by the commenters, we are not finalizing our proposed work RVU of 1.85, and we will instead finalize the RUC-recommended work RVU of 2.00 for CPT code 95717.

Comment: Many commenters disagreed with the CMS-proposed work RVU of 2.35 for CPT code 95718 and stated that CMS should instead finalize the RUC-recommended work RVU of 2.50. Commenters stated that since the CMS rationale for rejecting the RUC recommendation for CPT code 95717 was flawed as described above, it should not be used as the basis to derive a new value for CPT code 95718. Commenters stated that the CMS reference code (CPT code 99310) was a poor comparator as it is typically performed by a nonphysician and involves highly disparate work. Commenters stated that the proposed value would not maintain appropriate relativity to other services in this family, particularly CPT code 95813, by inappropriately assigning CPT code 95718 a lower intensity.

Response: As we stated in the proposed rule, we concurred with the RUC that the relative difference in work between CPT codes 95717 and 95718 is equivalent to the recommended interval of 0.50 RVUs. Since we are finalizing the RUC-recommended work RVU of 2.00 for CPT code 95717 based on feedback from commenters, we will also finalize the RUC-recommended work RVU of 2.50 for CPT code 95718 to maintain this incremental difference between the two codes.

Comment: Many commenters disagreed with the CMS proposed work RVU of 2.60 for CPT code 95719 and stated that CMS should instead finalize the RUC-recommended work RVU of 3.00. Commenters stated that the proposed crosswalk code (CPT code 99219) was inappropriate as observation care involves relatively less intensity than the typical long-term EEG

described by the survey code. Commenters stated that although both services involve identical intraservice time and similar total time, CPT code 95719 is a more intense service performed on a sicker patient population. Commenters also stated that the proposed value would not maintain appropriate relativity to other services in this family, particularly CPT code 95813, by inappropriately assigning CPT code 95719 a lower intensity.

Response: We appreciate the additional information provided by the commenters with respect to CPT code 95813. Based on the information provided by the commenters, we are not finalizing our proposed work RVU of 2.60, and we will instead finalize the RUC-recommended work RVU of 3.00 for CPT code 95719.

Comment: Many commenters disagreed with the CMS proposed work RVU of 3.50 for CPT code 95720 and stated that CMS should instead finalize the RUC-recommended work RVU of 3.86. Commenters stated that CMS incorrectly referenced CPT code 95956 as a predecessor code for CPT code 95720, rather than CPT code 95951. Commenters stated that CPT code 95956 is the predecessor code for CPT code 95719, which has no video recording, and therefore, has a lower work RVU. Commenters stated that CMS appreciated the difference in work when video is recorded but used the wrong predecessor code for CPT code 95720.

Response: We disagree with the commenters that we referred to an incorrect predecessor code for CPT code 95720 in the proposed rule. We noted in the proposed rule that *among the predecessor codes for this family*, CPT code 95956 had a higher intraservice time of 60 minutes and a higher total time of 105 minutes at a work RVU of 3.61. We did not state that CPT code 95956 was a direct predecessor code for CPT 95720, as we were aware that it did not include video recording, and therefore, we did not include CPT code 95956 in the proposed utilization crosswalk for CPT code 95720. We continue to believe that it is appropriate to make comparisons between the codes that are currently used to report Long Term EEG Monitoring and the newly created codes that will be used for these services going forward.

Comment: Commenters also disagreed with the CMS criticism of the RUC-recommended crosswalk to CPT code 99223. Commenters stated that CMS seemed to be asserting that all crosswalks must have near identical work intensity instead of simply involving the same overall amount of work. Commenters stated that

crosswalks with near identical times do not always exist, which was the case for this service, which sometimes necessitates selecting a crosswalk with somewhat disparate total time which has a different level of work intensity though the same overall amount of work. Commenters stated that although CPT code 99223 involved more total time, CPT code 95720 is a more intense service to perform given the difficulty involved in making an appropriate reading/diagnosis and a more intensive patient population in which the typical patient is a candidate for epilepsy surgery.

Response: We agree with the commenters that codes selected as crosswalks do not necessarily need to share the identical work times. However, since we are we are obligated under the statute to consider both time and intensity in establishing work RVUs for PFS services, we believe that, generally speaking, it is more accurate to use codes with similar work time values when determining which codes should be used for crosswalks. In the particular case of CPT code 95720, we believed that the 15 minutes of additional total time in CPT code 99223 as compared to CPT code 95720 resulted in a higher work valuation that overstated the work RVU of CPT code 95720.

Comment: Commenters also stated that the proposed work RVU for CPT code 95720 would not maintain appropriate relativity to other services in this family, particularly CPT code 95813, by inappropriately assigning CPT code 95720 a lower intensity. Commenters disagreed with the proposed work valuation of CPT code 95720 and stated that this code would indeed be notably more intense than the other codes in the same family given that the typical patient for that code is a candidate for epilepsy surgery. Commenters stated that CMS failed to take account for the typical patient for this service in determining the work valuation.

Response: We appreciate the additional information provided by the commenters with respect to CPT code 95813 and the typical patients for this code. Based on the information provided by the commenters, we are not finalizing our proposed work RVU of 3.50, and we will instead finalize the RUC-recommended work RVU of 3.86 for CPT code 95720. Therefore, we are finalizing the RUC-recommended work RVU for all ten of the PC codes in this family.

The following comments address the proposed direct PE inputs for the Long Term EEG Monitoring family of codes.

Comment: Many commenters were concerned that the RVUs associated with the TC Long Term EEG Monitoring services (CPT codes 95700–95716) would be reduced substantially from their predecessor codes, specifically as compared to CPT code 95951 and 95956. Commenters stated that these reductions would be unsustainable for these technical services, as the proposed values and resulting payment rates simply would not cover the costs.

Response: We are aware of the concerns raised by the commenters about the proposed values, and, as mentioned previously, we are finalizing contractor pricing for the TC Long Term EEG Monitoring services (CPT codes 95700–95716). Due to the high utilization of these services, we believe that they should eventually be transitioned to national pricing and, therefore, we are detailing and responding to many of the issues raised by stakeholders that relate to valuation of the TC codes. We believe that this discussion will assist in the eventual national pricing of these services through further rulemaking.

We note that there were many significant changes made to this code family when the previous Long Term EEG Monitoring codes were deleted and replaced with new codes, and we believe that it is important to explain for the commenters why the new TC codes do not correspond directly to the previous coding. Services will be reported differently under the new coding, and therefore, direct RVU comparisons between the old codes and the new codes are not necessarily accurate.

We note for readers that the new coding has been split into separate TC-only codes (CPT codes 95700–95716) and PC-only codes (CPT codes 95717–95726). Comparisons to the global component of the prior codes for Long Term EEG Monitoring, which included both PCs and TCs, would not be accurate due to this different coding structure. We also note that the new TC-only codes include a separate code for setting up and taking down the EEG equipment (CPT code 95700), whereas the prior coding contained these steps along with the monitoring itself in a single code. The new monitoring codes must be considered together with the setup code 95700 to be comparable to the previous coding.

We also believe that it is important to note that the new coding is more granular than the previous coding, and includes separate codes for 2–12 hours of monitoring (8 hours typical) along with codes for 12–26 hours of monitoring (24 hours typical). The

previous codes only described Long Term EEG Monitoring in 24 hour increments, and it is natural to assume that the resources associated with providing 8 hours of monitoring would be less than those associated with 24 hours of monitoring. Many commenters compared the RVUs for new TC codes such as CPT codes 95712 and 95713, which have 8 hours of monitoring in the typical case, to CPT code 95951, which assumes 24 hours of monitoring is typical. The PE methodology under the PFS is a resource-based system, and if the typical case for some of the new TC services involves 8 hours of monitoring, we believe that this should be reflected in the RVUs for those services.

We note as well that the coding has become more granular in describing different types of monitoring. The prior Long Term EEG Monitoring coding only made a distinction between attended versus unattended monitoring, whereas the new coding includes a third category for intermittent monitoring. We would expect the RVUs for CPT codes 95706, 95709, 95712, and 95715 to decrease as compared to the prior coding that assumed monitoring would be continuous throughout the duration of the procedures.

Finally, we also note that changes in practice patterns for these services has affected them since their last time of review. CPT code 95956 (*Monitoring for localization of cerebral seizure focus by cable or radio, 16 or more channel telemetry, electroencephalographic (EEG) recording and interpretation, each 24 hours, attended by a technologist or nurse*) contained 1440 minutes of clinical labor time (24 hours times 60 minutes) associated with monitoring in its direct PE inputs, assuming that the patient would be individually monitored for the entirety of the 24 hour period. However, based on the recommendations from the RUC, we understand that it is now typical for the clinical labor technician to monitor 4 patients at a time, even during the continuous monitoring procedures. This is reflected in the recommended clinical labor inputs for CPT codes 95710 and 95716, which contain 360 minutes of clinical labor (1,440 divided by 4) instead of the 1,440 minutes in the previous coding. The shorter duration continuous monitoring codes similarly contain 120 minutes (8 hours times 60 minutes divided by 4) of clinical labor time to reflect the fact that monitoring 4 patients at a time is the typical practice, and the intermittent monitoring codes contain even less clinical labor time to reflect the fact that monitoring 12 patients at a time is typical practice. (Obviously the

unattended monitoring codes do not contain any clinical labor at all for this activity as there is no technician monitoring the patient in these cases.)

The net result is that there is significantly less clinical labor associated with the new Long Term EEG Monitoring codes as compared to the prior coding set, and this was reflected in their proposed payment rates. We believe that it is important to propose the most accurate values possible under our relative value system, and if it has become the typical practice pattern for the technician to monitor 4 patients at a time, we believe that this should be reflected in the RVUs for these services. We do not believe that it would be accurate or serve the interests of relativity to continue to assign the prior 1,440 minutes of clinical labor time for the new TC codes if this no longer reflects current monitoring practice patterns. We emphasize again that we are finalizing contractor pricing for the TC codes, but we believe that if we were to adopt active pricing, the valuation must be resource-based and grounded in current practice patterns.

Comment: Several commenters disagreed with the CMS proposal of the survey 25th percentile direct PE inputs as opposed to the recommended survey median direct PE inputs for CPT code 95700. Commenters stated that the 25th percentile clinical labor times are a completely different measure than the 25th percentile work RVU, and the RUC makes recommendations on direct PE inputs only, not the PE RVUs which would be the equivalent of the work RVUs. Commenters also stated that the median survey times for work are what is most commonly recommended by the RUC, not the 25th percentile survey work times, which was even more reason to employ the survey median times from the PE survey. Commenters stated that PE surveys are especially difficult to conduct and require a great deal of resources from the specialty societies involved, and the commenters encouraged CMS to finalize the RUC-recommended direct PE inputs for CPT code 95700.

Response: We appreciate the feedback from the commenters regarding the use of the direct PE survey employed for CPT code 95700. We concur with the commenters that the use of a survey methodology to determine direct PE inputs is not identical to the surveys used for work valuation, which is why we stated in the proposed rule that we believed in applying “a similar process of scrutiny” and not the same process. We remind the commenters that we did not propose the 25th percentile value for all of the direct PE inputs, instead

choosing the survey value for each input that we believed to be most accurate based on the information that we had available. For example, we agreed in the proposed rule that the survey median clinical labor times of 12 minutes for the “Prepare room, equipment and supplies” (CA013) activity, 45 minutes for the “Prepare, set-up and start IV, initial positioning and monitoring of patient” (CA016) activity, and 22 minutes for the “Clean room/equipment by clinical staff” (CA024) activity would be typical for CPT code 95700. We believe that proposing the survey median value from the direct PE survey in all cases would be no more accurate than proposing the survey 25th percentile value in all cases. We reiterate that we assess the direct PE inputs for each procedure individually based on our methodology of what would be reasonable and medically necessary for the typical patient.

Comment: Several commenters disagreed with the CMS proposal to refine the clinical labor time for the “Complete pre-procedure phone calls and prescription” (CA005) activity from 10 minutes to 3 minutes for CPT code 95700. Commenters stated that instructions for video-EEG monitoring are lengthy and complicated, including the purpose of the test, patient preparation (hair care prior to test for electrode gel application, appropriate clothing), limitations on activities during the test, details of the location of testing, and type of equipment the patient will take home or be monitored with. Commenters stated that education typically takes 10 minutes.

Response: We disagree with the commenters that 10 minutes of clinical labor time would be typical for this activity. We note that the description of tasks provided by the commenters for the CA005 activity does not match the description of this activity code provided in the recommended materials for CPT code 95700, which instead listed calling the patient to confirm they have completed all pre-procedure activities, sanitizing and preparing any equipment that needs to be sanitized prior to each procedure, and collecting supplies to complete setup. The patient education tasks described by the commenters are contained in the CA011 activity code (“Provide education/obtain consent”), not the CA005 activity code. We continue to believe that many of the tasks described under the CA005 activity code are forms of indirect PE, and as we stated in the proposed rule, we believe that the RUC-recommended survey median clinical labor time of 10 minutes overstates the amount of direct clinical labor taking place. We continue

to believe that it was more accurate to propose the survey 25th percentile clinical labor time of 3 minutes for this activity code to reflect the non-administrative tasks performed by the clinical staff.

Comment: Several commenters disagreed with the CMS proposal to refine the clinical labor time for the “Provide education/obtain consent” (CA011) activity from 13 minutes to 7 minutes. Commenters stated that the proposed 7 minutes was not “more typical” for this service, as long-term EEG monitoring is a service often performed on patients associated with neuropsychological impairment. Commenters stated that this condition means that the cognitive status of the patient may be challenged, making it more difficult to provide education, obtain consent, and review instructions. Commenters stated that people experiencing seizures who require a long-term EEG may be confused, sleepy, or forgetful, and making certain that patients are aware of the care instructions is important and can be a time-consuming endeavor. Commenters included a series of studies involving epilepsy research and requested that CMS finalize the RUC-recommended value of 13 minutes to reflect the patient mix undertaking these procedures.

Response: We appreciate the additional information provided by the commenters, including the studies included with their comments. We agree that there is a need for additional clinical labor time for patient education and consent in these procedures due to the patient population concerns identified by the commenters. This is the reason why we proposed 7 minutes for the CA011 activity code, which is more than triple the typical time of 2 minutes assigned to most other procedures for this task. We continue to believe that the proposed time of 7 minutes would be more typical for obtaining consent and reviewing patient education.

Comment: Several commenters disagreed with the CMS proposal of the RUC-recommended clinical labor time of 45 minutes for the “Prepare, set-up and start IV, initial positioning and monitoring of patient” (CA016) activity. Commenters stated that this time was undervalued and it was missing clinical labor time for applying the 10–20 system for electrode placement, following universal infection control policies, assessing skin breakdown risk at the electrode application site, using appropriate electrode application technique for at-risk patients, placing recording reference and ground electrodes in digital recording systems,

and securing the headbox/transmitter system to protect against disconnection during patient movement. Commenters stated that the time that the EEG technologists takes to disconnect electrodes from the patient also appeared to be missing from the valuation of CPT code 95700 and needed to be included. The commenters stated that their EEG technologists averaged 128 minutes per patient for the activities covered in CPT code 95700, not the proposed 45 minutes.

Response: We disagree with the commenters that the tasks described in the CA016 activity code would typically require 128 minutes, almost triple the RUC-recommended time that we proposed. The same steps described by the commenter—such as preparing the patient, applying the electrodes, and testing the equipment—were part of the direct PE survey undertaken by the RUC, which returned a median time of 45 minutes and a 25th percentile time of 22 minutes. Although we agree with the commenter on the importance of these tasks, we do not believe that it would be typical for them to take 128 minutes given the survey data compiled by the RUC. We also note for the commenters that we did propose clinical labor time associated with disconnecting electrodes from the patient and taking down the monitoring equipment. This clinical labor time is listed under the CA024 clinical labor activity (“Clean room/equipment by clinical staff”), and we proposed the RUC-recommended 22 minutes for these tasks.

Comment: Several commenters disagreed with the CMS proposal of the RUC-recommended clinical labor time for the “Perform procedure/service—NOT directly related to physician work time” (CA021) activity across the TC Long Term EEG Monitoring family of codes. Commenters stated that the RUC survey data included more clinical labor time for the 2–12 hour EEG codes than for the longer duration 12–26 hour EEG codes, with a disproportionate amount of time given to the monitoring codes of shorter duration. Commenters provided several examples, such as CPT code 95706 having 57 minutes of clinical labor time as compared against CPT code 95709 having 50 minutes of clinical labor time. Commenters stated that the proposed clinical labor times were clearly in error and must be corrected in a final rule.

Response: We disagree with the commenters that the proposed clinical labor times were in error. The CA021 clinical labor times for the shorter 2–12 hour EEG codes have additional clinical labor time for maintenance activities, as

recommended by the RUC, which are not included for the longer 12–26 hour EEG codes due to the fact that these maintenance activities were stated not to be typically performed for the longer codes. We believe that many of these maintenance activities would not typically take place for the longer 12–26 hour EEG codes due to the fact that they will typically take place in the patient's home as opposed to the office setting. More importantly, we note that there are two technicians associated with each of the TC Long Term EEG Monitoring codes, one technician associated with monitoring tasks and another technician associated with non-monitoring tasks. We believe that looking at the clinical labor for only one of these two technicians presents an inaccurate picture of the coding structure. To use the same comparison between CPT codes 95706 and 95709 raised by the commenters, the second technician—the one present during the actual monitoring—has a clinical labor time of 40 minutes for the shorter 2–12 hour code (95706) and 120 minutes for the longer 12–26 hour code (95709), exactly as one would expect to see. We believe that it is highly misleading to look at only one of the two technicians in suggesting that the clinical labor times are in error and need correcting.

Comment: Several commenters stated that the proposed estimates for the non-monitoring clinical labor times associated with the continuous monitoring long term EEG codes were inaccurate. Commenters stated that the non-monitoring tasks involved in the provision of the services described in these codes are extensive, including: Reviewing patient clinical history, confirming the camera is displaying properly, reviewing patient events from prior monitoring, reviewing EEG recording for quality, checking electrode impedances for quality, documenting findings and notes, ensuring the patient is still in camera view, conducting maintenance during the patient session including contacting on-call maintenance support, repairing or replacing electrodes, counseling or instructing the patient if electrodes stop recording or a patient event occurs, communicating with the physician/QHP for events or triggers, reviewing and preparing data and video reports for the physician, analyzing and annotating the EEG test noting spike generator locations, and sending all data to the physician for reading. The commenters stated that the clinical labor time recommended by the RUC and proposed by CMS is substantially lower than what is required and fails to capture the time

involved for all of the tasks outlined above.

Response: We disagree with the commenters that the proposed clinical labor time for these non-monitoring clinical labor activities would not be typical for these codes. We proposed the RUC-recommended clinical labor time for the service period of all four continuous monitoring EEG codes, which does include clinical labor time associated with the very same tasks listed by the commenter. For example, we proposed the RUC-recommended 72 minutes of clinical labor time for the CA021 (“Perform procedure/service—NOT directly related to physician work time”) activity for CPT code 95713, which included 10 minutes of clinical labor time for reviewing patient clinical history, current medications, and prior monitoring. Our proposal also included 34 minutes of clinical labor time for reviewing and preparing data, annotating the EEG, noting spike generator locations, documenting technologist initial notes, and sending all data to the practitioner for reading. We note that the very same clinical labor tasks described by the commenters were recommended by the RUC and proposed by CMS to include substantial (over 60 minutes) clinical labor time for these activities. We clarify for the commenters that the proposed clinical labor did include time for maintenance activities, with the non-monitoring technician repositioning or reattaching the electrodes as needed throughout the procedure time. In the absence of data from the commenters to support these significantly higher clinical labor times, we continue to believe that our proposed times are the most accurate values.

Comment: Several commenters disagreed with the CMS proposal to refine the clinical labor time for the “Coordinate post-procedure services” (CA038) activity from either 11 minutes to 5 minutes or from 22 minutes to 10 minutes as appropriate for the CPT code in question. Commenters stated that CMS used a comparison to the clinical labor time for CPT code 95812 in making this refinement, however CPT code 95812 describes a 41–60 minute study as opposed to long term EEG monitoring. Commenters stated that selecting the relevant EEG data to be archived and then archiving it would take considerably longer due to the longer duration of the reviewed codes. Commenters urged CMS to finalize the RUC-recommended clinical labor times instead of the proposed values.

Response: We appreciate the additional information provided by the commenters regarding the shorter

duration of CPT code 95812. Based on the feedback from the commenters, we would not finalize our proposed refinements and would instead finalize the RUC-recommended clinical labor time for the “Coordinate post-procedure services” (CA038) activity at either 11 minutes or 22 minutes as appropriate for the CPT code in question if we were to adopt national pricing. We would also finalize the equipment time for the Technologist PACS workstation (ED050) to match the clinical labor time for the CA038 activity if we were to adopt active pricing.

Comment: A commenter disagreed with both the RUC-recommended and CMS-proposed clinical labor times for CPT code 95700. The commenter stated that this code does not specify whether the service is being performed in a physician's office or the patient's home, and this lack of differentiation makes it difficult to provide an accurate picture of the service. The commenter stated that the proposed clinical staff time for CPT code 95700 of 96 minutes was approximately half of the time actually required to do a set up in the patient's home and does not include any time for the take down. The commenter stated that in the home setting the procedure set up is typically 3 hours and take down is one hour. The commenter also stated that the proposed clinical labor for CPT code 95700 did not include any travel time, which is usually between 1 and 3 hours in each direction. The commenter stated that additional clinical labor time should be added to reflect this setup and takedown time along with 3 hours of clinical labor time to reflect travel.

Response: We disagree with the commenter that several additional hours of clinical labor time should be added to CPT code 95700. Although we do not believe that the RUC is the exclusive source of information used in valuation of PFS services, in the absence of alternative data used to value new services, we believe that the direct PE recommendations from the RUC are the key source to use for valuation. We believe that the direct PE survey used by the RUC for CPT code 95700 represents the best information available for this service, and given that we did not receive data from the commenter to support alternate valuations, we believe that the clinical labor times that we proposed, based on either the median or 25th percentile values from the RUC's direct PE survey, represent the most accurate times. We also note for the commenter that we did propose clinical labor time associated with disconnecting electrodes from the patient and taking down the monitoring

equipment. This clinical labor time is listed under the CA024 clinical labor activity (“Clean room/equipment by clinical staff”), and we proposed the RUC-recommended 22 minutes for these tasks.

With regard to the driving times mentioned by the commenter, we did not propose clinical labor time for these activities because we consider them to be a type of office expense, and therefore, a form of indirect PE. Transportation costs are not individually allocable to a particular patient for a particular service, and therefore, constitute indirect PE under our methodology.

Comment: A commenter disagreed with both the RUC-recommended and proposed clinical labor times for CPT codes 95715 and 95716. The commenter stated that the clinical labor inputs failed to include time for tasks such as maintenance and pruning, and the proposed clinical labor assumed that the maximum number of patients are being monitored at all times. The commenter stated that the clinical labor inputs also do not include time for data pruning, a critical component of EEG monitoring that allows the neurologist to more efficiently read the test results. The commenter stated that approximately 4 hours of clinical labor time should be added to these codes to reflect these missing inputs.

Response: We disagree with the commenter that this additional clinical labor time would be typical for CPT codes 95715 and 95716. We proposed the RUC-recommended clinical labor time for the service period of both codes, which does include clinical labor time associated with data management. For example, we proposed the RUC-recommended 70 minutes of clinical labor time for the CA021 (“Perform procedure/service—NOT directly related to physician work time”) activity for CPT code 95715, which included 60 minutes of clinical labor time for reviewing and preparing data, annotating the EEG, noting spike generator locations, documenting technologist initial notes, and sending all data to the practitioner for reading. The recommended materials stated that this data preparation would typically take place during the patient session, as opposed to separate from it, and we have no reason to believe that this would not be the case.

Comment: Several commenters stated that it was inappropriate for CMS to assume that IDTFs typically operate at maximum efficiency, providing continuous monitoring to 4 patients at the same time and intermittent monitoring to 12 patients at the same

time. Commenters stated that the RUC survey that was the basis for the proposed duration-of-monitoring assumptions indicated that it is more typical for continuous monitoring to be provided to three patients at the same time. Commenters stated that they anticipated that the time associated with monitoring would increase under the new CPT nomenclature, since the new nomenclature provides an incentive for increased physician involvement in the monitoring process, which likely would increase physician-technologist communication and coordination. Commenters also stated that some facilities will not have enough EEG machines to monitor 12 patients at a time under intermittent monitoring.

Response: We continue to believe that 4 patients would typically be monitored at a time under continuous monitoring and that 12 patients would typically be monitored at a time during intermittent monitoring. While it is true that the RUC survey initially suggested that 3 patients would be monitored at a time during continuous monitoring, the RUC updated its clinical labor times to reflect an assumption of 4 patients being monitored simultaneously based on a consensus opinion that this more accurately reflected the typical practice pattern. With regard to the specific issue raised by the commenters, we agree that some facilities may not have enough EEG machines to monitor 12 patients at a time, but, conversely, some facilities may be able to monitor more than 12 patients at a time. Our methodology is based on the typical case and is not intended to cover every possible situation that may occur across all providers. The typical case for long term EEG monitoring was recommended to us and we believe to be 4 patients at a time for continuous monitoring and 12 patients at a time for intermittent monitoring.

Comment: Several commenters disagreed with both the RUC-recommended and proposed supplies for CPT code 95700. Commenters stated that there were many additional supplies that should also be included in this code, such as 28 disposable electrodes, 9-volt lithium batteries, a battery tester, foam electrodes, a HIPAA-compliant lockbox, utility scissors, disinfecting Cavi-wipes, protective skin barrier wipes, disposable sterile sheet pads, Purell hand sanitizer, cotton-tip applicators, disposable Hefty bags, and patient safety labels. Commenters provided invoices for some of these supplies and requested that CMS add them to the direct PE inputs for CPT code 95700.

Response: We disagree with the commenters that these additional supplies should be added to the direct PE inputs for CPT code 95700. Aside from proposing to refine the quantity of the non-sterile gloves (SB022) supply from 3 to 2, due to the fact that we believed the third pair of gloves to be duplicative, we proposed the RUC-recommended supplies for this code. We believe that these recommended supplies, based on the direct PE survey for CPT code 95700, represent the most accurate data associated with this procedure. We continue to believe that the use of disposable electrodes would not be typical for CPT code 95700, as the recommended materials specifically stated that reusable electrodes would instead be typical. Many of the other supplies listed by the commenters were never included as supplies in the predecessor EEG monitoring codes, or they represent office expenses that we would consider to be indirect PE, such as the lockbox used for storage or the trash bags used for disposal. We continue to believe that the direct PE survey used by the RUC for CPT code 95700 represents the best supply information available for this service.

Comment: Several commenters disagreed with the CMS proposal to refine the equipment time for the Technologist PACS workstation (ED050) to match the clinical labor time proposed for the CA038 activity. Commenters stated that the work performed on the PACS station for long term EEG monitoring was different than other PACS stations, as the PAC station is where the EEG recording data and video data is processed, clipped, and ultimately saved. Commenters stated that given the duration of long term EEG recordings, the RUC-recommended equipment times for the technologist PACS workstation are more accurate and representative of the work performed.

Response: We disagree with the commenters that the technologist PACS workstation (ED050) equipment time is used differently for long term EEG monitoring procedures as compared to the use of the same workstation in other services. The fact that EEG recording data is processed and clipped on the technologist PACS workstation does not provide a rationale for additional equipment time, as similar activities take place in other services as well. We do not understand why the workstation would be in use for double the amount of clinical labor assigned to the CA038 (“Coordinate post-procedure services”) activity code, as the RUC recommended, and we continue to believe that the equipment time should, generally

speaking, match the clinical labor time in which the equipment item is in use.

Comment: Several commenters disagreed with the CMS proposal to refine the equipment time for the ambulatory EEG review station (EQ016) equipment for the four continuous monitoring procedures, CPT codes 95707, 95710, 95713, and 95716. Commenters stated that it was not typical for a review station to be hooked up to four monitors, as CMS stated in the proposed rule, and instead 2–3 monitors would be typical. Commenters stated that it would be more appropriate to assign EQ016 minutes by multiplying CA021 clinical labor time 2 or 3 times plus prep time, rather than the refined times proposed by CMS.

Response: We appreciate the additional information provided by the commenter stating that it would be typical for a review station to be hooked up to 2–3 monitors at a time. Based on the information from the commenters, we are refining the equipment times for the ambulatory EEG review station (EQ016) equipment to reflect the belief that having a review station connected to 3 monitors at a time is the typical case. This results in the equipment times increasing slightly for all four CPT codes, such as CPT code 95707 increasing from the proposed 150 minutes to a new time of 190 minutes. Therefore, we would finalize EQ016 equipment times of 190 minutes for CPT code 95707, 520 minutes for CPT code 95710, 194 minutes for CPT code 95713, and 535 minutes for CPT code 95716 if we were to adopt active pricing for these codes.

Comment: Several commenters disagreed with the CMS proposal to refine the equipment time for the ambulatory EEG review station (EQ016) equipment in the PC codes (CPT codes 95717–95726) based on the belief that the use of the ambulatory EEG review station is analogous in these procedures to the use of the professional PACS workstation (ED053) in other procedures. Commenters stated that the EEG review station is used during the postservice work period and should be included in the PE inputs for all of the PC codes. Commenters stated that often the referring physician calls the physician providing the service to ask questions about the recording, and the providing physician will pull up the record on an EEG review station and go over the questions and provide responses with the inquiring physician. Commenters stated that this is similar to when a physician asks a radiologist about an MRI or CT report, as the radiologist opens the radiology review station to view the images while

discussing with the referring physician the questions and answers.

Response: We continue to disagree with the commenters about assigning the full work time to the ambulatory EEG review station (EQ016) equipment in the PC codes. We appreciate the analogy provided by the commenters to the use of a review station for an MRI or CT report; as we wrote in the proposed rule, we believe that the use of the ambulatory EEG review station is analogous in these procedures to the use of the professional PACS workstation (ED053) in other procedures, and we do not assign equipment time for the professional PACS workstation in MRI or CT procedures based on review by the practitioner in the postservice work period. We continue to believe that it better serves the purpose of relativity to propose an equipment time for the ambulatory EEG review station equal to half the preservice work time (rounded up) plus the intraservice work time for CPT codes 95717 through 95726. We also continue to note that the work descriptors for CPT codes 95717–95726 make no mention of the ambulatory EEG review station in the postservice work period. Perhaps this equipment is used “often” as the commenters stated but that does not necessarily mean that its use is typical for the procedures.

Comment: A commenter disagreed with the proposed price of \$26,410.95 for the equipment, “EEG, digital, prolonged testing system with remote video, for patients home use” (EQ394). The commenter submitted two invoices indicating slightly higher pricing for this equipment item and requested that CMS incorporate them into the equipment price.

Response: We appreciate the submission of additional invoices from the commenter. Based on this information, we are finalizing an increase in the price of “EEG, digital, prolonged testing system with remote video, for patients home use” (EQ394) equipment from the proposed \$26,410.95 to \$29,496.98 based on the submission of three total invoices.

Comment: A commenter disagreed with the proposed equipment items for CPT codes 95715 and 95716. The commenter stated that these codes assume use of an EEG review station, ambulatory (EQ016) equipment item at a price of \$7,950 but the actual equipment used is more sophisticated and is better described as an EEG monitoring system (EQ019) equipment item at a price of \$33,389.29.

Response: We disagree with the commenter that the EEG monitoring system (EQ019) equipment would be more typical for these procedures than

the proposed EEG review station, ambulatory (EQ016) equipment. The EQ019 equipment is a specialized item utilized by only two CPT codes, 91132 and 91133, which are both transcutaneous diagnostic Electrogastrography procedures. By contrast, the EQ016 equipment is currently utilized in CPT code 95950, an actual EEG code that serves as a direct predecessor for many of the new long term EEG monitoring codes. We agree with the RUC that the use of the EQ016 equipment would be typical for these procedures.

Comment: A commenter stated that the bedroom furniture (EF003) equipment was included only in CPT codes 95706, 95707, 95712, and 95713, the EEG codes for 2–12 hours monitoring duration. The commenter stated that the need for furniture does not discontinue if the patient requires longer term monitoring, and requested that CMS add the EF003 equipment to CPT codes 95709, 95710, 95715, and 95716.

Response: As we noted elsewhere in the comment responses, the 2–12 hour EEG monitoring codes were reviewed by the RUC and recommended to CMS with the understanding that they were typically performed in the office setting, whereas the 12–26 hour EEG monitoring codes were reviewed by the RUC and then recommended to CMS with the understanding that they were typically performed in the home setting. Although we agree with the commenter that the patient would typically be resting on some kind of furniture in the longer EEG monitoring codes, there is no equipment cost in these codes because the furniture would be located in the patient’s own home and not in the office setting.

Comment: Several commenters disagreed with both the RUC-recommended and CMS-proposed equipment items. These commenters stated that the proposed equipment reflects three different systems for EEG/vEEG recording, ranging in cost from \$7,950 to \$46,750, even though the same type of system is used for all of the monitoring described in the new EEG TC codes. Commenters stated that the proposed inputs reflected no additional equipment cost for video equipment and had an unrealistically long useful life. Commenters stated that the proposed inputs failed to recognize the software that is necessary to facilitate physician monitoring of testing in real time, as anticipated by new CPT codes 95717–95720.

Response: We disagree with the commenters regarding these equipment issues. We proposed the use of different

equipment items to reflect the fact that the monitoring for the TC codes is captured by different types of equipment depending on the type of monitoring and the site of service. For example, the “EEG, digital, prolonged testing system with remote video, for patients home use” (EQ394) equipment is designed to be used to capture video recordings that take place in the patient’s home. In contrast, the “EEG monitor, digital, portable” (EQ014) equipment does not contain a video component, and we proposed to include it only in the non-video codes in this family. Under our resource-based methodology, it would not be accurate to assign the same equipment to each TC code in the family given that they describe different services with differing equipment needs. Similarly, we disagree with the statement from the commenters that the proposed inputs reflected no additional equipment cost for video equipment. As we noted, we proposed different and more expensive equipment types for the codes in the family that use video equipment as opposed to those that do not.

We also disagree with the commenters that we proposed unrealistically long useful life durations for the equipment. The only new equipment item used in this family of codes is the EQ394 equipment, for which we proposed a useful life of 7 years. This matches the same useful life of 7 years which has long been established for the EQ014, EQ015, and EQ017 equipment items, all of which involve EEG monitoring and all of which are utilized by codes in this family. We believe that the new EQ394 equipment would share this same useful life assumption with the other previously existing types of EEG monitoring equipment. We also disagree with the commenters that the direct PE inputs lack the necessary software to facilitate physician monitoring of testing in real time. The equipment items utilized for video monitoring, EQ017 and EQ394, both include basic software in their purchase prices, which helps to explain why they are priced at a higher rate than the non-video EQ014 monitoring equipment.

Comment: Several commenters suggested that the proposed equipment times were understated. Commenters stated that the monitoring system equipment times appeared to reflect only 8 hours of actual monitoring time (480 minutes) for the 2–12 hour codes and 24 hours (1,440 minutes) for the 12–26 hour codes. The commenter stated that the proposed equipment times only reflected the time for their direct use to monitor patients, and failed to reflect the time necessary for the delivery and

return of equipment, set up, disconnect, or cleaning of equipment.

Response: We disagree with the commenter that the proposed equipment times were understated. We note that the “EEG monitor, digital, portable” (EQ014) equipment did include proposed equipment time associated with patient setup and disconnecting of equipment in CPT code 95700. The other equipment items did not require this kind of set up, disconnecting, and cleaning time (such as the Technologist PACS workstation and ambulatory EEG review station). We also note for the commenters that time allocated for delivery and return of equipment is an office expense that we consider to be a form of indirect PE under our methodology.

Comment: Several commenters stated that the review station requires use of equipment that is not otherwise recognized in the proposed rule, including a high spec laptop PC, wide screen monitors, advanced review software, high bandwidth internet connectivity, software for security purposes, and data storage that is HIPAA compliant. Commenters stated that CMS failed to recognize substantial IT, software and server costs, including uploading and storing for large patient data files. One commenter included an invoice for a storage area network (SAN) displaying a paid purchase price of \$15,992.40 while another commenter submitted an invoice for a portable external hard drive at a price of \$51.89.

Response: These types of equipment listed by the commenters are administrative expenses that we are considered forms of indirect PE under our methodology. Although we agree that providers will have a need for laptops, monitors, internet connectivity, data storage, and software security systems, these expenses are not unique to individual procedures and constitute forms of general office expenses. We note as an example that we do not assign separate direct PE for higher electricity costs to diagnostic imaging procedures as compared to cognitive evaluation procedures; these expenses are part of the office costs of running a practice, not specific to individual procedures. We continue to believe that these costs are appropriately captured via the indirect PE methodology as opposed to being included as a separate direct PE input.

Comment: A commenter stated that there appeared to be a discrepancy in the RUC survey results sent to CMS. The commenter stated that, under clinical labor codes (CA021) for patient/family education and for internal communication, time was provided for

each code, however there was no time allotted for these clinical labor activities. The commenter stated that these activities are necessary for the conduct of long-term EEG services and asked CMS to clarify which data point was used within the proposed rule.

Response: We remind the commenter that CMS does not publish the RUC recommendations, and we cannot speak as to whether or not they may contain errors. We review and make our own assessment of the RUC recommendations. We remind readers that the direct PE inputs for CY 2020 are displayed in the CY 2020 direct PE input files, available on the CMS website under the downloads for the CY 2020 PFS final rule at <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html>.

After consideration of the public comments, we are finalizing the RUC-recommended work RVUs for all of the codes in the Long Term EEG Monitoring family. We are finalizing the direct PE inputs as proposed for the PC-only codes in the family (CPT codes 95717–95726) and finalizing the assignment of contractor pricing for the TC-only codes in the family (CPT codes 95700–95716). As we have summarized above, commenters have raised some significant concerns regarding the usefulness of these codes in establishing appropriate values for these services. Also as we have noted in the preceding discussion, we continually seek updated information, including and especially empirical data, regarding the resources involved in furnishing PFS services.

In the context of the concerns raised regarding the applicability of the new code set in various settings of care and by the services furnished to patients with varying needs, we are persuaded by commenters that we should maintain the stability inherent in contractor pricing despite consideration of RUC-recommended direct PE inputs for these TC services. While many of the same concerns apply to the PC component of these services, we note that the professional component of these services are currently valued using recommendations originally furnished by the RUC. Consequently, we believe it is appropriate to maintain national payment rates for the professional component of these services. However, we continue to seek information regarding these services and how the changes in valuation and coding might affect appropriate access to care for beneficiaries. For example, we would consider establishing G-codes specific for services in particular settings of care

in future rulemaking should such access concerns become apparent.

(64) Health and Behavioral Assessment and Intervention (CPT Codes 96156, 96158, 96159, 96164, 96165, 96167, 96168, 96170, and 96171)

The 2001 Health and Behavior Assessment and Intervention (HBAI) RUC valuations were based on the old CPT code 90801 (*Psychiatric diagnostic interview evaluation*), a 60-minute service. The RUC originally recommended the Health and Behavior Assessment and Intervention procedures to be 15-minute services, approximately equal to one-quarter of the value of CPT code 90801, which we finalized without refinements. While the RUC may have assumed that these services would typically be reported in four, 15-minute services per single patient encounter, in actual claims data, there is wide variation in the number of services provided and submitted. The RUC reconsidered their rationale for the original RUC-recommended valuation of this family of codes in September 2018. The CPT Editorial Panel deleted the six existing Health and Behavior Assessment and Intervention procedure CPT codes and replaced them with nine new CPT codes.

The six deleted CPT codes include CPT code 96150 (*Health and behavior assessment (e.g., health-focused clinical interview, behavioral observations, psychophysiological monitoring, health-oriented questionnaires), each 15 minutes face-to-face with the patient; initial assessment*), CPT code 96151 (*Health and behavior assessment (e.g., health-focused clinical interview, behavioral observations, psychophysiological monitoring, health-oriented questionnaires), each 15 minutes face-to-face with the patient; re-assessment*), CPT code 96152 (*Health and behavior intervention, each 15 minutes, face-to-face; individual*), CPT code 96153 (*Health and behavior intervention, each 15 minutes, face-to-face; group (2 or more patients)*), CPT code 96154 (*Health and behavior intervention, each 15 minutes, face-to-face; family (with the patient present)*), and CPT code 96155 (*Health and behavior intervention, each 15 minutes, face-to-face; family (without the patient present)*).

The nine replacement HBAI CPT codes include CPT code 96156 (*Health behavior assessment, including re-assessment (i.e., health-focused clinical interview, behavioral observations, clinical decision making)*), CPT code 96158 (*Health behavior intervention, individual, face-to-face; initial 30 minutes*), CPT code 96159 (*Health*

behavior intervention, individual, face-to-face; each additional 15 minutes (list separately in addition to code for primary service)), CPT code 96164 (*Health behavior intervention, group (2 or more patients), face-to-face; initial 30 minutes*), CPT code 96165 (*Health behavior intervention, group (2 or more patients), face-to-face; each additional 15 minutes (list separately in addition to code for primary service)*), CPT code 96167 (*Health behavior intervention, family (with the patient present), face-to-face; initial 30 minutes*), CPT code 96168 (*Health behavior intervention, family (with the patient present), face-to-face each additional 15 minutes (list separately in addition to code for primary service)*), CPT code 96170 (*Health behavior intervention, family (without the patient present), face-to-face; initial 30 minutes*), CPT code 96171 (*Health behavior intervention, family (without the patient present), face-to-face; each additional 15 minutes (list separately in addition to code for primary service)*).

We proposed the RUC-recommended work RVUs for each of the codes in this family as follows.

- For CPT code 96156, we proposed a work RVU of 2.10.
- For CPT code 96158, we proposed a work RVU of 1.45.
- For CPT code 96159, we proposed a work RVU of 0.50.
- For CPT code 96164, we proposed a work RVU of 0.21.
- For CPT code 96165, we proposed a work RVU of 0.10.
- For CPT code 96167, we proposed a work RVU of 1.55.
- For CPT code 96168, we proposed a work RVU of 0.55.
- For CPT code 96170, we proposed a work RVU of 1.50 (but this code will be non-covered by Medicare).
- For CPT code 96171, we proposed a work RVU of 0.54 (but this code will be non-covered by Medicare).

We proposed the RUC-recommended direct PE inputs for all of the CPT codes in this family without refinement.

We received public comments on the proposed valuation of the codes in the Health and Behavioral Assessment and Intervention family. The following is a summary of the comments we received and our responses.

Comment: The total number of comments for the HBAI CPT codes are from Psychologist who are uniformly pleased to see that CMS has accepted all of the AMA RUC's recommended increases for the Health Behavior Assessment and Intervention (HBAI) services and that the American Psychological Association further urges CMS to make payable CPT code 96170

and 96171, both Family Intervention services without the patient being present.

Response: As with the original HBAI non-covered codes, where the patient is not present during the service, that will remain true with the new replacement CPT code 96170 and 96171 where they will retain their non-covered status.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the Health and Behavioral Assessment and Intervention code family as proposed.

(65) Cognitive Function Intervention (CPT Codes 97129 and 97130)

In 2017, we received HCPAC recommendations for new CPT code 97127 (*Development of cognitive skills to improve attention, memory, problem solving, direct patient contact, 1*) that described the services under CPT code 97532 (*Development of cognitive skills to improve attention, memory, problem solving, direct patient contact, each 15 minutes*). CPT code 97532 was scheduled to be deleted and replaced by the new untimed code CPT code 97127. In the CY 2018 PFS final rule (82 FR 53074 through 53076), however, we suggested that CPT code 97127 as an untimed/per day code did not appropriately account for the variable amounts of time spent with a patient depending upon the discipline and/or setting and thus assigned the code a procedure status of "I" (Invalid). In place of CPT code 97127, we established a new HCPCS G code, G0515 (*Development of cognitive skills to improve attention, memory, problem solving, direct patient contact, each 15 minutes*), with a work RVU of 0.44. HCPCS code G0515 maintained the descriptor and values from the former CPT code 97532.

In September 2018, the CPT Editorial Panel revised CPT code 97129 (*Therapeutic interventions that focus on cognitive function (e.g., attention, memory, reasoning, executive function, problem solving and/or pragmatic functioning) and compensatory strategies to manage the performance of an activity (e.g., managing time or schedules, initiating, organizing and sequencing tasks), direct (one-to-one) patient contact; initial 15 minutes*) and created an add-on code, CPT code 97130 (*Therapeutic interventions that focus on cognitive function (e.g., attention, memory, reasoning, executive function, problem solving and/or pragmatic functioning) and compensatory strategies to manage the performance of an activity (e.g., managing time or schedules, initiating, organizing and*

sequencing tasks), direct (one-to-one) patient contact; each additional 15 minutes (list separately in addition to code for primary procedure)).

We proposed the RUC-recommended work RVUs of 0.50 for CPT code 97129 and 0.48 for CPT code 97130. We also proposed the RUC-recommended direct PE inputs for all codes in the family. Additionally, we proposed to designate CPT codes 97129 and 97130 as sometime therapy codes because the services might be appropriately furnished by therapists under the outpatient therapy services benefit (includes physical therapy, occupational therapy, or speech-language pathology) or outside the therapy benefit by physicians, NPPs, and psychologists.

We received public comments on the proposed valuation of CPT codes 97129 and 97130. The following is a summary of the comments we received and our response.

Comment: Commenters uniformly requested that we adopt the new cognitive function intervention codes at the values we proposed.

Response: We appreciate the support for our proposals from the commenters.

Comment: A commenter stated that CMS did not indicate whether HCPCS code G0515 (*Cognitive skills development, each 15 minutes*) will be deleted. The commenter requested that CMS delete HCPCS code G0515 given the proposal of new CPT codes describing the treatment of cognitive impairments.

Response: We proposed to delete HCPCS code G0515 and replace it with new CPT codes 97129 and 97130, as detailed in our CY 2019 Analytic Crosswalk to CY 2020 public use file issued along with the proposed rule. We can confirm for the commenter that HCPCS code G0515 will be deleted for CY 2020.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the Cognitive Function Intervention family as proposed. We are also finalizing our proposal to designate both codes as sometime therapy codes.

(66) Open Wound Debridement (CPT Codes 97597 and 97598)

CPT code 97598 (*Debridement (e.g., high pressure waterjet with/without suction, sharp selective debridement with scissors, scalpel and forceps), open wound, (e.g., fibrin, devitalized epidermis and/or dermis, exudate, debris, biofilm), including topical application(s), wound assessment, use of a whirlpool, when performed and instruction(s) for ongoing care, per*

session, total wound(s) surface area; each additional 20 sq cm, or part thereof) was identified by the RUC on a list of services that were originally surveyed by one specialty but are now typically performed by a different specialty. It was reviewed along CPT code 97597 (*Debridement (e.g., high pressure waterjet with/without suction, sharp selective debridement with scissors, scalpel and forceps), open wound, (e.g., fibrin, devitalized epidermis and/or dermis, exudate, debris, biofilm), including topical application(s), wound assessment, use of a whirlpool, when performed and instruction(s) for ongoing care, per session, total wound(s) surface area; first 20 sq cm or less*) at the October 2018 RUC meeting.

We disagree with the RUC-recommended work RVU of 0.88 for CPT code 97597 and we proposed a work RVU of 0.77 based on a crosswalk to CPT code 27369 (*Injection procedure for contrast knee arthrography or contrast enhanced CT/MRI knee arthrography*). CPT code 27369 is a recently-reviewed code with the same intraservice time of 15 minutes and a total time of 28 minutes, 1 minute fewer than CPT code 97597. In reviewing this code, we noted that the recommended intraservice time is increasing from 14 minutes to 15 minutes (7 percent), and the recommended total time is increasing from 24 minutes to 29 minutes (21 percent); however, the RUC-recommended work RVU is increasing from 0.51 to 0.88, which is an increase of 73 percent. Although we did not imply that the decrease in time as reflected in survey values must equate to a one-to-one or linear increase in the valuation of work RVUs, we believe that since the two components of work are time and intensity, modest increases in time should be appropriately reflected with a commensurate increase the work RVUs. In the case of CPT code 97597, we believed that it is more accurate to propose a work RVU of 0.77 based on a crosswalk to CPT code 27369 to account for these modest increases in the surveyed work time. We also note that even at the proposed work RVU of 0.77 the intensity of this procedure as measured by IWPUP is increasing by more than 50 percent over the current value.

We proposed the RUC-recommended work RVU of 0.50 for CPT code 97598. We are also proposing the RUC-recommended direct PE inputs for all codes in the family.

We received public comments on the proposed valuation of the codes in the Open Wound Debridement family. The

following is a summary of the comments we received and our responses.

Comment: Several commenters disagreed with the CMS proposed work RVU of 0.77 for CPT code 97597 and stated that CMS should instead finalize the RUC-recommended work RVU of 0.88. Commenters stated that the work RVU of 0.77 for the proposed CMS crosswalk code, CPT code 27369, was derived by CMS using a reverse building block methodology from the RUC-recommended work RVU of 0.96. Commenters stated that the use of the reverse building block methodology to develop a work RVU for CPT code 27369 was faulty, and therefore, this code was not an appropriate choice to serve as a crosswalk for CPT code 97597.

Response: We disagree with the commenters that CPT code 27369 was an inappropriate choice to serve as a crosswalk. In the CY 2011 PFS final rule with comment period (75 FR 73328 through 73329), we discussed a variety of methodologies and approaches used to develop work RVUs, including the use of building block methodologies (see the CY 2011 PFS final rule with comment period (75 FR 73328 through 73329) for more information). Components that we use in the building block approach may include preservice, intraservice, or postservice time and post-procedure visits. We use the building block methodology to construct, or deconstruct, the work RVU for a CPT code based on component pieces of the code, and building block methodologies have long been used in developing work RVUs under the PFS. More importantly, the work valuation of CPT code 27369 was finalized at 0.77 in the CY 2019 PFS final rule (83 FR 59525) and additional discussion of this code's work RVU is out of scope for this rule. We continue to believe that it is more accurate to propose a work RVU of 0.77 for CPT code 97597 based on a crosswalk to CPT code 27369 to account for the modest increases in the procedure's surveyed work time.

Comment: Several commenters stated that due to flawed methodologies in the survey process, CPT code 97597 was incorrectly valued in 2010, and therefore, it was invalid for CMS to compare the current time and work to the surveyed time and work of the newly created codes in the family. Commenters also stated that since CPT code 97597 was last valued there has been a change in the patient population, and therefore, the RUC-recommended increase in work time and work RVU was not commensurate with the flawed current work times and work RVU.

Response: We believe that it is crucial that the code valuation process take place with the understanding that the existing work times, used in the PFS ratesetting processes, are accurate. We recognize that adjusting work RVUs for changes in time is not always a straightforward process and that the intensity associated with changes in time is not necessarily always linear, which is why we apply various methodologies to identify several potential work values for individual codes. However, we reiterate that we believe it would be irresponsible to ignore changes in time based on the best data available and that we are statutorily obligated to consider both time and intensity in establishing work RVUs for PFS services. For additional information regarding the use of old work time values that were established many years ago and have not since been reviewed in our methodology, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section II.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80273 through 80274).

Comment: A commenter disagreed with the proposed valuation of CPT code 97597 based on a comparison to CPT codes 99212 and 99213, stating that the methodology employed for this code family was contradictory to how the Agency reviewed other codes in this same proposed rule for similar services. The commenter stated that CMS proposed a work RVU of 0.75 for CPT code 99212 compared with a proposed work RVU of 0.77 for CPT code 97597, a difference of only 3 percent, even though the total time for CPT code 97597 is 61 percent greater. The commenter stated that a similar comparison could also be made using CPT code 99213 (proposed work RVU = 1.30, total time = 30 minutes) which requires a low level of medical decision-making similar to CPT code 97597. The commenter stated that when considering work per unit time, the proposed work RVU for CPT code 97597 significantly undervalues the physician work compared to CPT codes 99212 and 99213.

Response: We recognize that it would not be appropriate to develop work RVUs solely based on time given that intensity is also an element of work. We clarify again that we do not treat all components of physician time as having identical intensity. Were we to disregard intensity altogether, the work RVUs for all services would be developed based solely on time values and that is definitively not the case, as indicated by the many services that share the same

time values but have different work RVUs. For more details on our methodology for developing work RVUs, we refer readers to our discussion of the subject in the Methodology for Establishing Work RVUs section of this rule (section II.N.2. of this final rule), as well as a longer discussion in the CY 2017 PFS final rule (81 FR 80272 through 80277). For the specific case of CPT code 97597, we note again that the proposed work RVU was not based on a time ratio or a building block methodology, but instead based on a crosswalk to CPT code 27369. This was only one of several different codes that we could have chosen for a crosswalk; we also considered CPT code 36470 (*Injection of sclerosant; single incompetent vein (other than telangiectasia)*) and CPT code 43756 (*Duodenal intubation and aspiration, diagnostic, includes image guidance; single specimen (e.g., bile study for crystals or afferent loop culture)*), both of which have similar time values and work RVUs of 0.75 and 0.77 respectively. We disagree with the commenters that CPT codes 99212 and 99213 are appropriate choices for comparisons, as they do not share the same 0 day global period as CPT code 97597.

Comment: Several commenters stated that they supported the proposal of the RUC-recommended work RVU for CPT code 97598 and the RUC-recommended direct PE inputs for both codes.

Response: We appreciate the support for our proposals from the commenters.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the Open Wound Debridement family as proposed.

(67) Negative Pressure Wound Therapy (CPT Codes 97607 and 97608)

In the CY 2013 final rule with comment period, we created two HCPCS codes to provide a payment mechanism for negative pressure wound therapy services furnished to beneficiaries using equipment that is not paid for as durable medical equipment: G0456 (*Negative pressure wound therapy, (for example, vacuum assisted drainage collection) using a mechanically powered device, not durable medical equipment, including provision of cartridge and dressing(s), topical application(s), wound assessment, and instructions for ongoing care, per session; total wound(s) surface area less than or equal to 50 square centimeters*) and G0457 (*Negative pressure wound therapy, (for example, vacuum assisted drainage collection) using a mechanically-powered device, not*

durable medical equipment, including provision of cartridge and dressing(s), topical application(s), wound assessment, and instructions for ongoing care, per session; total wound(s) surface area greater than 50 sq. cm). For CY 2015, the CPT Editorial Panel created CPT codes 97607 (*Negative pressure wound therapy, (e.g., vacuum assisted drainage collection), utilizing disposable, non-durable medical equipment including provision of exudate*) and 97608 (*Negative pressure wound therapy, (e.g., vacuum assisted drainage collection), utilizing disposable, non-durable medical equipment including provision of exudate*) to describe negative pressure wound therapy with the use of a disposable system. In addition, CPT codes 97605 (*Negative pressure wound therapy (e.g., vacuum assisted drainage collection), utilizing durable medical equipment (DME), including topical application(s), wound assessment, and instruction(s) for ongoing care, per session; total wound(s) surface area less than or equal to 50 square centimeters*) and 97606 (*Negative pressure wound therapy (e.g., vacuum assisted drainage collection), utilizing durable medical equipment (DME), including topical application(s), wound assessment, and instruction(s) for ongoing care, per session; total wound(s) surface area greater than 50 square centimeters*) were revised to specify the use of durable medical equipment. Based upon the revised coding scheme for negative pressure wound therapy, we deleted the G-codes. Due to concerns that we had with these services, we contractor priced CPT codes 97607 and 97608 beginning in CY 2015 (79 FR 67670). In the CY 2016 PFS final rule (80 FR 71005), in response to comment expressing disappointment with CMS' decision to contractor price these codes, we noted that there were obstacles to developing accurate payment rates for these services within the PE RVU methodology, including the indirect PE allocation for the typical practitioners who furnish these services and the diversity of the products used in furnishing these services.

We have received repeated requests from stakeholders, including in comments received in response to the CY 2019 PFS final rule, to assign an active status to these codes, meaning we would assign rates to the codes rather than allowing them to be contractor priced. In that rule, (83 FR 59473), we noted that we received a request that CMS should assign direct cost inputs and PE RVUs to CPT codes 97607 and 97608, and we indicated that we would

take this feedback from commenters under consideration for future rulemaking.

In response to stakeholder feedback, we evaluated the codes and determined there was adequate volume to assign an active status. We proposed to assign an active status to CPT codes 97607 and 97608 and we proposed the work RVUs as recommended by the RUC that we received for CY 2015 when the CPT Editorial Panel created these codes. Thus, we proposed a work RVU of 0.41 for CPT code 97607 and a work RVU of 0.46 for CPT code 97608. Similarly, we proposed the RUC-recommended direct PE inputs originally for CY 2015 with the following refinement: For the clinical labor activity “check dressings & wound/home care instructions/coordinate office visits/prescriptions,” we are refining the clinical labor time to the standard 2 minutes for this task. In addition, the direct inputs for these codes include the new supply item, “kit, negative pressure wound therapy, disposable” (SA131). A search of publicly available commercial pricing data indicates that a unit price of approximately \$100 is appropriate, and therefore, we proposed this price for this supply item. In the proposed rule, we sought invoices to more accurately price this kit.

We received public comments on the proposed valuation of the codes in the Negative Pressure Wound Therapy family. The following is a summary of the comments we received and our responses.

Comment: A commenter expressed support for our proposed work and direct PE values and appreciated CMS changing the payment status to active. Another commenter stated that they did not object to the proposed direct PE refinements and stated that these refinements matched the changes in time as compared with CPT codes 97605 and 97608.

Response: We appreciate the support for our proposals from the commenters.

Comment: Several commenters supported the proposal to establish a national fee schedule amount for application of single-use disposable negative pressure wound therapy billed with CPT codes 97607 and 97608. However, the commenters disagreed with the proposed price of \$100 for the disposable negative pressure wound therapy kit (SA131) supply. One commenter stated that although single-use disposable negative pressure wound therapy device costs can vary, the average price paid by office-based physicians is \$273.55 for these PICO single-use negative pressure wound therapy devices. The commenter

submitted five invoices to support this price for the SA131 supply, and requested that CMS update the proposed price. Another commenter agreed that the proposed price does not reflect the actual invoiced prices by manufacturers or suppliers/distributors on the market today, and submitted additional paid invoices showing the average supply cost for the disposable negative pressure wound therapy kit being between \$208 and \$494 depending on the type of disposable negative pressure wound therapy deployed.

Response: We appreciate the submission of additional invoices on the part of the commenter. However, when we reviewed the pricing for the SA131 supply, we continued to find disposal negative pressure wound therapy kits available for purchase online for roughly \$100. We compared the kits on the submitted invoices to the kits available for purchase online, and as far as we can determine, they appear to describe the same product, with both kits containing a dressing of the same size and a disposable pump. In light of the additional pricing information supplied by the commenters, we are finalizing an increase in the price of the disposable negative pressure wound therapy kit (SA131) supply, but only to the lower end of the invoice prices submitted by the commenters. We are finalizing a price of \$208 for the SA131 supply based on the lower end of the average supply cost provided by the commenters, as there appear to be kits that are readily available at both higher and lower prices. We believe that the \$208 price point will serve as a proxy for the typical purchase price of these kits.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the Negative Pressure Wound Therapy family as proposed.

(68) Ultrasonic Wound Assessment (CPT Code 97610)

In 2005, the AMA RUC began the process of flagging services that represent new technology or new services as they were presented to the Committee. CPT code 97610 (*Low frequency, non-contact, non-thermal ultrasound, including topical application(s), when performed, wound assessment, and instruction(s) for ongoing care, per day*) was flagged for CPT 2015 and reviewed at the October 2018 RAW meeting. The Workgroup indicated that the utilization is continuing to increase for this service, and recommended that it be resurveyed

for physician work and PE for the January 2019 RUC meeting.

We proposed the RUC-recommended work RVU of 0.40 for CPT code 97610. We also proposed the RUC-recommended direct PE inputs for CPT code 97610.

We received public comments on the proposed valuation of the codes in the Ultrasonic Wound Assessment family. The following is a summary of the comments we received and our responses.

Comment: A commenter supported our proposal for this code.

Response: We appreciate the support from the commenter.

After consideration of the public comments, we are finalizing the RUC-recommended work RVU and direct PE inputs as proposed.

(69) Online Digital Evaluation Service (E-Visit) (CPT Codes 98970, 98971, and 98972)

In September 2018, the CPT Editorial Panel deleted two codes and replaced them with six new non-face-to-face codes to describe patient-initiated digital communications that require a clinical decision that otherwise typically would have been provided in the office. The HCPAC reviewed and made recommendations for CPT code 98970 (*Qualified nonphysician healthcare professional online digital evaluation and management service, for an established patient, for up to seven days, cumulative time during the 7 days; 5–10 minutes*), CPT code 98971 (*Qualified nonphysician healthcare professional online digital evaluation and management service, for an established patient, for up to seven days, cumulative time during the 7 days; 11–20 minutes*), and CPT code 98972 (*Qualified nonphysician qualified healthcare professional online digital evaluation and management service, for an established patient, for up to seven days, cumulative time during the 7 days; 21 or more minutes*). CPT codes 99421–99423 are for practitioners who can independently bill E/M services while CPT codes 98970–98972 are for practitioners who cannot independently bill E/M services.

The statutory requirements that govern the Medicare benefit are specific regarding which practitioners may bill for E/M services. As such, when codes are established that describe E/M services that fall outside the Medicare benefit category of the practitioners who may bill for that service, we have typically created parallel HCPCS G-codes with descriptors that refer to the performance of an “assessment” rather than an “evaluation”. We acknowledge

that there are qualified non-physician health care professionals who will likely perform these services. Therefore, for CY 2020, we proposed separate payment for online digital assessments via three HCPCS G-codes that mirror the RUC recommendations for CPT codes 98970–98972. The proposed HCPCS G codes and descriptors are as follows:

- HCPCS code G2061 (*Qualified nonphysician healthcare professional online assessment, for an established patient, for up to seven days, cumulative time during the 7 days; 5–10 minutes*);

- HCPCS code G2062 (*Qualified nonphysician healthcare professional online assessment service, for an established patient, for up to seven days, cumulative time during the 7 days; 11–20 minutes*); and

- HCPCS code G2063 (*Qualified nonphysician qualified healthcare professional assessment service, for an established patient, for up to seven days, cumulative time during the 7 days; 21 or more minutes*).

For CY 2020, we proposed a work RVU of 0.25 for CPT code G2061, which reflects the RUC-recommended work RVU for CPT code 98970. For HCPCS codes G2062 and G2063, we believe that the 25th percentile work RVU associated with CPT codes 98971 and 98972 respectively, better reflects the intensity of performing these services, as well as the methodology used to value the other codes in the family, all of which use the 25th percentile work RVU. Therefore, we proposed a work RVU of 0.44 for HCPCS code G2062 and a work RVU of 0.69 for HCPCS code G2063.

We proposed the direct PE inputs associated with CPT codes 98970, 98971, and 98972 for G2061, G2062, and G2063 respectively.

We received public comments on the proposed valuation of the codes in the Online Digital Evaluation Service (e-Visit) family. The following is a summary of the comments we received and our responses.

Comment: Many commenters were supportive of separate payment for these services, although a number expressed reservations with the use of HCPCS G-codes and encouraged CMS to work with the CPT editorial panel to make refinements to the CPT code descriptors. Some commenters stated that the proposed values for HCPCS codes GPPP2 and GPPP3 undervalued the work associated with these services and encouraged CMS to adopt the RUC recommended work RVUs of 0.50 and 0.80, respectively. Commenters stated that these codes were valued to be identical to the work RVUs associated

with the corresponding physician codes, 99422 and 99423.

Commenters from specialty societies representing audiologist and speech language pathologists, who are ineligible to bill for HCPCS codes G2061–G2063 due to restrictions on their benefit category, nevertheless encouraged CMS to allow them to bill for these services.

Response: We thank commenters for submitting their comments. We note that a drafting error was made in the code descriptors for HCPCS codes G2061–G2063. The following are the correct descriptors:

- HCPCS code G2061 (*Qualified nonphysician healthcare professional online assessment and management, for an established patient, for up to seven days, cumulative time during the 7 days; 5–10 minutes*);

- HCPCS code G2062 (*Qualified nonphysician healthcare professional online assessment and management service, for an established patient, for up to seven days, cumulative time during the 7 days; 11–20 minutes*); and

- HCPCS code G2063 (*Qualified nonphysician qualified healthcare professional assessment and management service, for an established patient, for up to seven days, cumulative time during the 7 days; 21 or more minutes*).

We continue to believe that the work associated when these services are furnished by a nonphysician practitioner (NPP) will typically be less than when furnished by a physician, due to the acuity of the patient. Therefore, we maintain that HCPCS codes G2062 and G2063 are accurately valued at 0.44 and 0.69, respectively and are finalizing those values as proposed. We would also like to reiterate that there are many practitioners for whom these services fall outside the scope of their benefit category and as such, may not receive separate payment for these services under Medicare.

After consideration of the public comments we are finalizing as proposed.

(70) Emergency Department Visits (CPT Codes 99281, 99282, 99283, 99284, and 99285)

In the CY 2018 PFS final rule, we finalized a proposal to nominate CPT codes 99281–99285 as potentially misvalued based on information suggesting that the work RVUs for emergency department visits may not appropriately reflect the full resources involved in furnishing these services (FR 82 53018.) These five codes were surveyed and reviewed for the April

2018 RUC meeting. For CY 2020 we proposed the RUC-recommended work RVUs of 0.48 for CPT code 99281, a work RVU of 0.93 for CPT code 99282, a work RVU of 1.42 for 99283, a work RVU of 2.60 for 99284, and a work RVU of 3.80 for CPT code 99285.

The RUC did not recommend and we did not propose any direct PE inputs for the codes in this family.

We received public comments on the proposed valuation of the codes in the Emergency Department Visits family. The following is a summary of the comments we received and our responses.

Comment: Commenters from a major specialty society representing emergency department physicians suggested that, in order to maintain relativity with the newly revalued office/outpatient E/M visits, that CMS increase the work RVU to 1.60 for CPT code 99283, 2.74 for CPT code 99284, and 4.00 for CPT code 99285. Other commenters supported finalizing as proposed.

Response: We thank commenters for submitting their comments. As discussed in section II. P. of this final rule, Payment for Evaluation and Management Services, we are considering updating other E/M visits to maintain relativity with the revalued office/outpatient E/M code set as part of CY 2021 PFS rulemaking.

After consideration of the public comments, we are finalizing as proposed. We are also finalizing our proposal to have no direct PE inputs for these codes.

(71) Self-Measured Blood Pressure Monitoring (CPT Codes 99473, 99474, 93784, 93786, 93788, and 93790)

In September 2018, the CPT Editorial Panel created two new codes and revised four other codes to describe self-measured blood pressure monitoring services and to differentiate self-measured blood pressuring monitoring services from ambulatory blood pressure monitoring services. The first of the two new codes that describe self-measured blood pressure monitoring is CPT code 99473 (*Self-measured blood pressure using a device validated for clinical accuracy; patient education/training and device calibration*) and is a PE only code. The second code is 99474 (*Self-measured blood pressure using a device validated for clinical accuracy; separate self-measurements of two readings, one minute apart, twice daily over a 30-day period (minimum of 12 readings), collection of data reported by the patient and/or caregiver to the physician or other qualified health care professional, with report of average*

systolic and diastolic pressures and subsequent communication of a treatment plan to the patient).

The remaining four codes, which monitor ambulatory blood pressure, include CPT code 93784 (*Ambulatory blood pressure monitoring, utilizing report-generating software, automated, worn continuously for 24 hours or longer; including recording, scanning analysis, interpretation and report*), CPT code 93786 (*Ambulatory blood pressure monitoring, recording only*), CPT code 93788 (*Ambulatory blood pressure monitoring, scanning analysis with report*), and CPT code 93790 (*Ambulatory blood pressure monitoring, review with interpretation and report*). CPT code 93784 is a composite code that is the sum of CPT codes 93786, 93788, and 93790. CPT codes 93786 and 93788 are PE only codes.

We proposed the RUC-recommended work RVU of 0.18 for CPT code 99474, the RUC-recommended work RVU of 0.38 for CPT code 93784, and the RUC-recommended work RVU of 0.38 for CPT code 93790. We proposed the RUC-recommended work RVU of 0.00 for CPT codes 93786, 93788, and 99473. We also proposed the RUC-recommended direct PE inputs for all codes in the family.

We received public comments on the proposed valuation of the codes in the Self-Measured Blood Pressure Monitoring family. The following is a summary of the comments we received and our response.

Comment: Commenters expressed uniform support for the creation of self-measured blood pressure monitoring codes, as well as the proposed valuation of the codes.

Response: We are finalizing the work RVUs and direct PE inputs as proposed for CPT codes 99474, 93784, and 93790, as well as for CPT codes 93786, 93788, and 99473.

(72) Online Digital Evaluation Service (e-Visit) (CPT Codes 99421, 99422, and 99423)

In September 2018, the CPT Editorial Panel deleted two codes and replaced them with six new non-face-to-face codes to describe patient-initiated digital communications that require a clinical decision that otherwise typically would have been provided in the office. The RUC reviewed and made recommendations for CPT code 99421 (*Online digital evaluation and management service, for an established patient, for up to 7 days, cumulative time during the 7 days; 5–10 minutes*), CPT code 99422 (*Online digital evaluation and management service, for an established patient, for up to 7 days,*

cumulative time during the 7 days; 11–20 minutes), and CPT code 99423 (*Online digital evaluation and management service, for an established patient, for up to 7 days, cumulative time during the 7 days; 21 or more minutes*).

For CY 2020, we proposed the RUC-recommended work RVUs of 0.25 for CPT code 99421, 0.50 for CPT code 99422, and 0.80 for CPT code 99423. We proposed the RUC-recommended direct PE inputs for all codes in the family.

We received public comments on the proposed valuation of the codes in the Online Digital Evaluation Service (e-Visit) family. The following is a summary of the comments we received and our responses.

Comment: Commenters supported separate payment for these and the proposed values.

Response: We thank commenters for submitting their comments.

After consideration of the public comments we are finalizing as proposed.

(73) Radiation Therapy Codes (HCPCS Codes G6001, G6002, G6003, G6004, G6005, G6006, G6007, G6008, G6009, G6010, G6011, G6012, G6013, G6014, G6015, G6016 and G6017)

For CY 2015, CPT revised the radiation therapy code set for following identification of some of the codes as potentially misvalued and the affected specialty society's contention that the provision of radiation therapy could not be accurately reported under the existing code set. In the CY 2015 PFS final rule, we finalized that we were delaying implementation of this revised code set, citing concerns with our potentially having finalized a substantial coding revision on an interim final basis. In addition, we stated that substantial work needed to be done to assure the new valuations for these codes accurately reflect the coding changes. We finalized that we would maintain inputs at CY 2014 levels by creating G-codes as necessary to allow practitioners to continue to report services to CMS in CY 2015 as they did in CY 2014 and for payments to be made in the same way. Following the publication of the CY 2015 PFS final rule, the Patient Access and Medicare Protection Act (Pub. L. 114–115, December 28, 2015) was enacted, which included the provision that the code definitions, the work relative value units and the direct inputs for the PE RVUs for radiation treatment delivery and related imaging services (identified in 2016 by HCPCS G-codes G6001 through G6015) for the fee schedule established under this subsection for

services furnished in 2017 and 2018 shall be the same as such definitions, units, and inputs for such services for the fee schedule established for services furnished in 2016. In CY 2018, Congress extended this “freeze” in coding descriptions and inputs through CY 2019 as a provision of the Bipartisan Budget Act of 2018. For CY 2020, in the interest of payment stability, we proposed to continue using these G-codes, as well as their current work RVUs and direct PE inputs. We are also proposing that, for CY 2020, our PE methodology will continue to include a utilization rate assumption of 60 percent for the equipment item: ER089, “IMRT Accelerator.”

We received public comments on the proposed valuation of the codes in the Radiation Therapy Codes family. The following is a summary of the comments we received and our responses.

Comment: Commenters stated that they support our proposals for these services.

Response: We appreciate the support for our proposal. After consideration of the public comments, we are finalizing our proposal to continue making payment for these services using HCPCS G-codes G6001 through G6017 with their current work RVUs and direct PE inputs.

Comment: A few commenters stated that we should develop RVUs for HCPCS code G6017 (*Intra-fraction localization and tracking of target or patient motion during delivery of radiation therapy (e.g., 3d positional tracking, gating, 3d surface tracking)*), each fraction of treatment, which is a contractor priced code or its predecessor code CPT code 77387 (*Guidance for localization of target volume for delivery of radiation treatment, includes intrafraction tracking, when performed*), which has an inactive status. The commenters also request that we publish RVUs for CPT code 77387 based on the RUC-recommended inputs submitted in 2014 despite this code having an inactive status for the benefit of third party payers to mitigate confusion and inconsistency.

Response: We continue to believe that, given the introduction of the Radiation Oncology Payment Model, it is preferable to maintain the current payment rates for these codes for CY 2020 in the interest of stability and to prevent disruption. We will, however, take this information into consideration for future rulemaking.

After consideration of the public comments, we are finalizing our proposal for these services.

(74) Immunization Administration Services (HCPCS Codes G0008, G0009, and G0010)

Recent epidemics, including the measles crisis earlier this year, emphasize the importance of consistent beneficiary access to vaccinations that are vital to public health. Medicare has established coding and payment for immunization administration services, including HCPCS codes G0008 (*Admin influenza virus vac*), G0009 (*Admin pneumococcal vaccine*), and G0010 (*Admin hepatitis b vaccine*) that allow for the vaccination of Medicare

beneficiaries. While we did not make any specific proposals in the CY 2020 PFS proposed rule to change payment for these administration services, we did receive comments noting a decrease in payment for these services. These comments noted the linked crosswalk between CPT code 96372 (*Therapeutic, prophylactic, or diagnostic injection (specify substance or drug) subcutaneous or intramuscular*) and a number of the immunization services, and the impact that a proposed reduction to 96372 would have on payment for some practices that offer

immunization services. We recognize that it is in the public interest to ensure appropriate payment to physicians and other practitioners for provision of the immunization administration services that are used to deliver vaccines and plan to review the valuations for these services to ensure appropriate payment. In the interim, given our concern about public access to vaccines and in light of recent public health events, we are maintaining the CY 2019 national payment amount for immunization administration services for CY 2020.

BILLING CODE 4120-01-P

TABLE 26: CY 2020 Work RVUs for New, Revised, and Potentially Misvalued Codes

HCPCS	Descriptor	CY 2019 Work RVU	Proposed CY 2020 Work RVU	Final CY 2020 Work RVU	CMS Work Time Refinement
11981	Insertion, non-biodegradable drug delivery implant	1.48	1.14	1.14	No
11982	Removal, non-biodegradable drug delivery implant	1.78	1.34	1.34	No
11983	Removal with reinsertion, non-biodegradable drug delivery implant	3.30	1.91	1.91	No
15769	Grafting of autologous soft tissue, other, harvested by direct excision (eg, fat, dermis, fascia)	NEW	6.68	6.68	No
15771	Grafting of autologous fat harvested by liposuction technique to trunk, breasts, scalp, arms, and/or legs; 50 cc or less injectate	NEW	6.73	6.73	No
15772	Grafting of autologous fat harvested by liposuction technique to trunk, breasts, scalp, arms, and/or legs; each additional 50 cc injectate, or part thereof (List separately in addition to code for primary procedure)	NEW	2.50	2.50	No
15773	Grafting of autologous fat harvested by liposuction technique to face, eyelids, mouth, neck, ears, orbits, genitalia, hands, and/or feet; 25 cc or less injectate	NEW	6.83	6.83	No
15774	Grafting of autologous fat harvested by liposuction technique to face, eyelids, mouth, neck, ears, orbits, genitalia, hands, and/or feet; each additional 25 cc injectate, or part thereof (List separately in addition to code for primary procedure)	NEW	2.41	2.41	No
20220	Biopsy, bone, trocar, or needle; superficial (eg, ilium, sternum, spinous process, ribs)	1.27	1.65	1.65	No
20225	Biopsy, bone, trocar, or needle; deep (eg, vertebral body, femur)	1.87	2.45	2.45	No
20560	Needle insertion(s) without injection(s); 1 or 2 muscle(s)	NEW	0.32	0.32	No
20561	Needle insertion(s) without injection(s); 3 or more muscles	NEW	0.48	0.48	No
20700	Manual preparation and insertion of drug-delivery device(s), deep (eg, subfascial) (List separately in addition to code for primary procedure)	NEW	1.32	1.50	No
20701	Removal of drug-delivery device(s), deep (eg, subfascial) (List separately in addition to code for primary procedure)	NEW	1.13	1.13	No
20702	Manual preparation and insertion of drug-delivery device(s), intramedullary (List separately in addition to code for primary procedure)	NEW	1.70	2.50	No
20703	Removal of drug-delivery device(s), intramedullary (List separately in addition to code for primary procedure)	NEW	1.80	1.80	No

HCPCS	Descriptor	CY 2019 Work RVU	Proposed CY 2020 Work RVU	Final CY 2020 Work RVU	CMS Work Time Refinement
20704	Manual preparation and insertion of drug-delivery device(s), intra-articular (List separately in addition to code for primary procedure)	NEW	1.80	2.60	No
20705	Removal of drug-delivery device(s), intra-articular (List separately in addition to code for primary procedure)	NEW	2.15	2.15	No
21601	Excision of chest wall tumor including rib(s)	NEW	17.78	17.78	No
21602	Excision of chest wall tumor involving rib(s), with plastic reconstruction; without mediastinal lymphadenectomy	NEW	22.19	22.19	No
21603	Excision of chest wall tumor involving rib(s), with plastic reconstruction; with mediastinal lymphadenectomy	NEW	25.17	25.17	No
22310	Closed treatment of vertebral body fracture(s), without manipulation, requiring and including casting or bracing	3.89	3.45	3.45	No
26020	Drainage of tendon sheath, digit and/or palm, each	5.08	6.84	6.84	No
26055	Tendon sheath incision (eg, for trigger finger)	3.11	3.11	3.11	No
26160	Excision of lesion of tendon sheath or joint capsule (eg, cyst, mucous cyst, or ganglion), hand or finger	3.57	3.57	3.57	No
27220	Closed treatment of acetabulum (hip socket) fracture(s); without manipulation	6.83	5.50	5.50	No
27279	Arthrodesis, sacroiliac joint, percutaneous or minimally invasive (indirect visualization), with image guidance, includes obtaining bone graft when performed, and placement of transfixing device	9.03	9.03	12.13	No
33016	Pericardiocentesis, including imaging guidance, when performed	NEW	4.40	4.40	No
33017	Pericardial drainage with insertion of indwelling catheter, percutaneous, including fluoroscopy and/or ultrasound guidance, when performed; 6 years and older without congenital cardiac anomaly	NEW	4.62	4.62	No
33018	Pericardial drainage with insertion of indwelling catheter, percutaneous, including fluoroscopy and/or ultrasound guidance, when performed; birth through 5 years of age or any age with congenital cardiac anomaly	NEW	5.00	5.40	No
33019	Pericardial drainage with insertion of indwelling catheter, percutaneous, including CT guidance	NEW	4.29	4.29	No
33020	Pericardiotomy for removal of clot or foreign body (primary procedure)	14.95	12.95	14.31	No
33025	Creation of pericardial window or partial resection for drainage	13.70	11.84	13.20	No
33361	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; percutaneous femoral artery approach	25.13	22.47	22.47	No

HCPCS	Descriptor	CY 2019 Work RVU	Proposed CY 2020 Work RVU	Final CY 2020 Work RVU	CMS Work Time Refinement
33362	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open femoral artery approach	27.52	24.54	24.54	No
33363	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open axillary artery approach	28.50	25.47	25.47	No
33364	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open iliac artery approach	30.00	25.97	25.97	No
33365	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transaortic approach (eg, median sternotomy, mediastinotomy)	33.12	26.59	26.59	No
33366	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transapical exposure (eg, left thoracotomy)	35.88	29.35	29.35	No
33858	Ascending aorta graft, with cardiopulmonary bypass, includes valve suspension, when performed; for aortic dissection	NEW	63.40	63.40	No
33859	Ascending aorta graft, with cardiopulmonary bypass, includes valve suspension, when performed; for aortic disease other than dissection (eg, aneurysm)	NEW	45.13	45.13	No
33863	Ascending aorta graft, with cardiopulmonary bypass, with aortic root replacement using valved conduit and coronary reconstruction (eg, Bentall)	58.79	58.79	58.79	No
33864	Ascending aorta graft, with cardiopulmonary bypass with valve suspension, with coronary reconstruction and valve-sparing aortic root remodeling (eg, David Procedure, Yacoub Procedure)	60.08	60.08	60.08	No
33866	Aortic hemiarch graft including isolation and control of the arch vessels, beveled open distal aortic anastomosis extending under one or more of the arch vessels, and total circulatory arrest or isolated cerebral perfusion (List separately in addition to code for primary procedure)	19.74	17.75	17.75	No
33871	Transverse aortic arch graft, with cardiopulmonary bypass, with profound hypothermia, total circulatory arrest and isolated cerebral perfusion with reimplantation of arch vessel(s) (eg, island pedicle or individual arch vessel reimplantation)	NEW	60.88	60.88	No
34717	Endovascular repair of iliac artery at the time of aorto-iliac artery endograft placement by deployment of an iliac branched endograft including pre-procedure sizing and device selection, all ipsilateral selective iliac artery catheterization(s), all associated radiological supervision and interpretation, and all	NEW	9.00	9.00	No

HCPCS	Descriptor	CY 2019 Work RVU	Proposed CY 2020 Work RVU	Final CY 2020 Work RVU	CMS Work Time Refinement
	endograft extension(s) proximally to the aortic bifurcation and distally in the internal iliac, external iliac, and common femoral artery(ies), and treatment zone angioplasty/stenting, when performed, for rupture or other than rupture (eg, for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation, penetrating ulcer, traumatic disruption), unilateral (List separately in addition to code for primary procedure)				
34718	Endovascular repair of iliac artery, not associated with placement of an aorto-iliac artery endograft at the same session, by deployment of an iliac branched endograft, including pre-procedure sizing and device selection, all ipsilateral selective iliac artery catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally in the internal iliac, external iliac, and common femoral artery(ies), and treatment zone angioplasty/stenting, when performed, for other than rupture (eg, for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation, penetrating ulcer), unilateral	NEW	24.00	24.00	No
35701	Exploration not followed by surgical repair, artery; neck (eg, carotid, subclavian)	9.19	7.50	7.50	No

*O. Response to the Comment
Solicitation on Opportunities for
Bundled Payments Under the PFS*

Under the PFS, Medicare typically makes a separate payment for each individual service furnished to a beneficiary consistent with section 1848 of the Act, which requires CMS to establish payment for physicians' services based on the relative resources involved in furnishing the service. The statute defines "services" broadly, with reference to the uniform procedure coding system established by CMS for the purpose of Medicare FFS payments, called the Healthcare Common Procedure Coding System (HCPCS). There are sets of HCPCS codes that represent health care procedures, supplies, medical equipment, products, and services. The majority of physicians' services for which payment

is made under the PFS are described using HCPCS Level I codes and descriptors that are the AMA's Current Procedural Terminology (CPT) code set. CPT codes generally describe an individual item or service, while some codes describe a combination of services (a procedure and imaging guidance, for example) bundled together. Some HCPCS codes explicitly encompass multiple services (global surgery codes, for example), and the PFS payment for some services is reduced when a combination of services is furnished to the same patient on the same day (through multiple procedure payment reduction policies). However, payment for most services under the PFS is made based on rates established for individual services, each described by a CPT code. Identifying and developing appropriate payment policies that aim to achieve better care and improved health for

Medicare beneficiaries is a priority for CMS. Consistent with that goal, we are interested in exploring new options for establishing PFS payment rates or adjustments for services that are furnished together. For purposes of this discussion, we will refer to the circumstances where a set of services is grouped together for purposes of ratesetting and payment as "bundled payment."

One of the mechanisms through which we support innovative payment and service delivery models, for Medicare and other beneficiaries, is through CMS' Center for Medicare and Medicaid Innovation (the Innovation Center). The Innovation Center is currently testing models in which payment for physicians' services is bundled on a per-beneficiary population basis, or is based on episodes of care that usually begin with a triggering

event and extend for a specified period of time thereafter. An example of a model in which payment is made on a per-beneficiary population basis is Comprehensive Primary Care Plus (CPC+), in which participating practices receive prospective per-beneficiary care management fees and Comprehensive Primary Care Payments for certain primary care services such as chronic care management and E/M services. An example of an episode payment model is the Oncology Care Model (OCM), in which participating physician practices receive a per-beneficiary Monthly Enhanced Oncology Services payment for care management and care coordination surrounding chemotherapy administration to cancer patients.

As noted in the CY 2020 PFS proposed rule, we are actively exploring the extent to which these basic principles of bundled payment, such as establishing per-beneficiary payments for multiple services or condition-specific episodes of care, can be applied within the statutory framework of the PFS. As such, we solicited comment on opportunities to expand the concept of bundling to recognize efficiencies among physicians' services paid under the PFS and better align Medicare payment policies with CMS' broader goal of achieving better care for patients, better health for our communities, and lower costs through improvement in our health care system. We believe that the statute, while requiring CMS to pay for physicians' services based on the relative resources involved in furnishing the service, allows considerable flexibility for developing payments under the PFS.

We received public comments on the solicitation on opportunities for bundled payments under the PFS.

Comment: We received many comments in response to this solicitation. Some commenters expressed general support for the concept of bundled payments while urging caution on the design and implementation, suggesting that specialty societies and the CPT Editorial Panel are positioned to identify opportunities for bundled payments. Other commenters stated that bundled payments are not within the statutory authority of the PFS and stated that CMS continue to use the Innovation Center to test these concepts.

Response: We thank the commenters for all the information submitted. We will review the many public comments we received on this topic and consider this issue further for potential future rulemaking.

P. Payment for Evaluation and Management (E/M) Visits

1. Background

a. E/M Visits Coding Structure

Physicians and other practitioners who are paid under the PFS bill for common office visits for evaluation and management (E/M) services under a relatively generic set of CPT codes (Level I HCPCS codes) that distinguish visits based on the level of complexity, site of service, and whether the patient is new or established. These CPT codes are broadly referred to as E/M visit codes and have three key components within their code descriptors: history of present illness (History), physical examination (Exam), and medical decision-making (MDM).⁸³

The CPT code descriptors recognize counseling, care coordination, and the nature of the presenting problem as additional service components, but these are contributory factors in determining which code to report.⁸⁴ Per the CPT code descriptors, counseling and/or care coordination are provided consistent with the nature of the problem and the patient's and/or family's needs. Counseling and care coordination are not required at every patient encounter and can be accounted for in separate coding.⁸⁵

As finalized in the CY 2019 PFS final rule, the amount of time spent by the billing practitioner is not a determining factor in code level selection unless: (1) Counseling and care coordination dominate the visit, in which case time becomes the key factor in determining visit level; and/or (2) the service is a prolonged (or beginning in 2021, "extended") (83 FR 59630) E/M visit. Typical times for each level of E/M visit are included in each of the CPT code descriptors, are used for PFS rate setting purposes, and provide a reference point for the reporting of prolonged visits. Separate add-on codes describe, and can be reported for, visits that take prolonged (or beginning in 2021, "extended") (83 FR 59630) amounts of time.

There are 3 to 5 E/M visit code levels, depending upon site of service and the extent of the three components of history, exam, and MDM. For example, there are 3 to 4 levels of E/M visit codes in the inpatient hospital and nursing facility settings based on a relatively narrow range of complexity in those

settings. In contrast, there are 5 levels of E/M visit codes in the office or other outpatient setting based on a broader range of complexity in those settings.

PFS payment rates for E/M visit codes generally increase with the level of visit billed, although in the CY 2019 PFS final rule (83 FR 59638), for reasons discussed below, we finalized the assignment of a single payment rate for levels 2 through 4 office/outpatient E/M visits beginning in CY 2021. As for all services under the PFS, the payment rates for E/M visits are based on the work (time and intensity), PE, and malpractice expense resources required to furnish the typical case of the service.

In total, E/M visits comprise approximately 40 percent of allowed charges for PFS services, and office/outpatient E/M visits comprise approximately 20 percent of allowed charges for PFS services. Within the E/M services represented in these percentages, there is wide variation in the volume and level of E/M visits billed by different specialties.

According to Medicare claims data, E/M visits are furnished by nearly all specialties, but represent a greater share of total allowed services for physicians and other practitioners who do not routinely furnish procedural interventions or diagnostic tests. Generally, these practitioners include both primary care practitioners and certain specialists such as neurologists, endocrinologists and rheumatologists. Certain specialties, such as podiatry, tend to furnish lower level E/M visits more often than higher level E/M visits. Some specialties, such as dermatology and otolaryngology, tend to bill more E/M visits on the same day as they bill minor procedures.

b. E/M Documentation Guidelines

For CY 2019 and 2020, when coding and billing E/M visits to Medicare, practitioners may use one of two versions of the E/M Documentation Guidelines for a patient encounter, commonly referenced based on the year of their release: the "1995" or "1997" E/M Documentation Guidelines (hereafter, the 1995 and 1997 Guidelines).⁸⁶ These Guidelines specify the medical record information within each of the three key components (such as number of body systems reviewed) that serves as support

⁸³ 2019 CPT Codebook, Evaluation and Management, pp. 6–13.

⁸⁴ 2019 CPT Codebook, Evaluation and Management, pp. 6–13.

⁸⁵ 2019 CPT Codebook, Evaluation and Management, pp. 4–56.

⁸⁶ See <https://www.cms.gov/Outreach-and-Education/Medicare-Learning-Network-MLN/MLNEdWebGuide/Downloads/95Docguidelines.pdf>; <https://www.cms.gov/Outreach-and-Education/Medicare-Learning-Network-MLN/MLNEdWebGuide/Downloads/97Docguidelines.pdf>; and the Evaluation and Management Services guide at <https://www.cms.gov/Outreach-and-Education/Medicare-Learning-Network-MLN/MLNProducts/Downloads/eval-mgmt-serv-guide-ICN006764.pdf>.

for billing a given level of E/M visit. The 1995 and 1997 Guidelines are very similar to the guidelines for E/M visits that currently reside within the AMA's CPT codebook for E/M visits. For example, the core structure of what comprises or defines the different levels of history, exam, and medical decision-

making in the 1995 and 1997 Guidelines are the same as those in the CPT codebook. However, the 1995 and 1997 Guidelines include extensive examples of clinical work that comprise different levels of medical decision-making that do not appear in the AMA's CPT codebook. Also, the 1995 and 1997

Guidelines do not contain references to preventive care that appear in the AMA's CPT codebook. We provide an example of how the 1995 and 1997 Guidelines distinguish between level 2 and level 3 E/M visits in Table 32.

BILLING CODE 4120-01-P

TABLE 32: Key Component Documentation Requirements for Level 2 vs. 3 E/M Visit

Key Component*	Level 2 (1995)	Level 3 (1995)	Level 2 (1997)	Level 3 (1997)
History (History of Present Illness or HPI)	Review of Systems (ROS) n/a	Problem Pertinent ROS: inquires about the system directly related to the problem(s) identified in the HPI	No change from 1995	No change from 1995
Physical Examination (Exam)	A limited examination of the affected body area or organ system	A limited examination of the affected body area or organ system and other symptomatic or related organ system(s)	General multi-system exam: Performance and documentation of one to five elements in one or more organ system(s) or body area(s). Single organ system exam: Performance and documentation of one to five elements	General multi-system exam: Performance and documentation of at least six elements in one or more organ system(s) or body area(s). Single organ system exam: Performance and documentation of at least six elements
Medical Decision Making (MDM) Measured by:** 1. Problem – Number of diagnoses/treatment options 2. Data - Amount and/or complexity of data to be reviewed 3. Risk - Risk of complications and/or morbidity or mortality	Straightforward: 1. Minimal 2. Minimal or no data review 3. Minimal risk	Low complexity: 1. Limited. 2. Limited data review. 3. Low risk.	No change from 1995	

* For certain settings and patient types, each of these three key components must be met or exceeded (for example, new patients; initial hospital visits). For others, only two of the three key components must be met or exceeded (for example, established patients, subsequent hospital or other visits).

** Two of three met or exceeded.

BILLING CODE 4120-01-C

According to both Medicare claims processing manual instructions and CPT coding rules, when counseling and/or coordination of care accounts for more than 50 percent of the face-to-face physician/patient encounter (or, in the case of inpatient E/M services, the floor time) the duration of the visit can be used as an alternative basis to select the appropriate E/M visit level (Pub. 100-04, Medicare Claims Processing Manual, Chapter 12, Section 30.6.1.C available at

<https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/Downloads/clm104c12.pdf>; see also 2019 CPT Codebook Evaluation and Management Services Guidelines, page 10). Pub. 100-04, Medicare Claims Processing Manual, Chapter 12, Section 30.6.1.B states, "Instruct physicians to select the code for the service based upon the content of the service. The duration of the visit is an ancillary factor and does not control the level of the service to be billed unless more than

50 percent of the face-to-face time (for non-inpatient services) or more than 50 percent of the floor time (for inpatient services) is spent providing counseling or coordination of care as described in subsection C." Subsection C states that "the physician may document time spent with the patient in conjunction with the medical decision-making involved and a description of the coordination of care or counseling provided. Documentation must be in sufficient detail to support the claim."

The example included in subsection C further states, “The code selection is based on the total time of the face-to-face encounter or floor time, not just the counseling time. The medical record must be documented in sufficient detail to justify the selection of the specific code if time is the basis for selection of the code.”

Both the 1995 and 1997 Guidelines address time, stating that, “In the case where counseling and/or coordination of care dominates (more than 50 percent of) the physician/patient and/or family encounter (face-to-face time in the office or other outpatient setting or floor/unit time in the hospital or nursing facility), time is considered the key or controlling factor to qualify for a particular level of E/M services.” The Guidelines go on to state that, “If the physician elects to report the level of service based on counseling and/or coordination of care, the total length of time of the encounter (face-to-face or floor time, as appropriate) should be documented and the record should describe the counseling and/or activities to coordinate care.”⁸⁷ Additional manual provisions regarding E/M visits are housed separately within Medicare’s internet-Only Manuals, and are not contained within the 1995 or 1997 Guidelines.

In accordance with section 1862(a)(1)(A) of the Act, which requires services paid under Medicare Part B to be reasonable and necessary for the diagnosis or treatment of illness or injury or to improve the functioning of a malformed body member, medical necessity is a prerequisite to Medicare payment for E/M visits. Pub. 100–04, Medicare Claims Processing Manual, Chapter 12, Section 30.6.1.B states, “Medical necessity of a service is the overarching criterion for payment in addition to the individual requirements of a CPT code. It would not be medically necessary or appropriate to bill a higher level of E/M service when a lower level of service is warranted. The volume of documentation should not be the primary influence upon which a specific level of service is billed. Documentation should support the level of service reported.”

c. Summary of Changes to Coding, Payment and Documentation of Office/Outpatient E/M Visits Finalized for CY 2021 in the CY 2019 PFS Final Rule

In the CY 2019 PFS final rule (83 FR 59452 through 60303), we finalized a number of coding, payment, and documentation changes under the PFS

for office/outpatient E/M visits (CPT codes 99201–99215) to reduce administrative burden, improve payment accuracy, and update this code set to better reflect the current practice of medicine. In summary, we finalized the following policy changes for office/outpatient E/M visits under the PFS effective January 1, 2021:

- Reduction in the payment variation for office/outpatient E/M visit levels by paying a single rate (also referred to as a blended rate) for office/outpatient E/M visit levels 2 through 4 (one rate for established patients and another rate for new patients), while maintaining the payment rate for office/outpatient E/M visit level 5 in order to better account for the care and needs of complex patients. Practitioners will still report the appropriate code for the level of service they furnished, since we did not replace these CPT codes with HCPCS G codes and will continue to use typical times associated with each individual CPT code when time is used to document the office/outpatient E/M visit.

- Permitting practitioners to choose to document office/outpatient E/M level 2 through 5 visits using MDM or time, or the current framework based on the 1995 or 1997 Guidelines.

- As a corollary to the uniform payment rate for level 2–4 E/M visits, when using MDM or the current framework to document the office/outpatient E/M visit, a minimum supporting documentation standard associated with level 2 office/outpatient E/M visits will apply. For these cases, Medicare will require information to support a level 2 office/outpatient E/M visit code for history, exam, and/or MDM.

- When time is used to document, practitioners will document the medical necessity of the office/outpatient E/M visit and that the billing practitioner personally spent the required amount of time face-to-face with the beneficiary. The required face-to-face time will be the typical time for the reported code, except for extended or prolonged visits where extended or prolonged times will apply.

- Implementation of HCPCS add-on G codes that describe the additional resources inherent in visits for primary care and particular kinds of non-procedural specialized medical care (HCPCS codes GPC1X and GCG0X, respectively). These codes were finalized in order to reflect the differential resource costs associated with performing certain types of office/outpatient E/M visits. These codes will only be reportable with office/outpatient E/M level 2 through 4 visits.

- Adoption of a new “extended visit” add-on G code (HCPCS code GPRO1) for use only with office/outpatient E/M level 2 through 4 visits, to account for the additional resources required when practitioners need to spend extended time with the patient for these visits. The existing prolonged E/M codes can continue to be used with levels 1 and 5 office/outpatient E/M visits.

We stated that we believed these policies would allow practitioners greater flexibility to exercise clinical judgment in documentation so they can focus on what is clinically relevant and medically necessary for the beneficiary. We believed these policies will reduce a substantial amount of administrative burden (83 FR 60068 through 60070) and result in limited specialty-level redistributive impacts (83 FR 60060). We stated our intent to continue engaging in further discussions with the public over the next several years to potentially further refine our policies for 2021. We finalized the coding, payment, and documentation changes to reduce administrative burden, improve payment accuracy, and update the code set to better reflect the current practice of medicine.

2. Continued Stakeholder Feedback

In January and February 2019, we hosted a series of structured listening sessions on the forthcoming changes that CMS finalized for office/outpatient E/M visit coding, documentation and payment for CY 2021. These sessions provided an opportunity for CMS to gain further input and information from the wide range of affected stakeholders on these important policy changes. Our goal was to continue to listen and consider perspectives from individual practicing clinicians, specialty associations, beneficiaries and their advocates, and other interested stakeholders to prepare for implementation of the office/outpatient E/M visit policies that we finalized for CY 2021.

In these listening sessions, although stakeholders supported our intention to reduce burdensome, clinically outdated documentation requirements, they noted that in response to the office/outpatient E/M visit policies CMS finalized for CY 2021, the AMA/CPT established the Joint AMA CPT Workgroup on E/M to develop an alternative solution. This workgroup developed an alternative approach, similar to the one we finalized, for office/outpatient E/M coding and documentation. That approach was approved by the CPT Editorial Panel in February 2019, with an effective date of January 1, 2021 and is available on the

⁸⁷ Page 16 of the 1995 E/M guidelines and page 48 of the 1997 guidelines.

AMA's website at <https://www.ama-assn.org/cpt-evaluation-and-management>. Given the CPT coding changes that will take effect in 2021, the AMA RUC also conducted a resurvey and revaluation of the office/outpatient E/M visit codes, and provided us with its recommendations.

Effective January 1, 2021, the CPT Editorial Panel adopted revisions to the office/outpatient E/M code descriptors, and substantially revised both the CPT prefatory language and the CPT interpretive guidelines that instruct practitioners on how to bill these codes. The AMA has approved an accompanying set of interpretive guidelines governing and updating what determines different levels of MDM for office/outpatient E/M visits. Some of the changes made by the CPT Editorial Panel parallel our finalized policies for CY 2021, such as the choice of time or MDM in determination of code level. Other aspects differ, such as the number of code levels retained, presumably for purposes of differential payment; the times, and inclusion of all time spent on the day of the visit; and elimination of options such as the use of history and exam or time in combination with MDM, to select code level.

Many stakeholders have continued to express objections to our assignment of a single payment rate to level 2–4 office/outpatient E/M visits stating that this inappropriately incentivizes multiple, shorter visits and seeing less complex patients. Many stakeholders also stated that the purpose and use of the HCPCS add-on G codes that we established for primary care and non-procedural specialized medical care remain ambiguous, expressed concern that the codes are potentially contrary to current law prohibiting specialty-specific payment, and asserted that Medicare's coding approach is unlikely to be adopted by other payers.

In meetings with stakeholders since we issued the CY 2019 PFS final rule, some stakeholders suggested that only time should be used to select the service level because time is easy to audit, simple to document, and better accounts for patient complexity, in comparison to the CPT Editorial Panel revised MDM interpretive guidance. These stakeholders stated that the implementation of the CPT Editorial Panel revised MDM interpretive guidance will result in the likely increase in the selection of levels 4 and 5, relative to current typical coding patterns. They suggested that to more accurately distinguish varying levels of patient complexity, either the visit levels should be recalibrated so that levels 4 and 5 no longer represent the

most often billed visit, or a sixth level should be added. In these meetings, some stakeholders also stated that the office/outpatient E/M codes fail to capture the full range of services provided by certain specialties, particularly primary care and other specialties that rely heavily on office/outpatient E/M services rather than procedures, systematically undervaluing primary care visits and visits furnished in the context of non-procedural specialty care, thereby creating payment disparities that have contributed to workforce shortages and beneficiary access challenges across a range of specialties. They reiterated that office/outpatient E/M visit codes have not been extensively examined since the creation of the PFS and recommended that CMS conduct an extensive research effort to revise and revalue office/outpatient E/M services through a major research initiative akin to that undertaken when the PFS was first established.

The AMA believes its approach will accomplish greater burden reduction, is more clinically intuitive and reflects the current practice of medicine, and is more likely to be adopted by all payers than the policies CMS finalized for CY 2021. The AMA has posted an estimate of the burden reduction associated with the policies approved at CPT on the AMA's website at <https://www.ama-assn.org/cpt-evaluation-and-management>.

3. CY 2021 PFS Final Policies for Office/Outpatient Visits

a. Overview

In the CY 2020 PFS proposed rule, we discussed our proposal to adopt the CPT coding for office/outpatient E/M visits effective January 1, 2021, noting that the CPT coding changes will necessitate changes to CMS' policies for CY 2021, due to forthcoming changes in code descriptors. In addition, we addressed revaluation of the codes, proposing new values for the codes as revised by CPT, that would also take effect on January 1, 2021. We proposed to assign separate payment rather than a blended rate, to each of the office/outpatient E/M visit codes (except CPT code 99201, which CPT is deleting) and the new prolonged visit add-on CPT code (CPT code 99XXX). We proposed to delete the HCPCS add-on code we finalized last year for CY 2021 for extended visits (GPRO1), and to no longer pay separately for CPT codes 99358–9 (prolonged E/M visit without direct patient contact) in association with office/outpatient E/M visits. We proposed to simplify, consolidate and

revalue the HCPCS add-on codes we finalized last year for CY 2021 for primary care (GPC1X) and non-procedural specialized medical care (GCG0X), and to allow the consolidated single code to be reported with all office/outpatient E/M visit levels (not just levels 2 through 4). All of these changes would be effective January 1, 2021. We noted that our proposed policies would further our ongoing effort to reduce administrative burden, improve payment accuracy, and update the office/outpatient EM visit code set to better reflect the current practice of medicine.

We received many thousands of comments in response to these proposals. The following is a summary of the comments and our response.

b. Public Comments and Responses

(1) Office/Outpatient E/M Visit Coding and Documentation

For CY 2021, for office/outpatient E/M visits (CPT codes 99201–99215), we proposed generally to adopt the new coding, prefatory language, and interpretive guidance framework that has been issued by the AMA/CPT (*see https://www.ama-assn.org/cpt-evaluation-and-management*) because we believed it would accomplish greater burden reduction than the policies we finalized for CY 2021 and would be more intuitive and consistent with the current practice of medicine. We noted that this includes deletion of CPT code 99201 (Level 1 office/outpatient visit, new patient), which the CPT Editorial Panel decided to eliminate as CPT codes 99201 and 99202 are both straightforward MDM and only differentiated by history and exam elements.

Under this new framework, history and exam would no longer be used to select the level of code for office/outpatient E/M visits. Instead, an office/outpatient E/M visit would include a medically appropriate history and exam, when performed. The clinically outdated system for number of body systems/areas reviewed and examined under history and exam would no longer apply, and these components would only be performed when, and to the extent, medically necessary and clinically appropriate. Level 1 visits would only describe or include visits performed by clinical staff for established patients, and the concept of medical decision making would not apply to CPT code 99211.

For levels 2 through 5 office/outpatient E/M visits, the code level reported would be decided based on either the level of MDM (as redefined in

the new AMA/CPT guidance framework) or the total time personally spent by the reporting practitioner on the day of the visit (including face-to-face and non-face-to-face time). Because we would no longer assign a blended payment rate (discussed below), we would no longer adopt the minimum supporting documentation associated with level 2 office/outpatient E/M visits, which we had finalized in the CY 2019 PFS final rule (83 FR 59634) as a corollary to the uniform payment rate for level 2–4 office/outpatient E/M visits when using MDM or the current framework to document the office/outpatient E/M visit. We would adopt the new time ranges within the CPT codes as revised by the CPT Editorial Panel.

Comment: Commenters were generally supportive of our proposals to eliminate the blended payment rate and instead adopt the revised CPT coding and levels for separate payment, including the choice of selecting visit level on the basis of time or MDM. The commenters agreed that these proposals would reduce administrative burden, improve payment accuracy, and better reflect the current practice of medicine. However, a number of commenters disagreed with the new MDM guidelines and believe they need further refinement before implementation. A few commenters believed the revised guidelines represent a critical first step and supported them as such, but were concerned that they fail to capture all the inputs for the visit (especially physical exam) and the complexity (intensity) of the patient with multiple issues; may continue to result in undesired cutting and pasting in the medical record; and fail to properly differentiate levels (particularly level 2 versus 3, and level 3 versus 4). These commenters were concerned that the revised MDM criteria may not prevent upcoding or prevent the accumulation of meaningless or repetitive information in the medical record just for billing purposes, and suggested that CMS work with the Office of the National Coordinator for Health Information Technology (ONC) on ways to accomplish “behind-the-scenes” documentation in support of the data review associated with MDM.

One commenter supported using time as the basis for choosing the E/M code, but expressed concern about using MDM as one of the primary factors to determine E/M levels. This commenter viewed time as the most important factor, and was concerned about MDM levels failing to account for the complexity of neurologic patients and difficulty attaining the highest level of

E/M code using MDM alone. This commenter suggested there will be an increase in reporting of levels 4 and 5 office/outpatient E/M visits under the new construct that may necessitate recalibrating the visit levels.

A few commenters suggested that when time is used to determine visit level selection that it should be based on time spent during the 24-hour period that includes the face-to-face visit, in recognition of those practitioners who see patients during evening clinic hours. Similarly, when MDM is used to determine visit level, some commenters expressed concern that MDM cannot be concluded until practitioners receive test results, which may not occur until after the date of the encounter.

Response: We agree that the MDM guidelines as revised by the AMA/CPT represent a good first step in reducing burden and updating the different levels of MDM for the current practice of medicine, as well as the coming 2021 definitional changes in this code set. We agree with the majority of commenters that time and MDM are each important measures of office/outpatient E/M visit complexity that practitioners should have the option to use to select visit level, and that history and physical exam only need to be performed and documented as medically appropriate. Therefore, we are finalizing our proposal to adopt the MDM guidelines as revised by CPT and allow the use of time or MDM to select office/outpatient E/M visit level beginning January 1, 2021. We share some of the commenters’ concerns about potential resulting shifts in visit levels billed and among specialties, and intend to monitor the claims data to assess any resulting changes. We will continue to consider whether future refinements to the office/outpatient E/M visit code set, its valuation, and supporting documentation may be needed. We refer readers to our comment/response below on the prolonged service codes regarding the applicable time period for the primary office/outpatient E/M visit code and prolonged service code(s). Finally, the AMA/CPT has indicated it will undertake educational efforts on its new guidelines that we expect might clarify outstanding questions such as the application of test results received on subsequent dates when MDM is used to select visit level.

Comment: A few commenters stated that CPT’s new documentation guidelines for the revised office/outpatient E/M code set that would permit code selection based on either MDM or time did not accurately represent MDM activities for urgent care practitioners who report office/

outpatient E/Ms in the urgent care setting. These commenters were concerned that the revised MDM criteria fail to account for the complexity of the patient with multiple issues and would result in inaccurate visit level selection, and recommended that CMS allow urgent care practitioners to use either the 1995 and 1997 Guidelines or CPT’s new documentation guidelines for the revised office/outpatient E/M code set and allow data to be gathered to monitor it over time.

Response: We appreciate these concerns, but we believe that allowing practitioners to use either the 1995 and 1997 Guidelines or CPT’s new documentation guidelines for the revised office/outpatient E/M code set would create further burden. In the CY 2019 PFS proposed rule, we proposed to allow practitioners a choice between the 1995 and 1997 Guidelines, MDM alone, or time alone to document office/outpatient E/M services. In response to this proposal, commenters stated that “such a policy would introduce too much variation in medical record format and content, or too many potential frameworks against which an auditor might review a claim” (83 FR 59633). Because we believe that CPT’s new documentation guidelines for the revised office/outpatient E/M code set accomplishes greater burden reduction than the policies we finalized for CY 2021 in the CY 2019 PFS final rule, we are finalizing our proposal to adopt the MDM guidelines as revised by CPT and allow the use of time or MDM to select office/outpatient E/M visit level. We share some of the commenters’ concerns about potential resulting shifts in visit levels billed and among specialties, and intend to monitor the claims data to assess any resulting changes. We will continue to consider whether future refinements to the office/outpatient E/M visit code set, its valuation, and supporting documentation may be needed.

We interpreted the revised CPT prefatory language and reporting instructions to mean that there would be a single add-on CPT code for prolonged office/outpatient E/M visits (CPT code 99XXX (*Prolonged office or other outpatient evaluation and management service(s) (beyond the total time of the primary procedure which has been selected using total time), requiring total time with or without direct patient contact beyond the usual service, on the date of the primary service; each 15 minutes (List separately in addition to codes 99205, 99215 for office or other outpatient Evaluation and Management services)*)) that would only be reported when time is used for code level

selection and the time for a level 5 office/outpatient visit (the floor of the level 5 time range) is exceeded by 15

minutes or more on the date of service. We demonstrated how prolonged office/

outpatient E/M visit time would be reported:

TABLE 33: Proposed Total Practitioner Times for Office/Outpatient E/M Visits When Time Is Used to Select Visit Level

Established Patient Office/Outpatient E/M Visit (Total Practitioner Time, When Time is Used to Select Code Level)	CPT code
40–54 minutes	99215
55–69 minutes	99215x1 and 99XXXx1
70–84 minutes	99215x1 and 99XXXx2
85 or more minutes	99215x1 and 99XXXx3 or more for each additional 15 minutes
New Patient Office/Outpatient E/M Visit (Total Practitioner Time, When Time is Used to Select Code Level)	CPT code
60–74 minutes	99205
75–89 minutes	99205x1 and 99XXXx1
90–104 minutes	99205x1 and 99XXXx2
105 or more minutes	99205x1 and 99XXXx3 or more for each additional 15 minutes

Comment: Commenters supported the proposal to adopt CPT code 99XXX to report all prolonged time spent on the day of the visit. Several commenters sought to clarify that day or date of visit means the 24-hour period for the date of service of the reported office/outpatient E/M visit code.

Response: We are finalizing our proposal to adopt CPT code 99XXX to report all prolonged time spent on the date of the primary office/outpatient E/M visit code, which is the 24-hour period for the date of service reported for the primary office/outpatient E/M visit code.

We also proposed to adopt our interpretation of the revised CPT prefatory language and reporting instructions, that CPT codes 99358–9 (*Prolonged E/M without Direct Patient Contact*) would no longer be reportable in association or “conjunction” with office/outpatient E/M visits. In other words, when using time to select office/outpatient E/M visit level, any additional time spent by the reporting practitioner on a prior or subsequent date of service (such as reviewing medical records or test results) could not count toward the required times for reporting CPT codes 99202–99215 or 99XXX, or be reportable using CPT codes 99358–9. This interpretation would be consistent with the way the office/outpatient E/M visit codes were resurveyed, where the AMA/RUC instructed practitioners to consider all time spent 3 days prior to, or 7 days after, the office/outpatient E/M visit (*see below for a discussion of revaluation proposals*). Moreover we noted that CPT

codes 99358 and 99359 describe time spent beyond the “usual” time (CPT prefatory language), and it was not clear what would comprise “usual” time given the new time ranges for the office/outpatient E/M visit codes and new CPT code 99XXX (prolonged office/outpatient E/M visit).

New CPT prefatory language specifies, “For prolonged services on a date other than the date of a face-to-face encounter, including office or other outpatient services (99202, 99203, 99204, 99205, 99211, 99212, 99213, 99214, 99215), see 99358, 99359 . . . Do not report 99XXX in conjunction with . . . 99358, 99359”. We did not believe CPT code 99211 should be included in this list of base codes since it will only include clinical staff time. Also, given that CPT codes 99358, 99359 can currently be used to report practitioner time spent on any date (the date of the visit or any other day), and it was not clear whether CPT changed this rule, the CPT reporting instruction “see 99358, 99359” seemed circular. The new prefatory language seemed unclear regarding whether CPT codes 99358, 99359 could be reported instead of, or in addition to, CPT code 99XXX, and whether the prolonged time would have to be spent on the visit date, within 3 days prior or 7 days after the visit date, or outside of this new 10-day window relevant for the base code.

We solicited public input on the proposal and whether it would be appropriate to interpret the CPT reporting instructions for CPT codes 99358–99359 as proposed, as well as how this interpretation may impact valuation. We stated our belief that CPT

codes 99358 and 99359 may need to be redefined, resurveyed and revalued. After internal review, we believed that when time is used to select visit level, having one add-on code (CPT code 99XXX) instead of multiple add-on codes for additional time may be administratively simpler and most consistent with our goal of documentation burden reduction.

HCPCS code GPRO1 (*extended office/outpatient E/M time*) would no longer be needed because the time described by this code would instead be described by a level 3, 4 or 5 office/outpatient E/M visit base code and, if applicable, the single new add-on CPT code for prolonged office/outpatient E/M visits (CPT code 99XXX). Therefore, we proposed to delete HCPCS code GPRO1 for CY 2021. We proposed to adopt the AMA/CPT prefatory language that lists qualifying activities that could be included when time is used to select the visit level. Alternatively, if MDM is used to choose the visit level, time would not be relevant to code selection.

Comment: Some commenters sought clarification on apparent overlap between CPT codes 99358–99359 and 99XXX, and recommended that CPT review this. Some commenters specified that there should continue to be a way to code and bill separately for prolonged time spent on a day other than the visit, such as for medical record review in advance of a new patient visit. In their public comment, the AMA/RUC noted that CPT codes 99358–99359 are not frequently reported, and recommended that the CPT/RUC Workgroup on E/M should review the issues raised in our

proposed rule regarding CPT codes 99358–99359 and ensure that the codes and guidelines are clarified, as needed, prior to any future RUC survey.

Response: Since Medicare began separately paying for CPT codes 99358–99359 in 2017 under the PFS, their PFS utilization has increased more than ten-fold from approximately 10,000 claim lines in 2016 to approximately 126,000 claim lines in 2018. While this remains a small percentage of E/M visit claims, utilization may further increase once all office/outpatient E/M visits can be reported on the basis of time alone and new activities such as documenting clinical information are explicitly counted as qualifying time. We continue to believe that the new CPT prefatory language on these codes is difficult to follow and interpret. For example, it states, “for prolonged time without direct patient contact on the date of office or other outpatient services, use 99xxx. Codes 99358, 99359 may also be used for prolonged services on a date other than the date of a face-to-face encounter.” But for CPT code 99xxx it states not to report 99xxx in conjunction with 99358, 99359 which could mean not to report 99358–99359 if 99xxx is reported, even on a separate day. Additionally, CPT would allow reporting at the midpoint of time for CPT codes 99358–99359 but not 99XXX, and these codes have discrepant time increments (one hour for CPT codes 99358–9 reportable after the midpoint, and 15 minutes for CPT code 99XXX not reportable after the midpoint).

Under the new CPT framework allowing the use of time to select visit level and the new list of qualifying activities, there is a new Medicare program vulnerability and potential increased beneficiary cost sharing associated with the inability to assess what visit(s) prolonged service codes reported on a date other than the visit are associated with and, accordingly, to assess whether the prolonged time was reasonable and necessary. If more than one visit was furnished (for example, if a beneficiary has an inpatient visit or another outpatient visit by the same practitioner within a wide time range of a given office/outpatient visit), it would not be clear which visit the prolonged time reported under CPT codes 99358–99359 is associated with for evaluating medical necessity and increments of time in relation to the base/companion code.

We continue to believe it would be administratively simpler and improve payment accuracy and program integrity to have only a single add-on code specific to prolonged office/outpatient E/M visits that is clearly linked to the

companion E/M office/outpatient visit code. We believe that under the new coding framework, CPT codes 99358–99359 are potentially misvalued, need to be revised for clarity and present new program integrity challenges. Therefore, we are finalizing our proposal that CPT codes 99358–99359 will not be payable in association with office/outpatient E/M visits beginning in CY 2021. We will consider future changes made to these codes by the CPT Editorial Panel or the RUC for possible future rulemaking. We note that a number of other codes such as CCM, TCM, and other care management codes may be used to report time spent outside the direct patient contact on dates other than the office/outpatient visit, if the reporting requirements for those services are met. While these care management codes are not identical to the prolonged visit codes, they can be used to report a number of similar activities.

Comment: Commenters supported the proposal to delete HCPCS code GPRO1 for CY 2021 and to adopt the AMA/CPT prefatory language that lists qualifying activities that could be included when time is used to select the visit level. Alternatively, if MDM is used to choose the visit level, time would not be relevant to code selection.

Response: We are finalizing as proposed that GPRO1 will be deleted. Also, the new CPT prefatory language listing qualifying activities that can be included when time is used to select the visit level will apply for purposes of PFS payment. Alternatively, if MDM is used to choose the visit level, time will not be relevant to code selection.

Comment: Several commenters expressed concern regarding the use of physician and nonphysician practitioner (NPP) time and documentation as it pertains to a split/shared encounter when a beneficiary sees both the physician and NPP at one visit. One commenter questioned whether, when considering the use of an add-on code for time, the documented time would be limited to only one practitioner’s time spent providing the service, or the time could include a combination of more than one physician and/or clinician providing the service. Another commenter stated that the CPT guidelines are inconsistent with the Medicare guidelines for split/shared E/M services. The commenter stated that per CMS guidelines, “split/shared” office visit E/M services only apply to established patients, while the new CPT introductory guidelines for the new patient office visit codes 99202–99205, specifically describe “incident to” work and time of both the physician and QHP for selecting a level of code. The

commenter requested CMS clarify its incident-to policy rules relative to the revised CPT guidelines for new patient office visit codes.

One commenter requested that CMS consider the impact to the split/shared services guidelines as it incorporates documentation from a physician and a NPP. The commenter stated that policies set forth by the Medicare Administrative Contractors (MACs) require specific documentation of the second practitioner’s participation in the delivery of the service in the medical record to support medical necessity for their participation and inquired how the impact of time and medical decision making changes impact these other regulations. The commenter detailed their concerns with the current proposal as it relates to split/shared services and asked whether CMS would clarify or redefine the documentation requirements for physician assistants (PAs) advanced practice registered nurses (APRNs), or physicians for these types of services. The commenter further requested clarification on how best to select appropriate E/M levels when practitioners use time to support their levels of service and two practitioner types are involved in furnishing care to the same patient on the same day. The commenter also asked whether CMS is considering a change in payment for PAs and APRNs, if so, whether it would be at the same rate for physician, and if not, how these new proposed documentation changes define the billing practitioner.

Response: We did not make any proposals specific to split/shared services in the CY 2020 PFS proposed rule. We thank the public commenters for raising these issues. We will review and take into account the public comments received on this topic and will consider the issues raised in the comments for possible future rulemaking.

Comment: Several commenters expressed concern that practitioners who report E/M services in multiple settings (for example, hospital inpatient services, emergency department services) would be required to document and create billing protocols under one set of rules for office/outpatient E/M visits and another set of rules for other E/M settings. These commenters recommended that CMS should apply CPT’s new documentation guidelines for the revised office/outpatient E/M code set to all E/M services in all settings.

Response: Although we did not make any proposals in this regard for CYs 2020 or 2021, we appreciate the

information submitted. We will review and take into account the public comments received on this topic and will consider the issues raised in the comments for possible future rulemaking.

(2) Office/Outpatient E/M Visit Revaluation (CPT Codes 99201 Through 99215)

We received valuation recommendations from the AMA RUC for the revised office/outpatient E/M visit codes (CPT codes 99201 through 99215) following completion of its survey and revaluation process for these codes. Although these codes do not take effect until CY 2021, we believed that it was appropriate to follow our usual process of addressing the valuation of the revised office/outpatient E/M visit codes through rulemaking after we receive the RUC recommendations. Additionally, establishing values for the new codes through rulemaking this year will allow more time for clinicians to make any necessary process and systems adjustments before they begin using the codes. In recent years, we have considered how best to update and revalue the office/outpatient E/M visit codes as they represent a significant proportion of PFS expenditures.

MedPAC has had longstanding concerns that office/outpatient E/M services are undervalued in the PFS, and in its March 2019 Report to Congress, further asserted that the office/outpatient E/M code set has become passively devalued as values of these codes have remained unchanged, while the coding and valuation for other types of services under the fee schedule have been updated to reflect changes in medical practice (see pages 120 through 121 at http://www.medpac.gov/docs/default-source/reports/mar19_medpac_ch4_sec.pdf?sfvrsn=0).

In April 2019, the RUC provided us the results of its review, and recommendations for work RVUs, PE inputs and physician time (number of minutes) for the revised office/outpatient E/M visit code set. Please note that these changes in coding and values are for the revised office/outpatient E/M visit code set and a new 15-minute prolonged services code. That code set is effective beginning in CY 2021, and the values would go into effect with those codes as of January 1, 2021.

We proposed to adopt the RUC-recommended work RVUs for all of the office/outpatient E/M visit codes and the new prolonged services add-on code. Specifically, we proposed a work RVU of 0.93 for CPT code 99202 (*Office or other outpatient visit for the*

evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 15–29 minutes of total time is spent on the date of the encounter), a work RVU of 1.6 for CPT code 99203 (*Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30–44 minutes of total time is spent on the date of the encounter*), a work RVU of 2.6 for CPT code 99204 (*Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45–59 minutes of total time is spent on the date of the encounter*), a work RVU of 3.5 for CPT code 99205 (*Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60–74 minutes of total time is spent on the date of the encounter. (For services 75 minutes or longer, see Prolonged Services 99XXX)*), a work RVU of 0.18 for CPT code 99211 (*Office or other outpatient visit for the evaluation and management of an established patient, that may not require the presence of a physician or other qualified health care professional. Usually, the presenting problem(s) are minimal*), a work RVU of 0.7 for CPT code 99212 (*Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 10–19 minutes of total time is spent on the date of the encounter*), a work RVU of 1.3 for CPT code 99213 (*Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 20–29 minutes of total time is spent on the date of the encounter*), a work RVU of 1.92 for CPT code 99214 (*Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of*

time for code selection, 30–39 minutes of total time is spent on the date of the encounter), a work RVU of 2.8 for CPT code 99215 (*Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 40–54 minutes of total time is spent on the date of the encounter. (For services 55 minutes or longer, see Prolonged Services 99XXX)*) and a work RVU of 0.61 for CPT code 99XXX (*Prolonged office or other outpatient evaluation and management service(s) (beyond the total time of the primary procedure which has been selected using total time), requiring total time with or without direct patient contact beyond the usual service, on the date of the primary service; each 15 minutes (List separately in addition to codes 99205, 99215 for office or other outpatient Evaluation and Management services)*).

Regarding the RUC recommendations for PE inputs for these codes, we proposed to remove equipment item ED021 (*computer, desktop, with monitor*), as we do not believe that this item would be allocated to the use of an individual patient for an individual service; rather, we believe this item is better characterized as part of indirect costs similar to office rent or administrative expenses as per our standard process for refining PE for this and other services.

The information we reviewed on the RUC valuation exercise was based on an extensive survey the RUC conducted of more than 50 specialty societies. For purposes of valuation, survey respondents were asked to consider the total time spent on the day of the visit, as well as any pre- and post-service time occurring within a timeframe of 3 days prior to the visit and 7 days after, respectively. This is different from the way codes are usually surveyed by the RUC for purposes of valuation, where pre-, intra-, and post-service time were surveyed, but not within a specific timeframe. The RUC then separately averaged the survey results for pre-service, day of service, and post-service times, and the survey results for total time, with the result that, for some of the codes, the sum of the times associated with the three service periods does not match the RUC-recommended total time. The RUC's approach sometimes resulted in two conflicting sets of times: The component times as surveyed and the total time as surveyed. Although we proposed to adopt the RUC-recommended times as explained below, we solicited comment on how

CMS should address the discrepancies in times, which have implications both for valuation of individual codes and for PFS ratesetting in general, as the intra-service times and total times are used as references for valuing many other services under the PFS and that the

programming used for PFS ratesetting requires that the component times sum to the total time. Specifically, we solicited comment on which times should CMS use, and how we should resolve differences between the component and total times when they

conflict. Table 34 illustrates the surveyed times for each service period and the surveyed total time. It also shows the actual total time if summed from the component times.

TABLE 34: RUC-Recommended Pre-, Intra-, Post-Service Times, RUC-Recommended Total Times for CPT codes 99202-99215 and Actual Total Time

HCPCS	Pre-Service Time	Intra-Service Time	Immediate Post-Service Time	Actual Total Time	RUC-recommended Total Time
99202	2	15	3	20	22
99203	5	25	5	35	40
99204	10	40	10	60	60
99205	14	59	15	88	85
99211		5	2	7	7
99212	2	11	3	16	18
99213	5	20	5	30	30
99214	7	30	10	47	49
99215	10	45	15	70	70

Table 35 summarizes the current office/outpatient E/M visit code set, and the new prolonged services code

physician work RVUs and total time compared to what CMS finalized in CY

2019 for CY 2021, and the RUC-recommended work RVU and total time.

TABLE 35: Side by Side Comparison of Work RVUs and Physician Time for the Office/Outpatient E/M Services Code Set, and the New Prolonged Services Code (Current Versus Revised)

HCPCS Code	Current Total Time (mins)	Current Work RVU	CY 2021 Total Time (mins)	CY 2021 Work RVU	RUC rec Total Time (mins)	RUC rec Work RVU
99201	17	0.48	17	0.48	N/A	N/A
99202	22	0.93	22	1.76	22	0.93
99203	29	1.42	29	1.76	40	1.6
99204	45	2.43	45	1.76	60	2.6
99205	67	3.17	67	3.17	85	3.5
99211	7	0.18	7	0.18	7	0.18
99212	16	0.48	16	1.18	18	0.7
99213	23	0.97	23	1.18	30	1.3
99214	40	1.5	40	1.18	49	1.92
99215	55	2.11	55	2.11	70	2.8
99XXX	N/A	N/A	N/A	N/A	15	0.61

The RUC recommendations reflect a rigorous and robust survey approach, including surveying over 50 specialty societies, demonstrate that office/outpatient E/M visits are generally more complex, for most clinicians. In the CY 2019 PFS final rule, we finalized for CY 2021 a significant reduction in the payment variation in office/outpatient E/M visit levels by paying a single blended rate for E/M office/outpatient visit levels 2 through 4 (one for

established and another for new patients). We also maintained the separate payment rates for E/M office/outpatient level 5 visits in order to better account for the care and needs of particularly complex patients. We believed that the single blended payment rate for E/M office/outpatient visit levels 2-4 better accounted for the resources associated with the typical visit. After reviewing the RUC recommendations, in conjunction with

the revised code descriptors and documentation guidelines for CPT codes 99202 through 99215, we believe codes and recommended values would more accurately account for the time and intensity of office/outpatient E/M visits than either the current codes and values or the values we finalized in the CY 2019 PFS final rule for CY 2021. Therefore, we proposed to establish separate values for Levels 2-4 office/outpatient E/M visits for both new and

established patients rather than continue with the blended rate. We proposed to accept the RUC-recommended work and time values for the revised office/outpatient E/M visit codes without refinement for CY 2021. With regard to the RUC's recommendations for PE inputs, we proposed to remove equipment item ED021 (computer, desktop, with monitor), as this item is included in the overhead costs. Note that these changes to codes and values would go into effect January 1, 2021.

We received public comments on the proposed Office/Outpatient E/M Visit Revaluation provisions. The following is a summary of the comments we received and our responses.

Comment: The majority of commenters supported revision of CMS' finalized policies, including blended payment rate for levels 2–4 and CMS' proposed adoption of the RUC recommended values for CPT codes 99202–99215, and 99xxx, deleting CPT code 99201, and maintaining separate payment for the remaining codes.

A few commenters expressed concern with the RUC-recommended values, stating that the standard for compelling evidence had not been met, that the survey instrument was flawed, and that the survey respondents may not have understood the survey method or the new coding guidance itself. These commenters urged CMS to delay implementation of the RUC-recommended times and RVUs until the public is more familiar with the new coding system, at which time the codes could be resurveyed by the RUC.

Response: With regard to the concerns raised regarding the RUC survey process and revaluation effort, we recognize that valuation of codes is an iterative process and that estimates may need to be updated. Due to the robust nature of the survey and the consensus of the RUC participants, we believe that the combination of adopting the CPT's revised code set and accepting the RUC-recommended values will represent a significant improvement in the description and payment of office and outpatient E/M visits over the current coding and values. We believe the RUC process and resultant recommendations provide a sufficient basis on which to set values for CY 2021; and that this is especially so given that there is sufficient time to consider any additional information developed before the new code set and values take effect. We note that the updated values are not effective until CY 2021, and will consider additional information pertaining to valuation of these services if submitted prior to the February 10,

2020 deadline for submission of RUC and/or stakeholder valuation recommendations to be considered for CY 2021 rulemaking.

Comment: Most commenters did not support the classification of equipment item ED021 (computer, desktop, with monitor) as an indirect PE, stating that the computer was an important part of furnishing the service, used for documentation or to view test results, and was not available for other uses while a visit was being furnished. A few commenters suggested that the office/outpatient E/M visit codes should include as direct PE 2 minutes for identifying and obtaining imaging, lab, or other test results.

Response: We continue to believe that ED021 is best characterized as an indirect PE. Although desktop computers may be used perform not only administrative tasks, but also a number of clinical tasks such as recording information about the patient obtained during evaluation or accessing the patient's history during the visit, we continue to believe that the majority of the functionality of a desktop computer is not individually allocable to a particular patient for a particular service. We also note that there are a number of services similar to an office visit, such as CPT code 99483 (*Assessment of and care planning for a patient with cognitive impairment, requiring an independent historian, in the office or other outpatient, home or domiciliary or rest home, with all of the following required elements: Cognition-focused evaluation including a pertinent history and examination; Medical decision making of moderate or high complexity; Functional assessment (e.g., basic and instrumental activities of daily living), including decision-making capacity; Use of standardized instruments for staging of dementia (e.g., functional assessment staging test [FAST], clinical dementia rating [CDR]); Medication reconciliation and review for high-risk medications; Evaluation for neuropsychiatric and behavioral symptoms, including depression, including use of standardized screening instrument(s); Evaluation of safety (e.g., home), including motor vehicle operation; Identification of caregiver(s), caregiver knowledge, caregiver needs, social supports, and the willingness of caregiver to take on caregiving tasks; Development, updating or revision, or review of an Advance Care Plan; Creation of a written care plan, including initial plans to address any neuropsychiatric symptoms, neuro-cognitive symptoms, functional limitations, and referral to community resources as needed (e.g., rehabilitation*

services, adult day programs, support groups) shared with the patient and/or caregiver with initial education and support. Typically, 50 minutes are spent face-to-face with the patient and/or family or caregiver) and CPT code 99490 (Chronic care management services, at least 20 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month, with the following required elements: Multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient; chronic conditions place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline; comprehensive care plan established, implemented, revised, or monitored) that do not include equipment item ED021 as a direct PE input despite specifically requiring information be entered into an EHR or other tasks that would typically be completed using a desktop computer. Beyond the classification of the desktop computer as an indirect PE, we believe that the PE inputs as recommended to CMS by the RUC are accurate, and as such, we do not agree that additional time is needed for identifying and obtaining imaging, lab, or other test results.

Comment: Many commenters recommended that, for purposes of ratesetting and the CMS time file, CMS should consider total time to be the median total time as recommended by the RUC.

Response: We thank the commenters for their suggestions. Currently, for ratesetting and the CMS time file, the total time for the office/outpatient E/M code set is the sum of pre-, intra-, and post-service times. If we were to consider the median total time as recommended by commenters and the RUC, then the pre-, intra-, and post-services times would no longer, in some instances, sum to the total. As we noted in the proposed rule, this has implications both for valuation of individual codes and for PFS ratesetting in general, as the intra-service times and total times are used as references for valuing many other services under the PFS and that the programming used for PFS ratesetting requires that the component times sum to the total time. We will continue to consider this issue in future rulemaking.

Comment: Many commenters expressed concerns about the redistributive impact of revaluing of the office/outpatient E/M visit code set, particularly for practitioners who do not routinely bill office/outpatient E/M visits. Commenters suggested a number of strategies CMS could use to mitigate

the negative redistributive impact, such as phasing the changes in over 4 or 5 years, capping increases or decreases, conducting claims-based analysis, and working with Congress to ensure that these changes would not negatively impact the CY 2021 conversion factor.

Response: As these office/outpatient E/M visit codes make up around 20 percent of total PFS expenditures, we understand commenters' concerns with the magnitude of the redistributive adjustment necessary to budget neutralize the increased values. Given that these revised codes and values do not take effect until CY 2021, and we do not know the magnitude of redistribution resulting from other policies we may adopt through rulemaking before then, we believe it would be premature to finalize a strategy in this final rule as these values would not be effective until CY 2021. However, we intend to consider these concerns and address them in future rulemaking.

Based on our review of public comments, we are finalizing valuation for CPT codes 99202 through 99215, as proposed for implementation beginning in CY 2021.

(3) Simplification, Consolidation and Revaluation of HCPCS Codes GCG0X and GPC1X

Although we believe that the RUC-recommended values for the revised office/outpatient E/M visit codes will more accurately reflect the resources involved in furnishing a typical office/outpatient E/M visit, we believe that the revalued office/outpatient E/M visit code set itself still does not appropriately reflect differences in resource costs between certain types of office/outpatient E/M visits. In the CY 2019 PFS proposed rule, we articulated that, based on stakeholder comments, clinical examples, and our review of the literature on office/outpatient E/M services, there are three types of office/outpatient E/M visits that differ from the typical office/outpatient E/M visit and are not appropriately reflected in the current office/outpatient E/M visit code set and valuation. These three types of office/outpatient E/M visits can be distinguished by the mode of care provided and, as a result, have different resource costs. The three types of office/outpatient E/M visits that differ from the typical office/outpatient E/M service are: (1) Separately identifiable office/outpatient E/M visits furnished in conjunction with a global procedure; (2) primary care office/outpatient E/M visits for continuous patient care; and (3) certain types of specialist office/outpatient E/M visits. We proposed, but

did not finalize, the application of a multiple procedure payment reduction (MPPR) to the first category of visits, to account for overlapping resource costs when office/outpatient E/M visits were furnished on the same day as a 0-day global procedure. To address the shortcomings in the E/M code set in appropriately describing and reflecting resource costs for the other two types of office/outpatient E/M visits, we proposed and finalized the two HCPCS G codes: HCPCS code GCG0X (*Visit complexity inherent to evaluation and management associated with non-procedural specialty care including endocrinology, rheumatology, hematology/oncology, urology, neurology, obstetrics/gynecology, allergy/immunology, otolaryngology, interventional pain management, cardiology, nephrology, infectious disease, psychiatry, and pulmonology (Add-on code, list separately in addition to level 2 through 4 office/outpatient evaluation and management visit, new or established)*) which describes the inherent complexity associated with certain types of specialist visits and GPC1X (*Visit complexity inherent to evaluation and management associated with primary medical care services that serve as the continuing focal point for all needed health care services (Add-on code, list separately in addition to level 2 through 4 office/outpatient evaluation and management visit, new or established)*), which describes additional resources associated with primary care visits.

Although we finalized two separate codes, we valued both HCPCS codes GCG0X and GPC1X via a crosswalk to 75 percent of the work and time value of CPT code 90785 (*Interactive complexity (List separately in addition to the code for primary procedure)*). Interactive complexity is an add-on code that may be billed when a psychotherapy or psychiatric service requires more work due to the complexity of the patient, and we believed that 75 percent of its work and time values accurately captured the additional resource costs of primary care office/outpatient E/M visits and certain types of specialty office/outpatient E/M visits when billed with the single, blended payment rate for office/outpatient E/M visit levels 2–4.

In the CY 2019 PFS final rule, we stated that, due to the variation among the types of visits performed by certain specialties, we did not believe that the broad office/outpatient E/M visit code set captured the resource costs associated with furnishing primary care and certain types of specialist visits (FR 83 59638). As we stated above, we

believe that the revised office/outpatient E/M visit code set and RUC-recommended values more accurately reflect the resources associated with a typical visit. However, we believe the typical visit described by the revised code set still does not adequately describe or reflect the resources associated with primary care and certain types of specialty visits.

As such, we believe that there is still a need for add-on coding because the revised office/outpatient E/M visit code set does not recognize that there are additional resource costs inherent in furnishing some kinds of office/outpatient E/M visits. However, based on previous public comments and ongoing engagement with stakeholders, we understand the need for the add-on code(s) and descriptor(s) to be easy to understand and report when appropriate, including in terms of medical record documentation and billing. We also clarify that the add-on coding is not intended to reflect any difference in payment based on the billing practitioner's specialty, but rather the recognition of different per-visit resource costs based on the kinds of care the practitioner provides, regardless of their specialty. Therefore, we proposed to simplify the coding by consolidating the two add-on codes into a single add-on code and revising the single code descriptor to better describe the work associated with visits that are part of ongoing, comprehensive primary care and/or visits that are part of ongoing care related to a patient's single, serious, or complex chronic condition.

We proposed to revise the descriptor for HCPCS code GPC1X and delete HCPCS code GCG0X. The proposed descriptor for GPC1X appears in Table 36. We solicited comment regarding the proposed changes, particularly the proposed new code descriptor for GPC1X and whether or not more than one code, similar to the policy finalized last year, would be necessary or beneficial.

We have also reconsidered the appropriate valuation for this HCPCS add-on G-code in the context of the revised office/outpatient E/M visit code set and proposed values. Upon further review and in light of the other changes to the office/outpatient E/M visit code set, we believe that valuing the add-on code at 75 percent of CPT code 90785 would understate the additional inherent intensity associated with furnishing primary care and certain types of specialty visits. As CPT code 90785 also describes additional work associated with certain psychotherapy or psychiatric visits, we believe its work

and time values are the most appropriate crosswalk for the revised HCPCS code GPC1X. Therefore, we proposed to value HCPCS code GPC1X at 100 percent of the work and time values for CPT code 90785, and proposed a work RVU of 0.33 and a physician time of 11 minutes. We also proposed that this HCPCS add-on G

code could be billed as applicable with every level of office/outpatient E/M visit, and that we would revise the code descriptor to reflect that change. See Table 36 for the changes to the code descriptor. We note that if the CPT Editorial Panel makes any further changes to the office/outpatient E/M visit codes and descriptors, or creates

one or more CPT codes that duplicate this add-on code, or if the RUC and/or stakeholders or other public commenters recommend values for these or other related codes, we would consider them through subsequent rulemaking.

TABLE 36: Revaluation of HCPCS Add-on G code Finalized for CY 2021

HCPCS Code	Proposed Code Descriptor Revisions	FR 2019 total time (mins)	FR 2019 Work RVU	Total Time (mins)	Work RVU
GPC1X	<i>Visit complexity inherent to evaluation and management associated with medical care services that serve as the continuing focal point for all needed health care services and/or with medical care services that are part of ongoing care related to a patient's single, serious, or complex chronic condition. (Add-on code, list separately in addition to office/ outpatient evaluation and management visit, new or established)</i>	8.25	0.25	11	0.33

We received public comments on the proposed Simplification, Consolidation and Revaluation of HCPCS codes GCG0X and GPC1X. The following is a summary of the comments we received and our responses.

Comment: Many commenters who rely upon the level 4 and 5 office/outpatient E/M visits to report the majority of their services were very supportive of the consolidation and redefinition of HCPCS codes GCG0X and GPC1X. Commenters agreed with CMS in that, although the revalued office/outpatient E/M visit codes better account for the intensity associated with furnishing these services, there are additional resources associated with primary care and certain types of non-procedural specialty care that are not captured by the revalued codes. Commenters also stated that the revised descriptor was clearer in that it did not allude to certain specialties specifically, but described the work associated with primary care or ongoing care related to a patient's single, serious, or complex chronic condition. Commenters generally supported CMS' proposal to change the level of visits billable with HCPCS code GPC1X from level 2–4 new or established patient visits to all visit levels, although a few commenters stated that it would only be billable with the level 4 and 5 visits because the clinical vignettes associated with those services describe patients with single, serious or complex chronic problem whereas the vignettes associated with

the lower level office/outpatient E/M visit codes do not. Commenters also supported the increased work RVU.

Response: We thank the commenters for their support and generally agree with these comments. We note that clinical vignettes are meant to describe a typical patient for purposes of code valuation. Given the wide variety of visit types billable with the office/outpatient E/M visit code set, we do not believe that the value associated with the typical patient accounts for the additional resources associated with primary care or ongoing care related to a patient's single, serious, or complex chronic condition, regardless of the visit level. Therefore, we do not agree that billing HCPCS code GPC1X should be restricted to higher level office/outpatient E/M visits.

Comment: A few commenters recommended that the code descriptor for GPC1X be modified as follows (additions italicized): "Visit complexity inherent to evaluation and management associated with medical care services that serve as the *first contact* and continuing focal point for all needed health care services *in coordination with others as needed* and/or with medical care services that are part of ongoing care related to a patient's single, serious, or complex chronic condition(s). (Add-on code, list separately in addition to office/outpatient evaluation and management visit, new, or established.)" These commenters stated that these revisions better capture the

work associated with primary care visits. Commenters also requested clarification on what CMS considers to be a "complex" or "serious" condition, and stated that CMS should issue detailed guidance and clinical scenarios wherein the billing of the GPC1X would be appropriate.

Response: We agree with commenters that the revisions have the potential to improve the accuracy of the code descriptor as it pertains to the primary care services described by HCPCS code GPC1X. We look forward to continued engagement with the public in the development of guidance and, in making this or similar refinements to the code through future rulemaking.

Comment: Other commenters disagreed with CMS' proposal. Many of these commenters, including the RUC, stated that they were supportive of separate payment for an add-on code that would account for additional work associated with "outlier" cases of particular clinical intensity but urged CMS to work with CPT and RUC to define and value the service.

Other commenters expressed concern regarding the necessity of HCPCS code GPC1X entirely. A few stated that, given the revaluation of the office/outpatient E/M visit codes, separate payment for certain types of primary care or specialty visits was duplicative and unnecessary. Some commenters also noted that the additional utilization associated with HCPCS code GPC1X further contributed to the redistributive effect of budget neutrality (BN)

adjustment related to revaluing the office/outpatient E/M visit codes, particularly for those specialties who do not routinely furnish office visits.

Response: HCPCS code GPC1X does not describe outlier visits, but visits associated with primary care or care services that are part of ongoing care related to a patient's single, serious, or complex chronic condition(s), which we maintain is qualitatively different from the work accounted for in the revalued office/outpatient E/M visits. As stated previously, we will consider strategies to mitigate the redistributive effects of BN adjustment associated with revaluing of the office/outpatient E/M visit code set as part of future rulemaking.

After considering the comments, we are finalizing the code descriptor for GPC1X as proposed. We are finalizing valuation as proposed. GPC1X will be implemented in CY 2021.

(4) Valuation of CPT Code 99xxx (Prolonged Office/Outpatient E/M)

We proposed to delete to the HCPCS add-on code we finalized last year for CY 2021 for extended office/outpatient E/M visits (GPRO1) and adopt the new CPT code 99XXX. The RUC also provided a recommendation for new CPT code 99XXX (*Prolonged office or other outpatient evaluation and management service(s) (beyond the total time of the primary procedure which has been selected using total time), requiring total time with or without direct patient contact beyond the usual service, on the date of the primary service; each 15 minutes (List separately in addition to codes 99205, 99215 for office or other outpatient Evaluation and Management services)*). The RUC recommended 15 minutes of physician time and a work RVU of 0.61. Further, we proposed to accept the RUC recommended values for CPT code 99XXX without refinement.

We solicited comment on these proposals, as well as any additional information stakeholders can provide on the appropriate valuation for these services.

We received public comments on the proposed valuation of CPT code 99xxx. The following is a summary of the comments we received and our responses.

Comment: Most commenters supported the proposed value for CPT code 99XXX. A few commenters recommended a work RVU of 1.17, consistent with the valuation of the HCPCS G-code for additional time finalized in last year's rulemaking, GPRO1.

Response: We note that 99XXX describes 15 minutes of additional time, whereas GPRO1 described 30 minutes of additional time. Therefore, we continue to believe that 0.61 is a more accurate work RVU for 99XXX.

After considering the comments, we are finalizing valuation for CPT code 99XXX as proposed.

(5) Implementation Timeframe

We proposed that these policy changes for office/outpatient E/M visits would be effective starting January 1, 2021. We believed this would allow sufficient time for physician and practitioner education and further feedback; changes in clinical workflows, EHRs and any other impacted systems; and corresponding changes that may be made by other payers. In summary, we proposed to adopt the following policies for office/outpatient E/M visits effective January 1, 2021:

- Separate payment for the five levels of office/outpatient E/M visit CPT codes, as revised by the CPT Editorial Panel effective January 1, 2021 and resurveyed by the AMA RUC, with minor refinement. This would include deletion of CPT code 99201 (*Level 1 new patient office/outpatient E/M visit*) and adoption of the revised CPT code descriptors for CPT codes 99202–99215;

- Elimination of the use of history and/or physical exam to select among code levels;

- Choice of time or MDM to decide the level of office/outpatient E/M visit (using the revised CPT interpretive guidelines for MDM);

- Payment for prolonged office/outpatient E/M visits using the new CPT code 99xxx, deletion of HCPCS code GPRO1 (*extended office/outpatient E/M visit*) that we previously finalized for 2021, and no longer recognizing CPT codes 99358–9 for separate payment in association with office/outpatient E/M visits;

- Revise the descriptor for HCPCS code GPC1X and delete HCPCS code GCG0X; and

- Increase in value for HCPCS code GCG1X and allow it to be reported with all office/outpatient E/M visit levels.

We received public comments on the proposed implementation timeframe. The following is a summary of the comments we received and our responses.

Comment: Commenters generally supported the proposed implementation date of CY 2021, stating that this implementation date would allow adequate time to educate practitioners and their staff, revise electronic health records, and transition clinical workflows, institutional processes and

policies, and other aspects of practitioner work that would be impacted by these policy changes. Several commenters suggested that CMS should implement changes for CY 2020 instead of CY 2021. A few commenters suggested that CMS should phase in implementation more gradually, ranging between 18 months to allow electronic health record systems vendors more time to prepare, and 4 or 5 years to mitigate the redistributive impact of the valuation changes.

Response: Given that the CPT coding changes will take effect in 2021, we are finalizing these proposals for January 1, 2021, which is also the implementation timeframe we finalized last year. We believe the delayed implementation to CY 2021 will allow practitioners and electronic health records vendors time to prepare. As stated previously, given that we do not know the magnitude of redistribution resulting from other policies we may adopt through rulemaking before these changes take effect, we believe it would be premature to finalize a strategy in this final rule for addressing redistributive impacts. However, we intend to consider concerns expressed by commenters and address them in future rulemaking.

(6) Global Surgical Packages

In addition to their recommendations regarding physician work, time, and PE for office/outpatient E/M visits, the AMA RUC also recommended adjusting the office/outpatient E/M visits for procedures with post-operative visits included in 10- or 90-day global periods to reflect the changes made to the values for office/outpatient E/M visits. The valuation of most procedures with 10- and 90-day global periods reflect a certain number of post-operative visits that are assumed to typically be furnished by the same practice and specialty as the procedure itself during the global period. While the work involved in these post-operative visits is often valued with reference to RVUs for separately-billed E/M visits, bundled post-operative visit RVUs do not directly contribute a certain number of RVUs to the valuation of procedures with 10- or 90-day global periods.

In the CY 2015 PFS final rule, we discussed the challenges of accurately accounting for the number of visits included in the valuation of 10- and 90-day global packages (79 FR 67548, 67582). We finalized a policy to change all global periods to 0-day global periods, and to allow separate payment for post-operative E/M visits. Our concerns were based on a number of key points including: The lack of sufficient data on the number of visits typically

furnished during the global periods, questions about whether we will be able to adjust values on a regular basis to reflect changes in the practice of medicine and health care delivery, and concerns about how our global payment policies could affect the services that are actually furnished. In finalizing a policy to transform all 10- and 90-day global codes to 0-day global codes in CY 2017 and CY 2018, respectively, to improve the accuracy of valuation and payment for the various components of global packages, including pre- and post-operative visits and the procedure itself, we stated that we were adopting this policy because it is critical that PFS payment rates be based upon RVUs that reflect the relative resources involved in furnishing the services. We also stated our belief that transforming all 10- and 90-day global codes to 0-day global packages would:

- Increase the accuracy of PFS payment by setting payment rates for individual services that more closely reflect the typical resources used in furnishing the procedures;
- Avoid potentially duplicative or unwarranted payments when a beneficiary receives post-operative care from a different practitioner during the global period;
- Eliminate disparities between the payment for E/M services in global periods and those furnished individually;
- Maintain the same-day packaging of pre- and post-operative physicians' services in the 0-day global packages; and
- Facilitate the availability of more accurate data for new payment models and quality research.

Section 523(a) of the MACRA added section 1848(c)(8)(A) of the Act, which prohibited the Secretary from implementing the policy described above, which would have transformed all 10-day and 90-day global surgery packages to 0-day global packages. Section 1848(c)(8)(B) of the Act, which was also added by section 523(a) of the MACRA, required us to collect data to value surgical services. Section 1848(c)(8)(B)(i) of the Act requires us to develop a process to gather information needed to value surgical services from a representative sample of physicians, and requires that the data collection begin no later than January 1, 2017. The collected information must include the number and level of medical visits furnished during the global period and other items and services related to the surgery and furnished during the global period, as appropriate. Section 1848(c)(8)(B)(iii) of the Act specifies that the Inspector General shall audit a

sample of the collected information to verify its accuracy. Section 1848(c)(8)(C) of the Act, which was also added by section 523(a) of the MACRA, requires that, beginning in CY 2019, we must use the information collected as appropriate, along with other available data, to improve the accuracy of valuation of surgical services under the PFS.

Resource-based valuation of individual physicians' services is a critical foundation for Medicare payment to physicians. It is essential that the RVUs under the PFS be based as closely and accurately as possible on the actual resources used in furnishing specific services to make appropriate payment and preserve relativity among services. For global surgical packages, this requires using objective data on all of the resources used to furnish the services that are included in the package. Not having such data for some components may significantly skew relativity and create unwarranted payment disparities within the PFS. The current valuations for many services valued as global packages are based upon the total package as a unit rather than by determining the resources used in furnishing the procedure and each additional service/visit and summing the results. As a result, we do not have the same level of information about the components of global packages as we do for other services. To value global packages accurately and relative to other procedures, we need accurate information about the resources—work, PEs and malpractice—used in furnishing the procedure, similar to what is used to determine RVUs for all services. In addition, we need the same information on the postoperative services furnished in the global period (and pre-operative services the day before for 90-day global packages).

In response to the MACRA amendments to section 1848(c)(8) of the Act, CMS required practitioners who work in practices that include 10 or more practitioners in Florida, Kentucky, Louisiana, Nevada, New Jersey, North Dakota, Ohio, Oregon, and Rhode Island to report using CPT 99024 on post-operative visits furnished during the global period for select procedures furnished on or after July 1, 2017. The specified procedures are those that are furnished by more than 100 practitioners and either are nationally furnished more than 10,000 times annually or have more than \$10 million in annual allowed charges.

RAND analyzed the data collected from the post-operative visits through this claim-based reporting for the first year of reporting, July 1, 2017 through

June 30, 2018. They found that only 4 percent of procedures with 10-day global periods had any post-operative visits reported. While 71 percent of procedures with 90-day global periods had at least one associated post-operative visit, only 39 percent of the total post-operative visits expected for procedures with 90-day global periods were reported. (A complete report on this is available at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/Global-Surgery-Data-Collection-.html>.)

In addition to the claims-based data collection, RAND collected data on the level of visits. They began with an attempt to collect data via a survey from all specialties as described in the 2017 final rule. Given the low rate of response from practitioners, we narrowed the scope and focused on three high-volume procedures with global periods that were common enough to likely result in a robust sample size: (1) Cataract surgery; (2) hip arthroplasty; and (3) complex wound repair. A total of 725 physicians billing frequently for cataract surgery, hip arthroplasty, and complex wound repair reported on the time, activities, and staff involved in 3,469 visits. Our findings on physician time and work from the survey were broadly similar to what we expected based on E/M visits in the Time File for cataract surgery and hip replacement and somewhat different for complex wound repair. It should be noted that the time and work values used for this comparison were for 2018 E/M visits. (For the complete report, see <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/Global-Surgery-Data-Collection-.html>.)

The third report in the series looks at ways we could consider revaluing procedures using the collected data. To provide us with estimates to frame a discussion, RAND modeled how valuation for procedures would change by adjusting work RVUs, physician time, and direct PE inputs based on the difference between the number of post-operative visits observed via claims-based reporting and the expected number of post-operative visits used during valuation. RAND looked at three types of changes: (1) Updated work RVUs based on the observed number of post-operative visits measured four ways (median, 75th percentile, mean, and modal observed visits); (2) Allocated PE RVUs reflecting direct PE inputs updated to reflect the median number of reported post-operative visits; and (3) Modeled total RVUs reflecting (a) updated work RVUs, (b) updated physician time, and (c) updated

direct PE inputs, and including allocated PE and malpractice RVUs. This report is designed to inform further conversations about how to revalue global procedures. (For the complete report, see <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/Global-Surgery-Data-Collection-.html>.) We provided the public and stakeholders the data we had available with the proposed rule, and asked that they provide input on an appropriate approach to using these data to revalue global surgical procedures. We will continue to study and consider alternative ways to address the values for these services.

We received public comments on the impact of the new E/M coding and valuations on global surgical packages and on the reports and other information on revaluing global surgical packages that we made available with the proposed rule. The following is a summary of the comments we received and our responses.

Comment: Most commenters objected to not using the proposed new E/M coding and valuations to revise the values for global surgery packages. The commenters stated that failure to use the new E/M coding and values for global services will disrupt the relativity in the PFS, create specialty differences and could violate the MACRA section 523(a) statutory requirements. Most commenters objected to our not proposing to adopt the AMA RUC recommendations to apply revised values for E/M office visits in global surgery procedures. They stated that not adopting the RUC recommendations interferes with relativity because we proposed to apply the RUC-recommended E/M values to stand-alone E/M services, but not to the E/M services that are included in global surgical packages. Commenters noted that in the past, CMS has aligned changes in valuation of stand-alone office visits with valuation of the office visits in the surgical global period so that each time the value for separately billed office visits was changed, corresponding changes were made to the value of visits for all global surgery packages. In addition, some commenters stated that, by failing to adopt all of the RUC-recommended work and time values for the revised office visit E/M codes, including the recommended adjustments to the 10- and 90-day global codes, CMS is implementing these values in an arbitrary and piecemeal fashion. Some commenters stated that applying the RUC-recommended E/M values to stand-alone E/M services, but not to the E/M services that are included

in the global surgical package, would result in disruption to the relativity between codes across the Medicare PFS. A number of commenters also stated that failing to adjust the global codes to reflect adjustments to separately billable E/M services is tantamount to paying some physicians less for providing the same E/M services, in violation of the law.

Response: Relativity is an important concept we consider heavily when establishing values for services under the PFS. To maintain relativity in the past, we had adjusted values for global surgery procedures when we updated values for E/M visits because we did not have information to suggest that it might not be appropriate to do so. However, there are now important, unresolved questions regarding how post-operative visits included in global surgery codes should be valued relative to stand-alone E/M visit analogues. Specifically, it is unclear whether it would be appropriate to use a building-block approach to increase the valuation for global surgical packages in a way that could disrupt potentially more accurate estimates of total work for procedures with global periods from magnitude estimation. Furthermore, given the information described above on E/M services furnished as part of global surgery services, we have questions about the appropriate number of E/M services reflected in the values for global surgery procedures. If the number of E/M services for global codes is not appropriate, adopting the AMA RUC-recommended values for E/M services in global surgery codes would exacerbate rather than ameliorate any potential relativity issues. Therefore, we are not adopting the RUC recommendation to apply revised values for E/M services to the global surgery codes at this time.

Section 1848(c)(8)(C) of the Act, as added by section 523a of the MACRA, requires CMS to use the information collected as appropriate, along with other available data, to improve the accuracy of valuation of surgical services under the PFS. We believe it is important to avoid contributing further to the potential misvaluation of global surgical procedures. Reflexively adding revised E/M work RVUs to values for global codes as recommended by the RUC and other commenters could potentially result in inappropriate shifts in relativity under the PFS, and the associated BN adjustment could result in potentially inappropriate adjustments to payment rates for services without global periods, such as separately-billed E/M visits. Given that the information we have gathered to date as required by

section 1848(c)(8)(B)(i) of the Act, as well as the conclusions of past OIG studies, suggests that the values for E/M services typically furnished in global surgery periods are overstated in the current valuations for global surgery codes, we do not believe it would be appropriate to amplify the effects of any such overvaluation by increasing the values of included E/M services while we continue to look into the information and develop appropriate solutions.

Comment: Commenters raised concerns about the generalizability of the claims data we collected on post-operative visits since it was only collected from practices with 10 or more practitioners in 9 states. One commenter stated that the AMA 2018 Physician Practice Benchmark Survey indicated that 54 percent of physicians are in practices with fewer than 10 physicians. They added that, for surgical specialties, 64 percent of physicians are in practices with fewer than 10 physicians. Commenters expressed a related concern that the definition of “practice” used in the reporting of post-operative visits caused confusion and decreased reporting. Further, commenters expressed concern that some physicians may not have been aware of the reporting requirement, and therefore, some post-operative visits were not reported. One commenter noted that using CPT 99024 to report post-operative visits contradicts specialty society coding education, and some practices encountered difficulties reporting the zero-charge CPT 99024 as attempts to report the code in many practices and EHR systems are blocked by the software.

Response: We believe that the newly-collected post-operative visit data significantly improves our understanding of which bundled post-operative visits are actually furnished during global periods, beyond estimates provided by the AMA RUC and specialty society surveys. CMS chose to limit reporting to a random sample of 9 states and to exclude practices with less than 10 practitioners because of concerns from the physician community about reporting burden, which might be particularly high for smaller practices. Some commenters have now suggested that the scope of our required reporting may be inadequate. We can consider for the future whether requiring reporting for smaller practices and throughout the country would give us better data. We also note that, although we have authority to do so, we chose not to penalize practitioners who did not report, but we could also reevaluate this decision if the current reporting rates are insufficient.

Comment: Commenters disagreed with the conclusion in the RAND report that only 39 percent of expected post-operative visits following procedures with 90-day global periods and only 4 percent of expected post-operative visits following procedure with 10-day global periods were actually performed.

Commenters objected to counting all non-occurring visits as “no” visits as some visits were not reported. Relatedly, commenters raised many concerns with the methodology used in the RAND analyses. These include:

- Revaluations from the RUC have made the data outdated.
- Potential flaws in the way procedures were matched to reported 99024 codes.
- Disagreement with the definition of “robust reporters” used in the sensitivity analyses.
- Possible bias from the use of half-visits from the time file.
- Reporting of procedures with 10-day global periods are dominated by HCPCS codes 17000, 17004 and 17110, which are not representative of all procedures.
- Inclusion of separately-billed E/M services to provide post-operative care could account for the gap between observed and expected visits.

Response: The RAND results focus on the share of expected post-operative visits that were reported to CMS. It is true that the absence of a reported visit does not necessarily mean that a post-operative visit did not occur. However, apart from required reporting, we have no way to know whether a visit occurred. For some specialties, including hand surgery, orthopedic surgery, vascular surgery, ophthalmology, neurosurgery, urology, plastic and reconstructive surgery, dermatology and general surgery, 85 percent or more of practitioners who were expected to report post-operative visits relating to global surgical services reported at least some visits. We can only assume the visits that are furnished are being reported.

The RAND report includes results from many sensitivity analyses that aim to address several methodological concerns raised by some commenters, and particularly concerns related to potentially incomplete reporting. While different sensitivity approaches slightly increase or decrease the number of reported post-operative visits we would expect to see, none results in findings that differ substantially from the report’s main conclusions that a small share of expected post-operative visits for procedures with 10-day global periods, and less than half of expected post-operative visits for procedure with 90-

day global periods, appear to actually occur. RAND will be issuing a report in response to each of these methodological concerns later this year. This report will also be posted on the CMS website.

Comment: MedPAC supported CMS’ decision to not adopt the RUC’s recommendation that CMS adjust the work RVUs for postoperative E/M visits that are part of surgical codes with 10-day and 90-day global periods. MedPAC cited evidence that 10-day and 90-day global surgical codes are overvalued. Several other commenters agreed that we should not adjust values for the global surgery codes to reflect revised values for E/M visits. For example, one commenter stated, “[W]e believe it would be imprudent to adjust the E/M component [of global surgery codes] because of any changes to the values of stand-alone office/outpatient visit codes 99201–99215 and we support CMS’ decision in this regard.” Another commenter expressed support for CMS’ “efforts to collect this information and ensure an appropriate number and type of E/M codes bundled with the 10-day and 90-day globals.”

Response: We agree that it would be imprudent at this point to adjust the values for surgical codes with 10- and 90-day global periods to reflect the values for stand-alone E/M visits.

After considering the comments, we are not making changes in the values of global surgery procedures to reflect changes we are making in this final rule beginning in CY 2021 to coding and values for stand-alone E/M services. We anticipate continuing to assess and develop an approach to revaluing global surgery procedures, including the associated post-operative visits. We appreciate all the comments on the three RAND reports and we will study them as we go forward. For the specialty societies that expressed concern that our current method does not accurately account for the data, we welcome submissions on other methods of gathering the data or ways to tabulate the results.

c. Comment Solicitation on Revaluing the Office/Outpatient E/M Visit Within TCM, Cognitive Impairment Assessment/Care Planning and Similar Services

In the CY 2020 PFS proposed rule, we recognized that there are services other than the global surgical codes for which the values are closely tied to the values of the office/outpatient E/M visit codes, such as transitional care management services (CPT codes 99495, 99496); cognitive impairment assessment and care planning (CPT code 99483); certain

ESRD monthly services (CPT codes 90951 through 90961); the Initial Preventive Physical Exam (G0438) and the Annual Wellness Visit (G0439). We stated that, in future rulemaking, we may consider adjusting the RVUs for these services and we sought public input on such a policy. We noted that, unlike the global surgical codes, many of these services always include an office/outpatient E/M visit(s) furnished by the reporting practitioner as part of the service, and therefore, it may be appropriate to adjust their valuation commensurate with any changes to the values for the revised codes for office/outpatient E/M visits. While some of these services do not involve an included E/M visit, we valued them using a direct crosswalk to the RVUs assigned to an office/outpatient E/M visit(s), and for this reason they are closely tied to values for office/outpatient E/M visits.

We also sought comment on whether or not the public believes it would be necessary or beneficial to make systematic adjustments to other related PFS services to maintain relativity between these services and office/outpatient E/M visits. We were particularly interested in whether it would be beneficial or necessary to make corresponding adjustments to E/M codes describing visits in other settings, such as home visits, or to codes describing more specific kinds of visits, like counseling visits. For example, CPT code 99348 (*Home visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: An expanded problem focused interval history; An expanded problem focused examination; Medical decision making of low complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient’s and/or family’s needs. Usually, the presenting problem(s) are of low to moderate severity. Typically, 25 minutes are spent face-to-face with the patient and/or family*) is commonly used to report home visits, and like CPT code 99214, the code describes approximately 45 minutes of time with the patient and has a work RVU of 1.56. Under the proposal to increase the work RVU of CPT code 99214 from 1.5 to 1.92, the proportional value of CPT code 99348 would decrease relative to the work RVU for CPT code 99214. To maintain the same proportional value to CPT code 99214, the work RVU for CPT code 99348 would need to increase from 1.56 to

2.00. We understand that certain other services, such as those that describe ophthalmological examination and evaluation, as well as psychotherapy visit codes, are used either in place of or in association with office/outpatient visit codes.

For example, CPT code 92012 (*Ophthalmological services: Medical examination and evaluation, with initiation or continuation of diagnostic and treatment program; intermediate, established patient*) currently has a work RVU of 0.92. Under the proposal to increase the work RVU of CPT code 99213 from 0.97 to 1.30, the proportional value of CPT code 92012 would decrease relative to the work RVU for CPT code 99213, as both codes describe around 30 minutes of work. To maintain the same proportional value to CPT code 99213, the work RVU for CPT code 92012 would need to increase from 0.92 to 1.23. Similarly, behavioral health professionals report several codes to describe psychiatric diagnostic evaluations and visits they furnish. When furnished with an E/M service, practitioners report psychotherapy add-on codes instead of stand-alone psychotherapy codes that would otherwise be reported. Because the overall work RVUs for the combined service, including the value for the office/outpatient visit code, would increase under the proposal, we are interested in comments regarding whether or not it would be appropriate to reconsider the value of the psychotherapy codes, as well as the psychiatric diagnostic evaluations relative to the proposed values for the office/outpatient visit codes. Under the proposed reevaluation of the office/outpatient E/M visits, the proportional value of CPT code 90834 (*Psychotherapy, 45 minutes with patient*) would decrease relative to work RVUs for CPT code 99214 plus CPT code 90836. The current work RVU for CPT code 99214 when reported with CPT code 90836 is 3.40 (1.90 + 1.50) and the current work RVU for CPT code 90834 is 2.0. Under the proposed reevaluation of the office/outpatient E/M visits, the combined work RVU for CPT codes 99214 and 90836 would be 3.82 (1.90 + 1.92). To maintain the proportionate difference between these services, the work RVU for CPT code 90834 would increase from 2.00 to 2.25. Based on these three examples, we sought public comment on whether we should make similar adjustments to E/M codes in different settings, and other types of visits, such as counseling services.

Comment: Many commenters supported some degree of reevaluation of

non-global surgical codes that include one or more bundled office/outpatient visits (such as TCM and the ESRD MCPs), E/M visits in other settings (such as inpatient or home visits), other E/M services (such as care planning for patients with cognitive impairment), and/or non-E/M office visits (such as the ophthalmology visit codes.)

Some commenters suggested specific reevaluations. Commenters recommended that CMS revalue the ophthalmological visits to maintain relativity with the office/outpatient E/M services. This commenter recommended a new RVU of 0.88 for CPT code 92002, an RVU of 2.05 for CPT code 92004, and RVU of 1.23 for CPT code 92012, and an RVU of 1.82 for CPT code 92014. Commenters also suggested a work RVU of 1.60 for CPT code 99283, and RVU of 2.74 for CPT code 99284, and an RVU of 4.00 for CPT code 99285 to maintain relativity between these services and the office/outpatient E/M visits.

Other commenters suggested making a single adjustment to the E/M visits in other settings to maintain relativity between these services and the revalued office/outpatient E/M visits. Many of these commenters also requested that CMS make similar revisions to the code definitions and documentation requirements for those services. Commenters also supported updating the payment rates for the ESRD MCP codes, noting that a similar adjustment had not been made to those codes when the office/outpatient E/M visits were revalued in the past.

Response: We thank commenters for their thorough recommendations and look forward to considering these recommendations for future rulemaking.

III. Other Provisions of the Proposed Regulations

A. Changes to the Ambulance Physician Certification Statement Requirement

Under our ongoing initiative to identify Medicare regulations that are unnecessary, obsolete, or excessively burdensome on health care providers and suppliers, we proposed to revise §§ 410.40 and 410.41. Importantly, in the proposed rule (84 FR 40680), we first clarified that these requirements apply to ambulance providers, as well as suppliers. We stated that the revisions would give certain clarity to ambulance providers and suppliers regarding the physician or non-physician certification statement and add staff who may sign certification statements when the ambulance provider or supplier is unable to obtain a signed statement from the attending physician.

1. Exceptions to Certification Statement Requirement

Under section 1861(s)(7) of the Act, ambulance services are covered where the use of other methods of transportation is contraindicated by the individual's condition, but only to the extent provided in regulations. Currently, § 410.40(d) specifies the medical necessity requirements for both nonemergency, scheduled, repetitive ambulance services and nonemergency ambulance services that are either unscheduled or that are scheduled on a non-repetitive basis. In the final rule with comment period that appeared in the January 25, 1999 **Federal Register** (64 FR 3637) (hereinafter referred to as the "January 25, 1999 final rule with comment period"), we stated that a physician certification statement (PCS) must be obtained as evidence that the attending physician has determined that other means of transportation are contraindicated and that the transport is medically necessary (64 FR 3639). In the final rule with comment period that appeared in the February 27, 2002 **Federal Register** (67 FR 9100) (hereinafter referred to as the "February 27, 2002 final rule with comment period"), we added that a certification statement (hereinafter referred to as "non-physician certification statement") could be obtained from other authorized staff should the attending physician be unavailable. (67 FR 9111)

We stated in the proposed rule (84 FR 40680) that currently there are no circumstances, other than those specified at § 410.40(d)(3)(ii) and (iv), granting exceptions to the need for a PCS or non-physician certification statement, and that we have received feedback from ambulance providers, suppliers, and their industry representatives ("stakeholders") that various situations exist where the need for a PCS or non-physician certification is excessive, or at least redundant to similar existing documentation requirements. Two of the most prominent circumstances identified by the stakeholders include interfacility transports (IFTs), commonly referred to as hospital-to-hospital transports, and specialty care transports (SCTs), and stakeholders have requested that we incorporate additional exceptions into the regulatory framework.

As we discussed in the proposed rule (84 FR 40680 through 40681), upon reviewing the need for a PCS and non-physician certification statement, stakeholders' concerns, and our commitment to reducing the burden placed on providers and suppliers, we have determined that instead of

incorporating additional exceptions, our efforts would be better served by minorly altering the structure of the existing regulatory framework. We stated in the proposed rule that these changes are intended to maximize flexibility for ambulance providers and suppliers to obtain the requisite certification statements and maintain the focus on the determination that other means of transportation are contraindicated and that the transport is medically necessary.

To accomplish this, we proposed to add a new paragraph (a) in § 410.40 in which we would define both PCSs, as well as non-physician certification statements. Therefore, we proposed to redesignate existing paragraph (a) “Basic rules” as paragraph (b) and redesignate the remaining paragraphs, respectively. Most significantly, paragraph (d) “Medical necessity requirements” will be redesignated as paragraph (e).

We stated in the proposed rule (84 FR 40681) that for paragraph (a), the two definitions, PCSs and non-physician certification statements, would clarify that: (1) The focus is on the certification of the medical necessity provisions contained in newly redesignated paragraph (e)(1); and (2) the form of the certification statement is not prescribed, thus affording maximum flexibility to ambulance providers and suppliers. We stated that since the two definitions would incorporate the requirement to obtain a certification of medical necessity, we proposed a conforming change to newly redesignated paragraph (e)(2) to remove the language requiring that an order certifying medical necessity be obtained.

As we stated in the proposed rule, we have repeatedly been told by stakeholders that there are ample opportunities for ambulance providers and suppliers to convey the information required in the certification statement. Stakeholders have mentioned, for example, that for transports such as IFTs and SCTs other requirements of federal, state, or local law require them to obtain other documentation, such as Emergency Medical Treatment & Labor Act (EMTALA) forms and medical transport forms, that serve the same purpose as the PCS or non-physician certification statement. There is every likelihood that other ambulance transports require similarly styled documentation that likewise could serve the same purpose.

To be clear, our regulations have never prescribed the precise form or format of this required documentation. As we discussed in the proposed rule, to satisfy the requirements of section

1861(s)(7) of the Act, ambulance providers’ and suppliers’ focus should be on clearly documenting the threshold determination that other means of transportation are contraindicated and that the transport is medically necessary. We stated that the precise form or format by which that information is conveyed has never been prescribed. We further stated that our aim here is to ensure that ambulance providers and suppliers understand they have flexibility in the form by which they convey the requirements of proposed § 410.40(e), so long as that threshold determination is clearly expressed.

We stated in the proposed rule that the definition of non-physician certification statement in § 410.40(a) would incorporate the existing requirements that apply when an ambulance provider or supplier is unable to obtain a signed PCS from the attending physician and, instead, obtains a non-physician certification statement, including: (1) That the staff have personal knowledge of the beneficiary’s condition at the time the ambulance transport is ordered or the service is furnished; (2) the employment-related requirements; and (3) the specific staff that can sign in lieu of the attending physician. We stated that included within the definition of non-physician certification statement, and as further discussed below, is an expansion of the list of staff who may sign when the attending physician is unavailable. In light of the staff being listed as part of the definition of non-physician certification statement at § 410.40(a), we proposed a corresponding change to proposed and newly redesignated paragraph (e)(3)(iii) to remove the reference to the staff currently listed within the paragraph. Moreover, in paragraphs (e)(3)(i) and (iv), we proposed changes to refer to the newly redesignated paragraph (e), and in paragraph (e)(3)(v), we proposed changes to refer to the newly defined terms in paragraph (a), specifically the physician or non-physician certification statement. Lastly, we also proposed a corresponding change to § 410.41(c)(1) to add that ambulance providers or suppliers must indicate on the claims form that, “when applicable, a physician certification statement or non-physician certification statement is on file.”

In the CY 2013 PFS final rule with comment period (77 FR 69161), we stated that the Secretary is the final arbiter of whether a service is medically necessary for Medicare coverage. We stated in the proposed rule that we believe that the proposed changes

would better enable contractors to establish the medical necessity of these transports by focusing more on the threshold medical necessity determination as opposed to the form or format of the documentation used. We further stated that we did not anticipate that this clarification will alter the frequency of claim denials.

In 2018, 68.9 percent of improper payments in non-emergency transport was due to insufficient documentation. Although we know the ambulance certification statement is a source of documentation error, we are unable to determine if clarifying that there is no specific form or format for the certification statement will lead to significantly fewer denials. Similarly, we are unable to determine whether adding to the list of non-physicians that may sign a certification statement will lead to significantly fewer denials. The impact primarily will afford providers increased flexibility in completing the form. We believe that claims denied for technical documentation issues currently are likely appealed and overturned in the supplier/provider’s favor if the ambulance transport was indeed medically necessary. Therefore, although we believe the clarifications could result in fewer claims being denied, it is unlikely to be a statistically significant change.

2. Addition of Staff Authorized To Sign Non-Physician Certification Statements

In the January 25, 1999 final rule with comment period (64 FR 3637), we finalized language at § 410.40 to require ambulance providers or suppliers, in the case of nonemergency unscheduled ambulance services (§ 410.40(d)(3)) to obtain a PCS. In that rule, we explained that: (1) Nonemergency ambulance service is a Medicare service furnished to a beneficiary for whom a physician is responsible, therefore, the physician is responsible for the medical necessity determination; and (2) the PCS will help to ensure that the claims submitted for ambulance services are reasonable and necessary, because other methods of transportation are contraindicated (64 FR 3641). We further stated that we believed the requirement would help to avoid Medicare payment for unnecessary ambulance services that are not medically necessary even though they may be desirable to beneficiaries. However, in that final rule with comment period, we also addressed the ability of ambulance providers or suppliers to obtain a written order from the beneficiary’s attending physician within 48 hours after the transport to avoid unnecessary delays. We agreed with stakeholders that while it is

reasonable to expect that an ambulance supplier could obtain a pretransport PCS for routine, scheduled trips, it is less reasonable to impose such a requirement on unscheduled transports, and that it was not necessary that the ambulance suppliers have the PCS in hand prior to furnishing the service. To avoid unnecessary delays for unscheduled transports, we finalized the requirement that required documentation can be obtained within 48 hours after the ambulance transportation service has been furnished.

In the February 27, 2002 final rule with comment period (67 FR 9111), we noted that we had been made aware of instances in which ambulance suppliers, despite having provided ambulance transports, were, through no fault of their own, experiencing difficulty in obtaining the necessary PCS within the required 48-hour timeframe. We stated that the 48-hour period remained the appropriate period of time, but created alternatives for ambulance providers and suppliers unable to obtain a PCS. We finalized an alternative at § 410.40(d)(3)(iii) where ambulance providers and suppliers unable to obtain a PCS from the attending physician could obtain a signed certification (*not* a physician certification statement) from certain other staff. At that time, we identified several staff members, including a physician assistant (PA), nurse practitioner (NP), clinical nurse specialist (CNS), registered nurse (RN), and a discharge planner as staff members able to sign such a non-physician certification statement. The only additional constraints are: (1) That the staff be employed by the beneficiary's attending physician or by the hospital or facility where the beneficiary is being treated and from which the beneficiary is transported; and (2) that the staff have personal knowledge of the beneficiary's condition at the time the ambulance transport is ordered or the service is furnished.

We stated in the proposed rule (84 FR 40682) that in the intervening years, we have received feedback from stakeholders that other staff, such as licensed practical nurses (LPNs), social workers, and case managers, should be included in the list of staff that can sign a certification statement. Similar to the currently designated staff, we stated that we now believe that LPNs, social workers, and case managers who have personal knowledge of a beneficiary's condition at the time ambulance transport is ordered and the service is furnished have a skill set largely equal

or similar to the other staff members. Thus, we proposed as part of the new definition of non-physician certification statement at § 410.40(a)(2)(iii) to add LPNs, social workers, and case managers to the list of staff who may sign a certification statement when the ambulance provider or supplier is unable to obtain a signed PCS from the attending physician. As with the staff currently listed in § 410.40(d)(3)(iii), LPNs, social workers, and case managers would need to be employed by the beneficiary's attending physician or the hospital or facility where the beneficiary is being treated and from which the beneficiary is transported, and have personal knowledge of the beneficiary's condition at the time the ambulance transport is ordered or the service is furnished. We also requested comments on whether other staff should be included in this regulation, and requested that commenters identify such staff's licensure and position and the reason it would be appropriate for such staff to sign a certification statement.

The following is a summary of the comments we received and our responses.

Comment: Several commenters supported our changes to the ambulance certification requirements, including the addition of licensed practical nurses, social workers, and case managers to the list of non-physician staff who are authorized to sign a certification statement when a statement cannot be obtained from the attending physician. One commenter noted that CMS should monitor the new provisions closely to ensure that enforcement is fair, consistent, and expected and the new approach is not abused.

Response: We agree that the new provisions must be fairly and consistently applied. Through our contractors, we will focus on ensuring a fair and consistent application of the new requirements so that the requirements are not subject to abuse.

Comment: One commenter recommended that a licensed non-physician staff member should be authorized to sign a certification statement for all emergency and nonemergency cases and that adding an additional layer of bureaucracy does not increase quality, but does increase cost.

Response: We do not currently require a certification statement for emergency ambulance transport, and did not propose to add such a requirement for emergency ambulance transport as it would, among other things, increase documentation burden and costs. We continue to believe that requiring a certification statement for non-

emergency ambulance transports is necessary. Of note, the certification assists our efforts in combating fraud, waste and abuse.

Comment: One commenter supported the "proposal to eliminate the PCS as a requirement for hospital-to-hospital transports," and requested confirmation that CMS will not burden ambulance service providers and suppliers with having to obtain the other documents, for example, transfer forms and/or EMTALA forms, that can be used in lieu of the PCS and to clarify that if a PCS is not required for interfacility transports, then ambulance service providers and suppliers will not be required to obtain a certificate of mailing (or proof of mailing).

Response: To be clear, we did not propose the elimination of the PCS as a requirement for hospital-to-hospital transports. Rather, we clarified that the precise form or format of the certification statement is not prescribed, thus increasing ambulance suppliers' and providers' flexibility to comply with the certification statement requirements. Also, the steps we have taken to clarify the regulations do not obviate a provider's or supplier's responsibility to submit required documentation upon request to Medicare review contractors, which may request documentation from the supplier or provider to evaluate eligibility, coverage, medical necessity, and other reimbursement-related factors.

Comment: One commenter questioned if CMS would consider the completion of a non-physician certification statement by nursing staff in the emergency department as compliant with the regulatory requirements, if the treating physician is unavailable due to treatment of another patient in the Emergency Department.

Response: The scope of this rule is to clarify the requirements associated with the form and content of the physician certification statement and the non-physician certification statement along with adding additional staff members who may, under the appropriate circumstances, sign a non-physician certification statement. Although this scenario could be acceptable should the criteria set forth in the regulations be met, specific fact-based scenarios should be discussed with the appropriate Medicare Administrative Contractor.

Comment: One commenter recommended CMS make additional changes, including modernizing and streamlining the 855B Ambulance Enrollment form, eliminating the duplicative requirements for patient

signatures, and modernizing the revocation process for suppliers' and providers' ability to bill Medicare.

Response: These recommendations are outside the scope of the proposed changes.

Comment: One commenter noted that the changes will do very little to lessen the unnecessary burden that the PCS requirement imposes on ambulance providers and suppliers every day and that CMS, instead, should "eliminate this useless exercise in chasing paper" and alleged that the PCS carries "no weight." This same commenter recommended that CMS add several additional staff members who can sign the non-physician certification statement, including licensed vocational nurses (LVNs), advanced practice registered nurses (APRNs), paramedics not functioning as an employee of the ambulance provider or supplier furnishing the ambulance services for which payment is claimed, physical therapists, occupational therapists, psychiatrists and psychologists.

Response: Although we understand the commenter's concern regarding burden, we disagree that the certification statements are a useless exercise or that they carry no weight. We specifically noted within the proposed rule that the changes were intended to maximize flexibility for ambulance providers and suppliers to obtain the requisite certification statements and maintain the focus on the determination that other means of transportation are contraindicated and that the transport is medically necessary. We believe the clarifications are in line with our intended outcome and the certification statements serve an important role in preventing and combating fraud, waste and abuse. The clarifications to the certification statement requirements will, in fact, reduce burden by clearly conveying that redundant certification statements need not be submitted and as a result of other non-physician staff members being authorized to sign non-physician certification statements. Moreover, while we appreciate the information regarding other staff members who could sign a non-physician certification, we are not adding additional staff members at this time. Of note, psychiatrists, as physicians are already included as staff who can sign the physician certification statement. For the remaining suggested positions, we appreciate the suggestions regarding additional staff who could sign the non-physician certification and will consider the suggestions in future rulemaking.

Comment: One commenter suggested CMS correct what the commenter

believed is an inaccurate statement regarding the prior existence or use of the term "non-physician certification statement" in that CMS had not previously used that term. The same commenter also recommended several other modifications to promote consistency and readability within the regulations, including: (1) Deleting superfluous language in § 410.40(e)(3)(i) related to the certifying of medical necessity since the phrase is already included as part of the newly proposed definition of PCS in paragraph (a); (2) that CMS should change the words "procedure codes" to "modifiers" in proposed § 410.41(c)(1) as the term "modifiers" more accurately refers to origin and destination indicators; and (3) that CMS add references to both suppliers and providers in § 410.41(c) and (c)(2), that refer to both physician certification statements and non-physician certification statements in (c)(1) and change the word "or" to "a" in newly proposed § 410.40(e)(3)(iii) preceding the phrase "non-physician certification statements must be obtained."

Response: We appreciate the commenter's observation that we did not previously use the term "non-physician certification statement," but we merely used the term to facilitate our efforts to more clearly convey the distinction we are attempting to account for within the regulations, namely that a certification statement can—in certain limited circumstances—be signed by a staff member who is not a physician. We believe that use of the term non-physician certification statement is particularly relevant since we are adding even more positions to the list of personnel who can sign these statements. We believe that the clarified terminology allows better process accountability so a physician's signature is not mistaken with other personnel only sometimes eligible to sign, which should aid in combatting potential fraud and abuse. Additionally, with regard to (1) deleting superfluous language in § 410.40(e)(3)(i) related to the certifying of medical necessity since the phrase is already included as part of the newly proposed definition of PCS in paragraph (a), we agree this language is no longer necessary in light of the definition and are deleting it. Regarding item (2) that we should change the words "procedure codes" to "modifiers" in proposed § 410.41(c)(1) as the term "modifiers" more accurately refers to origin and destination indicators, we appreciate the commenter's suggestion and may propose alternative language to address this in future rulemaking. Finally, we

agree and are implementing the recommendations in (3) that we add references to both suppliers and providers in § 410.41(c) and (c)(2) and noted an additional need for reference to both in § 410.40(e)(3)(iv), refer to both the physician certification statement and non-physician certification statement in § 410.41(c)(1), and change the word "or" to "a" in newly proposed § 410.40(e)(3)(iii) preceding the phrase "non-physician certification statements must be obtained."

After consideration of the comments received, for the reasons set forth in the proposed rule and in this final rule, we are finalizing our proposed revisions to §§ 410.40 and 410.41 with the modifications discussed above. In addition, we are making conforming/technical changes to update cross-references in §§ 409.27 and 414.605, as necessitated by the redesignation of paragraphs in § 410.40.

B. Establishment of a Medicare Ground Ambulance Data Collection System

1. Background

Section 1861(s)(7) of the Act establishes an ambulance service as a Medicare Part B service where the use of other methods of transportation is contraindicated by the individual's condition, but only to the extent provided in regulations. Since April 1, 2002, payment for ambulance services has been made under the ambulance fee schedule (AFS), which the Secretary established under section 1834(l) of the Act. Payment for an ambulance service is made at the lesser of the actual billed amount or the AFS amount, which consists of a base rate for the level of service, a separate payment for mileage to the nearest appropriate facility, a GAF, and other applicable adjustment factors as set forth at section 1834(l) of the Act and § 414.610 of the regulations. In accordance with section 1834(l)(3) of the Act and § 414.610(f), the AFS rates are adjusted annually based on an inflation factor. The AFS also incorporates two permanent add-on payments and three temporary add-on payments to the base rate and/or mileage rate. The two permanent add-on payments are: (1) A 50 percent increase in the standard mileage rate for ground ambulance transports that originate in rural areas where the travel distance is between 1 and 17 miles; and (2) a 50 percent increase to both the base and mileage rate for rural air ambulance transports. The three temporary add-on payments are: (1) A 3 percent increase to the base and mileage rate for ground ambulance transports that originate in rural areas; (2) a 2 percent increase to

the base and mileage rate for ground ambulance transports that originate in urban areas; and (3) a 22.6 percent increase in the base rate for ground ambulance transports that originate in "super rural" areas. Our regulations relating to coverage of and payment for ambulance services are set forth at 42 CFR part 410, subpart B, and 42 CFR part 414, subpart H.

2. Statutory Requirement for Ground Ambulance Providers and Suppliers To Submit Cost and Other Information

Section 50203(b) of the BBA of 2018 added a new paragraph (17) to section 1834(l) of the Act, which requires ground ambulance providers of services and suppliers to submit cost and other information. Specifically, section 1834(l)(17)(A) of the Act requires the Secretary to develop a data collection system (which may include use of a cost survey) to collect cost, revenue, utilization, and other information determined appropriate by the Secretary for providers and suppliers of ground ambulance services. Such system must be designed to collect information: (1) Needed to evaluate the extent to which reported costs relate to payment rates under the AFS; (2) on the utilization of capital equipment and ambulance capacity, including information consistent with the type of information described in section 1121(a) of the Act; and (3) on different types of ground ambulance services furnished in different geographic locations, including rural areas and low population density areas described in section 1834(l)(12) of the Act (super rural areas).

Section 1834(l)(17)(B)(i) of the Act requires the Secretary to specify the data collection system by December 31, 2019, and to identify the ground ambulance providers and suppliers that would be required to submit information under the data collection system, including the representative sample defined at clause (ii).

Under section 1834(l)(17)(B)(ii) of the Act, not later than December 31, 2019, for the data collection for the first year and for each subsequent year through 2024, the Secretary must determine a representative sample to submit information under the data collection system. The sample must be representative of different types of ground ambulance providers and suppliers (such as those providers and suppliers that are part of an emergency service or part of a government organization) and the geographic locations in which ground ambulance services are furnished (such as urban, rural, and low population density areas), and not include an individual

ground ambulance provider or supplier in the sample for 2 consecutive years, to the extent practicable.

Section 1834(l)(17)(C) of the Act requires that for each year, a ground ambulance provider or supplier identified by the Secretary in the representative sample as being required to submit information under the data collection system for a period for the year must submit to the Secretary the information specified under the system in a form and manner, and at a time specified by the Secretary.

Section 1834(l)(17)(D) of the Act requires that beginning January 1, 2022, the Secretary apply a 10 percent payment reduction to payments made under section 1834(l) of the Act for the applicable period to a ground ambulance provider or supplier that is required to submit information under the data collection system and does not sufficiently submit such information. The term "applicable period" is defined under section 1834(l)(17)(D)(ii) of the Act to mean, for a ground ambulance provider or supplier, a year specified by the Secretary not more than 2 years after the end of the period for which the Secretary has made a determination that the ground ambulance provider or supplier has failed to sufficiently submit information under the data collection system. A hardship exemption to the payment reduction is authorized under section 1834(l)(17)(D)(iii) of the Act, which provides that the Secretary may exempt a ground ambulance provider or supplier from the payment reduction for an applicable period in the event of significant hardship, such as a natural disaster, bankruptcy, or other similar situation that the Secretary determines interfered with the ability of the ground ambulance provider or supplier to submit such information in a timely manner for the specified period. Lastly, section 1834(l)(17)(D)(iv) of the Act requires the Secretary to establish an informal review process under which a ground ambulance provider or supplier may seek an informal review of a determination that the provider or supplier is subject to the payment reduction.

Section 1834(l)(17)(E)(i) of the Act allows the Secretary to revise the data collection system as appropriate and, if available, taking into consideration the report (or reports) that the Medicare Payment Advisory Commission (MedPAC) will submit to Congress. Section 1834(l)(17)(E)(ii) of the Act specifies that, to continue to evaluate the extent to which reported costs relate to payment rates under section 1834(l) of the Act and other purposes as the Secretary deems appropriate, the

Secretary shall require ground ambulance providers and suppliers to submit information for years after 2024, but in no case less often than once every 3 years, as determined appropriate by the Secretary.

As required by section 1834(l)(17)(F) of the Act, not later than March 15, 2023, and as determined necessary by MedPAC, MedPAC must assess, and submit to Congress a report on, information submitted by providers and suppliers of ground ambulance services through the data collection system, the adequacy of payments for ground ambulance services and geographic variations in the cost of furnishing such services. The report must contain the following:

- An analysis of information submitted through the data collection system;
- An analysis of any burden on ground ambulance providers and suppliers associated with the data collection system;
- A recommendation as to whether information should continue to be submitted through such data collection system or if such system should be revised by the Secretary, as provided under section 1834(l)(17)(E)(i) of the Act; and
- Other information determined appropriate by MedPAC.

Section 1834(l)(17)(G) of the Act requires the Secretary to post information on the results of the data collection on the CMS website, as determined appropriate by the Secretary.

Section 1834(l)(17)(H) of the Act requires the Secretary to implement the provisions of section 1834(l)(17) of the Act through notice and comment rulemaking.

Section 1834(l)(17)(I) of the Act provides that the Paperwork Reduction Act (Title 44, Chapter 35 of the U.S. Code) does not apply to collection of information required under section 1834(l)(17) of the Act.

Section 1834(l)(17)(J) of the Act provides that there shall be no administrative or judicial review under sections 1869 or 1878 of the Act, or otherwise, of the data collection system or identification of respondents.

We note that while the requirements of section 1834(l)(17) of the Act are specific to ground ambulance organizations, many stakeholders have expressed interest to us in making this type of information available for other providers and suppliers of ambulance services. For example, air ambulance organizations have suggested they are interested in making this information available. We recognize that the

regulation of air ambulances spans multiple federal agencies, and note that section 418 of the FAA Reauthorization Act of 2018 (Pub. L. 115–254, enacted October 5, 2018) requires the Secretary of Transportation, in consultation with the Secretary of HHS, to establish an advisory committee that includes HHS; DOT; insurance regulators; patient and consumer advocacy groups; physicians specializing in emergency, trauma, cardiac, or stroke; various segments of the air ambulance industry; and others. This committee will review options to improve the disclosure of charges and fees for air medical services, better inform consumers of insurance options for those services, and better inform and protect consumers of these services. We welcomed comments on the state of the air ambulance industry and how CMS can work within its statutory authority to ensure that appropriate payments are made to air ambulance organizations serving the Medicare population.

We received 58 public comments on our proposals to establish a ground ambulance data collection system, including 11 public comments on air ambulance payments from air ambulance organizations, air and ground ambulance organizations, an international trade association that represents providers of emergency air medical services and critical care ground medical transport services, an insurance company and a national heart association. The following is a summary of the comments we received and our response.

Comments: Many commenters stated that they appreciate that CMS proposed to establish a data collection system for ground ambulance providers and suppliers, but noted that ground ambulance transportation is only a part of the overall emergency medical services ecosystem. Some commenters described the vital role of air medical services in providing timely critical care responses to high-acuity life-or-death incidents, and stated that air medical service providers and suppliers are the critical link to tertiary care in severe medical emergencies.

Several commenters stated that the current payment rates for air ambulance services are inadequate and that, except for the annual ambulance inflation factor (AIF), CMS has not adjusted the AFS since it was established in 2002. They stated that prior to 2006, CMS had exercised its authority to make periodic adjustments to the AFS based on the actual costs of providing air medical transportation, and that Medicare payments have failed to keep pace with costs of providing air medical services. One commenter stated that ensuring

that Medicare beneficiaries continue to have access to air medical transportation when they need it the most should be a priority for the Medicare program, and another commenter suggested that the Medical or Transportation Consumer Price Index (CPI) should be used to update air ambulance payments. Other commenters noted that the Medicare payment rate has an impact on Medicaid payment rates, as well as payment rates from private payors. Commenters described the various factors that are increasing the cost of providing air medical services, particularly in rural areas.

According to several commenters, air ambulance providers and suppliers have access to detailed cost information and are willing to share this information with CMS. Several stated that there is an existing study entitled “Air Medical Services Cost Study Report” (March 24, 2017; Xcenda) that provides accurate information on the costs of providing air ambulance services, and that this study could be used to determine appropriate payment for air ambulance providers and suppliers under the Medicare program.

Some commenters encouraged CMS to continue to explore ways to collect the same cost, revenue, and utilization data from air ambulance providers and suppliers that it has proposed to collect from ground ambulance providers and suppliers. Some commenters stated that ground and air ambulance services are increasingly contributing to growing healthcare expenditures and that they appreciate CMS’ efforts to better understand the associated services and costs.

Several commenters urged CMS to exercise its existing authority to develop, with stakeholder input, a data collection process that would provide CMS with current cost data that could be used to rebase the AFS. The commenters also stated that this would result in more adequate Medicare payment rates for air ambulance services, and that this would also address inadequate payment from commercial insurers.

Response: We agree that it is essential that Medicare beneficiaries have adequate access to ambulance services, especially in rural areas, and we appreciate the comments regarding the adequacy of the Medicare air ambulance rates and the suggestions regarding updating those rates. We note that section 1834(l)(17) of the Act, which is the authority for establishing a ground ambulance services data collection system, applies only to providers and suppliers of ground ambulance services.

Accordingly, we do not have the statutory authority to implement a data collection system for air ambulance services at this time.

3. Research To Inform the Development of a Ground Ambulance Data Collection System

To inform the development of a ground ambulance data collection system, including a representative sampling plan, our contractor developed recommendations regarding the methodology for collecting cost, revenue, utilization and other information from ground ambulance providers and suppliers (also collectively referred to in this final rule as “ground ambulance organizations”) and a sampling plan consistent with sections 1834(l)(17)(A) and (B) of the Act. Our contractor also developed recommendations for the collection and reporting of data with the least amount of burden possible to ground ambulance organizations. The recommendations took into consideration the following:

- An environmental scan consisting of a review of existing peer-reviewed literature, government and association reports, and targeted web searches. The purpose of the environmental scan was to collect information on costs and revenues of ground ambulance transportation services, identify background information regarding the differences among ground ambulance organizations including state and local requirements that may impact the costs of providing ambulance services, and describe financial challenges facing the ambulance industry. Five previously fielded ambulance cost collection tools were also identified and analyzed and are described below.

- Interviews with ambulance providers and suppliers, billing companies, and other stakeholders to determine all major cost, revenue, and utilization components, and differences in these components across ground ambulance organizations. These discussions provided valuable information on the process for developing a data collection system, including how to best elicit valid responses and limit burden on respondents, as well as the timing of the data collection.

- Analyses of Medicare claims and enrollment data, including all fee-for-service (FFS) Medicare claims with dates of service in 2016, the most recent complete year of claims data for ground ambulance services.

Our contractor also analyzed the following five data collection tools that currently collect or have collected data from ground ambulance organizations:

- The Moran Company Statistical and Financial Data Survey (the “Moran survey”).⁸⁸ In 2012, American Ambulance Association (AAA) commissioned a study with the goal of developing a data collection tool and making recommendations for collecting data to determine the costs of delivering ground ambulance services to Medicare beneficiaries. The result was the Moran survey, which is a two-step data collection method in which all ambulance providers and suppliers first complete a short survey with basic descriptive information on their characteristics, and second, a representative sample of ambulance providers and suppliers report more specific cost information.

- Ground Emergency Medical Transportation (GEMT) Cost Report form and instructions from California’s Medicaid program.⁸⁹ The GEMT Cost Report form and instructions is used by some states to determine whether ambulance providers and suppliers should receive supplemental payments from state Medicaid programs to cover shortfalls between revenue and costs. This data collection tool is geared toward government entities, as private ambulance providers and suppliers do not qualify for the supplemental payments.

- The Emergency Medical Services Cost Analysis Project (EMSCAP) framework.⁹⁰ The National Highway Traffic Safety Administration funded EMSCAP in 2007 to develop a framework for determining the cost for an EMS system at the community level. Subsequently, EMSCAP researchers used this framework to develop a cost workbook and pilot test the tool on three communities representing rural, urban, and suburban areas. EMS services within the three communities included volunteer, paid, and combination EMS agencies, both fire department and third service-based.

Third service-based refers to services provided by a local government that include a fire department, police department and a separate EMS, forming an emergency trio.

- A 2012 Government Accountability Office (GAO) ambulance survey.⁹¹ To examine ground ambulance suppliers’ costs for transports, in 2012 GAO administered a web-based survey to a random sample of 294 eligible ambulance suppliers. GAO collected data on their 2010 costs, revenues, transports, and organizational characteristics. Although the GAO survey collected data for each domain at the summary level, it also prompted respondents to take into account multiple factors when calculating their summary costs.

- The Rural Ambulance Service Budget Model.⁹² This tool was developed by a task force of the Rural EMS and Trauma Technical Assistance Center with funds from the Health Resources and Services Administration (HRSA) in the early 2000s. The purpose was to provide assistance to rural ambulance entities in establishing an annual budget and to calculate the value of services donated by other entities, as well as services donated by the ambulance entity’s staff to the community. The tool was last updated in 2010 and has been cited as a resource for rural ground ambulance organizations by state and national government agencies. However, use of the tool is not required by any of these agencies.

As discussed in the proposed rule, our contractor’s analysis of these tools revealed that while there was overlap of the broad cost categories collected (for example, labor, vehicles, and facilities costs) via these tools, there were significant differences in the more specific data collected within these broad categories. Overall, there was a large amount of variability regarding whether the tools allowed for detailed accounting of costs and whether the tools used respondent-defined or survey-defined categories for reporting. The five tools also differed in terms of their instructions, format, and design in terms of how a portion of organizations’ total costs were allocated to ground ambulance costs, the timeframe for reporting, and the flexibility of reporting.

Based on these activities, our contractor prepared a report entitled, “Medicare Ground Ambulance Data Collection System—Sampling and Data Collection Instrument Considerations and Recommendations” (referred to as “the CAMH⁹³ report”) which is referenced throughout this final rule. It is available at <https://www.cms.gov/Center/Provider-Type/Ambulance-Services-Center.html> and provides more detail on the research, findings and recommendations concerning the data collection instrument and sampling.

We received comments on our research, including testing, to inform the data collection system. The following is a summary of the comments we received and our responses.

Comment: While commenters were generally very supportive of the proposed data collection system, several commenters stated that testing is a critical step in the development of any survey and they were disappointed that we did not test the data collection instrument and sampling methodology prior to making our proposals. To address these concerns, the commenters recommended that CMS assess the quality and consistency of submitted data throughout the first year of data reporting, and consider revisions to the data collection instrument either during or after the first year of data collection to address any issues that are identified. They also asked that CMS work with stakeholders to provide any needed clarifications for subsequent collection years and make any adjustments necessary to assure that a statistically appropriate representative sample is obtained. A commenter recommended that CMS not wait for rulemaking cycles to clarify definitions or make other minor changes to the system, and that doing so would slow down the process and make the first years of data less useful. Many commenters urged CMS to provide substantial education to ground ambulance organizations and develop definitions and instruction manuals to ensure that accurate and usable data is obtained from all types of services as quickly as possible.

Response: While the data collection system and instrument was not widely tested prior to making our proposals, we conducted an extensive environmental scan as described above, consulted with as many stakeholders as possible throughout the tight timeframe between when the law was enacted and the statutory deadline for specifying the data collection system. This included meeting with all the major associations representing ground ambulance

⁹³ CMS Alliance to Modernize Healthcare.

providers and suppliers, and conducting interviews with randomly selected ground ambulance organizations as described in our contractor's report. Given the extensive effort that has gone into preparing the data collection instrument and sampling plan, as well as the overall positive feedback we received from commenters to the proposed rule, we believe the data collection instrument and sampling plan will achieve the requirements of the statute. We also plan to conduct extensive stakeholder outreach and develop educational materials to help respondents report accurate information, and will make revisions to the data collection instrument and sampling plan as expeditiously as possible to address any issues that are identified.

4. Final Policies for the Data Collection Instrument

a. Format

In the proposed rule, we discussed several options we considered for collecting the data including a survey, a cost report spreadsheet similar to the GEMT, and the Medicare Cost Report (MCR). During interviews with ambulance providers and suppliers, some participants stated that they would prefer that data collection be done through a cost report spreadsheet, rather than a survey, such as the GEMT and other similar data collection tools utilized by state Medicaid programs. They noted that data cost collection spreadsheets such as the GEMT are used in some states where supplemental payments are made to ground ambulance organizations based on costs and revenue reported via a cost reporting template. Although these tools are valuable to the ambulance suppliers that utilize them for Medicaid payment purposes, we noted that only a small number of states make use of these tools for the purpose of providing supplemental payments and that they are generally geared toward government run entities that provide a broad range of emergency medical services and not just ground ambulance services. We stated that for these reasons, we did not believe that these tools could be used by all ground ambulance organizations for Medicare payment purposes without significant revision.

During stakeholder outreach, other ambulance providers and suppliers stated their preference for survey-based reporting such as the Moran survey, because they believe survey reporting is less burdensome and allows more flexibility for reporting. We agreed that survey reporting can be designed to

provide greater flexibility of reporting with reduced reporting burden. However, the Moran survey recommended excluding small ground ambulance organizations with limited capacity or those which relied heavily on volunteer services, which we stated would exclude a large percentage of ground ambulance organizations from our sample, would not take into account the unique differences of government run ground ambulance entities, and could not be used by all ground ambulance organizations without significant revisions. Some ambulance organizations that favored using the Moran survey also recommended using cost reporting guidelines that are similar to the CMS requirements for the MCR. In the proposed rule, we stated that although we agree that standardization is important for data analysis, many smaller ground ambulance organizations have stated they would have difficulty complying with complex cost reporting guidelines. We stated that we believed that requiring ground ambulance organizations to complete and submit an MCR for the purpose of the data collection required in section 1834(l)(17) of the Act would be unnecessarily resource intensive and burdensome.

In the proposed rule, we also considered using multiple instruments or staged data collection as recommended in the Moran Report, where we would first collect organizational characteristic data from all ground ambulance organizations, use that information for sampling purposes, and then collect cost and revenue information from a sample of ambulance providers and suppliers. Using this approach, we stated we would need 100 percent participation from all ground ambulance organizations in reporting the organizational characteristic data in order for the data to be used for sampling purposes. We did not propose this approach because we believed multiple data collections would increase respondent burden and may not align with sections 1834(l)(17)(A) and (B) of the Act which requires CMS to collect data from a random sample and prohibits data collection from the same ground ambulance organizations in 2 consecutive years to the extent practicable.

In the proposed rule, we stated that we did not believe that any of the existing or previously used data collection instruments described above would be sufficient to adequately capture the data required by section 1834(l) of the Act. Therefore, we proposed to collect ground ambulance organization data using a survey that we

developed specifically for this purpose, referred to as the data collection instrument, via a secure web-based system. We stated that we believed that the data collection instrument should be usable by all ground ambulance organizations, regardless of their size, scope of operations and services offered, and structure and proposed that the data collection instrument include screening questions and skip patterns that direct ground ambulance organizations to only view and respond to questions that apply to their specific type of organization. We stated that we also believed that the data collection instrument we proposed is easier to navigate and less time consuming to complete than a cost report spreadsheet. We also stated that the secure web-based survey would be available before the start of the first data reporting period to allow time for users to register, receive their secure login information, and receive training from CMS on how to use the system. Finally, we proposed to codify these policies at § 414.626.

We received comments on the format of the data collection instrument. The following is a summary of the comments we received and our responses.

Comment: Many commenters stated that they support our proposal to collect ground ambulance data using a survey developed specifically for this purpose and not use existing GEMT workbooks or Medicaid cost reports because they do not believe that either would provide the necessary information for CMS and MedPAC to use when addressing the questions that Congress set forth in the statute. They also expressed support for our approach to the development of a web-enabled data collection system and the principles that guided the development of the data collection instrument. In particular, they noted our goal of developing a system that will balance respondent burden against the need to collect the data required by the statute, provide flexibility to collect data from diverse ambulance organizations, and enable the calculation of per-transport costs for comparison to Medicare payment rates. They encouraged us to collect the data in a manner that allows for as much analysis as possible, such as the comparison of per-transport costs across subgroups of ambulance organizations, and analyses estimating the marginal cost of a particular type of transport. These commenters stated that they believe the proposed data collection system and draft Medicare ground ambulance data collection instrument provide a solid foundation for future evaluation.

Some commenters stated that while they would have preferred a spreadsheet

for the data collection instrument, they agree that the proposed web-based survey with skip logic and other embedded tools to help ground ambulance organizations navigate the data collection instrument will be helpful. They asked that CMS consider ways that web-based tools can leverage the technology to provide additional clarity around the data submission. For example, they stated that it may be useful to include standardized definitions or address common questions by incorporating links to specific questions to the terms/answers and to have definitions or allocation rules “pop-up” on the screen when a user starts a new question. One commenter requested that the data collection system allow enough time for the respondent to complete the information, to save partially completed data, and easily come back to where they left off to edit or continue entering the data. Commenters stated that they would welcome the chance to walk through the data collection system, as well as the data collection instrument once it is coded and share ideas about how the web-based nature of it can be refined. They would also like to work with CMS to find ways that may allow for easier data entry, including auto-population of certain fields and an application programming interface (API) import method from commonly used accounting software.

While nearly all commenters expressed support for the proposed format of the data collection instrument, some commenters were concerned that due to the complexity of the data collection instrument, the response rate will be low and that the submitted data may be inaccurate, particularly for smaller ground ambulance organizations. One commenter recommended that low-volume ambulance organizations (for example, those providing 600 or fewer all-payer ground transports per year) should only be required to complete a much shorter version of the proposed data collection instrument in order to increase the response rate. This commenter suggested that for low-volume ambulance organizations, only the minimum information needed to calculate the organization’s cost per transport, such as the organization’s total annual budget, total number and type of transports regardless of payer, average number of miles per transport, type of organization, non-profit vs. for-profit status, use of shared space, and percent of labor hours from volunteers, should be collected.

Response: We thank the commenters for the overwhelming support of the

proposed format of the data collection instrument and will implement many of the suggestions commenters provided to ensure the data collection system is user friendly and provides as many avenues for analysis as possible.

We understand the concern that upon first glance, the data collection instrument may appear complex, as well as the concern that it may suffer from a low response rate. However, we expect that ambulance organizations will find that the use of screening questions and skip patterns that direct them to only view and respond to questions that apply to their specific type of organization will be easier to navigate and less time consuming to complete than a cost report spreadsheet. We believe that the data collection instrument will be usable by all ground ambulance organizations regardless of their size or other characteristics, and do not believe it is necessary or beneficial to have a limited data collection instrument for low-volume ambulance organizations to complete. Our belief is that all ground ambulance organizations that are chosen to participate in the sample will work with CMS and their ambulance associations to receive the assistance they need to report the data required, not just because they will receive a 10 percent payment reduction for failure to report the data, but also because they believe their data is important so that those analyzing the data can accurately assess whether or not Medicare payment rates are adequate. We specifically designed the data collection instrument to leave as many doors open as possible for data analysis while also considering the burden associated with every question.

Comment: Some commenters expressed concern that information on key organizational characteristics (such as organization type and use of volunteer labor) are being collected as part of this data collection effort, rather than in a separate data collection process that would occur before the collection of cost and revenue data. They stated this two-stage approach to data collection is needed to stratify the sample and ensure a representative sample.

Response: We recognize the desire that many commenters shared to have all of the organizational characteristic data prior to selecting samples to ensure that CMS has what commenters believe would be a complete set of data to use to stratify the sample. As stated in the proposed rule, we believe that Medicare claims and enrollment data provide CMS with enough data to appropriately stratify the sample. We also continue to believe that multiple data collections

would increase respondent burden and that the commenters’ suggestion to collect data from all ground ambulance organizations in the first data collection and then select a random sample to collect data from some ground ambulance organizations in that same year or the year after may not align with sections 1834(l)(17)(B) of the Act, which requires CMS to collect data from a random sample and prohibits data collection from the same ground ambulance organizations in 2 consecutive years, to the extent practicable. Furthermore, we believe that collecting data on organizational characteristics as part of one data collection effort will enable skip patterns within the survey to limit the number of questions organizations with certain characteristics will need to answer.

After consideration of the comments, we are finalizing our proposal to collect ground ambulance organization data using a single survey-based data collection instrument delivered via a secure web-based system. We made a few technical changes to our proposals to codify these policies at § 414.626 including adding a definition for Medicare Ground Ambulance Data Collection Instrument. We are finalizing our proposals to codify these policies at § 414.626.

b. Scope of Cost, Revenue, and Utilization Data

Section 1834(l)(17)(A) of the Act requires CMS to develop a data collection system to collect data related to cost, revenue, utilization, and other information determined appropriate by the Secretary for ground ambulance organizations. Section 1834(l)(17)(A)(i) of the Act further specifies that the information collected through the system should be sufficient to evaluate the extent to which reported costs relate to payment rates.

In the proposed rule we stated that we considered several options regarding the scope of collecting data on ground ambulance cost, revenue, and utilization. One option was to require ground ambulance organizations to report on their: (1) Total costs related to ground ambulance services; (2) total revenue from ground ambulance services; and (3) total ground ambulance service utilization. We stated that this approach considers all ground ambulance costs, revenue, and utilization, regardless of whether the service was billable to Medicare or related to a Medicare beneficiary and that the advantage of this approach is that ground ambulance organizations already track information at their

organizational level on total costs, revenue, and utilization for their own internal budgeting and planning. We stated that this method was also used to calculate an organization-level average cost per transport in two previous studies described below:

In a 2012 study entitled, “Ambulance Providers: Costs and Medicare Margins Varied Widely; Transports of Beneficiaries has Increased”,⁹⁴ the GAO performed an analysis to assess how Medicare payments, including the temporary add-on payments, compared to costs reported using a survey. The GAO collected information via a survey on organizations’ total costs, including operating and capital costs, without restriction to costs associated with Medicare transports or costs incurred in responding to calls for service from Medicare beneficiaries. GAO then divided reported total costs by the reported number of transports (regardless of whether Medicare paid for the transport) to calculate an average cost per transport for each organization, and reported summary statistics across these averages, including a median cost per transport of \$429. However, to simplify data collection and analysis, the analysis was limited to ambulance suppliers that did not share operational costs with a fire department, hospital, or other entity. GAO stated that its calculations assumed that this average cost per transport was constant for all of an organization’s transports regardless of whether or not the patient transported was a Medicare beneficiary. This approach implicitly loads the costs associated with activities that did not result in a transport, such as responses by a ground ambulance where the patient could not be located, refused transport, or was treated on the scene, into the estimated cost per transport.

The second study, “Report to Congress Evaluation of Hospitals’ Ambulance Data on Medicare Cost Reports and Feasibility of Obtaining Cost Data from All Ambulance Providers and Suppliers,”⁹⁵ was conducted by HHS as required under the American Taxpayer Relief Act of 2012 (ATRA) (Pub. L. 112–240, enacted January 2, 2013). This report used data from Medicare cost reports as its data source, rather than a survey, and included only ambulance providers, rather than ambulance providers and suppliers. It described substantially higher costs per transports for

ambulance providers compared to the estimate from GAO, with a median of approximately \$1,750 per transport. It did not compare reported total costs to Medicare revenue tallied in claims data with and without the temporary add-on payments. Neither the GAO nor the HHS report compared costs and AFS payment rates for specific Healthcare Common Procedure Coding System (HCPCS) codes because the available cost data in both studies did not support that level of analysis.

Another option we discussed in the proposed rule was considering only those costs that are relevant to ground ambulance services furnished to Medicare beneficiaries. We stated that collecting costs associated with specific services (such as Medicare transports) and excluding other services (such as Medicaid transports or responses that did not result in transport) would require either a much more intensive and costly data collection approach (such as time and motion studies) or assumptions on which portions of total costs were related to the specific activity. We also stated that we believed this approach would be overly burdensome and complex for ground ambulance organizations, especially those who provide other services in addition to ground ambulance services.

A third option we considered for the proposed rule was to only consider those costs that are related to the specific ground ambulance transport services that are paid under the AFS. We stated that this would require ground ambulance organizations to report costs, revenue, and utilization related to specific levels of services reported with HCPCS codes, but not costs, revenue, and utilization for other services such as responses that did not result in a transport (which is not covered under the AFS). In the proposed rule we stated that we believe this option would be overly burdensome and complex.

We stated that in discussions with ambulance providers and suppliers, we were informed that ground ambulance organizations most often track organization-level total costs, revenue, and utilization across all activities and services furnished to all patients. We were told that most would find it difficult to report costs, revenue, and utilization associated with services furnished exclusively to Medicare beneficiaries or associated with Medicare services covered under the AFS.

Therefore, we proposed the first option, which would require ground ambulance organizations to report on their: (1) Total costs related to ground

ambulance services; (2) total revenue from ground ambulance services; and (3) total ground ambulance service utilization. We stated that this approach considers all ground ambulance costs, revenue, and utilization, regardless of whether the service was billable to Medicare or related to a Medicare beneficiary to collect total cost, total revenue, and total utilization data.

Although we proposed to collect a ground ambulance organization’s total costs and total revenues, we stated we were aware that many ground ambulance organizations share operational costs with fire departments, other public service organizations, air ambulance services, hospitals, and other entities. We stated that for these organizations, only a portion of certain capital and operational costs contribute to total ground ambulance costs, and only a portion of revenue is from ground ambulance services. We also stated we were aware that some ground ambulance suppliers deploy emergency medical technicians (EMTs) in fire trucks, which will make it difficult to determine whether the fire truck costs should be factored into the total ground ambulance costs, and if so, how that will be calculated.

In the proposed rule, we stated that one option to address these challenges is to limit data collection to ground ambulance organizations that do not share operational costs with fire departments, hospitals, or other entities, as GAO did for their 2012 report. We stated that we did not believe this approach meets the requirement in section 1834(l)(17)(B)(ii) of the Act for a representative sample because many ambulance suppliers and all ambulance providers share operational costs with fire, police, health care delivery or other activities. We also considered including providers’ and suppliers’ total costs and revenues across all activities and stated that while this would simplify cost and revenue data reporting, the resulting data would not be limited to ground ambulance activities, and therefore, would result in biased estimates of ground ambulance costs or require significant assumptions to estimate ground ambulance costs alone.

To more accurately define total costs and total revenues related to ground ambulance services for those ground ambulance organizations that provide other services in addition to ground ambulance services, we proposed an approach where the data collection instrument instructions would separately address three further refined proposed categories of total ground ambulance costs and revenues:

⁹⁴ This report is available at <https://www.gao.gov/assets/650/649018.pdf>.

⁹⁵ This report is available at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AmbulanceFeeSchedule/Downloads/Report-To-Congress-September-2015.pdf>.

- *Cost and revenue components completely unrelated to ground ambulance services.* In the proposed rule, we stated these costs and revenues would be unrelated to this data collection and not reported. We gave examples that included administrative staff without ground ambulance responsibilities, health care delivery outside of ground ambulance, community paramedicine, community education and outreach, and fire and police public safety response.

- *Cost and revenue components partially related to ground ambulance services.* We stated these costs and revenue would be reported in full, but respondents would report additional information that could be used to allocate a portion of the costs to ground ambulance services. We stated that depending on how the data would be utilized, certain costs could be included or excluded from an analysis after data are collected. We provided examples to include EMTs who are also firefighters and facilities with both ground ambulance and fire department functions. (We stated that we considered an alternative where respondents would allocate costs and report only costs associated with ground ambulance services but believed that would pose an additional burden on the respondent to calculate allocated amounts, and would result in an allocation process that is less transparent and standardized).

- *Cost and revenue components entirely related to ground ambulance services.* We stated that these costs are reported in full. We gave an example to include EMTs with only ground ambulance responsibilities and ground ambulance vehicles.

In the proposed rule, we stated that we believe that this approach will enable us to collect the data necessary to evaluate the adequacy of payments for ground ambulance services, the utilization of capital equipment and ambulance capacity, and the geographic variation in the cost of furnishing such services. We stated that the data could be analyzed in the same manner as the data in the GAO report, for example, calculating an average per-transport cost for each organization and calculating Medicare margins with and without add-on payments, or could provide the basis for other analyses to link reported costs to AFS rates. We stated that an

analysis could use reported total costs and information on the volume of transports by levels of services to estimate a cost for each HCPCS code reported for the AFS, or regression-based approaches to estimate the marginal cost of furnishing each HCPCS code on the AFS. We stated that we believed that under our approach, the collected data will be available to estimate total costs and revenue relevant to ground ambulance services.

We received comments on scope of cost, revenue, and utilization data.

Comment: Many commenters stated that they support CMS' approach to collect data on total costs related to ground ambulance services, total revenue from ground ambulance services, and total ground ambulance service utilization. They stated that they support this approach because it will provide the most accurate and complete view of ground ambulance costs, revenue, and utilization.

Commenters also expressed support of CMS' proposal to collect data in such a way that will allow the allocation of a share of organizations' total costs to ground ambulance services in cases where an organization also provides other services or activities. Commenters stated that separating ground ambulance costs from non-ground ambulance costs is essential for the data collection system to comply with the intent of the Congress when it established the new program. They also stated that they agree that the data collection instrument should provide clear instructions to separately address these costs while in many cases allowing them to be reported and that the clear definition of these terms will be critically important to ensure the consistent application of these categories.

Finally, one commenter expressed concern that several categories of "hidden" or "opportunity" costs were not captured in the data collection instrument. These include, but are not limited to: volunteers using their own cars to respond to calls; the time/money volunteers lose in responding to calls, and position vacancies that organizations cannot fill or needed capital equipment or buildings that they cannot purchase due budget constraints. The commenter noted these "hidden costs" artificially lower the cost of running an ambulance service for some organizations.

Response: We agree that it is critical to collect data in such a way that ground ambulance costs can be separated from an organization's total costs in cases where an organization performs ground ambulance and other activities. The approach that we proposed would collect information in such a way that analysts (rather than the respondent) would be able to allocate many costs to ground ambulance services.

We also do not agree with the commenter who suggested that we collect information on what they described as "hidden" costs. The statute requires us to collect information on actual costs, not on costs that would have occurred under certain circumstances. We believe that the proposed data collection instrument will provide the necessary data required by the statute, and collecting information on other costs or potential costs would be out of scope for this data collection.

After consideration of the comments, we are finalizing our proposals to collect data on total costs related to ground ambulance services, total revenue from ground ambulance services, and total ground ambulance service utilization. We are also finalizing our proposals regarding allocation of a share of organizations' total costs and revenues unrelated to, partially related to, and entirely related to ground ambulance services.

c. Final Data Collection Elements

In the proposed rule, we shared the proposed data collection instrument on the CMS website at <https://www.cms.gov/Center/Provider-Type/Ambulances-Services-Center.html>. We provided an overview of the elements of the data collection instrument we proposed in Table 37, including information on costs, revenues, utilization (which we define for the purposes of the data collection instrument as service volume and service mix), as well as the characteristics of ground ambulance organizations.

In the proposed rule we stated that to help structure the data collection instrument, we organized costs by category (for example, labor, vehicles, and facilities), which we stated was the approach used in the GEMT and the AAA/Moran survey.

TABLE 37: Components for the Data Collection Instrument

Component (Data Collection Instrument Section)	Broad Description
Ground ambulance organization characteristics (2-4)	Information regarding the identity of the organization and respondent(s), service area, ownership, response time, and other characteristics; broad questions about offered services to serve as screening questions.
Utilization: Ground ambulance service volume and service mix (5 and 6)	Number of responses and transports, level of services reported by HCPCS code.
Costs (7-12)	Information on all costs partially or entirely related to ground ambulance services.
<ul style="list-style-type: none"> Staffing and Labor Costs (7) 	Number and costs associated with EMTs administrative staff, and facilities staff; separate reporting of volunteer staff and associated costs.
<ul style="list-style-type: none"> Facilities Costs (8) 	Number of facilities; rent and mortgage payments, insurance, maintenance, and utility costs.
<ul style="list-style-type: none"> Vehicle Costs (9) 	Number of ground ambulances; number of other vehicles used in ground ambulance responses; annual depreciation; total fuel, maintenance, and insurance costs.
<ul style="list-style-type: none"> Equipment & Supply Costs (10) 	Capital medical and non-medical equipment; medical and non-medical supplies and other equipment.
<ul style="list-style-type: none"> Other Costs (11) 	All other costs not reported elsewhere.
<ul style="list-style-type: none"> Total Cost (12) 	Total costs for the ground ambulance organization included as a way to cross-check costs reported in the data collection instrument.
Revenue (13)	Revenue from health insurers (including Medicare); revenue from all other sources including communities served.

(1) Collecting Data on Ground Ambulance Provider and Supplier Characteristics

We are required to collect information regarding the geographic location of ground ambulance organizations to meet the requirement at section 1834(l)(17)(A)(iii) of the Act that the collected data include information on services furnished in different geographic locations, including rural areas and low population density areas. In the proposed rule, we stated that we recognized that there are differences between and among ground ambulance organizations on several key characteristics, including geographic location; ownership (for-profit or non-profit, government or non-government, etc.); service volume, organization type (including whether costs are shared with fire or police response or health care delivery operations); EMS responsibilities; and staffing models. We stated that our research indicated that:

- There are differences in costs per transport by ground ambulance organizations with a different ownership status;
- EMS level of service and staffing models often have an important impact on costs, with higher EMS levels of service (for example, quicker response

times) and static staffing models (that is, maintaining a constant response capability 24 hours a day, 7 days a week, 365 days a year) involving higher fixed costs; and

- Utilization varies significantly across ambulance providers and suppliers of different characteristics.

Due to this variation in characteristics and the effect it has on costs and revenues, we stated that we believed it is important for ground ambulance organizations to report additional characteristics to adequately analyze the differences in costs and revenue among different types of ambulance providers and suppliers. We also stated that we believed collecting this information directly through the data collection instrument will improve data quality with minimal burden on the respondents because the data collection instrument was designed to tailor later sections and questions based on respondents' characteristics through programmed "skip patterns". We stated we considered relying exclusively on the Medicare enrollment form CMS 855A for ground ambulance providers or CMS 855B for ground ambulance suppliers to capture this information, but believed that data accuracy would be more robust if reported directly by

respondents for the specific purpose of this data collection.

We proposed to collect information on ownership and organization type through a sequence of questions in Section 2 of the data collection instrument. We stated that some of the questions in this section were adapted in part from prior surveys (such as the GAO and Moran surveys) with changes as necessary to fit scenarios reported during interviews with ground ambulance organizations. The first question related to organizational characteristics, question 6, asked about the organizations' ownership status and aligned closely with a similar question on the Medicare enrollment form CMS 855B for ambulance suppliers. Question 7 asked whether the respondent's organization used any volunteer labor. While this question could have been asked later in the data collection instrument around the collection of labor data, we stated we opted to include it here because many ground ambulance organizations informed CMS that they view the use of volunteer labor as a defining organizational characteristic, on par with ownership status, and that a volunteer labor question was expected by respondents at this early point in the data collection instrument. Question 8 asked

respondents to select a category that best describes their ambulance organization. We stated that the response options for this item are mutually exclusive and align with the ambulance provider and supplier taxonomy described in the CAMH report. The next two questions, 9 and 10, more directly asked whether the respondent has shared operational costs with an entity of another type, including a fire department, hospital, or other entity. We stated that we proposed these questions in addition to the organization type question to account for situations where a respondent might primarily identify as an organization of one type (with implications for shared operational costs) but then might have shared operational costs with another entity type. We stated that responses to questions 9 and 10 play an important role in skip logic later in the data collection instrument regarding questions and response options relevant only to ground ambulance organizations with shared operational costs with an entity of another type.

We stated that other questions regarding organizational characteristics are necessary to tailor later parts of the data collection instrument to the respondent. These included questions in Section 2 of the data collection instrument on whether the respondent's ambulance organization:

- Is part of a broader corporation or other entity billing under multiple National Provider Identifiers (NPIs) (question 2).
- Routinely responds to emergency calls for service (question 11).
- Operates land, water, and air ambulances (questions 12–14).
- Has a staffing model that is static (that is, consistent staffing over the course of a day/week) or dynamic (that is, staffing varies over the course of a day/week) or combined deployment (certain times of the day have a fixed number of units, and other times are dynamic depending on need) (question 15).
- Provides continuous (also known as “24/7/365”) emergency services (question 16).
- Provides paramedic or other emergency response staff to meet ambulances from other organizations in the course of a response (questions 17 and 18).

In our interviews with ambulance providers and suppliers, some participants indicated that their staffing model is an organizational characteristic that would likely be associated with costs per transport and that organizations that need to maintain fixed staffing levels over time (for

example, to maintain an emergency response capability to serve a community) would likely have higher costs than those that do not.

Section 1834(l)(17)(A)(iii) of the Act requires collecting data from ambulance providers and suppliers in different geographic locations, including rural areas and low population density areas. In the proposed rule, we stated that the area served by ambulance organizations is an important characteristic and we proposed to collect information on the geographic area served by each ambulance organization in Section 3 of the data collection instrument.

In the proposed rule, we stated that many ground ambulance organizations have a primary service area in which they are responsible for a certain type of service (for example, ALS–1 emergency response within the borders of a county, town, or other municipality) and may have secondary services areas for a variety of reasons, such as providing mutual or auto aid, or providing a different service in a secondary area (for example, non-emergency transports state-wide). For the proposed rule, we considered several alternatives to collect information on service area. One option was to utilize Medicare claims data, but we stated that this would limit the information to Medicare billed transports only and would also not differentiate between primary and other service areas. Another option was to allow respondents to write in a description of their primary and other service areas, but we stated this would require converting written responses to a format that can be used for analysis. A third option was for respondents to report the ZIP codes that constitute their primary and other service area. We stated this approach aligns with the Medicare enrollment process requirement to submit ZIP codes where the ground ambulance organization operates and that it would also collect ZIP code-based information on service area that can be easily linked to the ZIP Code to Carrier Locality file⁹⁶ that lists each ZIP code and its designation as urban; rural; or super-rural. We stated that this file is used by the MACs to determine if the temporary add-on payments should apply to a transport under the AFS. We also stated the main limitation of this approach is that ZIP codes would not always align to service areas, because ZIP codes routinely cross town, county, and other boundaries that

are likely relevant for defining ground ambulance organizations' service areas.

We proposed to require ground ambulance organizations that are selected during sampling to identify their primary service area by either: (1) Providing a list of ZIP codes that constitute their primary service area; or (2) selecting a primary service area using pre-populated drop-down menus at the county and municipality level in question 1, Section 3 of the data collection instrument. We also proposed to require respondents to specify whether they have a “secondary” service area, which we stated are areas where services are regularly provided under mutual aid, auto-aid, or other agreements in Section 3, question 4 of the data collection instrument and if so, to identify the secondary service area using ZIP codes or other regions as described above for the primary service area (Section 3, question 5). We stated that mutual aid agreements are joint agreements with neighboring areas in which they can ask each other for assistance and that auto-aid arrangements allow a central dispatch to send the closest ambulance to the scene. We did not propose to collect information on areas served only in exceptional circumstances, such as areas rarely served under mutual or auto-aid agreements or deployments in response to natural disasters or mass casualty events because we stated we believe reporting on rarely-served areas will involve significant additional burden and will add to complexity of the data collection instrument without generating data that will be useful for analysis.

In the proposed rule, we stated that the proposed approach distinguishes between primary and secondary service areas and will allow subsequent questions on the balance of transports in a respondent's primary versus secondary service area and whether average trip time and response times are substantively longer in the secondary versus primary service area. We stated that we believed this approach results in data that can be easily analyzed and eliminates the need to ask certain other questions (such as the population and square mileage of the respondent's service area) because this information can be inferred using the reported geographic service area boundaries.

We proposed to ask the following questions in Sections 3 and 4 of the data collection instrument, service area and subsequent emergency response time, because the responses to these questions are closely related to the area served by the organization:

⁹⁶ Available at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AmbulanceFeeSchedule/index.html>.

- Whether the respondent is the primary emergency ambulance organization for at least one type of service in their primary service area (Section 3, question 2).

- Average trip time in primary and secondary service areas (Section 3, questions 3 and 6).

- Average response time (for organizations responding to emergency calls for service) for primary and secondary service areas (Section 4, questions 1–2).

- Whether the organization is required or incentivized to meet response time targets by contract or other arrangement (for organizations responding to emergency calls for service) (Section 4, question 3).

In the proposed rule, we stated that average trip and response time are necessary to understand how geographic distance between the ground ambulance organization's facilities and patients affects costs. In interviews, ground ambulance organizations recommended the collection of average trip time in addition to mileage because some rural and remote areas may have relatively long average trip times even though mileage may be more modest due to terrain, the quality of roads, and other factors. We stated that we believed that collecting information on average response time would allow the analysis of whether communities with different response time expectations and targets have systematically different costs.

We received comments on collecting data on ground ambulance provider and supplier characteristics. The following is a summary of the comments we received and our responses.

Comments: Many commenters stated that they are pleased that CMS has recognized the importance of taking into account organizational characteristics in designing the data collection instrument. They stated that even though the organizational characteristics in Section 2 of the data collection instrument differ from those initially recommended by the AAA based on its work with the Moran Company, they believe that in its totality the data collection instrument covers the key organizational characteristics that policy-makers will need to use to accurately determine the cost of providing ground ambulance services. Commenters made several specific recommendations. One commenter recommended that CMS add questions asking whether the respondent has sole source contracts or local jurisdictional requirements and suggested that we add categorical response options (specifically, less than and greater than 20 percent) to the existing question on

the use of volunteer labor because these characteristics may be systematically related to reported costs and revenue.

Commenters also asked CMS to consider several specific clarifying changes to the data collection instrument including: (1) Clarifying how respondents should respond to question 1 in Section 2 if they have multiple service types under the same NPI; (2) defining NPI; (3) distinguishing between response options for independent/proprietary organization types; (4) specifying which organization name should be reported; (5) defining the term “public/private partnership;” (6) adding an “other” organization type; (7) clarifying the term ‘volunteer’ and which volunteer personnel are in-scope when reporting volunteer labor; and (8) clarifying how to classify 501(c)(4) organizations.

Many commenters requested that because the questions in Section 4, emergency response time, are similar to those in Section 3 of the data collection instrument, they would like CMS to provide the same clarification to these questions that they highlighted for Section 3 of the data collection instrument.

One commenter requested clarification on whether the average trip time is calculated across all calls or just specific types such as emergency, scheduled, etc. One commenter recommended that average response time be defined as starting when the call for service is answered to when the first EMS unit arrives on location. The commenter stated this definition is best because it measures response times as experienced by the public/patient. One commenter requested clarification on Section 4, Question 3 which asks whether organizations are penalized for exceeding response time targets, if their local area imposes these standards. The commenter requested clarification on whether any performance penalties should be included in the answer to this question or only response time penalties.

Several commenters also recommended asking ground ambulance organizations to provide 90th percentile response time rather than average response time. They believe 90th percentile response time is a more accurate indicator of ambulance services capabilities and quality. They stated that average time has too wide a range for error, since roughly half of responses are quicker/slower than average. They further stated that using average response time also tends to flatten the data, which means that the fastest and slowest organizations do not stand out as much.

Response: We appreciate commenters' points that much of the information collected via the data collection instrument will be useful in describing variation across ground ambulance organizations. Many of the specific characteristics that commenters suggested adding to the initial section of the data collection instrument are already included in the survey. For example, Section 3 of the proposed data collection instrument asks if the organization is the only EMS provider in most or all of their service area, Section 4 asks about response time targets, and Section 7 asks for detailed information related to volunteer labor. We added screening questions to the initial section of the data collection instrument only when they were necessary to inform skip patterns, and reserved asking other questions until later sections. The information collected via the survey can be used to conduct analyses for various subgroups of organizations, for example those that are and are not the only EMS provider in part or all of their service area.

We thank commenters for pointing out several opportunities to clarify the instructions and items in the proposed data collection instrument. We believe that based on the wording of question 1, Section 2, organizations with more than one service line under the same NPI (such as both air and ground ambulance) should answer “yes” to question 1 in Section 2. We agree that the term national provider identifier should be defined at its first use in the data collection instrument. When distinguishing between different types of proprietary/independent ground ambulance organizations, we intended option (e) to reflect primarily EMS responsibilities and option (f) to reflect primary responsibilities that are non-emergency. For the legal name, we are requesting that organizations use their legal name, which should match the name used on their Medicare enrollment form 855B in most cases. For this reason, we encourage all ambulance organizations to confirm that their information is up-to-date in the Medicare enrollment database, the Provider Enrollment Chain and Ownership System (PECOS). A public/private partnership is a formal contractual arrangement between a government and an entity chartered for the express purpose of providing the service. We believe that the response options for the ownership type item (question 6 in Section 2) are comprehensive and no additional “other” option is necessary. The volunteer labor question refers to any

volunteers, including non-medical personnel. Any staff member who is paid could not be counted twice, once as a paid staff member and once as a non-paid staff member or volunteer. So in the example of a paid administrator who serves as a volunteer responder, they should be counted in the administrator category since that is the category in which they are paid. Volunteers may receive some forms of compensation but are not considered full or part time employees if they are not paid a minimum wage in return for full or part-time labor. Finally, 501(c)(4) organizations are considered to be for-profit organizations.

We agree that most ground ambulance organizations that respond to emergency calls for service already track response times and that different organizations may use different methodologies for tracking. We also agree that it is important to define the term “average response time” to ensure respondents are reporting times measured in a consistent way but we are concerned that specifying one definition or another may result in additional burden for organizations that currently track response time using another definition. We believe that several summary statistics would be useful for analysis, including an estimate of central tendency (like the mean) and an estimate focusing more on outliers (like the 90th percentile). We are also clarifying that response time target penalties do not include performance or any other type of penalties.

As a result of these comments, we will change two of the options in Question 8 to (e) Independent/proprietary organization primarily providing EMS services and (f) Independent/proprietary organization providing non-emergency services. We will also add information on the use of volunteers to clarify that it refers to all volunteer staff, not only response personnel. We will add the text “that best fits your organization” to Section 2, question 6, and we will define NPI on the first use of that acronym. We will also add new items on whether or not the organization uses the response time definition in the data collection instrument or another definition, new instructions to clarify that respondents should report response times as they currently measure them, and a new item for the 90th percentile response time. We will revise the data collection instrument to add an initial yes/no question asking whether the organization measures response time specifically as the time from when the call for service is answered to when the first EMS unit arrives on the scene. If

the respondent answers yes, we would then ask for response time summary statistics. If the respondent answers no, we would ask them to specify what definition they use.

Comment: Many commenters were pleased that the proposed data collection instrument includes questions on their service area because of the impact of the service area on their costs. They described that in some rural areas, ambulance organizations may have to commit vehicles for several hours for a single response if their service areas cover hundreds of miles. In urban areas, an ambulance organization may face a similar challenge of having a vehicle committed to a single response as it navigates traffic congestion and overcrowded emergency rooms. Commenters were also appreciative that we proposed using ZIP code level data, because as the census data changes, so do the ZIP codes designated as urban, rural, and super-rural. They stated that this information is essential to understand the costs of ambulance organizations providing services in these areas, especially to assess the add-ons and adequacy of current ambulance fee schedule rates. These commenters stated that they appreciate the data elements related to average trip time since having standardized assessment of these elements is also important. They stated that while they had divided the average duration of a transport into three categories, they support the more detailed division in the proposed data collection instrument.

One commenter sought clarification on what CMS means by “primary service area” and “secondary service area”. They inferred that the intent of these distinctions is to allow the end users of the data to be able to allocate the costs appropriately as related to urban, rural, or super-rural areas by proportioning the costs of respondents based on where they provide the most services. They stated that they believe that this approach makes sense as a way to parse out the complexities that an ambulance organization might provide services in more than one geographic designated (for example, urban, rural, super-rural) and that using the ZIP codes rather than the current Medicare definitions of urban, rural, and super-rural will provide consistency in reporting, as the 2020 Census may shift the CMS definitions again. The commenter suggested that, if this assumption is in fact correct, that CMS define the term “primary service area” as the area where more than half of its services are provided. The same commenter asked that CMS provide a

standard definition to what it means by “the primary emergency service.” They stated that while many ambulance organizations will likely know whether they are the only provider of emergency services in an area or not, they may not know the volume of services provided by other organizations if there are others providing these services. They also stated that it could also be helpful to know whether CMS will audit the answers to this question and what will be done with the respondents’ data if more than one ambulance organization answers that it is the primary emergency ambulance provider for the same set of ZIP codes. Another commenter requested clarification on whether the secondary service area could include the whole state, or when an organization handles a transfer of a patient to higher level care for another organization.

Response: We thank the commenters for these detailed questions and appreciate the opportunity to provide additional clarification. Each ambulance organization will determine what it considers to be its primary service area, usually based on whether it has primary EMS or responsibilities within a specific jurisdiction or if it has contractual or other arrangements to provide a certain level of service with a particular region (as opposed to an area where it renders aid to other ambulance organizations). We expect that in most cases, well over 50 percent of an organization’s transports will occur in the primary service area. Given the lack of information about ambulance organization service areas, we believe it will be useful to collect respondents’ subjective assessment of their own primary and secondary service areas, and do not believe that a specific threshold would be relevant for all respondents. For example, there are likely cases where an organization’s primary service area by contract accounts for half or less than half of its paid transports if it serves an area with high levels of mutual or auto-aid agreements. While there are other approaches to collect more detailed information on service areas and the arrangements (both formal and informal), responsibilities, levels of service offered, and service volume in different parts of an organization’s service area, we believe that the burden involved in collecting this more detailed information would be considerable. Commenters highlighted several examples of cases where it might be difficult to identify whether they have a secondary service area. If an organization operates an emergency service for one jurisdiction but then

operates a non-emergency service in the rest of the state, both may be considered primary since the ground ambulance organization has the primary responsibility for serving both areas. Also, we would not expect that all ground ambulance organizations will have a secondary service area.

We also do not agree with the suggestion to describe primary service areas as those with only one emergency ambulance provider because that would exclude organizations that are the primary emergency ambulance provider in areas where other organizations respond to calls through mutual or auto-aid arrangements on an occasional, but perhaps not an exceptional basis. We understand that ambulance organizations vary in how they define their service areas, and we expect that ground ambulance organizations will report their service area information accurately. We believe the existing question provides us with the detail we need to understand the service area of the responding ground ambulance organization.

After consideration of the comments, we clarified that responses to questions related to the primary and secondary service area should be based on the respondents' best judgment regarding the definition of their organization's primary service area and, if applicable, secondary service area. We further clarified the primary and secondary service area definitions through the new examples in the data collection instrument instructions and making additional edits pertaining to the service area.

Comment: Several commenters suggested adding a question to Section 3 of the data collection instrument that would ask if the ground ambulance organizations uses EMS employees from another agency, such as a fire department or law enforcement agency, either to provide initial patient care/assessment or continue providing patient care during transportation to a hospital or other destination. If the respondent answers no, they would skip to Section 4. If the respondent answered yes, they would be asked the percentage of patient transports that are EMS employees from another response agencies providing initial patient care/assessment or continuing to provide patient care during transportation, and if the ground ambulance organization reimburses this non-transporting agency for the patient care/assessment services they provide.

Commenters stated that they believe it would be beneficial for CMS to gain an understanding of how frequently ground ambulance agencies rely upon a fire

department or law enforcement agency for additional EMS personnel to provide patient care. They stated that while they understand that we are focused mostly on obtaining data related to individual patient transportation, they believe it is important to consider the entire EMS response system because that is key to evaluating the efficiency and effectiveness of ambulance organizations that rely upon a third-party agencies (such as a fire department or law enforcement agency) to meet their response-time goals.

These same commenters also asked that CMS include a question in Section 4 of the data collection instrument that asks if a ground ambulance organization responds to calls for service in conjunction with a non-transporting EMS agency, such as a fire department or law enforcement agency. If the respondent answers no, they would skip to Section 5 of the data collection instrument. If the respondent answers yes, they would then be asked for additional information including: The percentage of responses in which a non-transporting agency responds initially to the patient; the percentage of transports where an initial responding EMS provider from another agency continue providing patient care during transport to a destination; if they have a formal agreement with the non-transporting agency to provide these services; and if they reimburse the non-transporting agency for these services. Commenters also stated that often ground ambulance organizations may rely upon a non-transporting fire department or law enforcement agency for the initial response to a call for service in order to "stop the clock" and that they believe CMS should include this set of questions to determine how often transporting agencies rely upon a non-transporting agency for initial response and whether the transporting agency is reimbursing the non-transporting fire department or law enforcement agency for this critical response role. Other commenters also suggested that the survey needs to better capture these situations where non-transporting agencies also respond.

Response: The commenters raise an important issue that medical care provided to beneficiaries in emergency settings by the EMS system as a whole consist of more than simply transporting beneficiaries. Costs may differ for organizations in these situations in important ways; therefore, we agree with the commenters to add one question to the survey that incorporates whether the agency responds to calls with another agency.

After consideration of the comments we added a question in Section 2 of the data collection instrument asking whether the organization responds to calls for service in conjunction with a non-transporting EMS agency, such as a fire department or law enforcement agency. We also added a follow-up question for respondents answering "yes" to collection information on (a) the share of ground ambulance responses during which a non-transporting EMS agency provides staff contributing to the response, and (b) the broad roles of these staff (including EMT-Paramedic, other EMT, and other.

(2) Collecting Data on Ground Ambulance Utilization

CMS is required to collect information on the utilization of ground ambulance services. In the proposed rule we stated that while we could collect information on the volume of ground ambulance services that can be billed to Medicare, this approach would not provide information needed to determine total utilization of ground ambulance organizations. We stated another option would be to utilize Medicare claims data for estimates of ground ambulance transport volume and separately collect information on services not payable by Medicare (such as responses that did not result in a transport), but that this approach would also not provide complete information on total transport volume, since other services, such as responses that do not result in a transport, would not be included.

Based on information provided during interviews with ground ambulance organizations, we identified several distinct utilization categories, such as total responses and ground ambulance responses. In the proposed rule, we stated that this is particularly important for fire-based and police-based organizations that may have a significant volume of fire and police responses that do not involve a ground ambulance. We stated that the number of responses that did not result in a transport can be separately tallied. We also stated that other important utilization categories are ground ambulance transports (that is, responses during which a patient is loaded in a ground ambulance), which can be measured in terms of total transports (that is, all ground ambulance transports regardless of payor) or paid transports (that is, transports for which the ambulance provider or supplier was paid in part or in full). Additionally, we stated that another utilization category would include information on ambulance providers and suppliers that furnish paramedic intercept services or

provide paramedic-level staff in the course of a BLS response where another organization provides the ground ambulance transport.

In the proposed rule, we stated we believed it is important to collect utilization data related to all services, not just transports, because other services that contribute to the total volume of responses have direct implications for costs and that collecting utilization information related to transports without collecting information on other services would omit important cost information. We stated that some utilization measures, such as the ratio of ground ambulance to total responses, may be one basis for allocating certain costs reported elsewhere in the data collection instrument. We stated that another example would be the difference between total and paid transport, as this would provide information on services that were provided to patients but for which no payment is received.

To best capture the full range of utilization data, we proposed a two-pronged approach to collect data on the volume and the mix of services. First, we proposed to collect total volume of services for each of the categories listed below in Section 5 of the data collection instrument:

- Total responses, including those where a ground ambulance was not deployed (question 1).
- Ground ambulance responses, that is, responses where a ground ambulance was deployed (question 2).
- Ground ambulance responses that did not result in a transport (question 4).
- Ground ambulance transports (question 5).
- Paid ground ambulance transports, that is, ground ambulance transports where the ambulance provider or supplier was paid for a billed amount in part or in full (question 6).
- Standby events (question 7).
- Paramedic intercept services as defined by Medicare (question 8).
- Other situations where paramedic staff contributes to a response where another organization provides the ground ambulance transport (question 9).

The CAMH report describes several cases where an ambulance provider or suppliers' mix of services within one of the utilization categories described above could affect costs or revenue. Most importantly, within billed transports, variation in the mix of specific ground ambulance services (for example, ALS versus BLS services) will affect both costs (because ALS transports require more and more costly inputs) and revenue (because ALS

services are generally paid at a higher rate). We stated that ground ambulance organizations with a higher share of responses that are emergency responses may also face higher fixed costs, and that the costs for organizations furnishing larger shares of water ambulance transports are likely different than costs from organizations that do not furnish water ambulance transports. We stated that there is a subset of ground ambulance organizations that specialize in non-emergency transports or inter-facility transports, which suggests that this business model may result in different per-transport costs compared to EMS-focused ambulance providers and suppliers.

Second, to account for this significant variation, we proposed to collect the following information related to service mix:

- The share of responses that were emergency versus non-emergency (Section 6, question 1).
- The share of transports that were land versus water (asked only of organizations reporting that they operate water ambulances; Section 6 question 2).
- The share of transports by service level (Section 6 question 3).
- The share of transports that were inter-facility transports (Section 6 question 4).

We did not propose that respondents report on their mix of services in primary and secondary service areas (as defined above) separately because this would double the length of this section of the data collection instrument and require complex calculations or use of assumptions by respondents that do not separately track services by area. Instead, we proposed that respondents report the share of total ground ambulance responses that were in a secondary rather than primary service area in a single item (Section 5 question 3). We also did not propose to collect detailed information regarding the mix of services for total transports (versus paid transports) and paid transports (versus total transports) because collecting information on the mix of services for total and paid transports separately would double the reporting burden in this section and because we believed, based on discussions with stakeholders, that it is reasonable to assume that the distribution of transports across categories would be the same.

We received comments on collecting data on ground ambulance utilization and service mix. The following is a summary of the comments we received and our responses.

Comment: Many commenters stated that they were pleased that CMS proposed to collect utilization data on all services, not just transports, in Section 3 of the data collection instrument. These commenters stated that they agree with CMS that these data are important because other services that contribute to the total volume of responses have direct implications for costs. They also stated that given the importance of this information to determining and evaluating the costs of providing ground ambulance services, they asked that CMS add "low," "medium," and "high" response options to allow the data to be separated by the volume of services provided by each respondent. They stated that while that information might be obtained by adding the various questions in Section 5 of the data collection instrument, adding such a question would allow for evaluators to have a more straightforward and consistent method of taking this critical factor into account. They stated that by setting the definition of low, medium, and high volume, CMS would be standardizing the way in which these terms are used by anyone seeking to use the data to develop policy and that standardization is critically important when policies such as low-volume adjusters are being considered.

Several commenters requested clarifications on the definitions of "ground ambulance," "response," and "transport, including removing the Medicare definition of 'medically necessary' from the definition of transports because it is not uniform across payers. For items related to service mix, one commenter suggested using the Medicare manual definitions of specific ground ambulance services to avoid confusion. Commenters also suggested clarifications to the definition of "interfacility transport."

Another commenter suggested several points of clarification on responses and transports. The commenter stated that it was not clear how to count responses for situations when multiple ambulances may be dispatched to the scene, but not all of them transport beneficiaries. They suggested that responses should actually be the number of ambulances sent to the scene. This same commenter also requested clarification on whether responses where a police car is first on the scene and then cancels the ambulance should be counted in responses, and whether community paramedicine visits should be counted.

One commenter requested clarification about how to treat transfers that are 'emergency.' The commenter noted that in rural areas, transfers can

be considered emergency calls when a patient needs to be transported to a higher level of care. They requested clarification on how an emergency transfer should be counted in the responses and transports. This commenter also requested clarification on how ground ambulance organizations who receive some local tax funding to offset the patients who do not pay should report unpaid transports since in this scenario all patients' transports are partially paid.

Many commenters noted that, while they believe it is important to collect information on responses that do not result in transports, they believed some ground ambulance organizations do not currently track this information. These commenters suggested that CMS add new response options to allow respondents to either estimate the share of responses where the patient is not transported or to report that this information is not available.

Several commenters noted that they incur significant costs for ground ambulance where the patient is pronounced dead at the scene. These commenters asked that CMS add several items to the data collection instrument to collect information on the share of responses that involve a patient pronounced dead on-scene and the time and costs involved in these responses.

Response: We appreciate the detailed comments to our proposals, but do not agree that respondents should be presented with an option to report service volume in terms of categorical "low," "medium," and "high" response options. Data collected using this categorical approach would considerably decrease the precision of estimated per-transport costs. We also believe that it would be challenging to combine data from ground ambulance organizations reporting specific counts of services with those opting to use the categorical response options. Reported counts of services can easily be described in terms of categories when the data is analyzed.

We agree that it is appropriate to use Medicare manual definitions for ground ambulance services, although some of the verbatim descriptions may need to be abridged due to their length. We appreciate commenters' concerns that the specific Medicare definition of ground ambulance transport may not apply to transports paid by certain other payers. While we would generally prefer to use the Medicare definition of ground ambulance transports, we believe that the burden of asking respondents to distinguish between transports paid by other payers that would or would not have met Medicare requirements would

be unreasonable compared to incremental benefit of using this narrower definition. We agree that the definition of interfacility transport in the data collection instrument needs to be clarified and revised. We agree that the commenters' specific clarifications to the definitions of several service categories will be helpful to respondents.

In the data collection instrument, the term 'ground ambulance response' is defined as "a response by a fully equipped and staffed ground ambulance, scheduled or unscheduled, with or without a transport, and with or without payment. If more than one vehicle is sent to the scene, the instructions are to count this as one response." For example, if three ambulances are sent to one incident, and only one ambulance transports a patient, then this example is counted as one response and one transport. Similarly, responses where another EMS vehicle arrives and cancels the ambulance would not be counted in the responses. While there may be some discrepancy between the number of responses, paid transports and responses that do not result in a transport, we do not agree with the suggestion to allow for multiple ambulances sent to one scene to be counted as multiple responses since we do not encourage ground ambulance organizations to send more than one ambulance on every call.

Emergency transfers would be counted in the number of emergency responses in Section 6, Question 1, and under their corresponding level of service in Question 3. Paid transports should only include those where a health insurer or patient paid for some or all of the billed charge. Any payments that are offset by tax revenue should not be counted in this section since tax revenue is reported separately in the revenue section.

We agree with commenters that it is important to collect information on the number of responses that do not result in a transport, and understand that some ground ambulance organizations may not currently track this information. Due to the importance of this information for determining cost, we do not believe that adding the response options to report that the information is not available or to allow respondents to estimate the share of responses where the patient is not transported is appropriate.

The proposed data collection instrument asks respondents to report the share of responses that do not result in a transport for any reason, including that the death of the patient. We are collecting information on all ground

ambulance costs, regardless of whether the patient was transported. Given our overarching goal of minimizing burden while collecting the data necessary, we believe that existing items collecting information on the number of responses that did not result in a transport are sufficient.

After consideration of the comments, we used the Medicare manual definitions of Medicare ground ambulance services, clarified the definitions of other response and transport categories, and removed the Medicare medical necessity requirement from the definition of "ground ambulance transport." We also refined the definition of "interfacility transport" in the data collection instrument to include transports where "the origin and destination are one of the following: A hospital or skilled nursing facility that participates in the Medicare program or a hospital-based facility that meets Medicare's requirements for provider-based status. We also added an additional question to the data collection instrument that specifically asks for interfacility transports that are covered under Medicare Part A where the ambulance provider or supplier would seek payment from SNF, hospital, or hospice.

Finally, we clarified the instructions for the definitions of response and transports, incorporating the example of an emergency transfer.

(3) Collecting Data on Costs

Section 1834(l)(17)(A) of the Act requires CMS to collect cost information from ground ambulance organizations. This section describes the data in each cost category that we proposed to collect, as well as alternatives that we considered.

In the proposed rule we stated that the costs reported separately in the categories of costs we proposed to collect would sum to an organization's total ground ambulance costs. In addition to ground ambulance costs, we proposed to ask all respondents in the data collection instrument to report their total annual costs (that is, operating and capital expenses), inclusive of costs unrelated to ground ambulance services, in a single survey item (Section 12, question 1). For ground ambulance organizations that do not have costs from other activities (such as from operating a fire or police department), the reported total costs are a way to cross-check costs reported in individual cost categories throughout the data collection instrument, and we can compare the reported total to the sum of costs across categories. In the proposed rule, we stated that such a

cross-check may also be appropriate for ground ambulance organizations with costs from other activities, as the sum of costs across ground ambulance cost categories should always be less than the ground ambulance organization's reported total costs. We stated that we believed that this cross-check will improve data quality and is consistent with existing survey-based data collection tools and that this approach would provide a better understanding of the overall size and scope of ground ambulance organizations, including activities other than providing ground ambulance services and that relatively larger organizations may have lower ground ambulance costs due to economies of scale and scope.

To avoid reporting the same costs multiple times, we included instructions and reminders throughout the data collection instrument to avoid double-counting of costs. We stated that from a design perspective, we believe it is less important where a particular cost is reported on the data collection instrument and more important that the cost is reported only once.

We made two proposals that have important implications for reporting in all cost sections in the data collection instrument. First, in the case where a sampled organization is part of a broader organization (such as when a single parent company operates different ground ambulance suppliers), we proposed to ask the respondents to report an allocated portion of the relevant ground ambulance labor, facilities, vehicle, supply/equipment, and other costs from the broader parent organization level in separate questions in several places in the cost sections of the data collection instrument (Section 7.2 question 3, Section 8.2 question 2, Section 8.3 question 2, Section 9.2 question 5, Section 9.3 question 6, Section 10.2 question 4, and Section 11 questions 2 and 5). This scenario is discussed in more detail in the sampling section below. In exploratory analyses, we found that a small share of NPIs were part of broader parent organizations. Due to the rarity of this scenario and the complexity of calculations required, we proposed to allow the respondent to report an allocated amount directly for these questions using an allocation approach they regularly use for this purpose. We stated that while a specific allocation approach would yield more uniform and transparent data, we believed that these benefits were not worth the additional respondent burden.

Second, we proposed to include a general instruction stating that in cases where costs are paid by another entity

with which the respondent has an ongoing business relationship, the respondent must collect and report these costs to ensure that the data reported reflects all costs relevant to ground ambulance services. We provided examples including when a municipality pays rent, utilities, or benefits directly for a government or non-profit ambulance organization, or when hospitals provide supplies and/or medications to ground ambulance operations at no cost. During interviews with ground ambulance organizations, we were told that there are many nuanced arrangements that fit this broad scenario. In the proposed rule, we stated that although we recognized this would be an additional step for some ground ambulance organizations, we are concerned that the lack of reported cost data in one of these major categories could significantly affect calculated total cost.

Because some ambulances, other vehicles, and buildings are donated to ground ambulance organizations, we stated that we considered asking respondents to report fair market values for these vehicles and buildings. We stated our concern that the lack of reported cost data in one of these major categories could affect calculated total cost, as well as our understanding that it is not always clear what cost is appropriate to report. To avoid the subjectivity and burden involved in asking respondents to report fair market value, we proposed that respondents report which ambulances, other vehicles, and buildings have been donated, but not an estimate of the fair market value of those donations. We stated we believe fair market values could be imputed using publicly available sources of data to facilitate comparison of data between organizations that have donations and those that do not. For the same reasons, we also proposed not to collect an estimate of fair market value for donated equipment, supplies, and costs collected in the "other costs" section of the data collection instrument. We stated that for those ground ambulance organizations with costs that were paid by another entity with which the respondent has an ongoing business relationship, such as a ground ambulance organization that is part of or owned by a government entity, respondents would obtain the cost information directly from that entity since we would not consider these to be donated items.

We received general comments on collecting data on ground ambulance costs. The following is a summary of the comments we received and our responses.

Comment: Commenters were supportive of the categories of costs that we proposed for the data collection system. Commenters stated that they support collecting total ground ambulance costs across all cost data elements, without limiting the costs to those associated with transports and as a result, the cost of readiness will be embedded in the response for each cost category and then be automatically allocated across the services provided. However, one commenter suggested including an explicit question to measure readiness costs: Total trip time multiplied by total responses divided by total scheduled ambulance unit hours (total ambulance labor hours reported for a week divided by 2 as typically there are 2 personnel on an ambulance).

Commenters were also supportive of the proposal to have respondents report total annual costs that include the operating and capital expenses inclusive of costs unrelated to ground ambulance services in a single survey question, as well as CMS' efforts to eliminate double-counting of costs. Several commenters requested clarification that the total cost and total revenues section include non-ground ambulance related costs/revenues.

Commenters stated that they in general support the allocation rules as proposed. Several commenters recommended collecting costs paid by another entity in the data collection instrument and for inclusion in any analysis of Medicare margins so that the costs will not be artificially low and provided the example of including the labor provided by non-transporting organizations at the scene. Another commenter was concerned it may be difficult to obtain costs paid for by other entities for which they have an ongoing business relationship such as a municipality paying for dispatch services.

Commenters supported CMS' proposal to ask reporting ground ambulance organizations that are part of broader parent organizations (for example a broader for-profit corporation billing Medicare for ground ambulance services under multiple NPIs) to submit information related to an allocated share of their parent organization's costs. One commenter specifically recommended that CMS use the term "central office" rather than "parent organization" in the data collection instrument and suggested that CMS specify a specific allocation methodology that respondents must follow in this scenario to avoid concerns of differences in how these costs are reported across organizations. Another commenter asked that CMS take the

reported estimates of allocated parent organization costs in good faith, without the threat of audits as the data may be difficult for organizations to report, particularly in the initial years of data collection.

One commenter requested that respondents be asked to estimate the fair market value of any ambulances, other vehicles, and buildings that have been donated, rather than relying on CMS or MedPAC to impute these values. The commenter stated they believe respondents could be given the option of identifying the estimated value as of the year the item was donated (and the year it was donated), if that is less burdensome than estimating the current value. They thought that respondents would be in a much better position to accurately estimate these values than CMS or MedPAC.

One commenter stated that many small ground ambulance organizations do not keep track of data on depreciation and was concerned that any of the sections asking for depreciation would be difficult to fill out for some ground ambulance organizations.

Response: The survey is designed to collect information on total costs, which implicitly captures all costs related to readiness, and therefore, we do not believe it necessary to include a separate question that requires ground ambulance organizations to calculate a readiness cost.

We believe that while some commenters noted the lack of a standard approach to the allocation of costs between ambulance organizations and their parent organization or central office could potentially lead to differences in how these costs are reported, we do not believe that developing a specific, standardized allocation method for these costs is necessary, as we expect only a small share of reporting ground ambulance organizations to allocate parent organization costs in this way.

The questions for total costs and total revenue currently specify that services not related to ground ambulance services should be included, but we agree with the commenter suggesting the addition of a question on fees paid to other non-transporting organizations for their services, when there is an agreement in place to pay for these services. However, as we discuss elsewhere in these comments, we continue to believe that requiring ground ambulance organizations to report on the estimated costs of labor, supplies, vehicles, etc. for non-transport vehicles that are 'in-kind' donations would be extremely burdensome for

ground ambulance organizations that do not currently pay for these services. However, if a cost that is borne directly by the ground ambulance organization or another entity that owns, operates, or manages the ground ambulance organization, then that cost is required to be reported.

We acknowledge that certain items such as depreciation will be difficult for some agencies to estimate and we will provide additional instructions on how to estimate depreciation in the survey instructions. However, we disagree with the commenter regarding collecting fair market value from respondents because we want to reduce any subjectivity and burden involved in asking respondents to report fair market value. We continue to believe fair market values could be imputed using publicly available sources of data to facilitate comparison of data between organizations that have donations and those that do not. We believe the data collected on the survey will allow end users to infer approximate costs for donated items.

After consideration of the comments, we added a question to the 'other costs' section for funds paid to other organizations for services (such as non-transporting organizations providing medical personnel).

(i.) Collecting Data on Staffing and Labor Costs

As we discussed in the proposed rule, ambulance organizations told us in interviews that labor is one the largest contributors to total ground ambulance costs (especially medical staff such as EMTs, paramedics, and medical directors). They told us that they use a broad mix of labor types and hiring arrangements, and that there is significant variation in tracking staffing and labor cost inputs that are needed to calculate costs. We were also informed by ambulance organizations that data on the number of ground ambulance staff and associated labor costs were often available at one of three levels: The individual employee level; aggregated by category such as EMT-Basic or Medical Director; or aggregated across all staff. Additionally, we were told by ambulance providers and suppliers that ground ambulance organizations typically face challenges in tracking ground ambulance staff and costs by category when staff had multiple ground ambulance responsibilities (for example, EMTs with supervisory responsibilities, EMTs who are also firefighters, etc.).

In the proposed rule we stated that we agree that labor costs are an important component of total costs and believed that it is necessary to collect information on both staffing levels, that

is, the quantity of labor used, and the labor costs resulting from these labor inputs. Without information on staffing levels, we stated we would not be able to gauge whether differences in labor costs are due to compensation or different levels of staffing. We further stated that collecting information on staffing levels allows the use of imputed labor rates from other sources (such as the Bureau of Labor Statistics). We also acknowledged the practical need to balance the burden involved in reporting extremely detailed staffing and labor costs information against the usefulness of detailed data for explaining variation in ground ambulance costs. Therefore, we proposed to collect information in the data collection instrument on the number of staff and labor costs for several detailed categories of response staff in Section 7 of the data collection instrument. This includes medical staff such as EMT-basic, EMT-intermediate, and EMT-paramedic, a single category for paid administrative and facilities staff (for example, executives, billing staff, and maintenance staff), and a single category for medical directors. We stated we believed this approach involves less respondent burden compared to reporting on each individual staff member. If more detailed categories were used for reporting staffing levels and costs, we stated we believed the burden involved in assigning paid administrative and facilities staff with multiple roles to individual categories or apportioning their labor and costs to separate categories would increase.

We stated that the main limitation of our approach is that we would not collect detailed information on specific paid administration and facilities labor categories. Therefore, we also proposed to collect some information that would help explain variation in labor costs by asking whether the ground ambulance organization has some staff in more specific paid administration and facilities categories such as billing, dispatch, and maintenance staff (Section 7, question 1). We stated this question serves as a screening question to determine which response options appear to the respondent in several other questions in this section of the data collection instrument. We also proposed to ask for information on why individual labor categories are not used (Section 7, question 1) and if there is at least one individual with 20 hours a week or more of effort devoted to specific activities such as training and quality assurance (Section 7.2, question 2).

Reporting Staffing Levels

In reporting staffing levels in the data collection instrument, we stated that we considered several approaches. One approach we considered was asking the respondent to report only the number of staff (that is, counts of people). Under this approach, a part-time employee would count as “1” to the number of staff even if they worked a small number of hours per week. We stated we believed this approach would result in less accurate reporting of labor inputs, especially from organizations relying heavily on part-time staff or staff with responsibilities unrelated to ground ambulance services. We also considered allowing respondents to report full-time-equivalent (FTE) staff on a 40-hour per week basis, but ground ambulance organizations informed us that reporting FTEs would be burdensome. As a third approach, we considered asking respondents to report ground ambulance staffing levels in terms of hours over a reporting year. We stated that reporting labor hours over the entire reporting year allows for more accurate reporting of staff working part-time and may involve less burden for respondents that already tally annual labor hours (for example, via payroll records), but would likely be difficult for those who do not already track labor hours in this manner. As a fourth approach, we considered asking respondents to report ground ambulance staffing levels in terms of hours worked during a typical week. We stated that reporting staffing levels in terms of hours worked either over a reporting year or during a typical week allows detailed accounting of part-time staff and staff with ground ambulance and other responsibilities and involves fewer calculations and adjustments than reporting FTEs. We also stated that reporting in terms of hours over a typical week has the additional advantage of simplifying reporting for staff that start or stop work during the 12-month reporting period. We further stated that the main limitation of reporting staffing levels in terms of hours over a typical week is that the week that the respondent selects for reporting may not be generalizable to other weeks in the reporting period.

In the interest of minimizing reporting burden, we proposed to collect information on the number of staff in terms of hours worked over a typical week (Sections 7.1 and 7.2). The instructions in the data collection instrument asked respondents to “select a week for reporting that is typical, in terms of seasonality, in the volume of services that you offer (if any) and

staffing levels during the reporting year.”

Scope of Reported Labor Costs

For the purposes of collecting information on labor costs, we proposed to define labor costs to include compensation, benefits (for example, healthcare, paid time off, retirement contributions, etc.), stipends, overtime pay, and all other compensation to staff. We referred to these costs as fully-burdened costs. We stated that some ambulance providers and suppliers track compensation but not benefits because another entity, such as a municipality, pays for benefits, and that the ability of these ambulance organizations to report fully burdened costs may be limited. We stated that despite this limitation and due to the importance of labor costs as a component of total ground ambulance costs that we believed information on fully burdened costs (Sections 7.1 and 7.2) must be reported so that all relevant ground ambulance transport costs are collected. We stated that ground ambulance organizations selected to report data may need to implement new tracking systems or request information from other entities (such as municipalities) to be able to report fully-burdened labor costs.

Volunteer Labor

In the proposed rule, we stated that ground ambulance organizations have also informed us that a significant share of ambulance organizations rely in part or entirely on volunteer labor and that the systems and data available to track the number of volunteers and the time that they devote to ground ambulance services varies. We proposed to collect information on the total number of volunteers and the total volunteer hours in a typical week using the same EMT/response staff and administrative and facilities staff categories used elsewhere in the data collection instrument (Section 7.3, questions 1–5). We stated that although some suggested that assigning a value to volunteer labor hours may be important, the data collection instrument collects information only on the amount of volunteer labor (measured in hours in a typical week) and not a market value for that labor. We also stated that we believed reported hours can be converted, if necessary, to market rates using data from other sources. We proposed to collect the total realized costs associated with volunteer labor such as stipends, honorariums, and other benefits to ensure all costs associated with ground ambulance

transport are collected (Section 7.3, question 6).

Allocation and Reporting Staff With Other Non-Ground Ambulance Responsibilities

Since firefighter/EMTs are common in many ambulance suppliers, we proposed to ask respondents that share costs with a fire or police department to report total hours in a typical week for paid EMT/response staff with fire/police duties only (Section 7.1). In the proposed rule, we stated we believed this information could be used to subtract a portion of associated labor costs when calculating ground ambulance labor costs. We stated we believed our approach is more consistent and involves less burden than asking respondents to perform their own allocation calculations necessary to report only the hours or full-time equivalents related to ground ambulance services.

As already noted, many ground ambulance organizations have staff with responsibilities beyond ground ambulance and fire/police response. To account for these scenarios, we proposed to ask respondents to report the total hours in a typical week unrelated to ground ambulance or fire/police response duties (which are addressed separately as described in Section 7.1), as the costs associated with this labor can be subtracted by those analyzing the data when calculating ground ambulance labor costs. We stated we believed this approach provides both transparency and consistency in the data with minimal burden, and may avoid scenarios where all of the costs associated with staff with limited ground ambulance responsibilities contribute to total ground ambulance costs.

We received comments on collecting data on collecting labor costs. The following is a summary of the comments we received and our responses.

Comment: All commenters supported the collecting of information on staffing and labor costs. They stated that they agree that labor is a major driver of the cost of ground ambulance services; thus, despite the fact that it may be difficult for some organizations to report full labor-related costs, they should be encouraged to do so to allow CMS and others to understand the full cost of labor, including compensation, benefits (for example, healthcare, paid time off, retirement contributions, etc.), stipends, overtime pay, and all other compensation to staff.

Commenters also stated that understanding and accounting for volunteer hours is an important

component of ground ambulance costs and that they agree with our proposals to collect information on the total number of volunteers and the total volunteer hours in a typical week using the same EMT/response staff and administrative and facilities staff categories used elsewhere in the proposed data collection instrument, as well as the decision to collect only hours and allow those analyzing the information from the data collection instrument to use appropriate proxies for placing a value on the cost of volunteer labor. Additionally, they stated that they support the CMS proposal to have respondents who also provide fire or public safety services to report the hours of their EMTs in a manner that will allow those using the data to subtract the portion of the associated labor costs that is not attributable to ground ambulance labor costs. They stated that the data collection system must ensure that the costs used to assess Medicare payment rates are specific to the provision of ground ambulance services and not mixed with the costs associated with other services that an organization might provide.

Several commenters made specific recommendations related to the definitions used in this section of the data collection instrument. Some commenters were concerned that the instruction to exclude staff and labor costs related to staff with responsibilities in “healthcare delivery unrelated to ground ambulance” could be interpreted to include EMT and other response staff arriving on the scene via a vehicle other than a ground ambulance. Another commenter asked that CMS clarify the scope for costs related to volunteer labor “stipends and/or benefits”.

Several commenters made specific recommendations related to improving the instructions for this section of the survey. One commenter expressed concern that CMS may be biasing certain reported staffing and cost information by asking respondents to categorize staff based on their roles or certification at the start of the reporting period. Other commenters requested clarification on how to report information for staff who work in both response and administrative roles. One commenter requested clarification on how respondents should select a “typical week” over which staffing levels should be reported and recommended replacing the typical week approach with an approach based on dividing hours worked annually by 52. The same commenter also requested clarification on how the labor costs

associated with medical directors should be reported and recommended separate reporting on staffing and costs for medical directors who are employees and those who are contractors. Another commenter requested clarification about the reporting of hours for volunteers who might be on call with pagers.

Some commenters suggested adding additional items to capture more information on how labor from partner organizations (that is, other entities sending response and other staff to respond to calls for service) contribute to overall responses. One commenter specifically suggested that CMS ask for counts of total staff for different types of responses so that CMS can better understand different staffing and deployment models.

Several commenters stated that throughout the proposed rule, CMS mentioned their intention to calculate the value of services performed by volunteer personnel by benchmarking their number of hours served against the average wage data collected by the Bureau of Labor Statistics. They stated that the Bureau of Labor Statistics’ current processes for gathering wage information for EMS personnel is inaccurate as it pertains to cross-trained firefighter/EMTs and firefighter/paramedics. Another commenter suggested using another database called Independent Sector to determine the value of volunteer labor.

Response: We thank commenters for their support. We considered several alternatives when developing our proposals for collecting information on staffing and labor costs, including approaches that would have allowed respondents to split reported hours and labor costs across multiple staff categories for individual staff with multiple responsibilities. While these alternatives could collect more detailed information, they would all increase response burden substantially. The proposed instructions ensure that all compensation costs are reported, and no compensation costs are double counted. The instructions accomplish this by aiming to direct respondents to assign each individual staff member to only one labor category. While CMS recognizes the instructions are lengthy, the aim is to minimize necessary calculations and complex data tracking by the respondent.

It appears that several commenters mistakenly assumed that we proposed to collect compensation costs over a typical week rather than over the entire annual reporting period. While we did propose to collect information on staffing levels over a typical week, the data collection instrument collects

compensation costs only on an annual basis. Collecting annual compensation minimizes some of the concerns raised by commenters related to under or over-estimating labor costs in a particular category. The distinction between reporting *staffing levels* during a typical week and labor costs over the entire year may have introduced unnecessary complication, and therefore, we are removing the instruction to report staffing levels during a typical week and instead will ask respondents to report staffing levels in terms of hours over the entire annual reporting period.

The proposed data collection instrument instructions ask respondents to report costs associated with contracted medical director services in Section 11 of the data collection instrument as an “other cost.” We agree with commenters that separating questions related to medical directors is confusing particularly given the fact that contracted medical directors are so common.

In reporting the hours associated with volunteer labor, it was not our intention to capture hours on-call while volunteers are at other locations or jobs. We intended to capture the hours in service, which includes the time from which they receive a call or a page to the time they are finished with their call, as well as time spent in the station house performing duties as if they were being paid.

We agree that it would be possible to collect information that would help explain differences in staffing and deployment models, although collecting this information would add additional burden on respondents. The current labor questions collect what we believe is the most relevant information to assess how differences in labor inputs drive total costs—more specifically, the data collection instrument collects information on the total staff and total compensation. We agree that it is important to understand the extent to which other organizations contribute to responses, for example by providing paramedic or other staff to responses that are not paid by the organization submitting data. While the proposed data collection instrument collects costs related to these arrangements when a payment is made, the proposed data collection instrument does not otherwise collect information on when such arrangements exist, which we agree would be helpful information to include in the data collection instrument.

Comment: One commenter stated that using the Bureau of Labor Statistics is one method of valuing volunteer labor but provided an alternative method for

valuing volunteer labor using Independent Sector data. Another commenter stated that the BLS' current processes for gathering wage information for EMS personnel is inaccurate as it pertains to cross-trained firefighter/EMTs and firefighter/paramedics. Commenters also stated that the definition of stipends and benefits for volunteer labor should be broadened to include all forms of compensation from the ground ambulance organization such as insurance, stipends, or other forms of compensation.

Response: We did not specify the use BLS or any other source of wage data to determine the valuation of volunteer labor in the proposed rule in order to provide flexibility in valuing volunteer labor when analyzing the data. The data collection instrument collects information on volunteer hours and total compensation of any type from the ground ambulance organization so we agree that the definition of "stipends and/or benefits" should be broadened to include all forms of compensation from the ground ambulance organization such as insurance, stipends, or other forms of compensation.

After consideration of the comments, we are removing the instruction to report staffing levels during a typical week and instead will ask respondents to report staffing levels in terms of hours over the entire annual reporting period. This will result in reporting instructions that are more similar for staffing levels and labor costs. We are not changing the instructions that ask respondents to categorize each staff member in only one category. While alternative approaches could collect more accurate and detailed information, we believe these alternatives would involve significant additional burden. We are adding new items to the labor section asking (1) whether another organization provides staff in certain labor categories (including paramedic, other EMT, and other) to responses where the sampled ground ambulance organization would transport the patient, and (2) what share of responses involve labor from other organizations in these categories. We believe these additions will help CMS understand when reported labor costs may be lower due to contributions to responses from other organizations.

To minimize confusion and potential double-counting of costs associated with medical directors, we are moving the specific question related to contracted medical director service costs from the other costs section, Section 11, to the labor section, Section 7, in the data collection instrument. We are editing the definition of "stipends and/or

benefits" in relation to volunteer compensation to include all compensation provided by the ground ambulance organization. Organizations should only report the costs they pay for a medical director, not an estimated true cost for the value of that medical director's labor. We will also clarify the instructions surrounding the calculation of volunteer hours to include time spent in service for all volunteers. We are also editing the instructions in this section to clarify that staff participating in ground ambulance responses should be included regardless of how they arrive on the scene.

(ii) Collecting Data on Facility Costs

Facility costs may include rent, mortgage payments, depreciation, property taxes, utilities, insurance, and maintenance, and the associated costs vary widely across ambulance providers and suppliers. Some ground ambulance organizations own facilities while for others, rent, mortgage, or leasing is an important component of total operational costs. Some ground ambulance organizations share facilities with other operations (such as fire and rescue services), and individual ground ambulance organizations often operate out of several facilities of different types, sizes, and share of space related to ground ambulance operations.

In the proposed rule, we considered requiring respondents to report facility costs aggregated across all facilities. We stated we believed this approach would minimize burden on the respondent by eliminating the need to break costs down by facility but that it may also increase the risk for inconsistencies in how respondents report total facilities costs. We stated that under this approach, respondents whose ground ambulance organizations share operational costs with a fire department or other entity would need to calculate and report an estimate of facilities costs that was relevant only to ground ambulance services.

We also considered requiring respondents to report all costs on a per-facility basis. We stated we believed this approach would allow the most flexibility in reporting complex facility arrangements from ground ambulance organizations operating out of multiple facilities. We further stated that this approach may also involve more burden, particularly for larger organizations, to report costs on a facility-by-facility basis, and many organizations do not track costs such as maintenance or utilities on a per-facility basis.

We proposed a hybrid approach involving both per-facility and aggregate

reporting of different information. We stated that first respondents report the total number of facilities (Section 8., questions 1–2) and then indicate for each facility whether they paid rent, mortgage, or neither during the reporting period, total square footage, and share of square footage related to ground ambulance services (Section 8.1, question 3); second, respondents report their per-facility rent, mortgage, or annual depreciation (Section 8.2); and third, respondents report facilities-related insurance, maintenance, utilities, and property taxes aggregated across all facilities (Section 8.3).

We stated that we believe this approach allows for the collection of the information needed to calculate a total facilities cost related to ground ambulance services while avoiding a burden on respondents to calculate allocated facility costs. We stated that total insurance, maintenance, utility, and property tax costs can be allocated using reported square footage and shares of square footage related to ground ambulance services. We further stated that the approach requires respondents to provide both the square footage of each facility, and the share of square footage for the facility that is related to ground ambulance operations. We stated that we expect some ground ambulance organizations would have this information available and others would need to collect this square footage information to report along with facilities costs, but did not believe this information would be difficult to collect.

We received comments on collecting data on facility costs. The following is a summary of the comments we received and our responses.

Comment: Many commenters stated that they support the proposals related to facility costs and had no additional suggestions. One commenter requested further guidance on how ground ambulance organizations should interpret the percentage of their facility square footage directly attributable to ground ambulance services. They asked if CMS is just looking for the space used to park the ambulance and store EMS supplies, how ground ambulance organizations should categorize common spaces, and what portion of the chief's office should be designated as being attributable to ground ambulance services.

Response: We are not specifying a particular methodology for calculating the percent of square footage attributable to ground ambulance services, in order to reduce the burden on organizations who might have a particular method in place already. The

instructions in Section 8 of the data collection instrument ask for the total square footage of the facility and the percentage of the facility related to ground ambulance services. The entire square footage of the facility should be reported in the first case.

After consideration of the comments, we provided additional examples for clarification on how a ground ambulance organization should report the percentage of the facility attributed to ground ambulance services in the data collection instrument.

(iii.) Collecting Data on Vehicle Costs

Section 1834(l)(17)(A)(ii) of the Act requires CMS to collect information on “the utilization of capital equipment and ambulance capacity.” We proposed to collect information on the number of ground ambulances and other vehicles related to providing ground ambulance services, as well as the costs associated with these vehicles to meet these requirements.

In the proposed rule, we stated that ambulance organizations operate ground ambulances, as well as other vehicles to support their ground ambulance operation, and some may have a variety of other vehicles that are associated with ground ambulance responses. We provided the example of a fire truck staffed with fire personnel cross-trained as EMTs that may respond with a ground ambulance to an emergency call. We stated that other vehicles might be used in responses and may be referred to as a non-transporting EMS vehicle, a quick response vehicle, a fly-car, or an SUV that carries a paramedic to meet a BLS ambulance from another organization during the course of a response.

We considered two alternatives for collecting vehicle costs in the proposed rule. One alternative was to only include the costs for ambulances and exclude other certain non-ambulance response vehicles from reported costs. We stated that we believe that excluding other certain non-ambulance response vehicles from reported costs could potentially result in underreporting of total ground ambulance costs, particularly among those providers or suppliers that rely heavily on these vehicles to support their ground ambulance services. Another alternative we considered was to include the costs of all vehicles that are used as part of ambulance services, such as quick response vehicles that are used to supplement ambulances.

For all vehicles, vehicle costs can be reported either in aggregate or on a per-vehicle basis. We stated that we believe that while reporting vehicle costs in

aggregate may involve less burden for some respondents, those respondents that do not track aggregated costs would still require a tool to enter information on per-vehicle basis. Furthermore, we stated we believed that aggregated costs for vehicles other than ground ambulances offer analysts with fewer alternatives to allocate a share of vehicle costs to ground ambulance services.

We proposed to collect data on vehicle costs in the data collection instrument in two parts: Ground ambulance vehicles (Section 9.1); and all other vehicles related to ground ambulance operations (Section 9.2). For ground ambulance vehicles, we proposed to collect information on the number of vehicles, total miles traveled, and per-vehicle information on annual depreciated value (and remounting costs if applicable) for owned vehicles, and annual lease payments for rented vehicles (Section 9.1, questions 1–4). We considered proposing to collect the necessary information to calculate annual depreciated value using a standardized approach. However, we proposed to allow respondents with owned vehicles to use their own accounting approach to calculate annual depreciated value per vehicle. We stated we believed that allowing flexibility for respondents to use their standard approach for this calculation would result in more accurate data and less reporting burden.

We also proposed to use a similar approach to collect per-vehicle information for owned and leased vehicles of any other type that contribute to ground ambulance operations, including fire trucks, quick response vehicles, all-terrain vehicles, etc. (Section 9.2, questions 1–5). We stated that the proposed instructions in Section 9.2 of the data collection instrument specified that reported vehicles must support ground ambulance services. We proposed to collect the type of each vehicle in broad categories in addition to the annual depreciated value or lease payment amount for each vehicle.

In addition to the above costs, we also proposed to collect aggregate costs associated with licensing, registration, maintenance, fuel, insurance costs for all vehicles combined (ambulance and non-ambulance) (Section 9.3, questions 1–5). We stated we believe that these costs are often aggregated within providers’ and suppliers’ records and that reporting in aggregate form may reduce respondent burden with minimum risk for reporting error.

When estimating total ground ambulance vehicle costs for ground ambulance organizations that share

operational costs with fire and police response or other non-ground ambulance activities, we stated that a share of vehicle costs reported via the data collection instrument will need to be allocated as vehicle costs related to ground ambulance services. One alternative we considered to do this was simply to ask respondents about the share of costs associated with ground ambulance services as we thought this would be the least burdensome approach; however, we stated that we believed data collected in this manner would not allow for estimation of costs associated with non-ground ambulance vehicles that support ambulance services. We considered another alternative where (1) the ratio of ground ambulance to total responses would be used to allocate costs associated with non-ambulance vehicles, (2) the total number of vehicles would be used to allocate aggregate costs associated with licensing, registration, maintenance, and fuel costs, and (3) depreciated annual costs and/or lease payment amounts would be used to allocate insurance costs. We stated that the main limitation of this approach is that maintenance and fuel costs could vary significantly across vehicle categories. We provided the example that maintenance and fuel costs may be significantly different for ground ambulance than for other types of vehicles. As a result, we proposed a modification of this alternative where we also ask respondents to list percent of total maintenance and fuel costs attributable to each type of vehicle (that is, ground ambulances, fire trucks, land rescue vehicles, water rescue vehicle, other vehicles that respond to emergencies such as quick response vehicles, and other vehicles; Section 9.3, questions 4 and 5). We proposed to also ask respondents to report total mileage for ground ambulance (land and water separately) and total mileage for other vehicles related to ground ambulance responses (land and water separately) as a potential alternative means to allocate fuel and maintenance costs.

We received comments on collecting data on vehicle costs. The following is a summary of the comments we received and our responses.

Comment: Many commenters stated that they generally support the approach to collect vehicle cost data. Many commenters stated that they agree it will be easier for ground ambulance organizations to track their total vehicle costs and report that information than try to allocate the vehicle costs between “loaded” (or response) hours/miles and the costs incurred when the vehicles are not being used to respond directly to a

request for service (for example, a 911 call). They stated that this approach would work across the major cost centers outlined in the proposed rule. They stated that they understand that CMS has sought to strike a balance between asking for detailed information and not imposing an overwhelming burden on ground ambulance organizations. They stated that while they believe it may overstate the costs to aggregate those associated with licensing, registration, maintenance, fuel, insurance costs for all vehicles combined, both ambulance and non-ambulance, they appreciate the interest in reducing the burden on respondents when reporting such information. They stated that they also support differentiating between vehicles that function as ground ambulances and those that do not. They requested clarification on whether the definition of a ground ambulance refers to the CMS definition or to the definitions that apply in the respondent's state or locality. One commenter suggested adding more general examples of non-ambulance vehicles.

One commenter requested clarification about how to handle the reporting of fire trucks specifically, in cases where a fire truck with EMS personnel may be sent to the scene as part of a response. This fire truck could be owned by the organization filling out the survey, or another non-transporting fire truck from a different organization. This same commenter also requested clarification on how to report insurance costs when these may be paid by another agency, such as a state agency that purchases insurance on behalf of all of the vehicles in its fleet.

Response: We agree that it is important to balance burden on respondents with the level of detail of vehicle data reported in this section. While some data, for example licensing, registration, maintenance, fuel, insurance costs, could be collected in more detail in relation to ground ambulance services, we believe that alternatives to collect more detailed data would involve significant additional burden. Our intention is for organizations to report the ambulances that qualify as such in their jurisdiction. We expect that most of these ground ambulances would meet CMS' definition of a ground ambulance.

It is our intention in the vehicles section to collect data on the costs of vehicles associated with the reporting organization only. This may include fire trucks if the fire trucks are sent to the scene with EMS personnel. If there are no firefighters co-trained as EMS personnel, then these fire trucks are not

related to ground ambulance service and should not be included. If an organization is assisted by another organization at the scene (such as from a different fire department), the costs associated with these vehicles would not be included. We state elsewhere in these comments that we will add an additional question to the miscellaneous costs that allows organizations to report fees paid to other non-transporting organizations for their services. We believe that it would be too much additional burden to ask organizations to assess the costs of providing services for organizations other than their own.

For insurance, fuel or other vehicle-related costs, we ask that organizations ask the agency providing these items for an estimate of their cost.

After consideration of the comments, we added more general examples of non-ambulance vehicles, such as sport utility vehicles and pickup trucks used to support ground ambulance services, which should be included in reporting in this section. We also clarified in the data collection instrument that respondents should report on all ground ambulance vehicles that meet local and state requirements.

(iv.) Collecting Data on Equipment and Supply Costs

In our interviews with ground ambulance organizations, we were told that not all ground ambulance organizations would be able to report detailed item-by-item equipment and supply information, and that some organizations have far more sophisticated inventory tracking systems than others that would allow them to report detailed information within a category.

In the proposed rule, we stated we considered alternative approaches related to reporting equipment and supply costs that varied primarily on the level of detail for reporting. We considered extremely detailed data reporting as it would be potentially useful to identify variability in costs across organizations. However, as noted above, we stated that many ground ambulance organizations may not keep detailed records of all their individual equipment and supply costs. Taking those factors into account, we proposed to request total costs in a small number of equipment and supply categories rather than itemized information for all equipment and supply categories (Section 10). We stated these would include:

- Capital medical equipment.
- Medications.
- All other medical equipment, supplies, and consumables.

- Capital non-medical equipment.
- Uniforms.
- All other non-medical equipment and supplies.

We also considered whether to have respondents report both medical and non-medical equipment and supplies together. We stated that we believed that the majority of medical supplies are more likely to be related to ground ambulance services than non-medical supplies for organizations with shared services, and therefore, we proposed to collect this information separately.

Reporting of Capital Versus Non-Capital Equipment

To meet the requirement in section 1834(l)(17)(A)(ii) of the Act to collect information to facilitate the analysis of "the utilization of capital equipment," we proposed to separately collect information on capital equipment expenses (rather than equipment-related operating expenses). Capital equipment (both medical and non-medical) yield utility over time, which we stated can vary depending on the expected service life of the specific good. We stated that in addition to the cost of purchasing or leasing durable goods equipment, depreciation and maintenance costs must be considered in the total cost calculations. Since ground ambulance organizations often track capital equipment on an itemized level, separating items of significantly different age and cost is necessary to calculate depreciation. Therefore, to minimize burden by aligning reporting with the accounting approaches used by respondents, we proposed to ask for capital (Section 10.1, question 1; Section 10.2, question 1) and non-capital costs (Section 10.1, questions 2–3; Section 10.2, questions 2–3) separately so that respondents could report annual depreciated costs for capital equipment and total annual costs otherwise. We also proposed to allow respondents to report annual maintenance and service costs for capital equipment because ground ambulance organizations have stated during interviews that these costs can be significant compared to purchase costs or annual depreciated costs. Finally, we proposed to allow respondents to use their own standard accounting practice to categorize equipment as capital or non-capital. We stated that while we believe it would be possible to ask respondents to use a standard approach, we believed this would require respondents with another practice to recalculate annual depreciated cost and potentially increase respondent burden and reporting errors.

Allocation of Shared Costs

During interviews with ground ambulance organizations, it was noted that although the vast majority of equipment and supplies are for ground ambulance services, some costs are shared with hospitals or clinics. We stated that we believed separate reporting on medical and non-medical equipment and supplies would facilitate allocation (Section 10.1, versus Section 10.2). For organizations that indicate the use of shared services, we proposed to ask separately what share of medical and non-medical equipment and supply costs are related to ground ambulance services (Section 10.1, questions 1c, 2a; Section 10.2, questions 1c, 2a, 3a). We stated the share of non-medical equipment and supplies used for ambulance services may vary for respondents with operations beyond ambulance services. While other allocation methods (such as the share of responses that are ground ambulance responses) may be appropriate to allocate equipment and supply costs, asking respondents to provide their estimate of the share of equipment and supply costs related to ambulance services reduces assumptions made about how best to apply allocation across the various equipment and supplies reported.

We received comments on collecting data on equipment and supply costs. The following is a summary of the comments we received and our responses.

Comment: Many commenters expressed a desire to work with CMS to develop additional categories for the cost of equipment, consumables, and supplies for future surveys that would allow policy-makers to address high-cost products or patients who require services resulting in higher costs. They stated that they support the differentiation between capital and non-capital equipment, as well as the proposed allocation rules, and questioned whether nebulizers, which are devices for producing a fine spray of liquid for inhaling a drug, should be considered capital equipment. Another commenter stated that some organizations may not separately report medication costs from other supplies and equipment, and questioned why this was important to separate.

Response: While there are many other potential equipment and supply categories that could have been added separately to this section, in the interest of balancing the level of detail collected in the data collection instrument with burden, we decided to limit this section to only a small number of specific types

of supplies and equipment (such as drugs) for which we proposed to collect costs separately. We believe that the data collected through the data collection instrument may point to opportunities for additional refinement in this section in future years of data collection. For example, rather than collect information on all drugs in aggregate, reporting by category of drug or even for individual drugs may provide useful information. Still, given the fact that information on ground ambulance costs is limited, we believe the appropriate first step is to collect higher-level cost information. We also agree with the commenters that items such as nebulizers should be considered non-capital equipment as they are typically a single usage device when used by ground ambulance providers and suppliers. In the process of developing the survey, we heard from many organizations about the increasing cost of medications and as a result, we requested these items to be reported separately. We recognize that some organizations may not be able to separate their drug costs from other medical consumables, so this question is optional on the survey.

After consideration of the comments, we removed the example of nebulizers from the capital equipment section.

(v.) Collecting Data on Other Costs

In addition to core costs for ambulance providers and suppliers that are associated with labor, vehicles, facilities, and equipment or supplies, ground ambulance organizations have indicated that these entities incur costs associated with contracted services (for example, for billing, vehicle maintenance, accounting, dispatch or call center services, facilities maintenance, and IT support), as well as other miscellaneous costs (for example, administrative expenses, fees and taxes) to support ground ambulance services.

In the proposed rule, we considered including contracted services as part of the labor section, since many of the contracted services related to costs that would otherwise be labor-related if the tasks were performed by employed staff. However, we were concerned that ground ambulance organizations might report this information in multiple data collection instrument sections (for example, both labor and miscellaneous costs). As a result, we separated contracted services into their own categories. While we considered allowing respondents to report in the aggregate any other miscellaneous costs associated with ground ambulance services because we stated we believed this approach may be less burdensome

for organizations that track miscellaneous costs in aggregate, we stated we believed this would introduce a large amount of reporting bias and inconsistency in reporting across organizations. In the proposed rule, we made several proposals related to reporting contracted services and miscellaneous costs as described below.

Reporting Contracted Services

For contracted services, we proposed that respondents indicate whether their organization utilizes contracted services to support a variety of tasks (Section 11, question 1), the associated total annual cost for these services, and the percentage of costs attributable to ground ambulance services. The data collection instrument provided instructions to ensure that respondents do not report on contracted costs multiple times.

Reporting of Miscellaneous Costs

For other miscellaneous costs not otherwise captured in prior sections of the data collection instrument, we proposed that respondents be able to report additional costs first using an extensive list of other potential cost categories (Section 11, question 2) and then use write-in fields if necessary. We stated that providing a pre-populated check list would help ensure the consistency and completeness of reporting across respondents.

Allocation of Miscellaneous Shared Costs

Information from ground ambulance organizations indicates that there are a number of miscellaneous costs associated with the overall operation of organizations that are shared across services. To account for these shared costs, we proposed that respondents report an allocation factor for each contracted service, (Section 11, question 1), as well as for each reported miscellaneous expense (Section 11, questions 3–4) as described in the data collection instrument. We considered the alternative of asking for an overall share of miscellaneous costs associated with ground ambulance services or utilizing information gathered about the share of ground ambulance responses versus total responses to determine an overall allocation factor. We stated that while this would present less burden on respondents, the share of miscellaneous costs and share of contracted services varies widely across organizations with shared services.

We received comments on collecting data on other costs. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported the proposed data elements for other costs, but as noted with regard to labor, they requested clarification as to the allocation of medical director fees to ensure there is no double-counting between the two sections.

Several commenters stated that Section 11, Question 3 (advertising expenses) of the data collection instrument directs respondents to provide information on a variety of general and miscellaneous costs. They stated they believe CMS should clarify what is meant by the “Advertising” category of expenses because it is unclear whether this is generic advertising to the public or if this would be inclusive of advertising conducted in order to recruit volunteer personnel. Additionally, they thought CMS should clarify which advertising expenses this includes (print, television, radio, online/social media, trade show exhibitions, promotional items such as shirts and stickers, etc.).

Another commenter suggested that CMS collect information about unpaid transports (excluding charitable care) and/or uncompensated health care services when no transport is involved. They stated that they recognize that Section 5 in the data collection instrument asks about the volume of paid transports. They stated that it is not clear that information about the actual costs associated with unpaid transports could be determined through the other questions at this time but that this information is essential to understand how the limitations in the current Medicare benefit have a negative impact on overall Medicare costs. They also stated that this information would also help policy-makers assess how unpaid services could be addressed in the future. They stated that they believe that this information should be distinguished from bad debt or charitable care, because the former implies the inability to collect coinsurance amounts, while the latter indicates services provided to those without insurance or funds to pay for the services. This unpaid category would be focused on transports or services provided to patients with insurance, but for which the insurance company refuses to pay.

One commenter suggested that costs for franchise fees needed to be collected in the survey because franchise fees are costs some organizations pay local governments to operate within the jurisdiction. The same commenter advised that dispatch costs would be difficult to capture for rural organizations because dispatch services are generally run by a central entity

such as county government. Finally, one commenter requested clarification on what was included in ‘total costs’ and ‘total revenues’ as to whether this included total costs and revenues from organizations with shared services.

Response: As noted in our response to comments in the labor section, we are moving the reporting of contracted medical director services to the labor section to avoid potential confusion and double-counting. More generally, the proposed data collection instrument included an instruction in the contracted labor section to not report funds that had already been reported elsewhere in the survey. We agree with the comment suggesting clarifications to the definition of advertising. While the proposed data collection instrument collects some information relevant to uncompensated care, we did not intend to directly collect respondents’ estimates of uncompensated care. The data collection instrument does collect information on the total costs borne by the ground ambulance organization, including costs related to transports for which no or partial payment is received. The data collection instrument also collects information on the total number of transports for which payment is received versus total transports.

In response to the suggestion to add a question to collect information on franchise fees, we wanted to highlight that this data item is already being collected in the section on other costs, which reads as follows: “Fees paid to local jurisdictions required as condition of providing ground ambulance service.”

We intended the total costs and total revenues to incorporate the full totals for each question. This means that for organizations with shared services, they would report their full operating and capital costs, and revenues, even for the portions of their business unrelated to ground ambulance service. For example, a fire department also operating an ambulance service would answer this question with their total cost and total revenue across the whole organization. For organizations without shared services, their total costs will match those reported in the data collection instrument. For organizations with shared services, their total costs will be higher than those reported in the data collection instrument.

After consideration of the comments, we clarified the definition of advertising to include any type of advertising (even for recruiting purposes) in any medium (print, radio, internet, etc.). We also added additional clarification to the questions for total costs and total revenues.

d. Data Collection on Revenue

Section 1834(l)(17)(A) of the Act requires the development of a data collection system to collect revenue information for ground ambulance provider and suppliers. Payments from Medicare and other health care payers are important components of total revenue for some ambulance providers and suppliers. Most ambulance providers and suppliers also have other sources of revenue in addition to payments for billed services. Based on review of existing literature and discussions with ground ambulance organizations, these primary sources of revenue include, but are not limited to: Patient out-of-pocket payments; direct public financing of fire, EMS, or other agencies; subsidies, grants, and other revenue from local, state, or federal government sources; revenue from providing services under contract; and fundraising and donations. In the proposed rule we stated that we view total revenue as the sum of payments from health care payers and all other sources of revenue, including those listed above.

We stated that while collecting information on total revenue is essential to understanding variations in how EMS services are financed across the country, this information is not collected by Medicare or by any other entity of which we are aware. Similar to other sections of the data collection instrument, we stated that we also considered what level of data to request in this section. We proposed to ask for total revenue in aggregate (Section 13, question 1) and total revenue from paid ground ambulance transports for Medicare and, if possible, broken down by payer category for other payers (Section 13, questions 2–5). We proposed this level of detail because we believe understanding payer mix would be helpful to assess Medicare’s contributions to total revenue. We stated that based on information provided by ambulance providers and suppliers, there is variation in how patient-paid amounts were recorded in ambulance billing systems. We proposed to ask respondents whether revenue by payer includes corresponding patient cost sharing or whether cost-sharing amounts are included in a self-pay category. For other revenue (for example, contracts from facilities and membership fees (such as those associated with community members that enroll in ambulance clubs), we proposed to request information on additional revenue in predetermined categories and using write-in fields if necessary (Section 13, question 5).

Allocation of Shared Revenues.

Ground ambulance organizations vary widely in the types of other revenue sources (as noted in Section 13, question 6) they receive and their share of allocated costs. For this reason, we proposed to have respondents report the share of revenue for each category that is attributable to ground ambulance services (Section 13). Similar to miscellaneous costs, we considered the alternative of asking for an overall share of other revenue sources associated with ground ambulance services or utilizing information gathered about the share of ground ambulance responses versus total responses to determine an overall allocation factor. While this would present less burden on respondents, we stated that we did not believe it would adequately capture the revenue only associated with ground ambulance services, especially for organization with shared services.

To collect information on uncompensated care, including charity care and bad debt, we proposed to collect information on both total and paid transports. We stated these two measures of volume can be used to provide insight into the share of transports that are not paid. The data collection instrument broadly collects information on total costs (including costs incurred in furnishing services that are ultimately paid and not paid) and total transports (again including transports that are both paid and not paid). We stated that the collected data could be used to estimate per-transport costs that can be estimated by dividing total costs by total transports, so we do not believe it is necessary to directly collect information on uncompensated care in the revenue section of the data collection instrument.

We invited comments on collecting revenue. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported the collection of ground ambulance revenue from different types of payers, as well as the collection of other sources of revenue. These commenters asked that CMS divide Medicaid revenue by traditional Medicaid and Medicaid managed care, similar to the separate lines for Medicare fee-for-service and Medicare Advantage and recommend that CMS define the term “ambulance club,” which they stated is not a standard term.

Several commenters asked CMS to add a revenue category to Section 13, Question 5 in the data collection instrument to collect in-kind contributions (including labor, supplies,

medications, etc.) provided by another agency which responds to calls for emergency service in conjunction with the ground ambulance organization completing the data collection instrument. Commenters would like respondents to select yes or no, enter the dollar amount, and enter a percentage. They stated that fire departments often provide EMS care to patients, including at the ALS level, even when another agency provides the actual ground transportation services to a patient and when this occurs, the fire department’s ALS personnel often continue providing patient care inside the third-party ambulance during transportation to the hospital. They stated that this continuation of patient care by fire department personnel constitutes a significant savings to the third-party transportation company as they do not incur the costs associated with the fire department employee(s) such as salary, benefits, and insurance. They also stated that in many cases, the fire department never receives reimbursement for these costs by the third-party ground ambulance agency. They stated that since the data collection instrument only will apply to Medicare-enrolled ground ambulance agencies that they believe that the data collection instrument should count these services as in-kind contributions to the third-party ambulance agency. Commenters further stated that ground agencies selected for sampling by CMS each year can easily gain this information by requesting it from the agencies which commonly respond to calls for emergency service with the third-party ground ambulance agency.

Several commenters stated that Section 11, Question 5 seeks information from respondents on several revenue categories which may apply to an ambulance supplier or provider. They stated that since the goal of the data collection instrument is to assess the adequacy of CMS’ reimbursements for the cost of providing patient care, they believed that the inclusion of tax revenue for public agencies could lead to the inclusion of unrelated data. They stated that operating revenue that is derived from taxation and provided to public agencies represents the level of service expected by a community but is not expected to be a dollar-for-dollar coverage of patient care costs and that these funds should supplement, not supplant, CMS’ reimbursements to public agencies for the care that they provide to Medicare beneficiaries. They also stated that they believed that tax-derived subsidies should be reported by

respondents when these funds are included in a larger contract between a local government and a private entity. They stated that in these cases, these subsidies are intertwined with the overall structure and terms of the contract but that they do support the requirement for respondents to report when revenue is received by any agency (public or private) through an EMS-specific tax and as a result, they recommend that CMS adopt changes to Section 13, question 5.

Another commenter suggested that donations to organizations that support volunteers should be considered in the revenue section. This same commenter also requested clarification as to whether patient self-pay includes the uninsured or uncovered transports.

Response: We agree that it would be informative to distinguish between traditional FFS Medicaid and Medicaid managed care revenue and will add that option to the instrument. We use the term ‘ambulance club’ to describe a membership organization where local residents pay a regular fee for ambulance service not provided by their local governments. We do not agree with the commenter suggesting to collect information on the in-kind subsidies provided by other, non-transporting agencies who assist the reporting organization at the scene or while transporting patients. We believe this additional question will add substantial burden for organizations who must collect it, as this requires valuing the other organization’s labor, supplies, vehicles, facilities, etc., and this information will be captured in the cost sections if there is a contract between the organizations for reimbursement.

The data collection instrument is designed to capture the costs of operating a ground ambulance service, consistent with our statutory requirements and we do not believe that including donations to other organizations would be appropriate to include. Donations, payment, or benefits made by other entities that support staff or other services that are out of scope for this data collection are also out of scope when reporting revenue. The patient self-pay revenue section is intended to capture payments patients made to the ambulance organization for a transport that was covered or not covered by their health insurer.

We are required to collect information on revenue received by ground ambulance organizations. Therefore, we do not agree that tax revenue for public agencies should be excluded from the data collection instrument because omitting questions related to this source

of revenue from that data collection instrument would result in an incomplete picture of revenue across different types of ground ambulance organizations. The data collection instrument collects information separately on tax revenue for public agencies and from contracts between local governments and ground ambulance organizations.

After consideration of the comments, we clarified the meaning of an ambulance club and added an option to separately report Medicaid Managed care revenue. We also added an option to separately report contract revenue from local governments, as well as tax revenue from local governments, and clarified that self-pay refers to non-covered transports.

After consideration of the comments regarding the data collection instrument, we are finalizing our proposals regarding the format, scope, costs and revenue with several modifications or clarifications as described in the sections above.

5. Final Policies for Sampling

Section 1834(l)(17)(B)(i) of the Act requires that CMS identify the ground ambulance providers and suppliers organizations that would be required to submit information under the data collection system, including the representative sample. Section 1834(l)(17)(B)(ii)(II) of the Act requires the representative sample must be representative of the different types of providers and suppliers of ground ambulance services (such as those providers and suppliers that are part of an emergency service or part of a government organization) and the geographic locations in which ground ambulance services are furnished (such as urban, rural, and low population density areas). Under section 1834(l)(17)(B)(ii)(III) of the Act, the Secretary cannot include an individual ambulance provider and supplier in 2 consecutive years, to the extent practicable. In the proposed rule, we stated that in addition to meeting the requirements set forth in the statute, including developing a representative sample, our proposals around sampling aim to balance our need for statistical precision with reporting burden. We also stated that our we developed our proposals with the intention of obtaining statistical precision with the least amount of reporting burden.

Eligible Organizations. In the proposed rule, we stated that a sampling frame drawing on all ground ambulance organizations in the United States and its territories that provide ground ambulance services (that is, not just

those enrolled in Medicare or billing Medicare in a given year) may be of interest conceptually, but that we have not identified a data source listing all ambulance providers and suppliers that could be used as the source for a broader sampling frame. Since sections 1834(l)(17)(A) of the Act requires the Secretary to collect cost, revenue, and utilization information from providers of services and suppliers of ground ambulance services (which are Medicare specific terms with specific meaning) with the purpose of determining the adequacy of payment rates and section 1834(l)(17)(D) of the Act requires the Secretary to reduce payments to ground ambulance organizations that do not sufficiently report, we stated we believe that the intent of the statute is to collect information under the data collection system from ground ambulance organizations that bill Medicare. Therefore, we proposed to sample ground ambulance organizations that are enrolled in Medicare and that billed for at least one Medicare ambulance transport in the most recent year for which we have a full year of claims data prior to sampling. Since ground ambulance organizations have a full year to submit their claims to Medicare after the date of service, claims data for a calendar year are generally not considered complete until the end of the following calendar year. We stated that as a result, we would use 2017 Medicare claims and enrollment data to determine the sample for the 2020 data collection period because 2018 Medicare claims data could not be considered complete in late 2019 when the sample for the 2020 data collection period would be selected.

Sampling at the NPI level: Section 1834(l)(17) of the Act prohibits, to the extent practicable, sampling the same ambulance provider or supplier in 2 consecutive years. Although we stated we considered sampling at a broader parent organization level for those that bill Medicare under more than one NPI, we stated we found it was difficult to tease out of the Medicare enrollment data all the complexities of the business relationships and identify all NPIs that may be affiliated with the same parent organization. Therefore, we proposed to select the sample at the NPI level and to include the specific NPI selected to report information. Furthermore, we proposed to collect the name of the ground ambulance organization and the name and contact information of the person responsible for completing the data collection instrument for the purposes of confirming that the data

submitted aligns with the intended NPI (Section 2, questions 3 and 4).

Organizations using volunteer labor: Some stakeholders have suggested that ground ambulance organizations relying on volunteer labor above a certain threshold (for example, more than 10 percent of volunteer labor) should be exempt from sampling. Others have suggested that ground ambulance organizations using volunteer labor should not be excluded because those organizations that use volunteer labor are likely to be smaller and that a large share of ambulance suppliers (particularly those in rural and super rural areas) would be exempt from sampling, and therefore, our sample would not be representative as required by section 1834(l)(17)(B)(ii) of the Act. We acknowledged that analysis of the data may require additional steps to combine data submitted from ground ambulance organizations that do and do not rely on volunteers since reported labor costs would be significantly lower for ground ambulance organizations that use volunteer labor compared to those that do not. We stated that ground ambulance organizations that use volunteer labor might have some costs related to their volunteer labor, such as stipends, but may not have others, such as an hourly wage. Therefore, we proposed to collect information on paid and unpaid volunteer hours during a typical week using the same EMT/response staff categories used elsewhere in the data collection instrument. We stated we believed reported hours could be converted to market rates using data from other sources, such as the Bureau of Labor Statistics' wage data. Ambulance providers and supplies that rely on volunteer labor reported that it is becoming increasingly difficult to find volunteers and they are having to hire paid staff in their place, especially for the more costly labor categories, such as paramedics. Therefore, we proposed that ambulance providers and suppliers that use any amount of volunteer labor be included in sampling. We invited comments as to whether organizations that rely on volunteer labor should be exempt from sampling.

Sampling file. We proposed several organizational characteristics for the specific strata (volume of Medicare billed transports, service area population density, ownership, provider versus supplier status, and the share of transports that are non-emergency) that we stated could be obtained from available Medicare data. We proposed to develop sampling files using the most recent full year of data available. For the first sample notified in 2019 and

reporting in 2020, we proposed to use 2017 claims and enrollment data. Another alternative we considered was using 2018 data, however we did not propose this because such data may not be complete for all 2018 service dates at the time the sample for the initial year of data reporting is selected. We invited comments on our proposal to use the most recent full year of available Medicare data for sampling purposes, as described above.

Implications of historical sampling files. In the proposed rule we stated that we expect there may be instances in which some ground ambulance organizations that were in operation at the time they were selected for the sample may cease operations by the time data reporting begins and that we expect that some new ground ambulance organizations would start operating between the time the sample was created and when reporting begins. Since we proposed to collect a full 12 continuous months of data, these organizations would not have the data we proposed to collect. Therefore, we proposed that ground ambulance providers and suppliers organizations selected for the sample that were not operating for the full 12 continuous months of the data collection period would be exempt from reporting for the applicable data collection period; however, for newer ground ambulance organizations, they would be eligible for sampling and reporting in future years when they have a full continuous 12 months of data.

We stated that we believed the above scenarios are inevitable given the significant amount of time between sampling and data reporting and invited comments on our approach regarding exempting ground ambulance organizations who do not have a full 12-month continuous period of data.

Sampling rate: We proposed that 25 percent of ground ambulance organizations be sampled from all strata (as described below) in each of the first 4 years of reporting without replacement; that is, if an organization is sampled in Year 1, it would not be eligible for sampling again in the subsequent 3 years of data collection. We proposed a 25 percent sampling rate because we stated if a lower sampling rate is used, estimates of cost, revenue, and utilization from the data collected via the data collection instrument for subgroups of ground ambulance suppliers will be of inadequate precision as described in the following section. We stated that our analyses illustrated that using a 50 percent sampling rate would yield only marginal gains in precision over a

sampling NPIs at a 25 percent rate while doubling the response burden. We stated that in our view, these gains are not sufficient to merit the increased burden that would be imposed by implementing a higher sampling rate. We stated that our proposal was informed by analyses regarding the alternative sampling rates in Chapter 7 of the CAMH report. We invited comments on the sampling rate of 25 percent each year.

We also proposed to notify ground ambulance organizations that have been selected for the representative sample by listing such ground ambulance organizations on the CMS website at <https://www.cms.gov/Center/Provider-Type/Ambulances-Services-Center.html> and provide written notification to each selected ground ambulance organization via email or U.S. mail. We stated that notification on the CMS website would be provided at least 30 days prior to the time the selected ambulance organization would be required to begin collecting data. For purposes of CY 2020, we stated that we would post such information on the website when the CY 2020 PFS final rule is issued. We also proposed to codify the representative sample requirements in § 414.626(c).

Approach for Sampling: In the proposed rule, we considered several alternatives for developing a stratified sampling approach to facilitate data collection from specific types of ground ambulance organizations. Section 1834(l)(17)(B)(ii)(II) of the Act requires that the sample be representative of the different types of providers and suppliers of ground ambulance services, such as those providers and suppliers that are part of an emergency service or part of a government organization and the geographic locations in which ground ambulance services are furnished (such as urban, rural, and low population density areas). One approach we considered was sampling ground ambulance organizations in proportion to their volume of Medicare-billed ground ambulance services. Under this approach, we stated that organizations with more billed Medicare ground ambulance transports would be more likely to be sampled than organizations with fewer billed Medicare ground ambulance transports. The analysis of our 2016 data described in the CAMH report shows that a small number of ground ambulance organizations provided a large share of total Medicare transports. We stated that the top 10 percent of ground ambulance organizations by volume accounted for nearly 70 percent of total Medicare ground ambulance transports and the

bottom 50 percent of ambulance providers and suppliers by volume accounted for only 3 percent of total Medicare ground ambulance transports. Under this approach, we stated that the ambulance providers and suppliers in the top 10 percent by volume would be much more likely to be sampled compared to those in the bottom 50 percent by volume. We also stated that while this approach would efficiently collect data on the majority of Medicare ground ambulance transports, we do not believe that this approach would comport with the requirements in section 1834(l)(17)(B)(ii)(II) of the Act to develop a representative sample of ground ambulance organizations based on the characteristics (such as ownership and geographic location) of ambulance providers and suppliers. Therefore, we stated that we do not believe that data we would be collecting using this approach would meet the requirements in section 1834(l)(17)(B)(ii)(II) of the Act.

Other alternatives for a sampling methodology we considered included simple and stratified random samples of ground ambulance organizations. We stated a simple random sample would include a fixed share of all ground ambulance organizations, regardless of any differences in characteristics, in each year's sample. Unlike sampling in proportion to Medicare-billed ground ambulance services, we stated a simple random sample by definition provides a representative sample. A stratified random sample first stratifies all ground ambulance organizations based on selected characteristics and then a sample is selected at random from the strata. We stated the rate at which these organizations are sampled would be the same for organizations in the same stratum; however, that the sampling rate may vary across strata. So long as the sampling rate is not zero within any stratum and so long as appropriate weighting adjustments are used, we stated the sample would be considered representative.

As discussed in the proposed rule, stratified random sampling has several advantages in that it is easy to implement and it meets the requirement that the sample be representative and it also can be used to target sampling of ambulance organizations with specific characteristics, such as ownership and geographic location, to specifically meet the requirements in section 1834(l)(17)(B)(ii)(II) of the Act that the sample be representative of the different types of providers and suppliers of ground ambulance services, such as those providers and suppliers that are part of an emergency service or part of

a government organization and the geographic locations in which ground ambulance services are furnished (such as urban, rural, and low population density areas). We stated that it is also possible to oversample from less prevalent strata using this approach in order to facilitate more precise estimates for certain groups or comparisons between subgroups. Furthermore, unlike a simple random sample, we stated the flexibility to vary sampling rates across strata allows the ability to account for anticipated and unanticipated rates of nonresponse.

We stated that we believe that use of a stratified random sample would comport with the statutory requirements. Therefore, we proposed a stratified random sample approach. Specifically, we proposed to sample from each strata at the same rate (25 percent, as described above). We stated we believe that data collected from a sample of this type can be adjusted via statistical weighting to be representative of all ground ambulance organizations billing Medicare for ground ambulance services even if response rates vary across the characteristics used for stratification.

For the purposes of estimating the number of responses from the sampled ground ambulance organizations, we stated we assumed that all ground ambulance providers and suppliers organizations sampled will report, because: (1) Reporting is a requirement; (2) there is a 10 percent payment reduction for failure to sufficiently report; and (3) we believed every ground ambulance organization would want its data accounted for in the evaluation of the extent to which reported costs relate to payment rates.

Variables for Stratification: Section 1834(l)(17)(B)(ii)(II) of the Act requires that the sample be representative of the different types of providers and suppliers of ground ambulance services, such as those providers and suppliers that are part of an emergency service or part of a government organization, and the geographic locations in which ground ambulance services are furnished (such as urban, rural, and low population density areas). We proposed a stratified sampling approach under which we would first sample based on a set of characteristics of ground ambulance organizations that are described below (that is, strata) and then assess response rates based on those characteristics. Based on our analysis of information provided by ground ambulance organizations, we stated we believed there are several important characteristics that vary among ground ambulance organizations that have

implications for their costs and revenues and that could serve as strata for the purposes of sampling:

- *Provider versus supplier status.* The GAO (2012)⁹⁷ and HHS (2015)⁹⁸ reports found much higher per-transport costs for ambulance providers than those of ambulance suppliers. We stated this suggests that the ground ambulance cost structures for ambulance providers and suppliers are fundamentally different.
